Introduction 1

I. Geography, Climate and Prehuman History of Central Asia 3

1. On the definition of Central Asia 4

Excursus: *The dinosaur hunter Roy Chapman Andrews* 8

2. The interdependence of geography, climate and history 11

3. The factors determining climate 17

Excursus: *Hominin or hominid?* 17

II. The Settlement of Central Asia in the Palaeolithic 19

1. 'Out-of-Africa' or 'Out-of-Asia'? 20

2. The earliest settlements of Central Asia 22

2.1 Neanderthals and *Homo sapiens* – supersession or interbreeding? 24

3. The birth of art 28

4. The bow – a 12,000-year-old success story 35

III. A Global Climatic Warming Ushers in the Mesolithic 39

1. The retreat of the glaciers 40

2. Petroglyphs as information sources 40

Excursus: *The petroglyphs of Tsagaan Salaa and Baga Oigor, Mongolia* 42

3. Microliths 47

IV. The Economic Revolution of the Neolithic 49

1. The primary and secondary Neolithic revolutions 50

2. Hunters and gatherers in the mountains and along the waterways of inner Central Asia 50

3. Agriculture and early settlements in southern Central Asia 52
4. The northern steppes of Central Asia – meeting point of hunters and herders with farmers 55

V. The Chalcolithic and the Early Bronze Age 57
1. The division of early history and the beginnings of metallurgy 58
2. An initial proto-urban development 60
  Excursus: *The pioneer Raphael Pumpelly in Anau* 61
3. The first cities of Central Asia in southern Turkmenistan 65
  Excursus: *The Indus Valley Civilisation, trade partner of Central Asia in the early Bronze Age* 76
4. Agrarian and stockbreeding cultures in northern Central Asia 78
  4.1 The cultures of Cucuteni–Tripolye and Usatovo 78
  4.2 Early stockbreeding cultures 82
  4.3 The emergence of horse riding 84
  4.4 The invention of wheel and wagon 87
  4.5 The culture of Maikop 92
  4.6 The Yamnaya–Afanasievo Cultural Complex 95
  4.7 Sun deities and horse sacrifices 98

VI. The Middle and Late Bronze Age 101
1. The Bactria–Margiana Archaeological Complex BMAC 104
  1.1 The BMAC Culture of Margiana 106
  Excursus: *Lord and Mistress of animals* 110
  1.2 The BMAC Culture of Bactria 114
2. Indo-European mummies in north-western China 122
  2.1 The origins of metallurgy in China 122
  2.2 The Ayala Mazar–Xiaohe Culture 123
  2.3 The wheel, the horse and fertility rites 134
3. The steppes of Central Asia: 'origin' of the Indo–European languages? 135
4. Mysterious stone steles of the Okunev Culture in Khakassia 137

Excursus: *Cultures of the Bronze Age and the Iron Age in the Minusinsk Basin* 139
5. From the Volga to the Yenisei: homeland of the Indo–Iranians? 139
5.1 Cultures west of the Urals 140
5.2 Cultures east of the Urals: The Andronovo complex 141
5.2.1 The culture of Sintashta – fortified circular settlements and chariot burials 141
5.2.2 Alakul and Fyodorovo 149
6. Karasuk and the cultures of Khirigsuurs and Slab Graves during the transition to the Iron Age 151
6.1 Deer stones: flying deer as companions in the afterlife? 157

VII. The Iron Age 165
1. Nomadic horsemen in north-eastern Central Asia 169
1.1 The kurgan steppe of Minusinsk 169
1.2 Herodotus's geography of Central Asian peoples 172
1.3 Tuva, nucleus of the Scythian peoples and the Scytho-Siberian animal style 175
Excursus: *The Siberian collection of Tsar Peter the Great* 180
1.4 The ice kurgans of the Altai 186
1.5 Stockbreeding cultures of north-eastern Kazakhstan and the western Siberian forest steppe 195
1.6 Achaemenid invasions in the territory of the Saka: The beginning of a 2,500-year-long conflict between nomadic horse-riding peoples and states of settled societies 198
Excursus: *Zoroastrianism and its symbol, Faravahar* 204
1.7 Nomadic and settled cultures between the 'Land of Seven Rivers' and Choresmia 205
1.8 Mountain, steppe and desert stockbreeders between the Pamirs and Altyn Tagh 209
1.8.1 Fergana and the Pamirs 209
1.8.2 The Chinese Altai and regions north of the Tian Shan Mountains 211
1.8.3 Oasis cultures south of the Tian Shan Mountains 216
2. Nomadic riding peoples on the north-western periphery of Central Asia 224
2.1 Cimmerians and early Scythians 224
2.2 Scythians in the Kuban region 229
2.3 The Pontic Scythians 233
2.3.1 The Scythian pantheon 235

2.3.2 War and burial customs 237
Excursus: *Olbia and the Bosporan Kingdom* 239
2.3.3 Chronology of the Scythian kings 244
2.3.4 Greek influences on Scythian toreutics and grave architecture 249
2.4 Sarmatians, Alans and Amazons 253
2.4.1 Sauromatians and early Sarmatians between the Volga and the Ustyurt Plateau 254
2.4.2 Sarmatians and Alans on the Black Sea and in the Roman Empire 256
2.4.3 Military innovations 262
Excursus: *The Amazons – myth and reality* 264
2.4.4 The polychrome animal style 267

VIII. Greeks in Central Asia 271
1. The campaign of Alexander the Great 275
2. The Greco–Bactrian Kingdom 283
3. Bactrian art of the steppe, Hellenism and Zoroastrianism 291

Introduction

We must welcome the future, remembering that soon it will be the past; and we must respect the past, remembering that it was once all that was humanly possible.

ADAPTED FROM **GEORGE SANTAYANA** (1863–1952)

Central Asia is a region of superlatives and extremes. In a huge, though mostly sparsely populated area of about 10 million km^2 hundreds of languages have developed and manifold cultures have blossomed. Because of its great distance from seas and oceans, Central Asia has a distinctive continental climate with often bitterly cold winters and torrid summer heat, and water shortages prevail in large regions – when water is available at all. Sudden climatic, ecological or tectonic events sometimes forced people to repeatedly take drastic action – such as developing new economic systems or leaving their homelands.

For these reasons life in Central Asia has often focused on survival, which has facilitated the discovery of vital technologies in such areas as metallurgy, transportation, trade and warfare. The people understood that they had to adapt themselves to challenging conditions and lived as hunters, gatherers, fishermen, settled or nomadic cattle breeders, farmers or specialised artisans. In southern Central Asia there developed very early proto-urban cultures and trade networks, which enabled contacts and the exchange of goods between widely distant cultures, such as Mesopotamia, the Indus Valley Civilisation in modern-day Pakistan, and China. The mobility necessary for life in large stretches of Central Asia clearly fostered the early trade in certain raw materials; long before the Silk Roads, there were jade, lapis lazuli and tin roads.

The attraction of Central Asian raw materials for the wealthy economic powers at the periphery of the Eurasian continent has not changed in the twenty-first century. On the contrary, natural gas and petroleum have taken the place of silk, and existing and planned pipelines, which connect the vast gas and petroleum reserves of Kazakhstan, Turkmenistan and Siberia to the energy-hungry economies of China and Western Europe, are modern-day Silk Roads.

We use the word ‘culture’ to describe those activities and achievements by people that can be of a material, spiritual, ethical, religious or political nature. A specific cluster of such activities forms a culture and sets it apart from other cultures for a certain time span. Cultures are often connected to a particular territory, which, depending on the dynamic of the culture’s representatives at a given time, can expand or contract. Cultures tend to develop, to varying degrees, an ability to shape other cultures or to be influenced by them. Cultures are time-bound entities that go through several stages of development.[1]

In the case of the cultural history of Central Asia, however, the availability of sources for the pre-Christian era is inversely proportional to the territorial expanse and cultural riches of the area under study, as the peoples of that time did little or no writing. Thus, before the military expansion of powerful literate cultures such as Achaemenid Iran, China, the Northern-Indian Kushan or the Greek Macedonians, Central Asia resembles a prehistoric world. The only written sources come from the periphery of Central Asia. Among the most instructive are the ‘Histories’ of Herodotus (*ca.* 484–*ca.* 425 BC), the Greek reports of the campaigns of Alexander the Great in Sogdia and Bactria, the ‘Shiji’ chronicle of the Chinese historian Sima Qian (*ca.* 145–*ca.* 87 BC), and the ‘Han Shu’, the annals of the Western Han Dynasty (202 BC–9 AD) from the first century AD.[2] To these are added a few stone inscriptions from the realm of the Iranian Achaemenids. The Scythians, who lived north of the Black Sea, were in contact with Macedonia, the Bosporan Kingdom and Rome. Hence we are better informed about the Scythian culture than most other Central Asian cultures. Otherwise, the attempt at a reconstruction of the pre-Christian history of Central Asia is founded mainly on archaeological, ecological and linguistic evidence.

Among the most relevant archaeological sources are burial sites. Graves are sacred sites for nearly all cultures, as here the fundamental vulnerability of the human being to his inherent transience reveals itself abruptly and inescapably. Confrontation with the death of compatriots turns one’s attention to one’s own mortality and encourages, as a counterweight, ideas of some kind of survival after death and belief in supernatural powers, whether benevolent or threatening towards humanity. Insofar as members of a social group share these hopes and beliefs, they orient themselves to common ideals that give rise to normalised patterns related to death, such as burial ceremonies. Burial rites reveal not only the efforts to ensure the deceased have a smooth transition to the afterlife and thus the realm of the ancestors, but also the hope of remaining in contact with them and being watched over by them as guardians. Furthermore, these rituals express the hope of holding onto consciousness and continuing some mode of existence after one's own death. At the same time, the awareness of their own finite existence forces people to fashion their temporal lives with this in mind.

For these reasons, burial rites took on a culture-creating function, in that they motivated the living to consider and define their own responsibilities in this life. In the end, culture arises considerably from the conflict with death within the framework of burial and memorial rites, as well as from reflection on the unanswerable question of existence after death. In this sense the culture and society of the living are founded also in the world of the dead. The culture of the Egyptian pharaohs, with their elaborate death rites and enormous graves, which were undertaken even during the lifetime of the ruler, offers an outstanding example of this.

A second source for finding out the cognitive, emotional or spiritual life of a culture without written sources is its works of art, whether sacred or profane. These include two-dimensional works, such as cave painting and petroglyphs, and later murals and tapestries, as well as three-dimensional, figurative objects. In artworks the artist expresses particular values, hopes and fears, which are shared by a specific community, so they enable inferences to be made about the culture. Artworks are the most valuable 'books' of pre-literate cultures.

Regarding the timeframe under consideration, the intention of this four-volume work is to provide a well-grounded overview of the entire history of Central Asia, from the beginning of prehuman life to the twenty-first century present. Details and nuances can undoubtedly be lost, but a comprehensive view that does not content itself with the listing of events in a chronicle is able to reveal long-term trends and complex, interdisciplinary connections. The alternative to the aforementioned approach would be to entrust each chapter to a specialist as editor. The result would presumably be, as in the case of the seven-volume *History of Civilizations of Central Asia*,[3] produced by UNESCO, a lovely mosaic but not a complete, overarching picture. Admittedly, no work of history can be definitive, since history marches forward and new discoveries bring to light previously unknown facts and refine interpretation – each cultural history can only, like nomads, mark out a stage of the journey.

I

Geography, Climate and Prehuman History of Central Asia

Geography is the basis of history. It appears that the changes of climate have caused corresponding changes not only in the distribution of man, but in his occupations, habits, and even character. The climatic changes have been one of the greatest factors in determining the course of human progress.

ELLSWORTH HUNTINGTON, *THE PULSE OF ASIA*, 1907[1]

1. On the definition of Central Asia

The region of 'Central Asia' is shrouded in an aura of mystery. As much as it evokes dramatic images of endless steppes, life-threatening deserts, fierce horsemen and transcontinental Silk Roads, it tends to defy hard-and-fast analysis. The first person to use the term 'Central Asia' was the German explorer and naturalist Alexander von Humboldt (1769–1859) after returning from his research expedition of 1829. During this journey, at the behest of Tsar Nicholas I, he crossed Russia from St Petersburg in the west all the way to the Altai Mountains and the Chinese border[2] in the east. He was the first to recognise that Central Asia constituted a discrete entity within the Eurasian continent. The immense distance covered by Humboldt – the Russian-Chinese border is about 4,000 km from St Petersburg – gives a sense of how difficult it is to define Central Asia. It is as if one wanted to stake out a border in a borderless region.

One may attempt to define Central Asia in geographic, ethnic, economic-cultural or linguistic terms. In the linguistic sense it may be understood as the homeland of three great language families, namely Indo-European,[3] Altaic, and Uralic.

The Indo-European language family rapidly broke out of the bounds of Central Asia, developing into the Celtic languages in Western Europe, Hittite in Anatolia and proto-Tocharian in what is today north-western China, to name but a few. Speakers of the Iranian languages, especially the eastern Iranian subfamily, such as the equestrian nomadic Scythians, Sauromatians, Sarmatians and Alans in western Central Asia and the Saka in the east, played an important role until the first centuries of the Common Era.

From the sixth century AD, peoples of the Altaic language family shaped the history of Central Asia, beginning with the Turkic peoples and then, from the early thirteenth century, the Mongols. However, speakers of the Tungusic languages, which likewise belong to the Altaic language family, lived mostly in eastern Siberia and Manchuria and thus outside of Central Asia.

Finally, the presumed home of the Uralic language family lies in northern Eurasia, in the heart of the Urals. Within the largest, Finno-Ugric, language group, the Magyars were present in Eurasia before being driven from their then-homeland north of the Black Sea by the Turkic Pechenegs and fleeing to present-day Hungary. In summary, linguistic criteria are today inadequate to delimit Central Asia.

Economic-cultural aspects are also inadequate when it comes to delimiting the region of Central Asia. Large swaths of the Central Asian steppe belt were indeed home to stockbreeding peoples for millennia. Whether settled or, more commonly, mobile, these people developed their own individual cultures. The system of the semi-mobile livestock-raising economy began to develop first at the start of the third millennium BC in the heart of Eurasia as an adaptation to changing climatic and ecological conditions and does not represent an independent characteristic of Central Asia. In addition, agriculture began to advance in certain steppe and desert regions, thanks to irrigation systems along rivers.

It is geographic and ethnic factors that most accurately define Central Asia. Such a combination suggests itself because history deals not only with the cultural, economic, socio-political and military phenomena within a given geographic area. History, of course, also concerns the peoples who live there. These communities prospered, either within their ancestral lands or, having left them, in new homes at or even beyond Central Asia's peripheries, which they infiltrated, occupied, and enriched with their own cultures. On account of the economically driven mobility of many Central Asian cultures, such as the Scythians, the Turkic peoples, and the Mongols, the phenomenon of migration runs through the history of Central Asia as a leitmotif. The geographic permeability of the relatively flat steppe belt, stretching over 4,400 km on the east–west axis from the Mongolian Altai to the Danube basin without significant mountain or water obstacles, has for millennia invited the migration of peoples. The reverse migration of people and cultures from the fringes to the centre also occurred, if more rarely and often as part of a strategy developed for economic and military reasons. Among these were the campaigns of Alexander the Great to the east, the offensives of the Chinese Han and Tang Dynasties to Central Asia and into Mongolia, and the annexation of large parts of Central Asia by tsarist Russia in the nineteenth century. The history of the Eurasian continent resembles a pulsing interaction between Central Asia and the peripheries in west, east and south, so the cultural borders of Central Asia shifted frequently over the course of history. These permanent interactions of peoples, languages, cultures and states caused Central Asia to become a unique 'palimpsest of cultures'.[4]

In order to lend these naturally unstable borders a fixed framework it is best to give priority to geographic aspects. As with culture and language, Central Asia is geographically defined in different ways. In the political context, the term designates the five one-time Soviet republics of Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan and Uzbekistan – a region that extends over 4 million km^2 and is home to 62 million people.[5] UNESCO uses a much broader definition, including in Central Asia all the countries and regions between the

TRAL ASIATIC
PEDITION

The dinosaur hunter Roy Chapman Andrews

‘I always intended to be an explorer, to work in a natural history museum, and to live out of doors.’[6] The American Roy Chapman Andrews (1884–1960) had the perseverance and assertiveness to realise this vision of his life. During his early college years, however, he just indulged his desire for a life outdoors and was a mediocre student. After receiving his degree, he looked within himself: ‘Mentally I took myself apart and examined the pieces. I didn’t like what I saw. On that June [1906] afternoon I changed from an irresponsible boy to a man just as though one suit of clothes had been taken off and another put on.’[7] Andrews then took charge of his life, went to New York, and found a position, for a token wage, in the taxidermy department of the American Museum of Natural History. He soon undertook scientific expeditions to Borneo, Japan and Korea. In North Korea he spent months exploring densely forested mountains infested with bandits and, upon his much delayed return to Seoul, was surprised to read his own obituary in the newspapers!

Andrews’ moment arrived in early 1920, when he proposed to the museum’s president Henry Fairfield Osborn (1857–1935) that he test the latter’s theory of the origin of dinosaurs, pterosaurs, and perhaps even human beings in Central Asia by means of fieldwork in the Gobi Desert in Mongolia. Andrews had decided to devote himself to this question as early as 1915, after reading one of Osborn’s articles, and had undertaken a five-month reconnaissance of the Gobi with his wife Yvette in 1919. Although at the time there had been only a single official fossil discovery in that area, the tooth of a rhinoceros, northern China and the Gobi were very promising sites for searching, since Chinese apothecaries had for a long time sold the teeth and bones of unknown animals as medicine. Additionally, the first investigations of the Jesuit Emile Licent of 1916–20 had revealed a couple of potentially interesting fossil beds.[8] Still more promising was the fact that about 150 million years ago the Central Asian plateau was dry land and unlike, for instance, Europe, parts of it had not been flooded. Thus a fossil inventory stretching over many epochs could be anticipated.

The first expedition left Beijing in Dodge automobiles on 17 April 1922, after a camel caravan sent out several weeks earlier had placed fuel depots at regular intervals. After just a few days the expedition made two spectacular finds at Iren Dabasu in northern Inner Mongolia. The first were the teeth and bones of a powerful mammal, approximately 34 to 56 million years old and resembling a rhinoceros, from the family Titanotheriidae (Brontotheriidae). The excitement was great, since this was the first discovery of a titanotherium outside America. On the same evening the real sensation made itself known. Andrews reported:

> While dinner was being prepared, Granger [the chief palaeontologist] wandered off along the grey-white ridge that lay like a recumbent reptile west of the camp. Even in the failing light he found a few fossil bits and we realized that we had another deposit at our very door. The following morning … Granger was at work, exposing the tibia of a large dinosaur! ‘This means,’ said Doctor Berkey [geologist], ‘that we are standing on Cretaceous strata – the first Cretaceous and the first dinosaur known in eastern Asia [north of the Himalaya]!’[9]

Another important find followed about 800 km north-west of Iren Dabasu in Outer Mongolia, near the lake of Tsagaan Nuur, when the expedition discovered the skull and parts of the skeleton of a baluchitherium.[10] The baluchitherium, today called paraceratherium or indricotherium, looked like a gigantic, hornless rhinoceros and weighed more than 16 tons. This herbivore was the largest land mammal of all time and lived in the Oligocene (33.9–23.0 million years ago) and early Miocene (23.0 to 5.3 million years ago).

At the start of August 1922 two more thrilling discoveries were made, 220 km south-east of Tsagaan Nuur near the region of Shabarakh Usu, a formation of red sandstone. The second of these finds was the most sensational of all five of Andrews’ Gobi expeditions but, ironically, was not recognised as such for an entire year. First the photographer Shackelford discovered the skull of an unknown reptile at the top of a sandstone chimney. This was an ancestor of the Ceratopsia, a group of herbivorous, beaked dinosaurs from the Cretaceous that had a snout similar to a parrot’s beak and a neck frill in the form of a bony collar. In honour of Andrews this fossil of a relatively small, up to two-metre-long dinosaur genus bears the name *Protoceratops andrewsi*. Toward evening Granger encountered fragments of eggshells, which were at first classified as the relatively ordinary eggs of an extinct bird.[11]

A year later, in July 1923, the expedition returned to the ‘Flaming Cliffs’ of Shabarakh Usu, modern Bayan Zag, where they found more eggshells, among them 13 petrified eggs in a sandstone block. They had a cylindrical, elliptical shape and were up to 30 cm long. A few eggs were broken open and provided a glimpse of the delicate skeletons of embryonic dinosaurs. Now there was no doubt: ‘it was evident that dinosaurs did lay eggs and that we had discovered the first specimens known to science.’[12] It was long assumed that these eggs were from protoceratops; today they are also associated with hadrosaurids, duck-billed dinosaurs.[13] Spherical dinosaur eggs were later also found in the Gobi and attributed to the powerful sauropods, which had long, snake-like necks and small heads. Another surprising find was made by the third expedition in 1925, 500 m from Bayan Zag, when they found hundreds

◂ Start of the fourth Mongolian expedition of Roy Chapman Andrews on 16 April 1928, north of Kalgan, now the city of Zhangjiakou, Hebei Province, northern China. American Museum of Natural History Library, New York.

of small stone tools and worked flints from the Mesolithic period (11,700–6000 BC), as well as countless rectangular pieces of dinosaur eggs bearing neatly carved holes – clearly these early human beings had crafted necklaces out of dinosaur eggs.[14] All these discoveries in the today pitilessly hot desert around Bayan Zag suggest that during the Mesolithic and at the time of the dinosaurs, mild, humid weather prevailed.

Andrews had to cancel the planned expeditions of 1926, 1927, and 1929 on account of an increasingly hostile stance toward foreigners among the Chinese authorities and because robber gangs were operating ever more boldly in northern China, but he was able to undertake two further expeditions, under difficult conditions, in 1928 and 1930. During the last trip Andrews came upon a graveyard of more than 20 platybelodons, colloquially called shovel-tuskers. These weighty herbivores, which had a shovel-like lower jaw, were presumably trapped in the quicksand of a swamp, from which they could not free themselves, some 15 to 20 million years ago.[15] After 1930 scientific work in China was no longer possible for foreigners; only Sven Hedin managed to work until 1935 in a region on the edge of Xinjiang plagued by civil war. Among the additional significant discoveries of the expeditions led by Andrews were parts of skeletons of three theropods, the bipedal dinosaurs velociraptor, oviraptor, and the small, nocturnal sauronithoides, as well as the armoured pinacosaurus, which was as long as 5 m and moved on all fours. All of these dinosaurs lived about 80 to 70 million years ago. At the completion of the five expeditions it was clear that the Gobi represented one of the richest regions of Asia for late dinosaurs and early large mammals.

In 1933 Andrews prepared for another expedition, this time to Soviet Central Asia, but fate had other plans. In 1934 the museum director Sherwood suffered a heart attack, whereupon Andrews was named interim director. Shortly thereafter he injured his back so badly in a fall from a horse that he had to give up riding forever, and the prospect of further expeditions dimmed. Andrews was persuaded to assume the post of director permanently. Though he initially enjoyed the work, he badly missed the outdoor life: ‘For twenty-five years I had lived in the field, sleeping in the open, and I was like a wild animal suddenly put in a cage.’[16] Soon the Great Depression cast its shadow over the museum: generous sponsors saw their fortunes dwindle, scientific expeditions were cancelled, and Andrews’ work became that of a promoter; on 1 January 1942 he resigned from the directorship.

Dinosaur eggs discovered in May 1925 by George Olsen at Shabarak Usu (Bayan Zag), Ömnögov Aimag, southern Mongolia. American Museum of Natural History Library, New York.

Chalk formation called 'Tchink' near Bozzhira on the Ustyurt Plateau, Mangyshlak Peninsula, western Kazakhstan.

Caspian Sea and Mongolia without access to an ocean; that is, the five former Soviet republics, central and eastern Russia south of the taiga, north-eastern Iran, Afghanistan, northern Pakistan, Kashmir, Ladakh, Tibet and Mongolia.[17] With this far-reaching definition, Central Asia becomes a very heterogeneous entity, climatically, economically and culturally, which is divided into two parts by the Hindu Kush, Pamir, Kun Lun and Himalaya mountains.

For the purposes of this book Central Asia is defined in geographic terms as the region that lies between the Caspian Sea to the west, Mongolia to the east, the southern Siberian steppe to the north, and the Hindu Kush and Kun Lun mountain chains to the south. It stretches from roughly 48° to 115° longitude and 35° to 55° north latitude and encompasses the five former Soviet republics, southern Russia from Lake Baikal to the Volga, northern Afghanistan, Xinjiang and Inner and Outer Mongolia.[18] The maximum distance along the east–west axis is approximately 5,000 km and along the north–south axis approximately 2,000 km. In terms of ethnicity and nomadic confederations or empires, however, the boundaries of Central Asia were temporarily enlarged when Central Asian peoples settled in peripheral regions and markedly influenced the culture there. The Scythians and Saka, whose territory extended from 32° to 100° longitude and from 42° to 55° north latitude, represent an outstanding example of such a process. Further examples are the Sarmatians, Alans and Huns in Eastern Europe as well as the Yuezhi/Kushan, and, more than a millennium later, the Timurids in the northern part of the Indian subcontinent. But most nomadic federations or empires were primarily defined by their rule over peoples, less over territories.[19]

2. The interdependence of geography, climate and history

Compared with the age of the planet, about 4 billion years, the 55-million-km^2 Eurasian continent, and with it Central Asia, is, in geological terms, a relatively 'young' formation. It grew out of the separations and collisions of various tectonic plates – more specifically, lithosphere plates – which support the oceans and continents and drift like rafts on the semi-fluid rock of the underlying mantle.

The current form of the Eurasian continent began to form in the geologic Permian age (299–251 million years ago), when the continents of Laurussia, Siberia and Kazakhstania came together and formed Laurasia, the forerunner of the Eurasian continent. At the same time, the Urals arose along the most significant junction of the colliding continents. The nearly 2,100-km-long mountain chain, which runs from north to south and rises to 1,895 m, marks the boundary between Europe and Asia. This border was established by the Swedish officer and geographer Philipp Johann von Strahlenberg (1676–1747) in 1730, after he explored Siberia geographically and anthropologically during his 13 years as a prisoner of war. For Strahlenberg the boundary ran along the Urals, then the Emba (Jembi) River, which empties into the Caspian Sea, and finally the Kuma-Manych Depression north of the Caucasus.[20] With his definition of the border, which was recognised by Russia, von Strahlenberg resolved a centuries-long dispute, in which the border was proposed to be along either the Don[21] or the Ob. As a result of this boundary placement, the western part of Central Asia as geographically defined above, stretching from the Urals to the Volga, actually falls within Europe.

Shortly before the formation of Laurasia, at the end of the Carboniferous (358–299 million years ago), Laurussia fused with the southern supercontinent Gondwana, consisting of South America, Africa, India, Australia and Antarctica, from which came the final global geological megacontinent, Pangaea. Somewhat later, at the start of the Triassic (251–199.6 million years ago), first eastern China and then northern China collided with the supercontinent Laurasia, which formed the northern part of Pangaea. The Indian subcontinent, or the Indian Plate, began to collide with Eurasia only much later, some 40 million years ago. As the Indian Plate slid under the Eurasian, the Himalayas were pushed up by tectonic forces. The Himalaya range is still growing today. The interface between the Indian and the Eurasian plates was discovered by the Swiss geologist Augusto Gansser in 1936 near Kailash in western Tibet.[22]

The contiguous landmass of Pangaea, extending from north to south, enjoyed a climate at least 3 °C warmer than today's, allowing for an unlimited flourishing of land animals. Reptiles in particular, among them dinosaurs and pterosaurs,[23] experienced phenomenal growth and dominated life on land and in the air during the Triassic and the subsequent epochs of the Jurassic (199.6–145.5 million years ago) and Cretaceous (145.5–66.5 million years ago), while mammals in the broadest sense played a subordinate role until the Cretaceous. At the end of the Cretaceous, half of all species died out, among them all non-avian dinosaurs.[24] Thanks to particular geological conditions, spectacular discoveries of dinosaur fossils were made in southern Mongolia in the 1920s.

Already in the Late Triassic the first cracks of the eventual splitting off of North America from Eurasia were becoming evident. About 150 million years ago the global megacontinent Pangaea broke into the supercontinents Laurasia and Gondwana, and then, 15 million years later, the middle Atlantic opened like a zipper and divided North America from Eurasia. While the arrangement of the continents was comparable in rough outline to their current positions even 100 million years ago, they clearly approximated the present arrangement 12 to 14 million years ago. Since the continents are never still, however, further tectonic shifts are foreseeable. Extrapolation from the current movements points toward a union of Africa with Eurasia and disappearance of the Mediterranean Sea in *ca.* 50 million years.[25]

Geographic and climatic peculiarities have decisively shaped the development of Central Asia.[26] As a consequence of its particular position as a northern inland region, the compensatory mechanisms of the maritime climate play only a small role, which leads to a distinctive continental climate with large temperature differences between the cold and hot seasons. Winters in Central Asia are mostly cold to extremely cold; the summers, by contrast, warm to unbearably hot. The relatively northern position of Central Asia influences both the amount of daylight and the level of precipitation. Photosynthesis, vital to the growth of plants, is directly related to the amount of daylight, which is drastically reduced in northern zones during the long winter season. In addition, the prevailing west winds from the Atlantic and Mediterranean lose much of their moisture and compensating effect when they encounter the Urals and sweep eastward as dry winds. As a result the climatic differences between summer and winter, as well as relative aridity, increase markedly toward the east.

In general the west winds streaming in from the Mediterranean and the Black Sea are the main source of winter and spring rainfall in Central Asia. For this reason the climate of Central Asia is particularly sensitive to the lessening of moisture in these winds, as, for instance, when ice crusts covered Northern and Central Europe. By contrast, during the late Pliocene and early Pleistocene (*ca.* 2.8–2.4 million years ago) Central Asia was less arid and less broadly exposed to the dry, dust-bearing winds, since at the time the Caspian Sea and the Aral Sea formed a single, large body of water.[27] In south-eastern Central Asia the trend toward aridity increases still further because the mountain chains of the Hindu Kush, Pamir, Kun Lun and Himalayas on its southern edge force the moist summer monsoon clouds that stream from the south to the north to rise and release their moisture as rain. Thus the temperature differences between the seasons are especially dramatic in the Taklamakan and Gobi deserts.

One of the most important ways of judging climatic conditions in a given region, as well as its suitability for agriculture, is to measure the effective moisture on the ground, that is, the relationship between precipitation and potential evaporation, which is a function of the prevailing temperature. Thus, for example, 100 mm of rainfall in the tundra or northern taiga on the northern edge of Central Asia can, on account of the very limited potential evaporation, lead to floods or the creation of new layers of silt, while the same amount in the Gobi Desert quickly evaporates because of the intense sunlight and high potential evaporation. In the tundra precipitation exceeds evaporation by more than 50 percent; in the Taklamakan Desert it is up to 170 times less. All these factors seriously limit the amount of land usable for agriculture, leading to a relatively low population density.

The Central Asian landmass forms an enormous rectangle that falls into four climatic zones, whose main axes run east–west. From the north to the south these are the tundra (which lies outside the scope of this work), the forested zone of the taiga, the grass steppes, and the deserts.

The tundra is a treeless zone, about 400 to nearly 1,000 km wide, north of the Arctic Circle.[28] It is characterised by extremely cold and dark winters; strong, freezing winds; frequent fog and cloudiness; and permafrost, so that the growing season is limited to about three months and snow covers the ground for nearly eight months of the year. This hostile zone is a kind of frozen desert. South of the tundra lies the taiga with its immense coniferous forests, which are interspersed with deciduous forests, such as those of birch, in its southern part. These forests appeared at the end of the last Ice Age, 12,000 to 10,000 years ago; they stand on permafrost whose surface thaws in early summer, leading to marshy conditions and an accumulation of mud. Until the exploitation of their rich natural resources of timber and minerals by the emergent Russia and the subsequent Soviet Union, both the taiga and the tundra played subordinate roles in the history of Central Asia.

On the southern edge of the taiga the forests merge first with a narrow band of steppe forests, which is followed by an entirely grass steppe, giving way in its southern part to a desert-like steppe. The Central Asian steppe is part of the Eurasian steppe, which extends from the lower Danube plain in the west over 7,800 km to the Pacific Ocean, interrupted only by the southern Siberian Altai and Sayan mountains. The climate of the grass steppe is semi-arid; it is not humid enough to allow the growth of forests and is largely unsuitable for agricultural use. Precipitation is low and results in a chronic moisture deficit; aeolian erosion is significant, and the salinisation of the soil is also a problem. These obstacles to arable farming were only overcome when agriculture was mechanised in the nineteenth century. Thus the steppe offered little in the way of immediate nourishment to human beings, the foundations of their economy were mostly hunting, fishing and animal husbandry. To avoid overgrazing, animal breeding was tightly controlled; the herds had to rotate their grazing areas within a designated perimeter.

The mobility of the steppe stockbreeders and their need for products and raw materials from settled agrarian cultures gave rise to a state of flux between peaceful trade and plundering raids. At the start of the tenth century BC the inhabitants of the steppe had at their disposal horses, two-part bits, and small recurve bows, a combination that not only gave them military superiority but also represented the goods most desired by the settled societies. This paradox was revealed especially clearly in the case of China, which could resist the steppe nomads on its northern border only by means of a cavalry but which, due to a lack of its own pastureland, had to acquire horses from the same nomads or, beginning in the sixth century AD, from the equally forbidding Tibetans. For the nomads the horse represented both their most valuable export and their strongest instrument of war. Finally, the flat topography of the Central Asian steppe greatly facilitated mobility. In fact, the peoples of the steppe enjoyed a freedom of movement almost on a par with that of seafaring nations – whether for purposes of trade or of war.

Since in Central Asia aridity always increases from north to south, on its southern edge the steppe opens out into wide stretches of desert devoid of vegetation. To the west the Mangyshlak Peninsula, which belongs to Kazakhstan, protrudes into the north-eastern Caspian Sea. The landscape here is marked by spectacular lime and sandstone formations, and is an important source of natural gas and petroleum. The peninsula is sparsely populated today, but more than 1,000 years ago it was the meeting point for different cultures. It is often considered part of the 180,000-km^2 Ustyurt Plateau, a tableland in Kazakhstan and Uzbekistan, which consists of clay regions in the west, salt regions in the north near the Aral Sea, sand dunes in the south-east, and marl in the east. At the southern end of the Aral Sea, the nearly 300,000-km^2 Kyzyl Kum Desert, whose name means 'red sand', lies in the western part of the Turanian Basin. The Kyzyl Kum, rich in such ores as gold, silver, copper, and uranium, covers central Uzbekistan and extends into southern Kazakhstan as well. In the north-eastern part of the Kyzyl Kum, the Syr Darya river, the ancient Jaxartes, separates the desert from the Mujun Kum desert. The Mujun Kum gives way in turn to the bleak, steppe-like semi-desert Betpak-Dala, whose Kazakh name means 'bad plain'. North-east of this 'bad steppe' stretches the sand desert Saryesik-Atyrau, which is split in its eastern part by the mountains of the Dzungarian Alatau from the Dzungarian desert. This approximately 50,000-km^2 desert, which lies in the north-western Chinese Autonomous Region of Xinjiang, is a plain of gravel and salt and has the distinction of being the furthest place in the world from any sea.

As the Syr Darya separates the Kyzyl Kum and Mujun Kum deserts, the river Amu Darya, the legendary Oxus, splits the Kyzyl Kum in its southern part from the sand and scree desert called Kara Kum. With an area of about 450,000 km^2, the Kara Kum covers more than 90 percent of Turkmenistan. From the fourth to the start of the second millennium BC, the desert, rich in petroleum and especially natural gas, was home to a proto-urban culture. Later, one of the most important routes of the so-called Silk Road ran through it, with the oasis city of Merv one of the most significant junctions. These sophisticated early cultures had economies based on irrigated agriculture, animal husbandry and interregional trade with the Indus Valley and Mesopotamia. They are outstanding examples of the fact that even thousands of years ago life flourished in the desert. A precondition for this was the existence of mountains on the edges of the desert, from which rivers flowed into the interior. Mountains force air to rise, cooling it, which lowers the saturation point and increases precipitation. In the case of the Kopet Dag Mountains on the border between Turkmenistan and Iran these rains, provoked by an orographic lift, directly feed the rivers.[29] The significantly higher mountains of Pamir and Kun Lun, by contrast,

Sand dunes more than 100 m high are a distinguishing feature of the Taklamakan Desert north of Qiemo, Xinjiang, north-western China.

A fisherman cuts a hole in the ice of the frozen Aral Sea in order to fish, western Kazakhstan.

function as enormous reservoirs for the snow and ice that swell the rivers during the annual snowmelt.

In north-western China the Tian Shan Mountains divide the Dzungarian Desert in the north from the Taklamakan Desert in the south. Spreading over 338,000 km^2, the Taklamakan is, after the Rub' al Khali in Arabia, the second largest purely sand desert in the world. Since it occupies an exceptionally continental location, is surrounded to the south, west, and north by high mountains that repel rain clouds and in the east meets up with the Kum Tag desert, its climate is hyper-arid, with less than 20 mm of annual precipitation and in parts up to 2,900 mm of potential evaporation. Although today the desert consists of shifting sand dunes, a glacial sea occupied the land until about 800,000 years ago, after which the climate dried up dramatically. As in the Kara Kum Desert, however, rivers running north from the Kun Lun Mountains once crossed the desert and provided the basis for life on both the southern edge and in the interior of the Taklamakan. At the turn of the third to the second millennium BC at the latest, there were Bronze Age settlements along the rivers and in the oases, which survived by means of livestock breeding and irrigated agriculture.[30] Because these rivers shifted significantly in the flat desert landscape and held gradually less water from about 1000 BC on, the oases and settlements moved southward in tandem, so that one could speak of 'wandering oases'.

North-east of the Taklamakan there are further deserts. First is the desert of Lop Nor, which can also be regarded as the eastern part of the Taklamakan, and the deserts of Gashun Gobi east of Xinjiang and Badain Jaran and Tengger in Inner Mongolia, with

the latter two belonging to the Gobi. Finally the Yellow River divides the Tengger Desert from the deserts of Mu Us in the centre and Kubuqi in the north of the steppe-like Ordos plateau. The largest of all the Central Asian deserts is the Gobi at just under 1,300,000 km^2. This desert forms a complex system of steppe, scree, sand, and stone deserts and occupies more than half of the Republic of Mongolia. Only 10 percent of Mongolia is forested and just one percent is arable, hence the extraordinarily low population density of just under two inhabitants per square kilometre, although this was higher in the Middle Ages. Though just three percent of the Gobi, whose Mongol name means 'stone desert', is made up of pure sand dunes, the winds that blast to the south and south-east allow these to advance further and, along with the deserts of Mu Us and Kubuqi, threaten Beijing in the medium term.

A few of the Central Asian deserts, such as the Kara Kum and Kyzyl Kum, expanded or appeared in the late Middle Pleistocene (*ca.* 400,000–126,000 years ago), which shrank the territory of hominins that are extinct today and limited their mobility. When one considers the simultaneous expansion of deserts in Arabia, Syria, Mesopotamia and Iran, this climatic development may have effectively separated Africa from Asia for about 300,000 years, with the consequence that human evolution during the second half of the Pleistocene may have developed independently on the two continents.[31]

The American geography professor Ellsworth Huntington (1876–1947) was one of the first researchers to recognise, in the early twentieth century, a close connection between climatic conditions and economic options and to perceive the powerful

At the Kyzyl-Art pass, 4,336 m above sea level, on the border between Tajikistan and Kyrgyzstan.

influence of climatic changes on the life circumstances of people within a given climatic zone. He carried out research trips to Turkmenistan in 1903–4 and the Taklamakan Desert and Lop Nor in 1905–6, studying the geology and archaeology of the region. This gave him insight into the causal relationship between an initial geological and geographical location, climatic changes and the effects on human history.[32] A river in the midst of an inhospitable desert enables life to flourish by making productive arable agriculture possible. The drying up of the river as the result of climate change brings about the slow death of this green oasis and the transition to animal husbandry. Without falling into mechanistic climate determinism, it is possible to see in the history of Central Asia connections between societal changes, crises and corresponding climatic changes that deprived people of their means of sustenance. Major examples are the transition from an agrarian economy to one based on livestock breeding on the steppes during the third millennium BC or the immense migration of people that took place between the third and sixth centuries AD.

Although people long for stable climatic conditions and today feel threatened by dramatic climate events, if seen over the long term climate and weather are fundamentally unstable things. Climate change represents normality in the history of the Earth, as can be seen from two extremes in our planetary climate: during the Cryogenian (*ca*. 850–635 million years ago) an ice crust covered the entire Earth, except for the Equator; during the Cretaceous, however, the poles were free of ice. For its part, temperature has direct effects on the expanse of the oceans, as cold binds up water as ice: during warm periods sea levels rise and during cold periods they sink. For instance, during the last cold period, 24,000 to 16,000 years ago, global sea level was 125 m below the present level. At this time the British Isles were connected to Europe, and North America was linked with north-eastern Asia via the Bering land bridge.[33]

3. The factors determining climate

The Earth's climate is determined by five factors:[34] the orientation of the Earth to the sun, the sun's activity, the concentration of greenhouse gases, volcanic activity, and the atmospheric and oceanic currents.

The particular orientation of the Earth to the sun means that the amount of solar energy that reaches the Earth is variable over the long term for three reasons. First, the orbit of the Earth around the sun does not form a circle but rather an ellipse, and the sun does not lie in the centre of this ellipse; secondly, the relative inclination of the Earth's axis to the plane of the orbit fluctuates; and thirdly, the orientation of the Earth's axis changes cyclically. The combination of these three cyclical factors – the eccentricity of the Earth's orbit and the slope and the precession of its axis – has led in the last 800,000 years in the northern hemisphere to a basic trend of ice ages lasting about 100,000 years each, peppered with periods of extreme cold. Between each ice age, however, warmer intervals have appeared, lasting 5,000 to 17,000 years. Since our current warm period began about 12,000 years ago, its end, statistically speaking, is perhaps soon overdue.

The second climate-determining factor is the activity of the sun, which is a variable star. Depending on the level of the star's activity and differences in its magnetic field, it transmits differing amounts of heat energy to the Earth. Since the late 1940s the Earth has been receiving an unusually high level of energy from the sun, which contributes to so-called global warming. Also with regard to this parameter, statistical data, according to researchers at the Max Planck Institute, indicate a decrease in the presently high level of solar activity in the coming decades, which could likewise contribute to global cooling.[35]

Without the third factor, the greenhouse effect, there would be no life on our planet. The French physicist and mathematician

Hominin or hominid?

Before the spread of DNA analysis beginning in the late 1980s, it was considered proven that human beings and their ancestors were clearly distinct from great apes such as the chimpanzee, gorilla and orang-utan, so humans were subsumed under the term 'hominids' and the great apes and their ancestors under the term 'pongids'. Genetic research has shown, however, that we humans stand much more closely genetically to chimpanzees and gorillas than all three of these do to orang-utans. Thus it follows that the ancestors of the orang-utan branched off long before the most recent shared ancestor of humans, chimpanzees and gorillas. For this reason the term 'hominid' now refers to human beings and their ancestors as well as chimpanzees and gorillas and their ancestors. The term 'hominin' was introduced in order to distinguish us from the two African great apes. 'Hominin' refers only to humans and their ancestors, while 'gorillini' is used for gorillas and their ancestors and 'panini' for chimpanzees and their ancestors.[36]

Jean Baptiste Fourier (1768–1830) discovered as early as 1822 that certain gases in the atmosphere absorb the Earth's long-wave radiation. Most of the penetrating, shortwave solar radiation reach the Earth's surface and cloud layers and gets reflected into the atmosphere as long-wave terrestrial radiation. There greenhouse gases such as water vapour, carbon dioxide, ozone and methane absorb this radiation and return them half to the Earth and half into outer space. This natural greenhouse effect results in a warming of the Earth's surface by currently 33 °C; without this effect the mean temperature on the surface of the Earth would be -18 °C, instead of the current average of 14 to 15 °C. The greenhouse effect is not in itself a catastrophe but rather a normal condition necessary for life. Humanity has also experienced epochs significantly warmer than our own, such as during the Eemian interglacial period (*ca*. 126,000–115,000 years ago), when the average temperature was 5 °C higher.[37] There have been much higher concentrations of CO_2 in the atmosphere than at present, and this did not per se represent an apocalyptic disaster. During the Permian (*ca*. 299–251 million years ago) the concentration of CO_2 was about 900 ppm,[38] compared to the maximum concentration in 2008 of 385 ppm, and during the Triassic (251–199.6 million years ago) it even reached about 1,750 ppm[39] – almost five times the amount in 2008! During the Triassic, however, reptiles, especially dinosaurs, experienced an extraordinary flourishing on the supercontinent of Pangaea. And 55.8 million years ago, the CO_2 level surpassed 1,500 ppm during the 'Palaeocene-Eocene Thermal Maximum' (PETM) when global temperatures soared by 5 °C and all major ice sheets disappeared. This dramatic global warming of an already warm environment led to the emergence of several major modern mammalian orders.[40] A future increase in global temperature would, however, lead to a rise in sea level, submerging low-lying coast regions and islands.

The fourth climate-influencing factor is represented by strong volcanic eruptions that release huge amounts of aerosols such as sulphur dioxide into the atmosphere. If such mega-eruptions occur in the tropics, they can influence the global climate as aerosols trapped in the stratosphere reflect sunlight and thus less solar energy reaches the Earth, temporarily cooling the climate. One of the most famous examples in modern times was the eruption of the Mount Tambora volcano on the island of Sumbawa, Indonesia, from April to July 1815. In 1816, the world suffered a 'year without a summer', with correspondingly widespread crop failures.[41] A comparable event happened in 535 AD when an enormous volcanic eruption took place in Indonesia, with negative consequences for the entire Eurasian continent. Thus the Byzantine historian Procopius (*ca*. 500–562) noted that in the years 535 and 536 the sun shone only weakly.[42]

The major ocean currents and the atmospheric currents, also called jet streams, represent the fifth factor. Both the cold currents directed toward the Equator and the warm currents flowing to the poles, as well as polar front and subtropical jet streams, balance the weather between extremely hot and extremely cold regions, in that they inhibit an unchecked heating of the tropics and a similar cooling of the polar regions.

In the following chapters and volumes we will encounter many dramatic historical events that were set in motion by global climate changes. These should be distinguished from similarly appearing, narrowly defined regional climate shifts caused by earthquakes, changes in river courses, or anthropogenic factors such as the overuse of soil or bodies of water, overgrazing, widespread felling of forests, etc. Because the eastern part of Central Asia is generally more arid than the west, changes in climatic conditions there tend to have more dramatic consequences, since the situation can become life-threatening more quickly. Thus the peoples of western Central Asia were better able to adapt to negative climate changes than those in the east, who often decided to migrate. There is, however, no climate determinism that directs the course of history. People and societies react differently to comparable changes in their natural environment, depending on their degree of mobility, the organisation of the society, the available technologies, their own and their foreign neighbours' military capabilities, and the prevailing ideology.

II

The Settlement of Central Asia in the Palaeolithic

On the Birthplace and Antiquity of Man. *It is, therefore, probable that Africa was formerly inhabited by extinct apes closely allied to the gorilla and chimpanzee; and as these two species are now man's nearest allies, it is somewhat more probable that our early progenitors lived on the African continent than elsewhere.*

CHARLES DARWIN, *THE DESCENT OF MAN*, 1871[1]

The motifs of the origin, purpose and transience of human life belong to the age-old fundamental questions of human beings. Prior to the Enlightenment, these three questions remained the purview of philosophy, ethics and religion, after which the natural sciences began to emancipate themselves from belief in the supernatural and turned to the first fundamental question, that of our origin. It was primarily Charles Darwin (1809–82) who began the radical breaking of taboo and in 1859 explained the development of human beings as the product of natural evolution. In the model proposed by evolution there are for living things only two options: adaptation and reinvention or extinction. Twelve years later Darwin put forth the hypothesis that all modern human beings descended from a shared African ancestor. Was Darwin right? Is Africa the cradle of humanity? Or is Asia?

1. 'Out of Africa' or 'Out of Asia'?

In the Early Pleistocene in Asia there were presumably only the hominins *Homo erectus*, whose name means 'upright man', but by the Middle and Late Pleistocene (781,000–12,000 years ago) perhaps six different species of the genus Homo (man) inhabited the region. These were: *Homo erectus*; the ancestors of *Homo floresiensis*; *Homo denisova*, discovered in Central Asia; Neanderthals; maybe an 'archaic *Homo sapiens*'; and modern *Homo sapiens*.[2] The small-statured *Homo floresiensis*, discovered in 2003, died out over 12,000 years ago, leaving only our species, *Homo sapiens*. The variety of human species in Central and Southeast Asia raises the question of whether modern human beings may possibly have developed in Asia.

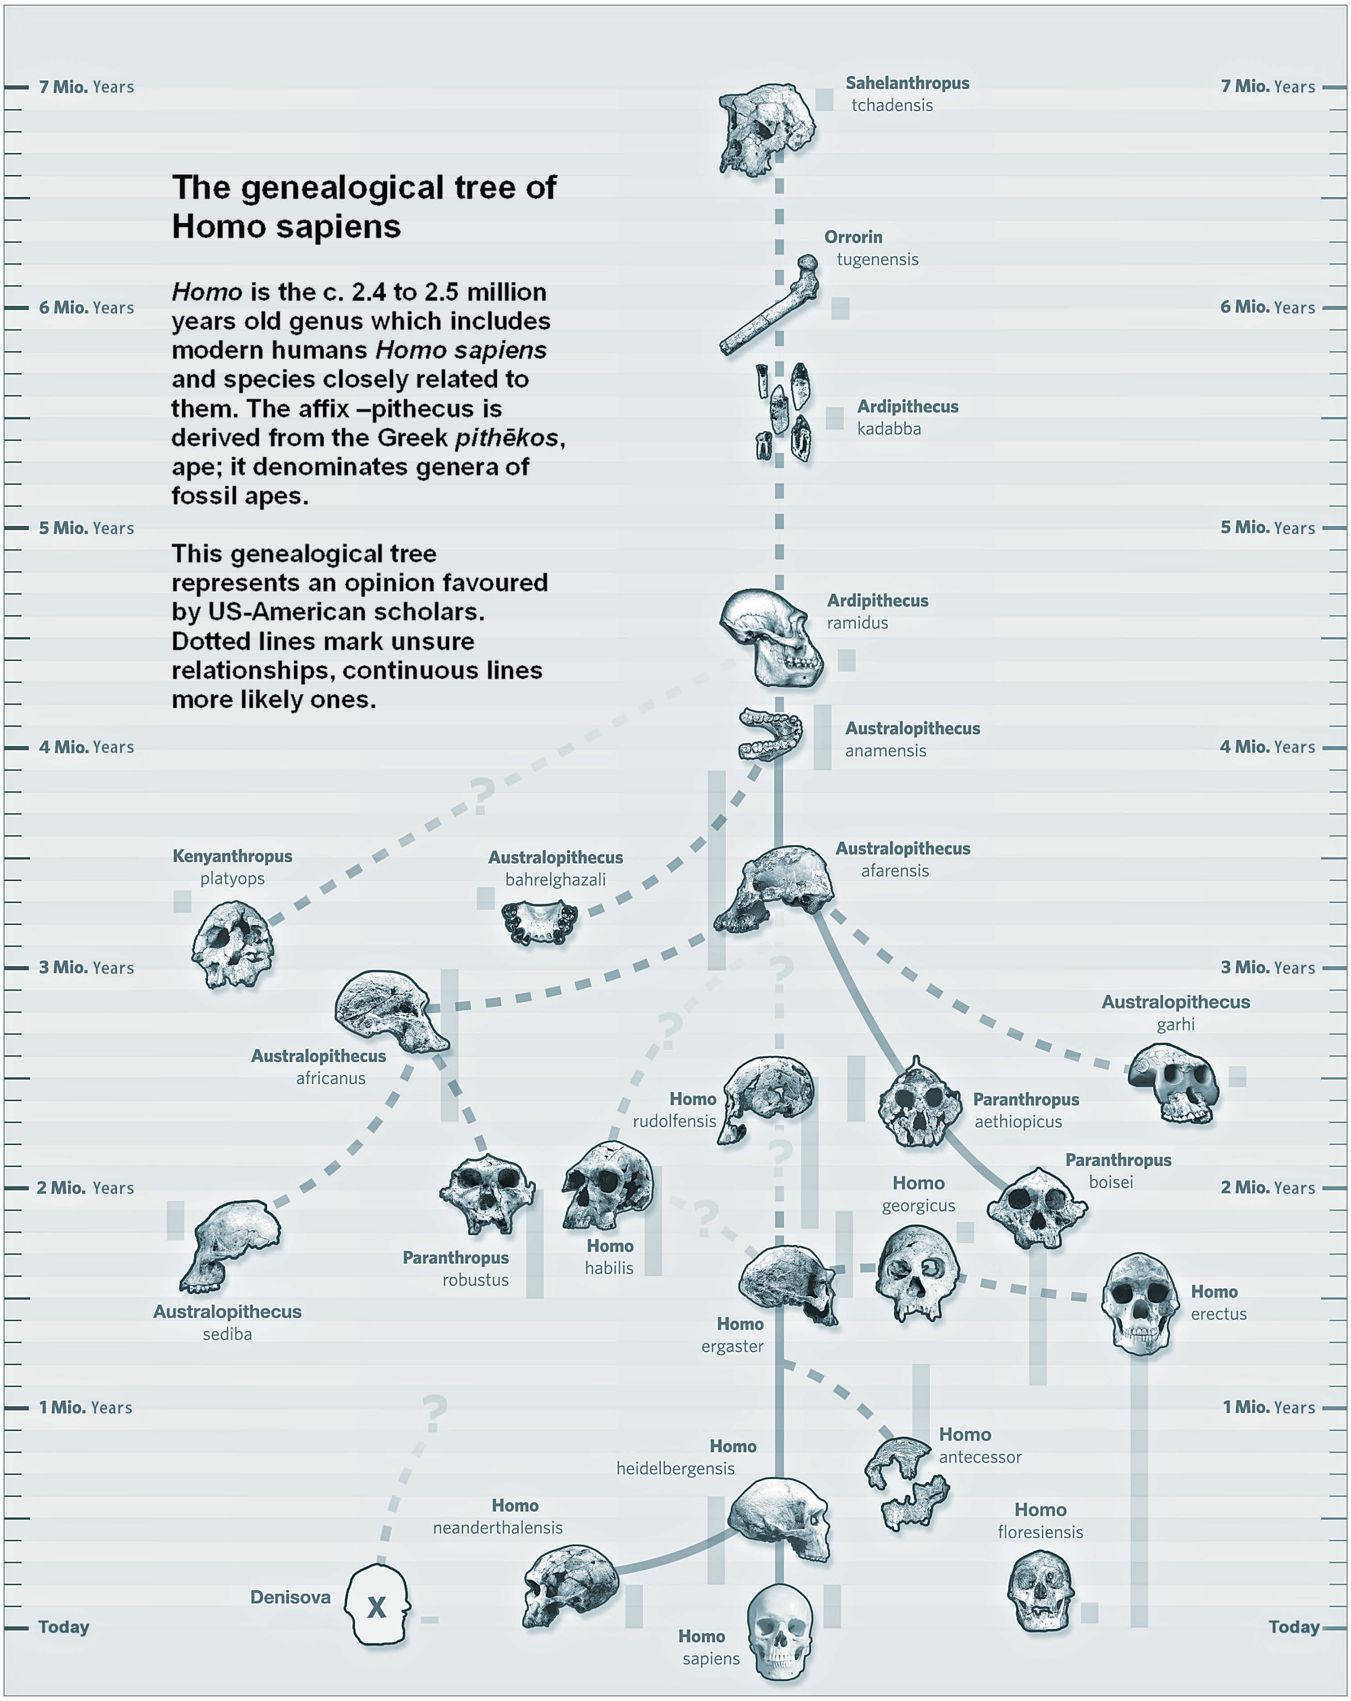
By the second half of the twentieth century almost no one contested the African origin of the first hominins. There are, however, two opposing schools of thought regarding the origin of human beings themselves. The 'Out of Africa' hypothesis postulates two or three significant migrations of early human species out of Africa. The first, of *Homo erectus*, took place about 1.8 million years ago, first to Asia and then to Europe, after which these hominins developed independently of each other on account of the isolation of their individual groups. A dissenting thesis, propagated especially in the United States, holds that *Homo erectus* refers only to an Asian line of descent and calls the further development of the *Homo erectus* remaining in Africa *Homo ergaster*, 'working man,' from which emerged *Homo heidelbergensis*, who settled in Europe some 600,000 years ago. Much later, about 100,000 to 130,000 years ago, the modern human being called *Homo sapiens* spread in a second or third wave from East Africa – first to the eastern Mediterranean coast and from there to Asia and Europe. In the process *Homo sapiens* is thought to have displaced and superseded all the other hominin species, including the Neanderthals, without interbreeding with them. For this reason, this hypothesis is also called the 'Replacement Hypothesis'. According to this theory, all human races have formed in a relatively short time out of this *Homo sapiens*, 'wise' or 'knowing' man.

The multiregional model, by contrast, postulates that the regional descendants of *Homo erectus* in Africa, Europe and Asia developed separately into modern human beings, with a continuous 'gene flow' on the edges of the centres of development ensuring anatomical and reproductive commonalities and preventing the development of regional divergent species. There is believed to have been no extinction of human species such as the Neanderthals,

Geological and prehistoric anthropological timetable

GEOLOGICAL CHRONOLOGY	AGE IN YEARS
Pliocene	5.332 – 2.588 million
Pleistocene	2.588 million – 12,000
Lower	2.588 million – 781,000
Middle	781,000 – 126,000
Upper	126,000 – 12,000
Holocene	12,000 – Today

ANTHROPOLOGICAL CHRONOLOGY	AGE IN YEARS
Palaeolithic	2.6 million – 11,700
Lower	2.6 million – 300,000
Middle	300,000 – 40,000
Upper	40,000 – 11,700
Mesolithic	11,700 – 8,500/5,500, depending on area of Central Asia
Neolithic	8,500/5,500 – 6,000/3,200, depending on area of Central Asia



The genealogical tree of Homo sapiens

Homo is the c. 2.4 to 2.5 million years old genus which includes modern humans *Homo sapiens* and species closely related to them. The affix –pithecus is derived from the Greek *pithēkos*, ape; it denominates genera of fossil apes.

This genealogical tree represents an opinion favoured by US-American scholars. Dotted lines mark unsure relationships, continuous lines more likely ones.

but rather continuous interbreeding. Thus the individual human races arose hundreds of thousands of years ago, and different physical traits are in part a legacy of the different ways in which *Homo erectus* developed.[3] DNA analyses of modern human beings contradict this conclusion, however, as they show an overall strong uniformity of the human genotype of all races. The isolation of the individual hominin groups also makes the postulated gene flow unlikely. On the basis of additional genetic, anatomical and archaeological research, according to the current state of knowledge, the Out of Africa hypothesis has, broadly, prevailed.[4] However, the most recent DNA analyses of Neanderthals and two Denisova hominins from the southern Siberian Altai, as well as Chinese discoveries of a few skulls, more than 100,000 years old, which display characteristics of both *Homo erectus* and *Homo sapiens*, have called into question the 'Replacement Hypothesis'.

2. The earliest settlements of Central Asia

A global cold period led to an extreme drought in Africa 2.8 to 2.5 million years ago and the savannas rapidly expanded. In East Africa, out of the hominin *Australopithecus afarensis* developed the presumable ur-human *Homo rudolfensis*. Some 400,000 years later *Homo habilis*, the 'handy man', emerged. Since these hominins fashioned the first stone tools in the form of 'pebble tools', they freed themselves from direct dependence on their environment and began the Oldowan period. About 1.8 million years ago emerged *Homo erectus*, who used fire and began to make pear-shaped hand axes, worked on both sides, called bifaces, which made the butchering of meat much easier. The ability to use meat expanded the potential habitat for humans into non-tropical colder and drier regions where plant food was less abundant. These hand axes introduced the Palaeolithic era of the Acheulean, which slowly superseded the Oldowan period. With fire, protein sources could be cooked and stored frozen meat could be thawed. Fire also offered protection from cold and predators. Thanks to these capabilities, *Homo erectus* expanded its search for sustenance to the north and soon became the first hominin to leave Africa; the members of its species that stayed behind are also called *Homo ergaster*. In its migration to Asia *Homo erectus* proved to be a successful pioneer who met the challenges of new ecological surroundings with technological innovations.

Because the strongly continental and arid climate of Central Asia offered difficult living conditions even then, it is not surprising that the earliest traces of *Homo erectus* are found in the southern regions. In 1984 in south-western Eurasia in Dmanisi, Georgia, archaeologists came upon three mostly complete skulls and other fossils of a very early example of *Homo erectus*, who displayed a conspicuously smaller skull, with barely half the volume of ours. Nevertheless these early hominins possessed an exceptional social culture, since the toothless skull of an old man, no longer able to survive alone, indicates that the group living there cared for its old and impaired members. These 1.75-million-year-old fossils from the Lower Palaeolithic are among the oldest human discoveries found outside Africa.[5] Fossils up to 1.66 million years old from Java, Indonesia and northern China show that *Homo erectus* arrived in East and Southeast Asia not long after they reached Dmanisi in the Caucasus. Contemporaneous with the finds in Sangiran and Mojokerto on Java are those of Majuangou, which lies in the

Even today in mountainous regions of Central Asia the mountain goat is venerated as a symbol of life and fertility. Tashkurgan, Xinjiang, north-western China.

northern Chinese Nihewan Basin, 150 km west of Beijing; these are the oldest human fossils in East Asia.[6] Later discoveries of *Homo erectus* in China come from Yunxian in Hubei Province and from Lantian, Shaanxi, both of which are about 800,000 years old.[7]

Hand axes dated at 1.4 million years from Ubeidiya, in the valley of the Jordan River south of Lake Tiberias, are not only the oldest stone tools of the Acheulean outside of Africa but they also suggest that the Near East, perhaps together with the crossing of the then narrower and shallower Red Sea, was the most important route from Africa to Eurasia.[8]

The fossils from the famous archaeological site of Zhoukoudian, 50 km southwest of Beijing, are only half as old as those from Majuangou, but the rich trove provided significant knowledge about the development of humans in East Asia. The Swedish geologist Gunnar Andersson discovered the site and two apparently simian molars in 1921. Only five years later were they attributed to an unknown early human. A molar uncovered by the Swedish palaeontologist Anders Bohlin later laid the groundwork for the hypothesis of a new human species, *Sinanthropus pekinensis*, which was reclassified as *Homo erectus* in 1950.[9] A total of 28 sites in Zhoukoudian yielded human fossils, among them 14 skullcaps, from about 45 individuals, as well as animal fossils and tools made of stone, horn and bone. In the most important site, Locality 1, a former cave, the oldest tools were 720,000 years old. The human fossils showed that representatives of *Homo erectus* lived here with interruptions between about 690,000 and 420,000 years ago. It appears that these humans not only mastered fire but also engaged in violent conflicts, armed with clubs, which led to the death of inferior combatants; cannibalism was also not unknown to them. Likewise from Zhoukoudian, from Locality 4 and Locality 15 as well as the 'New Cave', come fossils as old as 250,000 years that serve for Chinese scholars as proof of the ostensible development of an archaic *Homo sapiens* within China.[10]

Slightly less than 1 million years ago, *Homo erectus* established a foothold in the heart of Central Asia, at least during times between ice ages.[11] As a precondition they must have adapted to the harsh continental climate, which required insulating clothing in the form of animal skins, protection from the elements, mastery of fire, and an economy based on hunting. Such an orientation toward the hunt, in turn, presupposed suitable weapons and the ability to plan, organise and successfully execute a hunt. Thanks to the prevailing winter cold, meat was easy to preserve and only had to be thawed with fire. Humans in Central Asia could survive only as adaptable and social beings. The oldest verifiable evidence from Central Asia comes from Kuldara in southern Tajikistan, where 880,000- to 995,000-year-old stone scrapers have been found. In addition, in the neighbouring site of Khonako II artefacts about 740,000 years old have been discovered. Lakhuti I, another nearby site, has yielded stone objects about 475,000 to 530,000 years old; of comparable age are the pebble tools from Karatau I south-east of Dushanbe.[12] Slightly more recent are the finds at Obi-Mazar (Lakhuti III), which are 380,000 to 425,000 years old, somewhat older than those from Kulbulak, at the western end of the Tian Shan mountains, where archaeologists discovered more than 70,000 (!) flint tools.[13]

Then, north-east of Tajikistan in the Kyrgyz part of Fergana, in the cave of Selungur 2,000 m above sea level, archaeologists came upon human fossils and stone tools that were dated to the Middle Palaeolithic and could be about 126,000 to 200,000 years old. It is unclear whether only descendants of *Homo erectus* lived in Selungur[14] or if Neanderthals, who left revealing traces in the cave of Teshik-Tash in southern Uzbekistan, did as well. Significantly older discoveries of stone implements have been made in the Karatau Mountains in southern Kazakhstan and on the western Kazakh peninsula of Mangyshlak, which have been attributed to the Early and Middle Palaeolithic.[15] In addition to over 100 Central Asian archaeological sites from the Lower and Middle Palaeolithic,[16] such as the Angara Culture's Makarovo IV west of Lake Baikal, the site in the basin of Issyk-Kul Lake in northern Kyrgyzstan, or the Bolshoi Gluchoj cave in the Urals,[17] Mongolia has yielded some informative finds. In 2006, for the first time, a well-preserved pre-Holocene skullcap of an archaic *Homo sapiens* from the Upper Pleistocene was discovered here. The skullcap is about 20,000 years old and was found near Salkhit in Mongolia, north-east of the capital Ulaan Baatar.[18]

In Mongolia, the cave of Tsagaan Agui in the Gobi Desert in the south of the country is especially outstanding, for here researchers have access to 700,000 years of stratigraphy. Belonging to the earliest layer are hand axes of the Acheulean type, worked on both sides. These clearly contradict the assertion found in older literature that such tools had not reached Central and East Asia. The theory of a so-called 'Movius Line', introduced in 1948 by the American archaeologist Hallam Movius, says that the ostensibly sophisticated technology of the Acheulean did not spread further north-east of a border stretching from the Caucasus to India and that the corresponding populations on this side of this boundary remained at a lower technological level. Further discoveries of bifaces from Central Asia, such as those from Mangyshlak in western Kazakhstan[19] and the 800,000-year-old sites of Yunxian and Lantian in China – both 200,000 years older than the earliest 'biface' of Europe – belie this theory.[20] In Tsagaan Agui layers from the Middle and Late Palaeolithic follow the Early Palaeolithic band. Buddhist votive gifts and a Chinese coin from the eleventh century[21] show that the cave offered people shelter into our own era.

2.1 Neanderthals and *Homo sapiens* – supersession or interbreeding?

The first fossils of *Homo neanderthalensis* were discovered in Belgium in 1829 and on Gibraltar in 1848, but only after the find in 1856 of a curious, flat skullcap with a pronounced supraorbital ridge in the Neander valley in Germany were these fossils recognised the following year as the now world-renowned early human. This realisation, two years before the seminal book *On the Origin of Species*, represents the advent of palaeoanthropology, and the Neanderthal was quickly seized upon as a kind of 'chief witness for the theory of evolution'.[22] The site in the Neander valley was 42,000 years old; as of today bones from more than 400 individuals of *Homo neanderthalensis* have been discovered worldwide.

From whom did the Neanderthals descend and how close do they stand to us genetically? Science was preoccupied with these questions, especially the latter, for more than a century. Because there is evidence that Neanderthals and *Homo sapiens* lived near each other for millennia in Europe and the Near East,[23] the questions arise of whether they interbred and whether their offspring were fertile. If such mixed offspring could reproduce, Neanderthals and sapiens do not represent two separate species; if they were infertile, however, Neanderthals and sapiens would be two distinct species, such as the horse and the donkey, which can interbreed but whose offspring are barren. Investigation of this palaeogenetic question is at the same time an investigation into our own ancestral heritage.

A widely accepted hypothesis assumes that some 800,000 to 900,000 years ago a speciation significant for human history took place in Africa, leading to two distinct lines of descent. *Homo heidelbergensis*, descended from *Homo ergaster*, migrated from Africa to Europe. Here he encountered the somewhat older hominins called *Homo cepranensis*[24] and *Homo antecessor*,[25] perhaps in Italy or Spain, and developed into *Homo heidelbergensis* more narrowly defined, from which came the Neanderthals.[26]

In Africa, by contrast, Heidelberg Man, more broadly defined, sometimes interpreted as a variation of *Homo rhodensiensis*,[27] evolved further into an archaic *Homo sapiens*, of which the 154,000- to 160,000-year-old Herto Man, discovered in 1997 in the Afar Triangle in Ethiopia, may be the earliest ancestor. This discovery attests to the Out of Africa theory in that, as genetic studies suggest, modern humans first appeared in Africa less than 200,000 years ago. This hominin not only possessed a skull volume of 1,450 cubic centimetres, at least equal to that of modern humans, but also appears to have performed post-mortem rituals. This can be deduced from the skull of a youth that was stripped of its flesh shortly after death and polished clean.[28] Modern *Homo sapiens* then emerged from this Herto hominin, advancing into the Near East some 100,000 to 130,000 years ago and starting to spread worldwide about 80,000 years ago. According to this hypothesis, three great human species lived in the prehistoric world at the start of the Middle Pleistocene: *Homo heidelbergensis/rhodesiensis* in Africa, *Homo heidelbergensis*, narrowly defined, in Europe, and *Homo erectus* in Asia, with these last two leading to evolutionary dead ends.

When modern humans advanced into Europe 45,000 years ago, two human species encountered each other after having been genetically separate for hundreds of thousands of years. The latest evaluations, based on DNA analyses of Neanderthals and *Homo sapiens*, show that the two evolutionary lines, one leading to Neanderthals and the other to modern humans, split about 516,000 years ago.[29] Until recently the overwhelming majority of researchers supported the idea that Neanderthals and modern humans did not interbreed. Since 2010, however, it has been shown that Neanderthals and sapiens interbred not just in isolated cases, which would result merely in infertile hybrids, but rather intermixed, since as much as 4 percent of the genetic material of the Neanderthals can be found in modern humans. This consistency can be found between Stone Age DNA and that of modern Europeans, Asians and peoples of Oceania, but not with African DNA; hence this intermixing must have occurred outside Africa, but before the ancestors of Europeans and Asians split off from each other. This intermixing presumably took place in the Near East, 50,000 to 100,000 years ago, when an ice age between *ca.* 115,000 and 65,000 BC forced Neanderthals out of Central Europe southward.

A study, published in March 2010, of the mitochondrial DNA[30] of a 30,000- to 48,000-year-old finger bone from a Denisova girl showed twice as much genetic separation from modern human *Homo sapiens* as the separation between Neanderthals and modern humans. The complete DNA analysis of the nucleus, published in December 2010, as well as an earlier study of an archaic-looking molar of another young Denisova adult, brought to light very surprising results: the Denisova hominins, whose remains were found in a cave in the southern Siberian Altai Mountains, were a sister group of the Neanderthals, from whom they branched off about 300,000 years ago. The Denisova genetic material is twice as far removed from that of today's European and Asiatic people as the Neanderthals are from modern Europeans and Asians, but it shows significant proximity to today's Melanesians of Papua New Guinea. The intermixing of Denisova hominins and the ancestors of the Melanesians presumably took place not in southern Siberia but in Southeast Asia. The researchers concluded: 'We estimate that 2.5% (+/- 0.6%) of the genomes of non-African populations derive from Neanderthals, in agreement with our previous estimate of 1–4%. In addition, we estimate that 4.8% (+/- 0.5%) of the genomes of Melanesians derive from Denisovans. Altogether, as much as 7.4% (+/- 0.8%) of Melanesians may thus derive from recent admixture with archaic hominins.'[31] The first complete decipherment of the genome of an Australian Aboriginal published in September 2011 showed a similar genetic proximity to Denisovians as do Melanesians.[32]

With regard to eastern Eurasia, the authors state 'These results show that on the Eurasian mainland there existed at least two forms of archaic hominins in the Upper Pleistocene. A western Eurasian form with morphological features that are commonly used to define as Neanderthals, and an eastern form to which the Denisova individuals belong.'[33] Interestingly, the Denisovan hominins did not contribute to the genetic makeup of the neighbouring Chinese and Mongols.

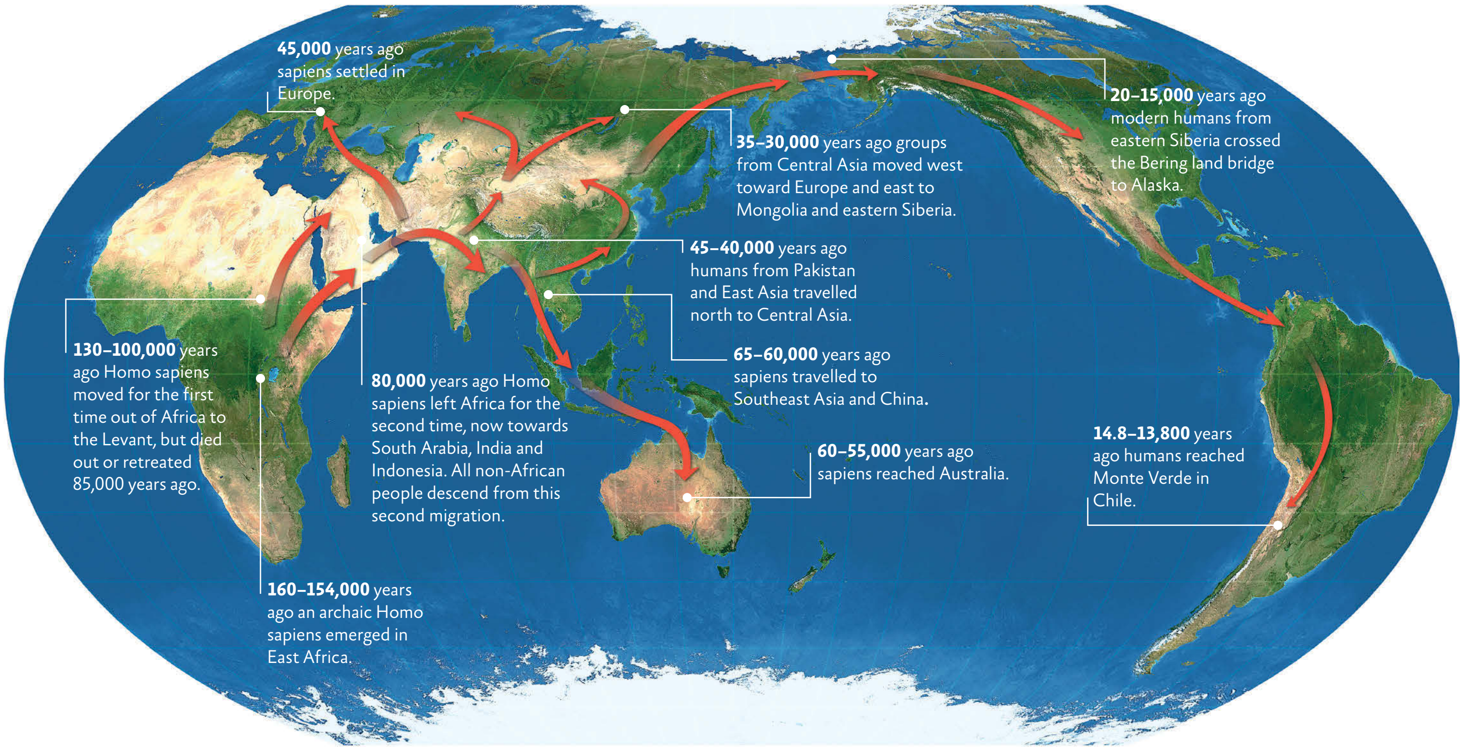
On the basis of these findings, the research team from the Max Planck Institute in Leipzig concluded that the Out-of-Africa theory remains valid insofar as the great preponderance of genetic variations that are spread outside of Africa originated in Africa: 'The vast majority of genetic variants that exist at appreciable frequency came from Africa with the spread of anatomically modern humans.'[34] The pure 'Replacement Hypothesis', however, cannot be sustained. It may be supposed that an 'Assimilation Out-of-Africa' theory will supersede the hitherto existing 'Replacement Out-of-Africa' theory.

The cave of Shanidar, inhabited by Neanderthals 80,000 to 60,000 years ago, northern Iraq.

Neanderthals were well adapted to a cold and harsh climate; they were of powerful, muscular build, somewhat smaller than modern Europeans but with a slightly larger brain. Their skulls were elongated, and the flat, projecting brow, as well as the pronounced supraorbital ridge, lent them an archaic appearance. Besides presumably cooked plants, meat was most prominent on the menu of Neanderthals, who, contrary to earlier ideas, did not eat carrion but instead actively hunted. During group hunts, which required planning and organisation, they used not only stones but also wooden lances and darts. Thanks to such long-range weapons, which were invented by *Homo heidelbergensis* about 270,000 to 400,000 years ago, it was possible to hunt large game such as wild horses, mammoths, woolly rhinoceroses and cave bears.[35] The animals were skinned, so that the Neanderthals could protect themselves from the cold with fur clothing. Contrary to general opinion, the Neanderthals were not pure cave dwellers, but also built a kind of tent at the entrances to their caves for protection and on the steppes probably constructed very simple shelters from mammoth tusks and bones. The remains of such shelters can be found on the western edge of Central Asia near Molodova in the Ukraine, among other places.[36]

It is unclear why Neanderthals left no traces after *ca.* 26,000 BC, after they had lived for nearly 10,000 years alongside *Homo sapiens* of the Cro-Magnon type. Presumably a combination of climatic, economic, technological and physiological factors led to the extinction of the Neanderthals. From 60,000 to 25,000 years ago the European climate oscillated rapidly several times between longer cold periods and short warm periods. This cycle peaked 30,000 to 26,000 years ago in a cold period, coupled with devastating loess storms, which damaged the vegetation layer.[37] The Neanderthals, who were dependent on eating meat, presumably could not adapt sufficiently to these volatile climate changes and their consequences, such as suddenly changed fauna that required new hunting weapons and tactics as well as preservation methods. In addition, the anatomical structure of Neanderthals meant they needed more calories than *Homo sapiens*, who, for their part, were more agile and mobile.[38] Analyses of comparable skeletons also suggest that modern Cro-Magnon humans were healthier and, in particular, suffered fewer broken bones than did Neanderthals, which indicates a greater life expectancy. Whether the Neanderthals' allegedly lesser speech abilities played a role is unknown.

The migration of *Homo sapiens* out of Africa



45,000 years ago sapiens settled in Europe.
35–30,000 years ago groups from Central Asia moved west toward Europe and east to Mongolia and eastern Siberia.
20–15,000 years ago modern humans from eastern Siberia crossed the Bering land bridge to Alaska.
45–40,000 years ago humans from Pakistan and East Asia travelled north to Central Asia.
130–100,000 years ago Homo sapiens moved for the first time out of Africa to the Levant, but died out or retreated 85,000 years ago.
80,000 years ago Homo sapiens left Africa for the second time, now towards South Arabia, India and Indonesia. All non-African people descend from this second migration.
65–60,000 years ago sapiens travelled to Southeast Asia and China.
60–55,000 years ago sapiens reached Australia.
14.8–13,800 years ago humans reached Monte Verde in Chile.
160–154,000 years ago an archaic Homo sapiens emerged in East Africa.

The latest research highlights two additional, related, factors that contributed to the extinction of the Neanderthals. These are their low reproductive ability – female Neanderthals matured later, gave birth only once every four years and had a relatively shorter life expectancy than *Homo sapiens*. As a result the Neanderthals had an extremely low population density. Presumably hardly more than 7,000 to at most 10,000 Neanderthals lived in Europe at one time, which meant they were highly vulnerable to epidemics, famine, or a more successful and probably better armed group of humans.[39]

Archaeological and palaeontological finds in Europe show that the geographic centre of the Neanderthal world lay between the Atlantic and the Black Sea. At times, however, it extended into the Near East, the Caucasus and Central Asia, as far as the Okladnikov cave in the Russian Altai. Presumably the Eemian interglacial period allowed the Neanderthals to settle in southern Siberia and Central Asia. Notably, the northern boundary of the Neanderthals' range in both Europe and Central Asia lies near the 52nd parallel, which bears witness to the adaptation of these prehistoric peoples to the harsh northern climate.

In Central Asia there have been over 100 discoveries from the period of the later Middle Palaeolithic and the early Late Palaeolithic (*ca.* 120,000 to 30,000 years ago) that include so-called Mousterian stone tools, which are characterised by sharp scrapers and flints with thin blades.[40] Although Neanderthals used Mousterian tools almost exclusively, one cannot automatically conclude that finds of such tools were necessarily associated with Neanderthals. This is because early sapiens and descendants of *Homo erectus* also used them. Just as we cannot assume that the distribution of cultural objects corresponds with the distribution of an associated language, we cannot assume that the distribution of human species corresponds with these objects either. Thus we associate a trove of Mousterian objects with Neanderthals only when contemporaneous corresponding bones are also found there.

A few Central Asian Neanderthal sites provide interesting evidence of their unexpectedly well-developed social relationships. While the 30,000- to 38,000-year-old bones found by Okladnikov attest to an advance of the Neanderthals almost to Mongolia, three sites are known in Uzbekistan: the Obi Rakhmat grotto north of the present capital of Tashkent with 30,000 (!) items about 70,000 years old;[41] the caves of Anghilak, in the south-eastern part of the country, with 40,000-year-old artefacts and the most interesting, that of Teshik Tash. Here in 1938 the Soviet archaeologist A.P. Okladnikov discovered not only many Mousterian tools but also a well-preserved skeleton, including the skull, of an eight- or nine-year-old Neanderthal child who died some 60,000 to 70,000 years ago. Assuming that the identification of this skeleton and the estimate of its age are correct, this refutes the theory sometimes put forth that Neanderthals first entered Central Asia about 35,000 to 40,000 years ago in reaction to the advancing sapiens.[42]

The young deceased Neanderthal was obviously intentionally buried; six pairs of horns of the Siberian mountain goat called 'Capra Sibirica' encircled the corpse, with the horns stuck point-down in the ground and oriented toward the skull.[43] This arrangement surely was not coincidental but rather manifests a burial rite; this represents one of the oldest gravesites in the world.[44] The Soviet archaeologist Vadim Masson interpreted this ritual as the start of totemism and compared it to the bear cult of the European Mousterian.[45] Interestingly, in the Pamir Mountains of Tajikistan the mountain goat is still venerated today; its horns often adorn the enclosure walls around Islamic sanctuaries.

Perhaps the humans of that time were familiar not only with burial rituals but also with cultic sites, as the cave of Ogzi-Kichik in southern Tajikistan suggests. There in 1979 Vadim Ranov discovered, together with about 10,000 artefacts, a 30,000-year-old oval stone arrangement without reference to a burial, with a pair of ibex horns on the end of the oval stuck in the ground.[46] Finally, a Neanderthal skull that is at least 30,000 years old was found southwest of Ogzi-Kichik, near the stone shelter of Dara-i Kur in north-eastern Afghanistan.

Although the cave of Shanidar in northern Iraq lies beyond Central Asia, it must be mentioned on account of its significance for the early settlement of Eurasia. In the 1950s in a back tunnel of the cave Ralph Solecki unearthed nine buried Neanderthals, 60,000 to 80,000 years old, of which skeletons I, III, and IV are the most famous.[47] The individual called Shanidar I was a 40- to 50-year-old man who was crippled by healed injuries suffered earlier and would not have been able to survive without help from others. From this Solecki inferred that these Neanderthals recognised a kind of social responsibility and cared for the sick and the elderly. Shanidar III, by contrast, died of a spear wound to the left lung; whether this was the result of a hunting accident or an intentional act of aggression is unclear.[48] The individual known as Shanidar IV, a 30- to 45-year-old man, was laid in a foetal position on a pallet of branches and twigs and likely covered with flowers that impeded inflammations. This was thus a planned, ritual Neanderthal burial like that at Teshik Tash.[49] The 40-m-wide, 45-m-deep, and 12- to 18-m-high cave was divided by stone walls and provided shelter to some 20 families. Holes bored in the ground in front of the rock face could indicate that the people stretched a kind of tent made of animal skins in front of the cave.

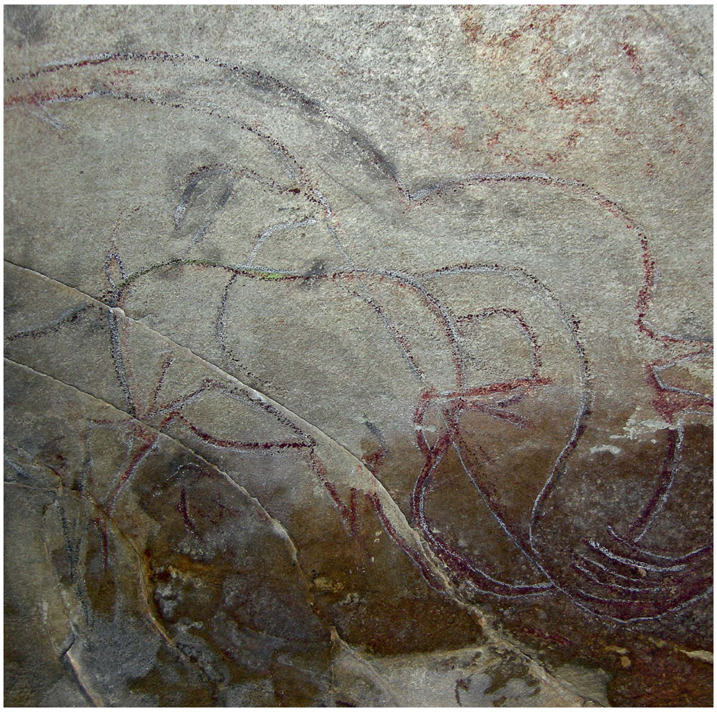
The modern human *Homo sapiens* left their East African homeland twice. They first set out for the Levant some 100,000 to 130,000 years ago, moving into the fertile bands on the eastern shore of the Mediterranean that stretch from Gaza in the south to north-western Syria in the north. This early *Homo sapiens* presumably died out here more than 80,000 years ago or returned from here to Africa. A few millennia later, however, modern humans began their successful settlement of the entire world. The climate was much drier than today and the sea level correspondingly low, which made it possible to cross the then-small Red Sea to reach the south-western Arabian Peninsula.[50] From here sapiens headed east toward India and Indonesia, from where they travelled to Australia about 60,000 to 55,000 years ago. A few millennia earlier, modern humans from India had settled in Southeast Asia and south-eastern China.

Only 10,000 years later did sapiens move from western Asia to the north and west, presumably because the climatic conditions at that time allowed for settlement. About 45,000 years ago modern humans reached Europe. At about the same time sapiens, coming from both Pakistan and East Asia, arrived in Central Asia, from where a few Central Asian sapiens turned west toward Eastern Europe, while others marched on toward Mongolia and eastern Siberia. DNA analyses indicate that the ethnic distinctions between European and Sino-Mongolid modern humans began to develop slowly about 60,000 years ago, and more than 40,000 years later – about 15,000 to 10,000 years ago – the differentiation of the current Asian ethnicities emerged.[51]

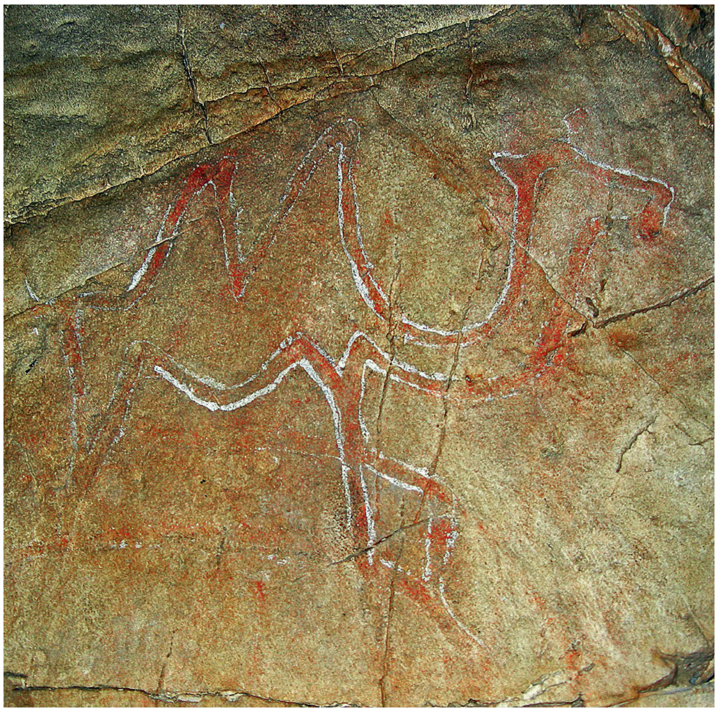
It is certainly conceivable that sapiens in the Siberian Altai encountered representatives of the Denisova ancient humans, whose genetic difference from sapiens is twice as great as that between Neanderthals and sapiens. For this reason the evolutionary anthropologist Johannes Krause of the Max Planck Institute has suggested that at one time in the Altai, which is about the size of Texas, three different human species lived simultaneously.[52] Before the end of the last ice age, presumably about 15,000 to 20,000 years ago, sapiens from eastern Siberia crossed the Bering land bridge, at that time dry land, which linked Asia with Alaska.[53]

3. The birth of art

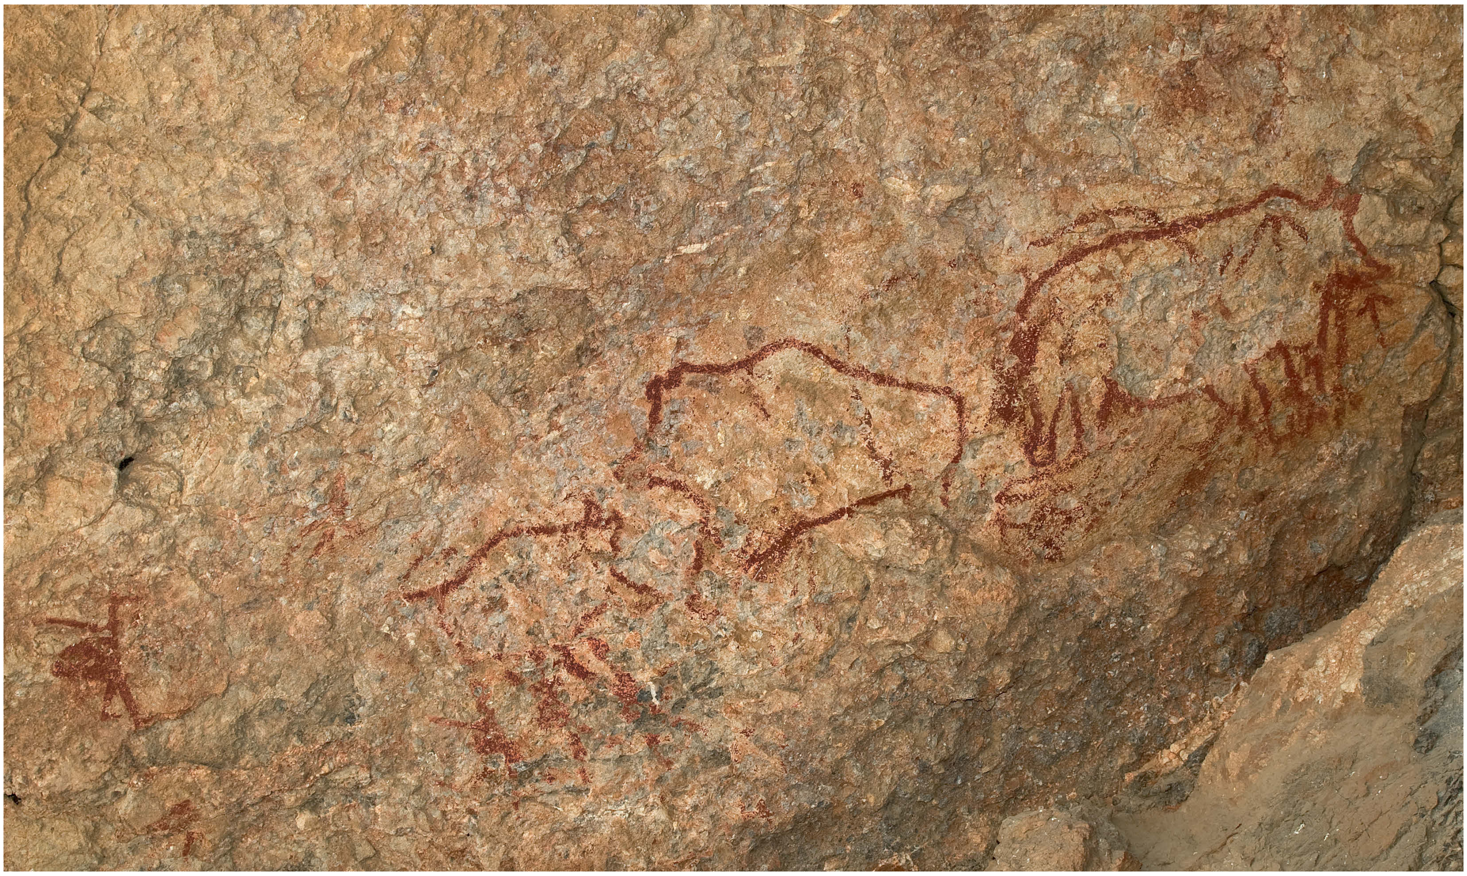
Just before the start of the Upper Palaeolithic, *ca.* 42,500 years ago,[54] a millennia-long cultural revolution began, marking the start of the pictorial, figurative and musical arts. Art blossomed quite suddenly, like a creative big bang, from the Iberian Peninsula in the west to Mongolia in the east. Perhaps it was the ecological conditions – extended cold periods, broad grass steppes, and changing fauna – which forced early humans to adopt a



Rock painting of two mammoths in the cave of Khoit Zenger Agui, Khovd Aimag, western Mongolia, *ca.* 13,000–15,000 BC.



The world's oldest portrayal of a Bactrian camel; rock painting in the cave of Khoit Zenger Agui, Khovd Aimag, western Mongolia, *ca.* 13,000–15,000 BC.



Rock painting of a bear hunt: from left to right, a hunter with a bird's head, a boar and two bears. Shakti, Pamir Mountains, Tajikistan, *ca.* 8000 BC.

mobile way of life. As they lived mainly off the hunt and secondarily from the gathering of edible plants, they had to follow the migration of animals. This led to social relations developing over large distances, which enabled the exchange of goods and pictorial styles. Examples of this are the snails from the Mediterranean used as jewellery and found in Central Europe, cave paintings, and the small, amply proportioned female figurines called 'Venus statues', which are found from Western Europe to Lake Baikal.

Of course, earlier human species such as the Neanderthals also exhibited an aesthetic sense, which may be seen in the symmetrical, superbly crafted hand axes of the Middle Palaeolithic, whose formal perfection far exceeds their functional purpose. An artistic engagement of the human being with himself and his world first began in the Upper Palaeolithic, as the more ancient, *ca.* 77,000-year-old piece of ochre engraved with lines from Blombos, South Africa, is certainly an artefact but hardly a work of art.[55] In the Upper Palaeolithic, however, cognitive abilities arising from interaction with the human environment enabled the creation of works of art in the form of colourful cave and rock paintings; small, portable figures of animals and people; and simple wind instruments.

While in Europe the earliest cave paintings were made in the Chauvet cave (France) 30,000 to 33,000 years ago, the oldest discovery in Central Asia were painted some 15,000 years later.[56]

The earliest rock paintings in Central Asia are in the cave of Khoit Zenger Agui in the province of Khovd in western Mongolia.[57] In the depths of the cave, where semi-darkness prevails, one can recognise on a pinkish-yellow limestone background contour drawings of animals, as well as arrows and dots, drawn in brown and reddish ochre tones. All the animals are shown in profile and consist at most of an outline. They represent wild sheep, ibexes, antelopes, a wild, two-humped camel and giant ostriches, as well as two mammoths or a small elephant of the species *Elephas namadicus*.[58] These last two animals provide evidence of the age of the paintings, since the mammoth and the *Elephas namadicus* died out in Mongolia 15,000 years ago at the latest; this is thus the lower limit of the dating. At that time a warm interim period forced both species to migrate north into colder Siberia. Simultaneously with the mammoth, or shortly thereafter, the ostrich also died out in Mongolia. Petrified ostrich eggshells show that the species was once much more widespread. The portrayal of the camel is also highly significant. In the first place, it is the oldest representation

View from the Shakti cave, located 4,199 m above sea level, on the Pamirs, Murgab District, Gorno-Badakhshan, eastern Tajikistan.

in the world of a two-humped, Bactrian camel. In addition, a slightly curved line drawn under the animal indicates a sand dune and a second line above it shows the horizon, lending the drawing a hint of three-dimensionality.[59]

As on a palimpsest, somewhat later portrayals of Siberian deer heads, snakes and arrows overlay the Palaeolithic paintings; it appears that the original pictures were reinterpreted as a hunting scene. In the Palaeolithic rock paintings of Khoit Zenger the complete absence of human representations also stands out; the animal reigns supreme in art and presumably also in myth.

Of a somewhat later date are the wonderfully well-preserved rock paintings of the abri of Shakti in south-eastern Tajikistan. The figures, drawn in ochre pigments of various shades, date from the early Mesolithic and are about 10,000 years old. They are found in the Pamir Mountains at a height of 4,199 m above sea level in a long dry riverbed, and are the highest Stone Age rock paintings in the world. The rock drawings are the work of people who came from western Tajikistan and were the first to settle in the eastern Pamir Mountains, at the end of the ice age after the retreat of the glaciers. At that time, the start of the Holocene, the climate in the eastern Pamir Mountains was warmer and more humid than today, offering the people a seasonal livelihood. In the summer hunters went up into the mountains, where they hunted red deer and boars. These hunters used the abri of Shakti, where they drew on the rock faces animal and human figures that most likely were related to hunt magic.

Today, however, this part of the Pamirs is a desolate wasteland of rocks and rubble, devoid of vegetation; even nomads can no longer live there. The French naturalist and hunter Vicomte Edmond de Poncins reported the impressions of his 1893 travels there as follows:

> The words at the start of Dante's Inferno came to mind: '*Abandon hope, all you who enter here*'. Regardless of one's ideas of desolation, desert, and aridity, the view of Kyzyl Art [the stone desert surrounding Shakti] will exceed all expectations. One could believe himself to be the only person who had ever seen this endless, accursed land, but the bleached bones that indicate the direction to follow show that others have come before.[60]

The abri of Shakti was discovered by archaeologists by chance in 1958, when they sought refuge from the weather. The cave-like shelter, oriented to the north, has an opening that is about 6.5 m wide and 8 m high. It is less than 4 m deep, but nonetheless offers protection from sun and rain. The drawings on limestone are arranged on a 250-cm-long frieze about 160 to 200 cm above the ground on the southern side of the cave. Of the seven figures, four are clearly recognisable: to the far left a 23-cm-tall man, holding a club, approaches three rather large animals; he resembles a bird and has a bird's head. The figure could represent a hunter wearing a bird mask and a bird-like costume as camouflage, a hunting tactic still used today in Central Asia and Mongolia. To the right stands the 40-cm-long figure of a boar, turned away from the hunter; it has either fallen into a trap or is surrounded by highly stylised hunters. To the right of the boar a 60-cm-long bear is ready to spring to the left, as if to attack the boar; below the bear are stuck in the ground one or two spears, with which it has been injured. To the far right stands an 85-cm-long bear, looking to the right, toward which fly three arrows from different directions; the scene portrays a bear hunt.[61] These rock paintings are part of the **Markansu** culture of the eastern Pamirs, to which the Mesolithic site at Oshkhona also belongs. Appearing in the eastern Pamirs at the same time as the Markansu culture was the Mesolithic culture of **Ishtyk**, whose stone tools displayed similarities to finds made in northern Afghanistan, which, for their part, were influenced by early Mesolithic cultures of south-western Central Asia.[62]

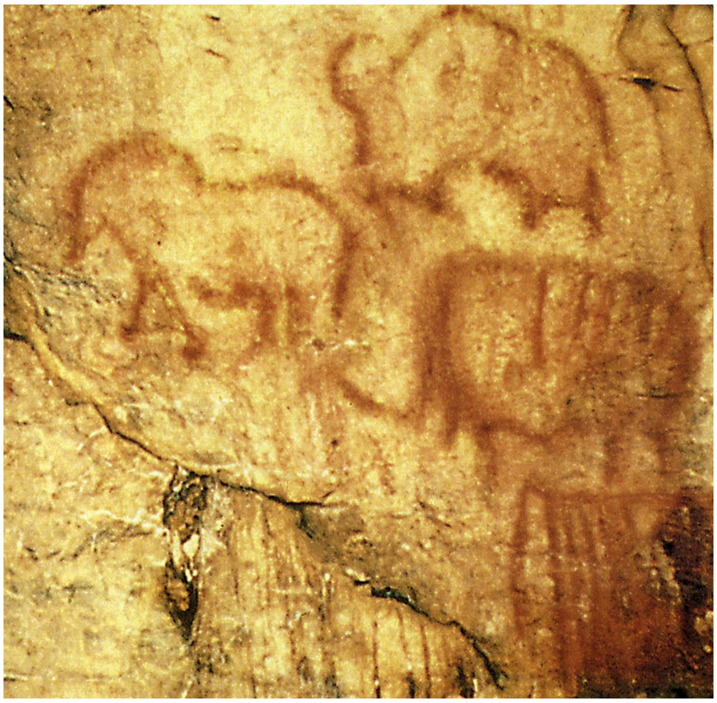
Just 2 km from Shakti is the shelter of Kurteke, 4,020 m above sea level, with traces of Neolithic drawings. Also close to Shakti, near the Naiza Tash pass, 4,137 m above sea level, there is another rock shelter with a few Neolithic paintings, presumably portraying a hunting scene.[63] Dating from the same epoch are the rock paintings in the cave of Ak Cunkur, at a height of 3,151 m above sea level in far north-eastern Kyrgyzstan on the border with China. The 45-m-long cave features hunting and dancing scenes drawn in ochre pigments that, as the author discovered in 2004, are no longer recognisable as they lie under a thick layer of soot.[64]

In contrast to the rock paintings of Khoit Zenger, in those of Tajikistan and Kyrgyzstan human figures clearly appear in the context of a hunt in at least three of the four caves. Thanks to the invention of the bow almost *ca.* 12,000 years ago[65] and the increased organisational abilities of the Mesolithic and Neolithic people, hunts could be more efficiently organised. Among the preparations for a successful hunt were attempts to actively influence elements of the environment. Presumably the rock paintings portraying hunting scenes had a magical relationship to the hunt preparations, whether as a wish that powerful spirits would provide for a successful hunt or that the corresponding animals would increase and remain in their usual habitats.

A somewhat different kind of coloured rock painting is found in the southern Urals in the Palaeolithic caves of Kapova and Ignateva, east of the city of Ufa. More than 50 drawings of mammoths, horses, a rhinoceros and possibly an ox, as well as unidentifiable beings and geometric figures, adorn the limestone walls of the Kapova cave. These drawings are divided into eight groups over the three levels of the cave. Most notable is a 35-cm-tall anthropomorphic figure consisting of a human torso and arms and a horse's legs; the head is no longer discernible. The colours used for the 14,000- to 16,000-year-old drawings were mostly ochre in various shades, ranging from a light red to a dark red-brown and purple-brown, with these different ochre tones being produced by the burning of iron ore or iron concretations. Added to these was the colour black, which was made from charcoal or manganese oxide.[66] On the basis of this discovery archaeologists assume that this complex cave had a cultic purpose and did not serve as a residence.

The humans of that time sheltered from cold, rain and predators not only in the caves or abris. They also built dwellings made of mammoth bones and tusk on terraces above a nearby canyon. Over the top of these makeshift dwellings, which were sunk slightly into the ground, they laid animal skins sewn together with sinew and bone needles. About 40 tusks driven into the ground formed supports for the roof and the entryway; on the ground, between the tusks, lay mammoth thighbones and skulls. Jawbones usually extended between these lower halves of the walls and the roof. The mammoth dwellings had a circular or oval floor plan of about 5 to 7 m in diameter and offered shelter to eight to ten people.[67] In Mezin, Ukraine, archaeologists found the remains of five such dwellings, consisting of 1,350 bones from at least 116 animals. At Mezhirich four such houses were discovered, the largest of which alone used 385 bones from 95 animals. Very similar dwellings made of mammoth bones were likewise found near Malt'a west of Lake Baikal. They usually did not stand alone but rather formed small settlements of three to six dwellings. These dwellings represent not only one of the earliest forms of architecture but also of the artistic embellishment of human habitations. The walls of Dwelling 1 in Mezin were decorated with zigzags, parallel lines and chevrons in reddish yellow pigments obtained from hematite and jarosite.[68]

These settlements show that in the Upper Palaeolithic southern Siberia and neighbouring Ukraine were rather well settled – in



Rock painting in the Kapova cave in the southern Urals, Russia. From left to right, a horse, a mammoth, a rhinoceros or a mammoth, a trapeze-shaped object, *ca.* 12,000–14,000 BC.

the Ukraine alone more than 500 Upper Palaeolithic archaeological sites have been found. They also indicate that the big game hunters of the Eurasian 'mammoth steppe' were semi-sedentary. Based on spear tips made of mammoth bones and the bones of slain bison and mammoths, which were found in the valley of a narrow canyon, the archaeologist Pidoplichko opined that the entire adult population of the settlement, including women, participated in the hunt. A few drove the animals over the ledge of a steep canyon, while others killed them with spears and presumably also spear-throwers as soon as they reached the valley floor. Such two-part spear-throwers had an effective range of about 30 m, and the spears reached a launch speed of more than 100 km/hr.[69]

The people also crafted arrowheads, hammers, needles and scrapers from mammoth bones and sharp awls from the shinbones of hares.[70] As long as sufficient big game lived within a habitat – the mammoth bone settlements stood dozens of kilometers apart – the hunters in it remained sedentary. According to Pidoplichko's estimate, these settlements lasted seven to 20 years, after which hunting communities moved on.[71]

At the 14,000- to 17,000-year-old settlement of Mezhirich, archaeologists also discovered jewellery in the form of carved mammoth bones coloured with ochre, small, flat, stylised female figurines and a rare engraved, flat mammoth bone. The archaeologist Ninelj Kornietz believes that mammoth bone dwellings, trees and a river are recognisable in the engraved forms. This would indicate that the piece was a kind of map. If this is true, it would represent by far the oldest map in the world and would attest to great imaginative abilities of the people at the time. At another mammoth bone settlement at Mezin, about 260 km northeast of Mezhirich, archaeologists found jewellery made from seashells that must have come from the Black Sea over 600 km to the south. This discovery provides evidence that even some 15,000 years ago goods were being exchanged between these hunting communities and people on the Black Sea, perhaps along the Desna and Dnieper rivers.[72]

At the Ignateva cave about 150 km north of the Kapova cave, only the entrance hall served as a place of settlement. The rooms decorated with 13,000- to 14,000-year-old paintings are, however, found deep in the cave's interior where complete darkness and nearly 100 per cent humidity prevail, since the air does not circulate. In this cave images of animals in shades of red and black also predominate; unfortunately, due to vandalism, they are not as well

Skeleton of a young mammoth which fell into the dripstone cave of Emine Bayir Chosar, central Crimea.

preserved as those at Kapova. Most of the animals portrayed are mammoths, but there are also horses, a rhinoceros, an auroch and a two-humped camel. Other figures depicted include a woman, a kind of stick figure, and a human-animal hybrid made up of a human body and a bird's head and legs, and arrows.[73] The very poorly preserved paintings of Serpievka 2 presumably date from the late Upper Palaeolithic; those of Muradymovka are more recent.[74]

Portrayals of mammoths are also prominent in the cave paintings of Western Europe, which date from *ca.* 10,000 to 17,000 years ago. Mammoths appear in at least 370 pictures in 41 different caves. European cave paintings also feature images of mysterious human-animal hybrids such as painted bull-, bison-, and deer-men or anthropomorphic statuettes like the 32,000-year-old figurine of the 'lion man of Hohenstein Stadel', made of mammoth ivory. In the Neolithic such hybrids also appeared in the petroglyphs of Central Asia. In the absence of written sources we can only guess at their deeper significance. Are they animal spirits and deified animals that appear to us with human attributes, or are they highly unusual humans endowed with animal attributes, who make contact with animal spirits? We do not know; evidence of parallels to shamanistic rituals remains speculative.

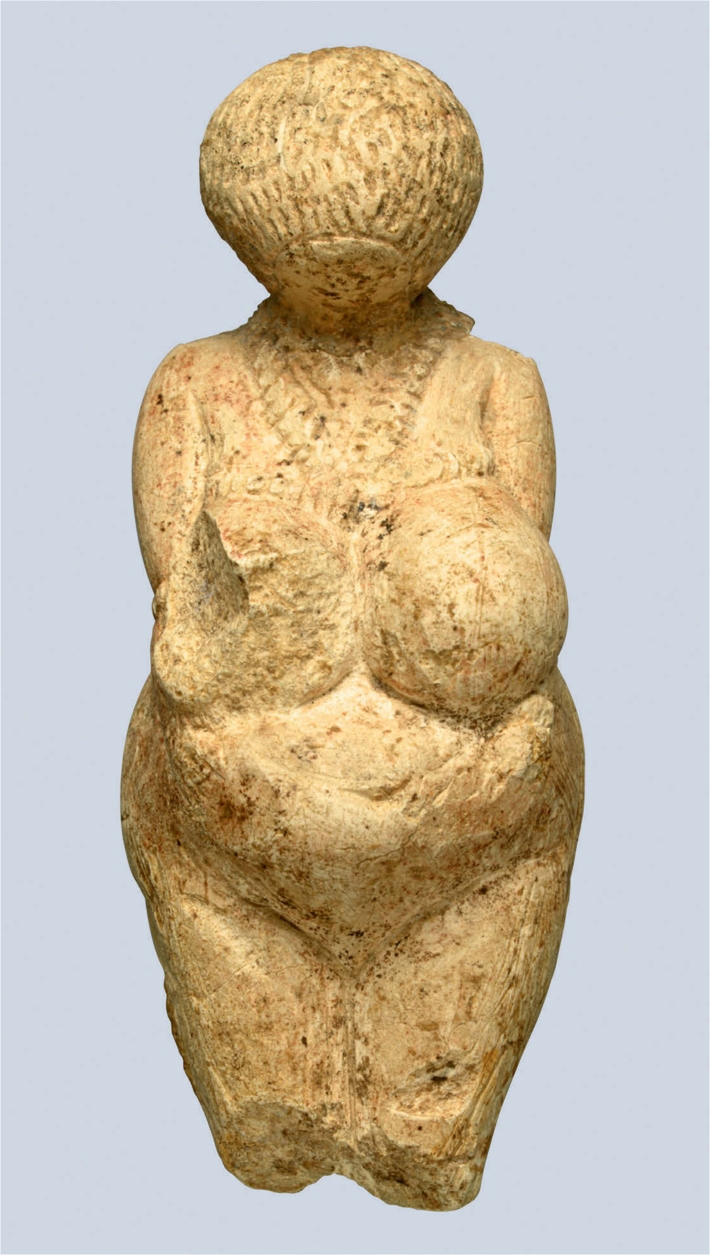
In any case, the rock paintings suggest that the people of the time saw the boundary between human and animal as not unbridgeable but rather in flux. It is also striking that the wall paintings of the Urals and Western Europe are found deep in the inaccessible cave interiors, where complete darkness and silence prevail. These were not residences but rather cultic sites, which were presumably open only to selected individuals. Whether they served purposes of hunting magic, were magical places of healing or initiation, or represented a bridge to the supernatural remains unknown. The appearance of rock paintings in the Earth's interior is hardly a coincidence, however; perhaps this development is related to dreams and memory, and it was the recollection of dreams that suggested to early humans the existence of a self-contained dream world and of beings independent of the body. Dreams opened for human beings the door to the unseen. Time spent in a dark cave, which offer hardly any stimuli to the senses, comes close to the conditions of a sleeping dream.

Regardless of their intended purpose, these paintings and drawings should be seen as art, since they express the desire to portray a figure or object according to aesthetic principles such that it is clearly recognisable and its attributes can be identified. Capacity for abstract thought, imagination, and the ability to think in symbols – capabilities that the Upper Palaeolithic human clearly possessed – are all essential preconditions for art, both its creation and its viewing.

In addition to cave paintings, the so-called Venus figurines connected Central Asia with Western and Central Europe in the Upper Palaeolithic. These tiny female figures, rarely more than 10 cm tall, may be made of stone, bones, mammoth ivory and clay. The term 'Venus' is misleading insofar as the statuettes have no relation to any 'goddess of love', but rather it denotes their nakedness. The statue that is presumably the oldest in the world is the 6-cm-tall 'Venus of Hohle Fels'. More than 35,000 years old, it is made of carved ivory and was discovered in Germany in 2008. This and the other 12,000- to 24,000-year-old Venus figurines of Western and Central Europe have pronounced feminine features, such as ample breasts and buttocks as well as abdomens and thighs. They give the impression of being pregnant or overweight; their faces are barely indicated. Their meaning has been interpreted in various ways, as amulets, as symbols of human fertility or an adequate diet, and as portrayals of goddesses.

About 2,000 km farther east similar figures of comparable age have been found in the Russian-Ukrainian lowlands west of the Urals. These include more than 120 statuettes discovered at Kostienki 1, as well as at Avdeevo and Gagarino.[75] Most notable is the 26,000-year-old 'Venus of Dolní Věstonice', discovered in the Czech Republic. This 11-cm-tall ceramic statuette lay near a camp of Upper Palaeolithic mammoth hunters. This female figurine and other terra cotta figures of mammoths and big cats found there show that the practice of hardening clay with heat was known millennia before the start of settled agrarian culture. Analyses of the statues of Dolní Věstonice reveal that they were fired in specialised kilns at temperatures of 500–800 °C.[76]

The small ivory figures from Bouret and Malt'a, north of Irkutsk on the western bank of the Angara River, reveal that 20,000 years ago the Upper Palaeolithic cultural zone extended over nearly 7,000 km from Western Europe to Lake Baikal. Here between 1956 and 1958 the archaeologist Gerasimov discovered near the remains of hunters' dwellings made of mammoth and woolly rhinoceros bones the grave of a child whose body had been covered with ochre and who had been given a diadem made from mammoth tusk. At the settlement Gerasimov discovered also dozens of small animal and human figurines, among them 24 Venus statuettes, whose age has been estimated at 20,000 to 23,000 years.[77] They belong to two different types, of which both are also represented in Western and Central Europe. The first are naked and have large breasts and wide hips, similar to most European female statuettes. The others, by contrast, appear to wear a fitted garment with a hood and have a sophisticated hairstyle and a very slender, even unnaturally thin figure, similar to the slim 'Venus of Galgenberg', who stands in a dancing pose.[78]



Palaeolithic female statue made of limestone, Kostienki-1, Don River basin, eastern Ukraine, *ca.* 20,000 BC. The State Hermitage Museum, St. Petersburg.

The culture of Malt'a on Lake Baikal existed at the same time as that of Kostienki-Avdeevo-Gagarino and along with the Western European hunter-gatherer culture of the Gravettian and Epigravettian, perhaps also along the preceding culture of the late Aurignacian. There is little doubt that they all formed a

Palaeolithic female statue made of mammoth bone, Malt'a, Siberia, Russia, 18,000–21,000 BC. The State Hermitage Museum, St. Petersburg.

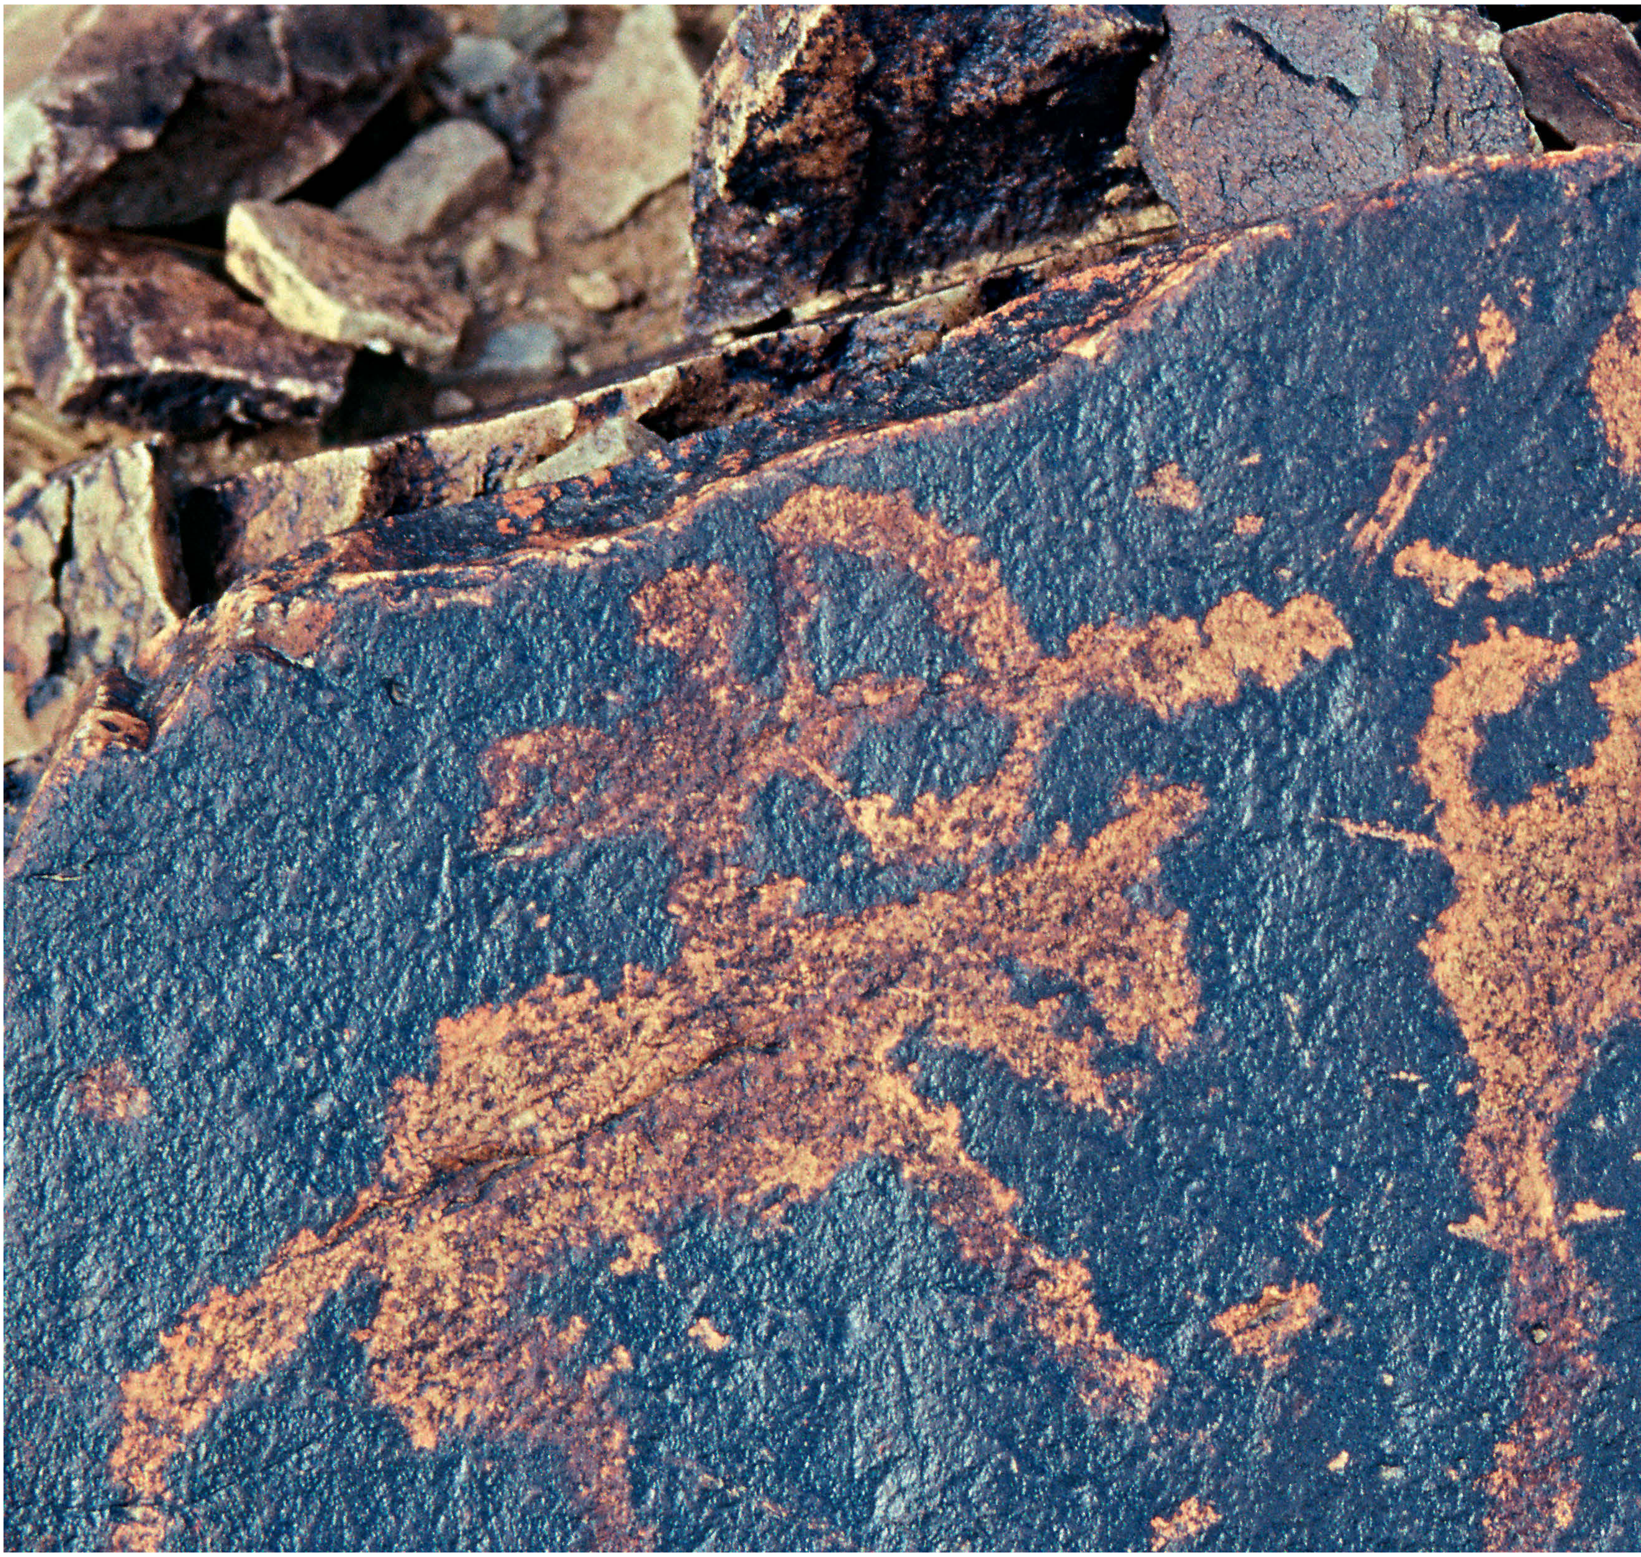
wide-ranging shared cultural horizon, in which social networks existed – a kind of pan-Eurasian proto-Silk Road of the northern steppe. When a markedly cold period set in about 20,000 years ago, Siberia and the Eastern European plains were depopulated as the hunter-gatherer communities migrated south and west for survival. These regions were slowly resettled only 4,000 years later, as the continental ice shield gradually receded.[79]

4. The bow – a 12,000-year-old success story

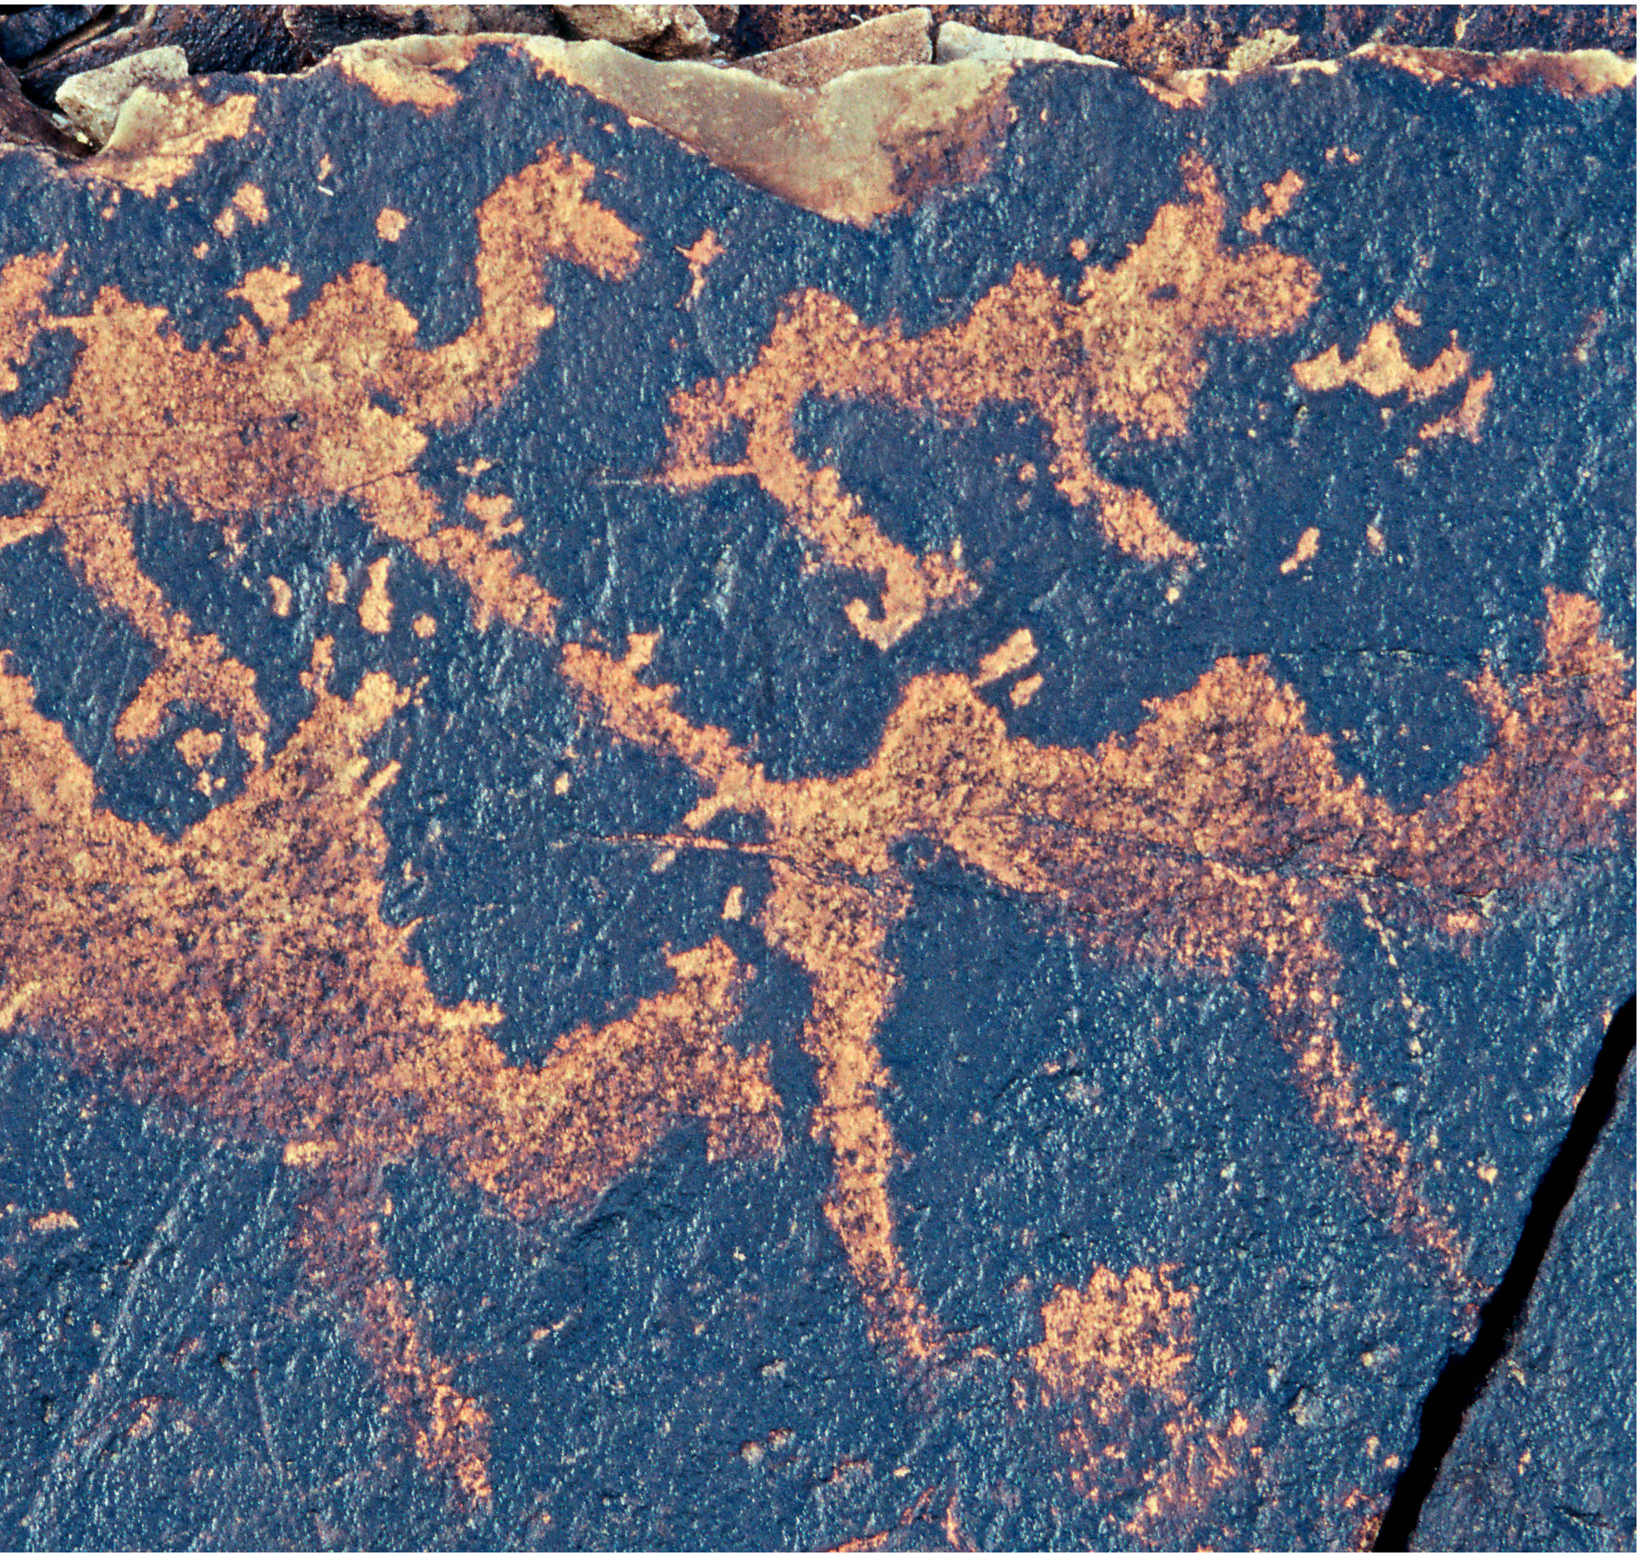
A second, somewhat later invention of the Palaeolithic was the bow. This new long-range weapon could be used both for hunting and fighting, and it had several advantages over the spear. Thanks to its greater range, the shooter was less exposed when taking a shot than was the thrower when using the spear. Second, it offered greater accuracy and, third, it was much lighter in weight, so a hunter could take many more arrows with him than spears. Finally, the arrow was faster and more convenient to make and could be shot from almost any body position and in any terrain. The bow revealed its full potential only millennia later in combination with the horse, when in the early first millennium BC on the steppes of Eurasia bands of mounted archers developed into the most feared fighting force of their time. As the rather small recurve bow of the Scythians could be drawn with relatively little effort, it was also an ideal weapon for women, especially as young female riders were the equals of male riders in agility and speed. The bow remained the dominant long-range weapon for *ca*. 12,000 years – gradually superseded by firearms only at the start of the late Middle Ages.

When precisely the bow was invented is disputed, since the oldest indications – *ca*. 20,000-year-old points made of flint – could also have served as the tips of light spears. A bow found near Mannheim in Germany in 1976 or 1978 is thought to be the oldest bow in the world. It is a 40-cm-long worked piece of pine, originally about 110 cm long. This approximately 11,700-year-old bow had a range of 80 m and a draw weight of 11 to 14 kg. The other and indisputable evidence for the bow is the approximately 12,000-year-old intact bows from Stellmoor near Hamburg, northern Germany, as well as two 8,000-year-old bows from Holmgård IV in Denmark.[80] Of roughly comparable age are the portrayals of bow hunters in petroglyphs on the eastern coast of Spain, which date to between 5000 and 2800 BC,[81] as well as those of Tsagaan Salaa in western Mongolia.[82]

The first bows were simple self bows without an arrow rest or a grip; out of this developed the longbow, whose length nearly equalled that of the bowman. More efficient than the self bow was the recurve bow, which features tips that curve backwards, so that it stores significantly more energy. Contrary to popular belief, the recurve bow did not first appear in the Bronze Age. This is shown by images of such bows in petroglyphs on Spain's Mediterranean coast and the almost contemporaneous rock paintings of Alta in Norway, dating from 5,000 to nearly 7,000 years ago.[83] Sixteen



A mounted archer hunts camels. Petroglyph in the Sirven foothills, Ömnögov Aimag, southern Mongolia, *ca*. 1000 BC.



4,500- to 5,000-year-old bows from a burial ground near Pribaikalja, north-west of Lake Baikal, may represent the oldest archaeological discovery of a recurve bow.[84]

The combination of a recurve bow with first bilobite arrowheads and, beginning in the late Bronze Age, three-winged trilobite arrowheads, was a deadly weapon. While arrowheads with bilobite tips could be pulled out of a wound that did not involve any vital organs, a trilobite arrowhead, with added barbs, caused a fatal loss of blood from the many parts of the body it could strike. In the later first millennium BC bands of Scythian riders multiplied the deadly effect of the weapon by dipping the arrow in a mixture of snake venom and blood contaminated with dung; the Greeks called this poison 'scythicon'.[85]

The composite bow, very likely invented on the steppes of Central Asia before or around the middle of the second millennium BC, represents a further refinement of the recurve bow. It was made of at least two materials, which further increased the tension force and draw weight and lessened the bow's length, so that it served as the ideal weapon for horse riders. Composite bows are usually made of a wooden core, over which, during a multi-year process, other materials like bone, horn, metal, or other types of wood are layered and wrapped in sinew and animal skins or tree bark. Depending on the type of arrow used, the later composite bows of the Mongol and Turkish horsemen had a range of more than 500 m. The laminated composite bow also had weaknesses, however, since it is vulnerable to humidity, which causes the layers to separate due to retained water. Thus horsemen from the north who invaded the humid plains of India, such as the Kushan, often discovered that their best weapons literally fell apart. For that reason the Byzantine Emperor Maurikios (*r.* 582–609 AD) who had successfully waged war against horse peoples recommended in his strategy handbook *Strategikon*: 'If the enemy has a very strong force of archers, watch for wet weather, which affects the bow, to launch our attack against them.'[86] With the introduction of the composite bow, bronze arrowheads with sockets of standard size and weight began to be produced, which made it easier to set up a shot and thus improved accuracy.[87]

Since bows were made of organic materials, well-preserved archaeological specimens remain rare in Central Asia. Among the oldest is the broken bow of Arzhan 2, Tuva (southern Siberia), which was unearthed in 2001 from the grave of a Scythian royal couple who lived in the seventh century BC.[88] Somewhat less old but better preserved is the asymmetrical horseman's bow of Olon Kurin Gol, found in Mongolia in 2006.[89] For climatic reasons the two best-preserved ancient composite bows come from the Turfan Basin and the Taklamakan Desert of China, two very arid regions on the eastern edge of Central Asia, where organic matter remains preserved for millennia. Both bows were grave goods; the one from Subexi[90] near Turfan dates from the fifth to the third century BC, and the one from Niya[91] in the interior of the Taklamakan Desert from the first three or four centuries AD.

III

A Global Climatic Warming Ushers in the Mesolithic

The paintings on rocks, they are the earliest dialog of the human being with eternity. With these pictures the human of prehistory recorded his wishes, his dreams, his worldview, his thoughts, and his experiences.

HERBERT KÜHN, FOREWORD TO *A.P. OKLADNIKOW, DER HIRSCH MIT DEM GOLDENEN GEWEIH*, 1972[1]

1. The retreat of the glaciers

The temperature in the northern hemisphere began to rise markedly about 14,700 years ago. This increase was caused by heightened solar activity, a notable increase in carbon dioxide in the atmosphere, and a shift to the north of the warm Gulf Stream ocean current. This warm period ended after two millennia with a return to cold conditions, but 11,700 years ago the current warm period began abruptly, caused by an increased intensity in solar radiation, with a temperature rise of as much as 8 °C in ten years.[2] With the retreat of the great glaciers, the Pleistocene ended and the Holocene began, coinciding with the transition from the Palaeolithic to the Mesolithic.[3]

The Mesolithic is defined by scholars according to two different criteria. Its start is identified according to geochronological considerations and placed at the beginning of the Holocene around 9700 BC; its end, however, is determined by archaeological criteria. The Mesolithic ends with the Neolithic revolution, the beginning of productive economic activity in the form of animal husbandry or farming. Thus the transition from the Mesolithic to the Neolithic occurred at different times in different regions.

The huge increase in temperature, well above our current level, had lasting consequences for flora and fauna. In the northern half of Central Asia large wooded zones expanded, forcing the steppes southward; in the southern half, however, several steppe regions became drier and turned into hostile deserts, so Mesolithic archaeological discoveries occur there much less frequently than do Palaeolithic.[4] Only the technology of artificial irrigation enabled Neolithic people to settle successfully in desert oases, as they did in, for example, south-western Turkmenistan.

The warming of the climate also forced large mammals adapted to the cold, such as the mammoth, to migrate north, where they quickly died out. Among the animals, besides the mammoth, that went extinct at the end of the Pleistocene were the woolly rhinoceros, the steppe bison, the cave lion, the cave hyena and the giant deer. Scientists still do not know, however, whether these large mammals fell victim only to the temperature increase, since they had adapted to earlier climate fluctuations, or if additional factors, such as a decreased rate of reproduction or intensive hunting, also played a role. Particularly in the case of popular meat sources such as the mammoth, the steppe bison and the giant deer, increased hunting may have contributed to their demise. At the same time, the great herds of wild horses and reindeer also disappeared, forcing hunters to change their strategies. They could no longer ambush herds or lure them into a trap, such as a rock pit, but rather had to pursue individual animals, for which the bow, as an accurate weapon, was indispensable.

In north-eastern Central Asia and in the northern steppes, unlike in the south-east, the temperature increase at the start of the Holocene did not cause a drying out of the landscape but rather, thanks to increased precipitation and the melting of permafrost and glaciers, a rise in humidity. In the region of modern western Mongolia, the Altai and southern Siberia, large woodland areas and marshy plains expanded, opening new habitats for other animals such as aurochs, elk, red deer, argalis (mountain sheep), bears and wild pigs. These new arrivals offered humans a rich hunting ground, while simultaneously forcing them to become more mobile.[5] At that time north-eastern Central Asia provided hunters, fishermen and gatherers with a wealth of sustenance. With the retreat of the permafrost and the cold far to the north, human beings and animals adapted to relative warmth advanced into regions that today have a harsh climate.

2. Petroglyphs as information sources

For the Middle Stone Age onwards, scholars of culture and history have access to a new source of knowledge in addition to archaeological, ecological and genetic data. These are petroglyphs, widespread in the eastern half of Central Asia though found mostly in inaccessible locations. These stone engravings not only have a mythical, magical or shamanistic meaning, depending on the interpretation, but also reflect the material reality of the time.[6] Thus they convey irreplaceable information about the fauna, human lifestyles and technologies used, such as the emergence of domesticated cattle herds, the use of tents or four-wheeled wagons and two-wheeled chariots, as well as the adoption of horse riding and various weapons. The relevance of the petroglyphs for history is enhanced by their continuity in a particular place, since they were often carved over the course of several millennia in the same, clearly sacred location. In this way they may be understood as both open-air holy sites and the earliest stone ‘history books’. Since such sites with petroglyphs were often used for centuries or even millennia, they must have contributed to a strong sense of social and cultural identity in the community concerned.

Sites with thousands or even tens of thousands of engravings in Mongolia, Xinjiang, Kazakhstan, Kyrgyzstan, Tajikistan and southern Siberia offer graphic information from the Mesolithic into the Middle Ages, provided the climatic conditions permitted human survival. Petroglyphs are an important extension of archaeological data because the latter provide information mostly from burial sites and the corresponding grave goods, while there are no portrayals of funerals in the petroglyphs. Instead, they depict important life events and traditions and the mythical and magical ideas associated with them.[7] In broad terms, archaeological burial sites give insight into a particular funereal culture, social norms, and to some extent material culture; petroglyphs, by contrast, tell us about life in this world and its associated ideals.

However, in the absence of organic material that permits the use of radiocarbon methods, petroglyphs are difficult to date. The organic material that becomes embedded in the fine engravings in the rock often oxidises, so that measurements result in a too recent date. In addition, organic matter can be blown by the wind into a layer of rock. Serving as a starting point for dating are analyses of the patina and the degree of weathering, the palaeoecological environment, and the technology employed. Dating based on stylistic characteristics is still highly inexact.

As surfaces for petroglyphs the artists chose granite-like stones, smoothed and polished by glaciers, or preferred so-called greywacke,[8] a relatively hard sandstone consisting of feldspar, clay shale, quartz, clay minerals, chlorite and mica. The boulders have a smooth surface and a patina whose colours range from dark brown through brick red to dark pink, so that the artists found ideal, naturally occurring 'canvases'. The engraved motifs first appeared white and were visible from greater distances than they are today; after a few centuries a new patina formed, lessening the contrast with the background. In the Mongolian Altai, for instance, it took about 3,000 years for the white colour of the petroglyphs to begin disappearing.[9]

Petroglyphs, which are defined as pictures either directly or indirectly engraved, embossed or scraped into rock, must be distinguished from rock painting, in which pigments are applied to rocks. In petroglyphs rock is removed, but this is not the case

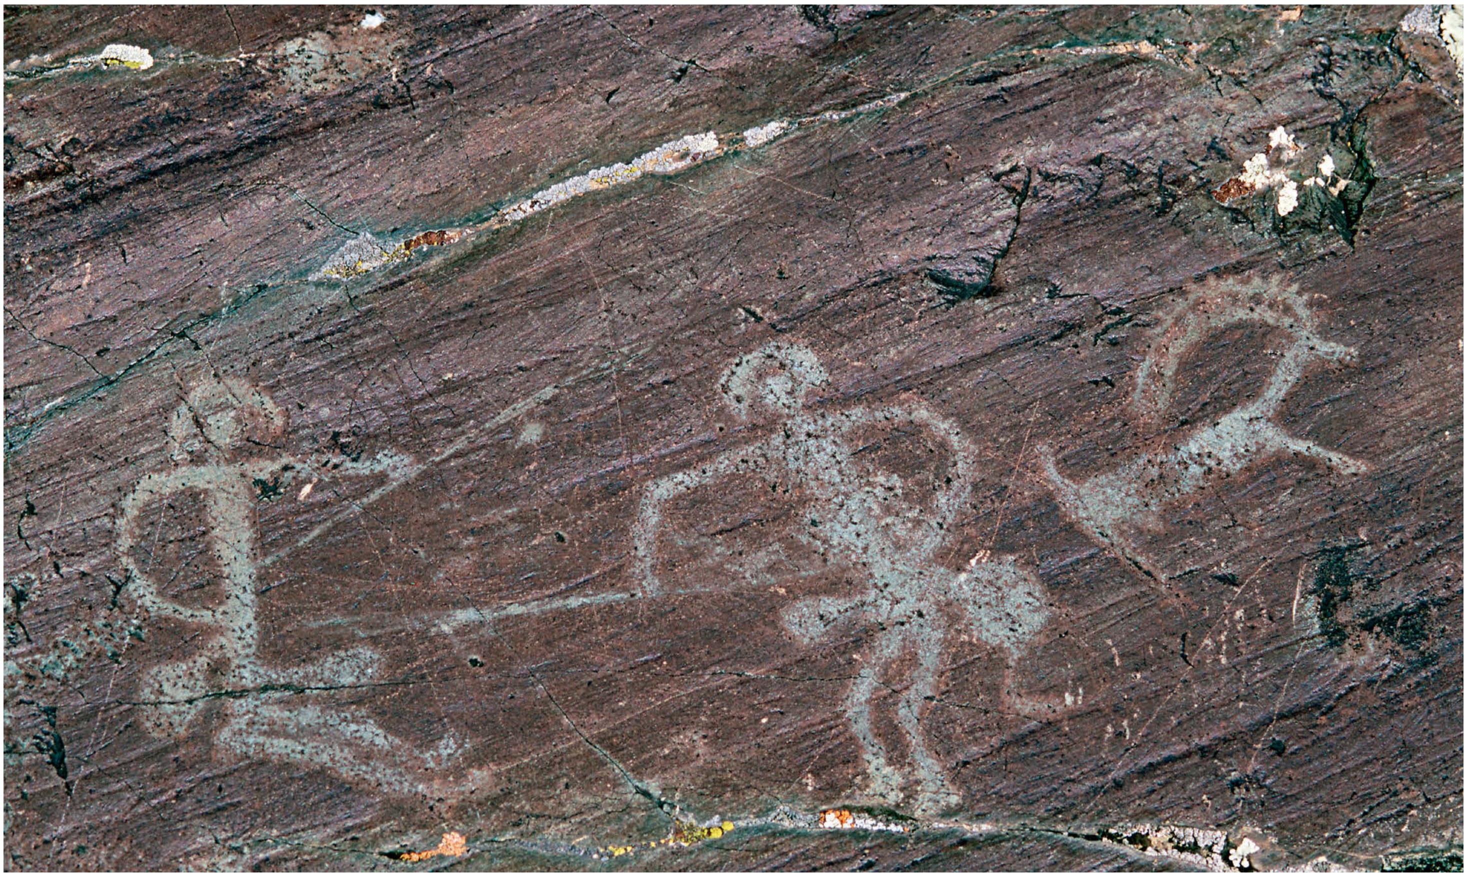
Crater of the Khorgo Uul volcano, 2,285 m above sea level and extinct for the past 8,000 years, Arkhangai Aimag, Central Mongolia.

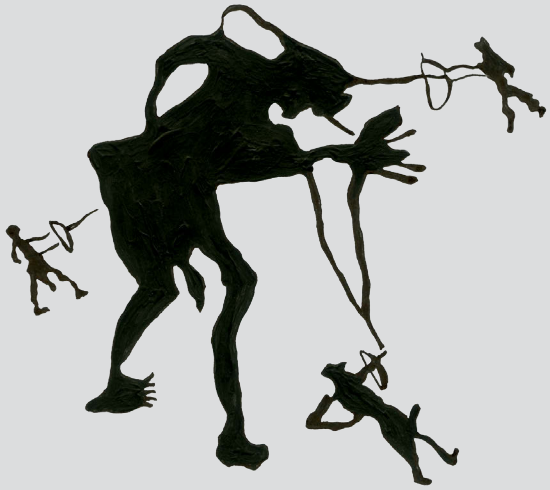
The petroglyphs of Tsagaan Salaa and Baga Oigor, Mongolia

The archaeological complex of Tsagaan Salaa and Baga Oigor is found in a sparse mountain steppe landscape of western Mongolia and, with its approximately 100,000 stone engravings, resembles a huge open-air museum that runs along the mountain rivers Tsagaan Salaa and Baga Oigor over an area of 15 km^2. The lowest engravings are about 30 m above the valley floor at a height of 2,240 m above sea level; the highest are at 2,630 m above sea level. They are mostly oriented toward the sun to the south, south-west or south-east. A few of the most heavily decorated and interesting complexes are found near areas sheltered from the wind, and presumably served as winter camps.

An exploration here is like a richly illustrated journey through 13,000 to 14,000 years of history. This petroglyph complex, still well preserved today thanks to its remote location, is not only one of the largest in Central Asia but also the most comprehensive with regard to chronological coverage of various cultural epochs. The stone engravings are landmarks of life over the course of climate fluctuations and the attendant development of a hunter-gatherer society into one of nomadic stockbreeders. This stone history book begins in the late Upper Palaeolithic when, toward the end of the last ice age, human beings hunted mammoths, which are portrayed in primitive form in a dozen petroglyphs. In the subsequent warm period of the Mesolithic, thick forests and marshy plains emerged in the Altai, which were inhabited by aurochs, elk and red deer. The petroglyphs of these animals, as well as of argalis and horses, were usually portrayed in the style of a monumental, somewhat static idealised realism; a captivating minority of them feature a lifelike, almost elegant realism, and all appear in profile. Toward the end of the Mesolithic they are joined by pictures of bears and Siberian ibexes; the latter suggest the start of a retreat of the forests.

The first human figures appear in petroglyphs dating from the Neolithic, which began about 6,000 to 6,500 years ago. Before this, stone art was dominated by animals. Now, however, not only the relationship between human and animal was reflected in the petroglyphs but also essential aspects of human existence. Animals no longer stood at the centre of the picture; the human being moved into that space. In Tsagaan Salaa three theme cycles can be seen: the hunt, human reproduction, and perhaps also a first step into the world of the supernatural. Neolithic hunters, usually large figures armed with a club or spear, were mostly portrayed frontally, as were birthing women. The third type of human portrayal is mysterious. It shows a bell-shaped figure with short legs, whose faceless head



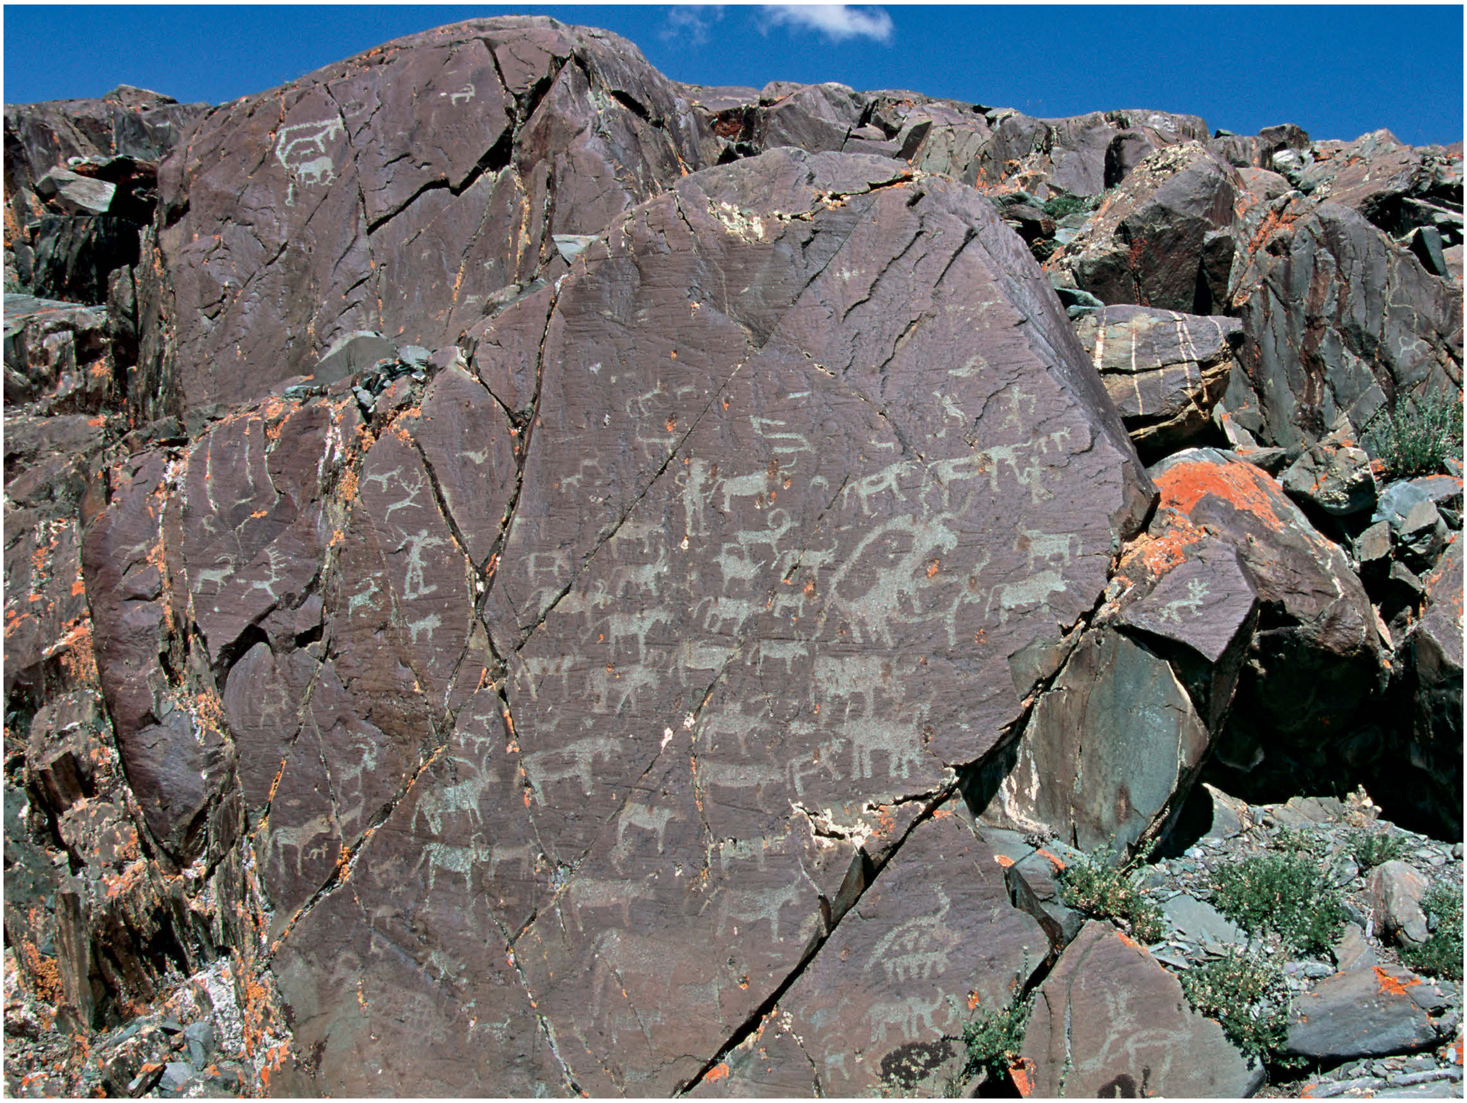


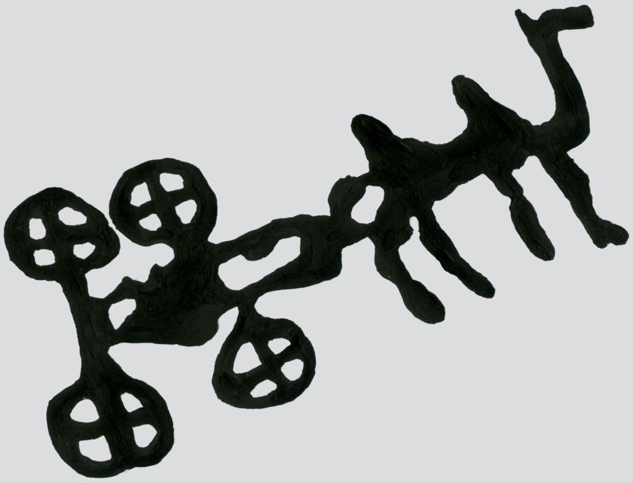
▲ (Top) Fight between two men with lances wearing mushroom-shaped headdresses, Tsagaan Salaa II, Bayan Ölgyi Aimag, western Mongolia, Bronze Age.

◥ (Above) Three archers attack a giant, Indian ink drawing of petroglyphs, Eshki Olmes, eastern Kazakhstan, Bronze Age.

◤ (Left) Bell-shaped figure with a mountain goat in its body, Baga Oigor I, Bayan Ölgyi Aimag, western Mongolia, Neolithic.

◀ (Opposite) Aurochs and horse, Tsagaan Salaa/Baga Oigor complex, Bayan Ölgyi Aimag, western Mongolia, Mesolithic.





wears a pair of horns, and inside the body there appears an infant or an animal like an ibex.

Four thousand six hundred years ago a cooling and drying trend that had begun about 800 years earlier in the north-eastern half of Central Asia accelerated, affecting western Mongolia and the Altai in particular and heralding the start of the Bronze Age. As a consequence of the climatic disruption, forests shrank and the landscape that had developed in the once-humid climate disappeared,

▲ **Cattle herd, Tsagaan Salaa II, Bayan Ölgyi Aimag, western Mongolia, Bronze Age.**

◀ **Two-axle wagon with spoked wheels pulled by a camel, Indian ink drawing of petroglyphs, Arpa Uzen in the Karatau Mountains, southern Kazakhstan, Bronze Age.**

leading to the loss of habitat for aurochs and large woodland animals. With the retreat of the forests, grasslands rapidly expanded. In the petroglyphs aurochs disappear and scenes in which bears, deer, wild yaks, horses and ibexes are hunted with flat bows and spears became common. In other places, such as Ak-Kainar or Tamgaly, southern Kazakhstan, the aurochs remained venerated for a longer time, as seen in petroglyphs of the aurochs with very long horns either strongly curved or directed forward. But in Tsagaan Salaa the animals are no longer portrayed statically but rather dynamically in motion. Sometimes the hunters wear a mushroom-shaped head covering and on the back of their hips something that looks like a ball-shaped tail.[10] This motif appears in the entire eastern half of Central Asia, in Outer and Inner Mongolia, southern Siberia and Kazakhstan, which suggests inter-regional cultural ties. That armed conflicts increased towards the end of the Bronze Age is suggested by battle scenes, such as at Eshki Olmes (eastern Kazakhstan), where two groups of bowmen shoot arrows at each other.[11] Another previously unknown battle scene is the attack of a giant by archers, as found at Eshki Olmes and Langar (Tajikistan).

A surprising, rarely seen motif from the Bronze Age shows a man on skis, pursuing a deer or an elk, which bears a round disc on its antlers.[12] This striking scene recalls a myth of the Evenks, formerly called the Tungus. According to this myth, the giant elk Kheglen stole the sun, impaled it on its horns, and carried it to the north. Eternal night and cold threatened humanity. In order to save it, the divine hero Ma'en pursued the elk and tore the sun away from it, returning it to the people at dawn. The Evenks believed that this cosmic drama played out every night. According to this, the engraved skier would represent Ma'en, who is pursuing Kheglen. In another version, an elk kidnaps the sun and carries it on its horns through the daylight sky until a bear catches it and returns the sun to the underworld. Thus night follows day.[13]

Toward the end of the Bronze Age, about 3,100 years ago, a rapid decrease in wild game forced a gradual transition from an economy based on hunting with little animal husbandry to a system of nomadic livestock-raising with large herds. An increase in precipitation, leading to the emergence of lush grazing lands, encouraged this development. The petroglyphs reflect this shift in lifestyle, with hunting scenes becoming markedly less common and portrayals of domesticated cattle herds correspondingly more widespread. Images of laden oxen and advancing herds led by herders on foot or on horseback and guarded by dogs suggest that stockbreeders varied their grazing areas. But they also had settled winter residences, as depicted in the stone engravings showing outlines of huts and stables with cattle standing inside them. In the petroglyphic world camels now appear as mounts or draught animals.[14] Scenes of

conflict between armed men, bearing lances and longbows, are also depicted. Such images show that fights arose over herds, grazing lands and winter camps, which indicates that the idea of property was well established in the herding society. Among hunter-gatherers, the idea of property was presumably not widespread and was dangerous for the community. Insofar as herder families or groups identified protected winter camps with secure access to water as 'their own' and would regularly return to them, they became owners of a particular territory, which they had to defend. Another new motif is wagons and carts. There are usually two-wheeled carts, pulled by horses, oxen, camels or even deer, but no scenes of conflict, as one finds in northern China. In the mountainous regions of western Mongolia wagons and carts were ineffectual for fighting; they had a ceremonial function only. Occasional engravings of spoked wheels could also represent sun symbols, as found in Tamgaly, Kazakhstan.

Also from the second half of the Bronze Age are elegantly portrayed deer and elk with strongly stylised horns and sometimes elongated noses that resemble birds' beaks. The same deer figures are found on the so-called deer stones of central Mongolia. The deer steles were one of the forerunners of the animal style widespread among the Saka and Scythians, which extended from the Altai to the Black Sea.[15] In another type of stylised portrayal of deer the antlers assume the form of a tree, becoming a metaphor for the tree of life. In this context the deer with the tree-like antlers also symbolises fertility. Its antlers, shed and regrown each year, stand for the cycle of life and death; they symbolise the reproduction of humans and animals as well as the fertility of nature.

In the next cultural epoch, the Iron Age, which began about 900 BC and coincided with the age of the warrior nomads, battle scenes and hunting scenes with the recurve bow predominate in Tsagaan Salaa. The final significant period of petroglyphic art, that of the Turkic empires, is represented only sparingly in Tsagaan Salaa; outstanding examples of it are found about 40 km south at Tsagaan Gol. Among these are images of heavily armoured horsemen and falcon hunters.

Chronological correlations between climatic and cultural developments in the example of the petroglyphs of Tsaagan Salaa and Baga Oigor, Mongolia [15a]

PERIOD	DATE	CLIMATE	FLORA	FAUNA	ECONOMY	IMAGES
Late Upper Palaeolithic	– 9700 BC	Cold, dry	Dry steppe	Mammoth, woolly rhinoceros, ostrich	Hunter-gatherer	Mammoth, woolly rhinoceros, ostrich
Mesolithic	9700–4500 BC	Warm, humid	Forests, marshy plains	Aurochs, elk, argali, bear, horse	Hunter-gatherer	Aurochs, elk, argali, bears, horses, Siberian ibexes
Neolithic	4500–2400 BC	Start of cooling trend	Forests, marshy plains	Bear, deer, yak, ibex, horse	Hunter-gatherer	Hunters with clubs, birthing women, bell-shaped figures
Bronze Age	2400–900 BC	Cold, dry	Forests disappear, steppe	Bear, deer, yak, ibex, horse, camel	Hunter, herder	Hunters with bows, fighting, carts, cattle herds, stables, camels, stylised deer
Iron Age	900 BC–550 AD	Moderately cold, humid	Grass steppe	Bear, deer, yak, ibex, horse, camel	Nomadic herder, warrior horsemen	Recurve bows, battle scenes, cattle herds
Turkic Empires	550–750 AD	Moderately cold and dry	Grass steppe	Bear, deer, yak, ibex, horse, camel	Nomadic herder, warrior horsemen	At Tsagaan Gol: armoured horsemen, mounted falconers

in rock painting. Petroglyphs are carved into rock, with lines engraved with the help of a hard instrument made of stone or metal. Pictures could also be embossed by carving away the rock around a picture, or scraped by grinding. In the direct method, the surface was chipped away with a single hard tool; in the indirect, a stone was hammered by a second hard instrument, enabling much more controlled and precise work. Finally, to be distinguished from these two types of rock art are geoglyphs, also found in Central Asia, enormous pictorial or geometric designs made on the ground itself. Geoglyphs are drawings or geometric designs made by either removing material from a dark upper layer of pebbles or soil to reveal a lighter layer beneath, or by placing dark or light stones on a contrasting background. The geoglyphs of Peru, Chile, Arizona and England belong to the former category; those of Tajikistan and Mongolia to the latter.

Among the oldest petroglyphs of Central Asia are those that include unambiguous portrayals of mammoths, woolly rhinoceroses or ostriches, such as the rock pictures of Oglakhty[16] and Tepsej[17] in southern Siberia, which unfortunately have been flooded by a reservoir, or the two western Mongolian sites at Aral Tolgoi near Khoton Nuur lake[18] and Tsagaan Salaa.[19]

The Tsagaan Salaa site was important, indeed sacred, for hundreds of generations, or else the rocks would not have been used for engraving for so long. A similar, much smaller petroglyph site is Arschaan Khod in the Khentii Mountains in north-eastern Mongolia. In contrast to Tsagaan Salaa, which has been known only since 1994, the region of Khentii played an important role in the consciousness of the Mongols, since Genghis Khan was born here in 1167 and buried in 1227 in a still unknown location. The pan-Mongol diet of 1206, which declared Genghis Khan ruler of all the Mongol peoples, took place just 34 km north of Arschaan Khod.[20] This place remained holy even after prehistoric times, as evidenced by medieval inscriptions in Old Mongolian, Chinese and Arabic, more recent Buddhist epigrams in Tibetan script, and numerous blue offering scarves, which are placed in cracks in the rock as votive offerings. Arschaan Khod is still an open-air sanctuary with the sky as its roof. The oldest petroglyphs date from the early Mesolithic, and portray no living things but rather symbols of indeterminate meaning.[21] They are circles with or without dots in the centre; circles with two legs; triangles, some with legs, which could represent humans; arrows; and many hoof prints. In the Bronze Age petroglyphs of ibexes and yaks were added. (In Mongolia there have been additional archaeological discoveries of hunters, fishermen and gatherers, who left behind their tools such as microliths, but there are no other petroglyphs from the Mesolithic.)[22]

3. Microliths

During the Mesolithic one of the most popular tools was the microlith, which first appeared in Central Asia in the Upper Palaeolithic. In the Mesolithic and subsequent Neolithic it was used in hunting and fishing, as well as for agriculture and woodworking. It was an implement made of flint or obsidian, up to 3 cm long and 1 cm wide, needle- or blade-shaped, which was chipped out of a stone and then finished. Before people recognised the potential uses for these flakes of stone, they were simply thrown away.

Fastened to lightweight projectiles such as spears and harpoons, they increased the piercing force of these weapons during hunting or fishing and acted as barbed hooks that stuck in the flesh of the victim. Affixed to thin wooden rods, pointed microliths became light and effective arrowheads. Somewhat broader microliths shaped like triangles could also be placed like teeth on a bowed shaft made of horn or a handgrip and attached with a resinous substance. Such implements could serve as sickles for cutting grass or grain or saws for cutting wood. Attached to shorter and somewhat thicker wooden rods than were used for arrows, they could be used to make a borer.

Microliths, were a brilliant addition to Stone Age technology that had many advantages. The source of the microliths, that is the stone from which they were cut, was available in nature and did not have to first be produced out of other materials, as did bronze, for instance. Additionally, a skilled stonecutter could produce microliths quickly and efficiently with no waste, and they could be used in a variety of ways. For this reason this ‘cheap mass-produced object’ was also used during the Bronze Age and even the Iron Age, especially in those regions that had to import the raw materials for the production of metal. There expensive metal arrowheads were used only in war, while hunters were satisfied with the cheaper microlith arrows. For this reason microliths, like flint arrowheads, are poor sources for the dating of archaeological sites.

IV

The Economic Revolution of the Neolithic

The camel is the constant companion of the nomad and often the source of his prosperity. Besides serving as a beast of burden and for riding, the camel supplies wool and milk and the hair is spun into ropes.

LT. COLONEL NICOLAI MICHAILOVITSCH PRZHEVALSKY, MONGOLIA, 1876[1]

1. The primary and secondary Neolithic revolutions

In the quotation above the Russian explorer of Central Asia Przhevalsky summed up the main principle of the two-part Neolithic revolution: in the first revolution, which was really a millennia-long evolution beginning in the tenth millennium BC, plant and animal sustenance was no longer only gathered and hunted but rather farmed and raised.[2] This innovation from the Near East marks the advent of farming and animal husbandry and simultaneously of the Neolithic.[3] Starting in the seventh millennium BC a few of these technologies also appeared in the warmer regions of the southern half of Central Asia, such as southern Turkmenistan. On the fertile western edge of Central Asia, in modern Ukraine, the encounter between hunter-gatherer cultures and agricultural-herding societies took place a millennium later.

The second Neolithic revolution, which began later, in the fifth millennium BC, is related to the use of animals. Instead of just consuming domesticated animals such as cattle, sheep, goats, horses and camels and using the inedible remains such as skins, bones, and sinews, people gradually began to use the animals in varied, combined, and repeatable ways without having to kill them. They were used as pack-animals for people and goods as well as draught animals for sleds, carts and ploughs; they provided hair for wool, felt and knitting, as well as milk and, in the case of horses, blood. For meat it was sufficient to slaughter just a fraction of the herd. Thanks to this varied and sustainable use of animals the people of the northern half of Central Asia now had the means of meeting their basic needs for food, clothing and shelter, as well as transportation for themselves and their goods, with a herding economy. The second Neolithic revolution was the genesis of mobile herding; now it was possible to use as grazing land the grass steppes that could not be used for planting and supported little wild game. The Neolithic revolutions changed the course of history. It enabled increased productivity and trade, giving rise to rapid population growth and the development of social hierarchies, but it also led indirectly to overgrazing and depletion of the soil and forests. However, those who lived in regions lacking the necessary conditions for both agriculture and nomadic herding, and nevertheless did not emigrate, remained part of a hunter-gatherer cultures even in the Neolithic, which we refer to as 'archaic Neolithic'.

As a consequence of the varied topography of Central Asia and its differing climates, all three developments – the transition to farming or to livestock breeding or the continuation of an archaic Neolithic – occurred in parallel. In the eastern half of Central Asia the boundary between the southern cultural sphere with agrarian and proto-urban cultures and the northern sphere of settled or semi-nomadic herders ran at first along the Amu Darya River. The proto-urban culture of Sarazm (fourth–second millennia BC) north of the Amu Darya was an exception. Towards the end of the second millennium BC this cultural boundary shifted north to the Syr Darya. In the geographic centre of eastern Central Asia, however, there existed an oasis of the archaic Neolithic with two noteworthy cultures: Hissar and Kelteminar.

2. Hunters and gatherers in the mountains and along the waterways of inner Central Asia

Toward the end of the seventh millennium BC, between the Amu Darya River on the southern border of Tajikistan and Lake Issyk Kul in north-western Kyrgyzstan, the archaic Neolithic culture of **Hissar** arose, with its geographic centre in south-western Tajikistan. In the then-forested mountains and their foothills communities of hunters, fishermen and gatherers, who used archaic pebble tools and hand axes, lived along the streams and rivers. The absence of microliths and the sparse discoveries of arrowheads underscore the archaic character of Hissar until the fourth millennium BC.[4] Beginning at this time, thanks to influences from the south-west, people on the peripheries and in the more accessible valleys gained knowledge of the domestication of goats and sheep, rudimentary farming and crude ceramics. The hand-crafted vessels, which were decorated with textile prints, did not have flat bases but rather came to a point, as people stuck them in the ground. In remote mountain regions of the upper Vakhsh valley an archaic form of the Hissar culture continued until the end of the second millennium BC, a kind of Stone Age enclave in an established culture of bronze.[5]

North-west of the mountain region of the Hissar culture, east of the Caspian Sea, extends the Turan Depression, in whose central and eastern part the culture of **Kelteminar** (*ca.* 5500–2400 BC) developed south of the Aral Sea. In light of the absence of sickles with flint blades and the many discoveries of arrowheads, as well as harpoons and net sinkers, it may be concluded that the people practised hardly any agriculture and instead lived by hunting and fishing; they also used slingshots as hunting weapons. The hunted

A Mongol captures a young horse with a catching loop, central Mongolia.

game consisted of gazelles, wild donkeys, boars, red deer, and presumably also wild horses. These people lived in the lower catchment area of the Zerafshan, whose name means 'sprayer of gold', and Amu Darya rivers.

At that time, the Amu Darya did not empty into the Aral Sea, as it did until the 1970s, but rather most of the water flowed into the Caspian Sea via the Sarykamysh Lake and formed the erstwhile Uzboy River, whose 700-km-long bed is today dry and in parts covered with sand, apart from a few long, shallow basins that appear in early summer with the snowmelt. Since the end of the last ice age the waters of the Amu Darya have repeatedly chosen this westward-tending riverbed and brought the Uzboy back to life, as shown by archaeological discoveries from times beginning with the Kelteminar culture in the sixth millennium BC. At that time the desolate Kara Kum Desert bordering on the Uzboy changed into a habitable steppe landscape with reeds and small alluvial forests.[6] The name 'Kelteminar' was coined by the Soviet archaeologist Sergei Tolstov (1907–1976), who was the first to explore the region of the Uzboy and that of Choresm, just to the north.[7] After the collapse of the Kelteminar culture in the second half of the third millennium BC the banks of the Uzboy were resettled and the river used as a transportation route in the mid-first millennium BC under the Iranian Achaemenids and the subsequent Parthians.[8] Parallel to these changes in the riverbed, the area of the Aral Sea also oscillated, since with the loss of the Amu Darya it had only the Syr Darya as a significant feeder river. In the sixteenth century, for instance, the Aral Sea contracted particularly significantly, and life along the Uzboy flourished.

When the English explorer Anthony Jenkinson (1529–1610), who travelled to Central Asia on behalf of the Muscovy Company, camped on Sarykamysh Lake in 1558, he noted that the Uzboy was being depleted by irrigation and no longer reached the Caspian Sea. He also predicted that the fertile landscape could soon become desert if water failed to return to the Uzboy: 'The water that serveth all that country is drawn by ditches out of the river Oxus [the Uzboy], unto the great destruction of the said river, for which cause it falleth not into the Caspian Sea as it hath done in times past, and in short time all that land is like to be destroyed, and to become a wilderness for want of water, when the river of Oxus [its western branch, the Uzboy] shall fail.'[9] The fertile Uzboy valley did in fact dry up abruptly at the start of the eighteenth century, when the Amu Darya returned to its northern course, and the Turkmen inhabitants abandoned their land.

A Mongol nomad woman spins yarn out of sheep's wool. She sits in a yurt on a felt carpet with a pattern of highly abstracted heads of horned animals. Nomads' camp near Khar Nuur Lake, Bayan Ölgyi Aimag, western Mongolia.

The people of the Kelteminar culture were mostly sedentary and lived, presumably as extended families, in spacious, oval-shaped huts with an area of 270 to 300 m^2 and covered by a cane roof. The hearths for individual families were found on the edges of the huts, while the one in the middle may have served a fire cult. Near their dwelling the people raised a few cattle, and they had dogs. Their pottery consisted of round-bottomed, hemispheric vessels as well as some that came to a point so they could be stuck in the ground. They were decorated with wavy or zigzag lines as well as triangular or rhomboid patterns, either painted or engraved with a stylus before firing.[10] Towards the end of the Kelteminar culture, around 2500 BC, its representatives came into contact with copper metallurgy and with agriculture, which they used to a limited degree, as can be determined from the small number of copper artefacts and a few stone sickles. They remained, however, largely a Neolithic society. Kelteminar was followed by the culture of Zamanbaba.

South of the Kelteminar culture there was in the sixth and fifth millennia BC a related culture, as can be seen in the archaeological finds in the caves of Jebel and Dam Dam Chasma II south-east of the Caspian Sea. The inhabitants hunted and fished and also raised domesticated sheep and goats. These animals appear not to have descended from the local wild sheep and goats, however, but rather from those of western Asia, Syria, or Mesopotamia – indicating a cultural transfer from the west.[11]

3. Agriculture and early settlements in southern Central Asia

On the Eurasian continent the cradles of stockbreeding and farming lie in the Fertile Crescent, a relatively rainy region in the Near East that extends in a sickle shape north of the Syrian Desert from the Persian Gulf in the east to Gaza in the west.[12] Here about 12,000 to 13,000 years ago people began to keep goats and sheep as domestic animals as well as to cultivate, irrigate, and store crops such as barley, wheat, lentils and peas. Two millennia later the raising of cattle and pigs began. As the next step of the second Neolithic revolution, additional uses were found for animals, such as the production of wool and their use for transportation and traction.

Over the course of millennia the introduction of these new methods of production in the Fertile Crescent yielded consequences of global significance. Settlements with production surpluses arose, as did cities with high population density, division of labour and centralised administration, with hierarchies and the attendant worldviews, as well as prestigious architecture. At the same time the ideas of private and state property emerged, bound up with the need to enforce and defend this property. Thanks to the division of labour, long-distance trade could also expand, and the anonymous and silent communication form of writing arose, presumably from the need to keep records of goods.

Towards the end of the eighth millennium BC the 'Neolithic idea' of the cultivation of wheat and barley as well as the raising of sheep and goats began to spread beyond the Fertile Crescent, first to the south-east and then, presumably in step with local climatic changes, into the Nile Valley, to Anatolia and south-eastern Europe and farther to Central and Western Europe. In the east migrants from western Asia reached the western part of the fertile Indus Valley in Baluchistan in western Pakistan around 7000 BC, where they encountered indigenous hunters and fishermen. From this grew the settlement of **Mehrgarh**, one of the first agrarian settlements of South Asia, which consisted of two dozen four-room mud brick houses and offered shelter to over 100 people. At burials goats were sacrificed and the dead were buried with grave goods such as tools, pendants, necklaces, bracelets and anklets, under houses or in the inner courtyard; seashells and lapis lazuli indicated trade with coastal regions and northern Afghanistan, where agriculture gained a limited foothold at Aq Kupruk around 6250 BC. Farmers not only raised sheep and goats; they also domesticated the local zebu cattle, which they used for ploughing. They kept clay statues of animals and seated people, a custom also found in the earliest agrarian settlement of Central Asia at Jeitun.[13]

In the seventh millennium BC the new technologies reached the south of Central Asia, first the southern coast of the Caspian Sea near the Gorgan valley and then the plains at the northern foot of the Kopet Dag Mountains in southern Turkmenistan. The systematic excavation begun by the Soviet archaeologist Vadim Masson in the 1950s has to date yielded some 20 farming settlements, of which **Jeitun** (6500–4500 BC) was the largest. Insofar as the culture of Jeitun appeared suddenly and without predecessors and no traces of wild wheat or barley have been found, it is likely that it emerged thanks to migrants from western Asia, who also brought with them domesticated sheep and goats. Since a dry desert climate with little precipitation prevailed in the northern foothills of the Kopet Dag Mountains, all the settlements lay in the deltas of rivers flowing out of the mountains. Without simple systems of irrigation no agriculture could be undertaken on the dry land.

An archer hunts an ibex, Tsagaan Salaa/Baga Oigor complex, Bayan Ölgyi Aimag, western Mongolia, Bronze Age.

The oases thus relied on the mountains retaining sufficient water in the form of snow and ice and rivers bringing the spring snowmelt to the plains, where the farmers stored it. In the absence of precipitation in the oases, life there was directly dependent on precipitation in the mountains.

The settlements consisted of 30 to 35 standardised mud brick houses with a single rectangular room of about 25 m^2. In these small, single-family houses, the hearth was found to the right of the entrance. Since the houses were freestanding and the villages had only low surrounding walls, the inhabitants at the time must have felt little threatened, presumably thanks to the very low population density. Noteworthy was the discovery in the centre of the 7,500-year-old settlement of Pessejik Tepe of a house more than twice as large as the others, where no implements of daily life were found.

Godon Go River, Bayan Ölgyi Aimag, western Mongolia. This region witnessed in the 3rd millennium BC the shift from a hunter-gatherer society into one of semi-nomadic stockbreeders.

On one side of the room, whose floor was covered by a thin layer of lime, there was a large fireplace and across from it a leopard was painted on a whitewashed wall in red and black pigment. This is the oldest wall painting of Central Asia, and it shows similarities to the wall paintings of Catal Hüyük in the Anatolian highland.[14] This room presumably served as a public cultic site, perhaps for a fire cult, and was thus one of the earliest cultic sites of Central Asia.

As in Mehrgarh, archaeologists found small clay statues of women and animals, which perhaps served as amulets, as well as ceramics decorated with red linear patters on a yellow background. Finds here included more than 500 sickles made of bone and antlers, which were trimmed with sharp flint blades, and many hand grinding stones. These objects underscore the significance of the cultivation of wheat and barley. In addition, the hunting of gazelles, wild sheep and wild asses with slingshots and spears continued to play an important role. Although the settlements were home to 200 to 350 people each, they were organised decentrally. Each family produced its own tools and made animal skins into clothing for themselves; there was not yet any task-specific division of labour. In Jeitun the dead were buried, as in Mehrgarh, within the villages, after they had been richly sprinkled with ochre – a custom that runs as a leitmotif through the prehistory of Central Asia.[15] In summary, the culture of Jeitun, lasting till 4500 BC, was a Central Asian outpost of the Near Eastern Neolithic, which laid the foundation for the coming cultures in southern Central Asia.[16] Although the settlements showed a standardised and thus planned architecture, which included public cultic sites or gathering spaces, the culture of Jeitun can still not be described as proto-urban, since the criteria of high population density, production surplus enabling trade, and an administrative structure remained unmet.

4. The northern steppes of Central Asia – meeting point of hunters and herders with farmers

In Mongolia economies developed differently according to the prevailing climate type. About 7000 years ago, in the humid half of the land east of the modern capital Ulaan Baatar arose settlements of farmers who grew millet, having adopted the art of farming from China.[17] The dead, buried with their feet bound together, were sprinkled with ochre and buried in a crouching position with bull skulls including horns buried in adjacent pits, which could indicate veneration of the bull as a fertility symbol. The settlements had stationary shelters, which were half-sunk into the ground and whose entrance was found in a roof that reached to the ground. By contrast, in the drier, western half of the region only seasonal shelters of hunters, fishermen, and gatherers have been found. The people living in these seasonal shelters also buried their dead in a crouching position, but covered the grave with a roughly cone-shaped, low pile of stones, so that these late Neolithic or early Chalcolithic (Copper Stone Age) kurgans[18] of western Mongolia are among the earliest burial mounds of Eurasia. A further difference between the two halves of the region concerns ethnicity, since the farmers in the east were Palaeo-Mongols, while the hunters and fishermen in the west were Europids.[19] This ethnic boundary between the Europid and Mongolid peoples began to shift slowly to the west only in the second half of the third millennium BC.

In the forest steppes of southern Siberia west of Lake Baikal lived other hunters and fishermen who sprinkled their dead with ochre.[20] Here followed various cultures with very similar burial practices, which often overlapped in time: the group called **Kitoi**, which began around 5500 BC was superseded in 4250 BC by the **Isakovo** and **Serovo**, who were followed around 3250 by the **Glazkovo**, who also erected burial mounds and lasted till 2100 BC. As artworks these people left behind bone carvings and petroglyphs portraying elk and deer as well as anthropomorphic figures.[21] South-west of the Baikal region, in northern Kazakhstan there were also hunting and fishing communities of the **Atbasar** and **Makhandzhar** cultures (5500–3000 BC). These people had highly developed stone tools and hunted wild horses and goats, though they raised neither animal.[22] That the economic systems of the time were similar from western Mongolia almost to the Urals can be explained by the fact that the same climatic conditions prevailed across the area and no technological influences infiltrated from outside.

Things unfolded differently in western Central Asia. While in south-eastern Central Asia a relatively linear development from a hunter-gatherer economy to an agrarian one may be observed, in the north-west economic and cultural change occurred in a variable way as the boundary between hunters and herders shifted back and forth with the rhythm of climate fluctuations and human-caused changes in regional ecosystems. About 8,500 years ago knowledge of farming and animal husbandry expanded from western Anatolia to Greece and Macedonia, after which, around 6200 BC, pioneers began to spread this knowledge northward, both along the western coast of the Black Sea and into the Pannonian Plain. These emigrants did not speak Indo-European languages but rather an idiom derived from a very ancient Anatolian language.[23] From this arose the Körös-Criä Culture in Hungary and Romania, whose farmers cultivated millet, barley and peas and raised cattle, pigs and sheep. The farmers who moved farther north-east encountered around 5700 BC in the south-western part of today's Ukraine the **Bug-Dniester Culture** (6500–5200 BC) from the earliest Neolithic.[24] After an earlier, pre-ceramic period, these hunters and fishermen adopted the pottery of the **Elshanka Culture** (7000–6000 BC) of north-western Central Asia. The very early Neolithic community of Elshanka lived in the middle Volga region in the area around the modern city of Samara and had mastered the art of pottery as early as 6700 BC.[25] Representatives of the Bug-Dniester culture presumably spoke an idiom derived from the large language family out of which proto-Indo-European, called PIE, crystallised around 4500 BC.[26]

For half a millennium the Dniester River formed the boundary between two different economic structures: sedentary farmers in the west and hunters and fishermen in the east, with the latter, in a process of 'Neolithicising', adopting over time the raising of pigs and cattle, as well as some cultivation of wheat, millet and barley.[27] After 5200 BC the Neolithic and later the Chalcolithic Age culture of Cucuteni–Tripolye,[28] whose origin lay west of the Dniester, advanced eastward and expanded to the Dnieper River near the modern city of Kiev. With this the boundary between agrarian and hunting economies shifted about 300 km to the north-east.[29]

East of the Dnieper lived hunters, fishermen and gatherers of the very early Neolithic **Dnieper–Donets Culture I** (5700–5200 BC), who still used rough-hewn stone axes and were not familiar with the finely polished axes of the contemporaneous Bug–Dniester Culture. They buried their dead in a supine position and sprinkled them with red ochre. Around 5200 BC the people east of the Dnieper began to domesticate cattle, sheep and goats, as well as to use polished axes, thus founding the Neolithic **Dnieper–Donets Culture II** (5200–4200 BC).[30] They lived in simple huts with roofs made of birch bark but carried out complex burial rites. Analyses of skulls and skeletons indicate that members of the Dnieper–Donets Culture II were strong, broad-faced Europids, in contrast to the farmers of the Cucuteni–Tripolye Culture, who corresponded to a gracile, Mediterranean type.[31]

The dead of the Dnieper–Donets Culture II were often laid first in an open charnel-house, after which the bones were stripped of their remaining flesh, covered with ochre, and placed in communal graves. As can be inferred from various rich grave furnishings, this society of early Central Asian stockbreeders was hierarchical, with a chief at the top of the hierarchy. Chiefs were buried with thousands of pearls, crystal, copper and gold jewellery, carved boars' teeth and stone maces. While the copper ornaments were imported from the Balkans, the polished maces, whose heads were sometimes formed into the shape of a horse's head, were local symbols of authority. They spread quickly east as far as the Urals and west as far as the Danube, where they found acceptance in farming cultures. The symbol of the horse clearly served as a powerful status symbol in the herding societies of the fifth millennium, elevating the chief above the rest of the people. The opulent burials were accompanied by sacrifices of cattle, horses, sheep and goats, whose meat was distributed to the participants. Thus more than 6000 years ago there emerged a burial culture which became, with modifications, the norm for the highest classes on the steppes of Central Asia into the Middle Ages.[32]

In summary we can see that the Neolithic revolution led to an agrarian economy beyond the western boundary of Central Asia, while in western Central Asia itself it took the form of adoption of technologies of animal husbandry. In the grass steppe regions this had the unrivalled advantage that cattle and sheep were able to use grass that was inedible for humans, and thus opened to them the possibility of surviving on the grass steppe without having to hunt. However, livestock are vulnerable to bad weather and can easily be stolen, which led to conflicts with thieves or foreign, predatory groups. The volatility inherent in the raising of livestock, which increased with growing mobility, forced herders to stand in constant readiness to fight, and clans to cooperate more closely.

Hence, west of the Dnieper people mostly engaged in farming; to the east, livestock-raising was supplemented by hunting, often connected with particular burial rites. This contrast marked the history of Eurasia until the end of the Middle Ages. Within the Central Asian steppe there was likewise an economic boundary, with stockbreeding well established west of the Urals and ignored for more than a millennium east of them.

V

The Chalcolithic and the Early Bronze Age

The only god they [the Massagetae] worship is the sun, to which they sacrifice horses: the idea behind this is to offer the swiftest of mortal creatures to the swiftest of the gods.

HERODOTUS, *THE HISTORIES*[1]

1. The division of early history and the beginnings of metallurgy

The basic division of prehistoric cultural history according to the raw material used to make tools and weapons traces back to the French scholar Nicholas Mahudel (1704–1747), who in 1734 published *The Three Successive Ages of Stone, Bronze, and Iron*. More than 80 years later the Danish museum curator Christian Jürgensen Thomsen (1788–1865) implemented this concretely when he reclassified the collections of the future National Museum of Denmark. In the exhibition, which opened in 1819, he combined the objects in three large halls: in the first hall of the Stone Age, all stone objects came from a grave or an environment completely lacking metal objects. The second hall, of the Bronze Age, featured exclusively bronze objects from archaeological sites where there were no iron objects, and the Iron Age hall had only iron objects. The exhibition was a tremendous success and the underlying principle was put into place in other museums and collections.[2] Thomsen's classification was based on the belief that earlier humans had undergone a technological development that was reflected in their tools and weapons. In this the new, more powerful tools in each case superseded the older ones, and human prehistory proceeded in steps from simpler to more advanced technologies and products. Thus Thomsen's classification by technologies of production gave archaeology a way to work according to the principles of stratigraphy and wrested human prehistory away from the authority of mythology and religion by offering it a scientific foundation.

Later Thomsen's schema was expanded to include the Chalcolithic, the Copper Stone Age, as a fourth age, and the Stone Age was divided into three parts, so that the chronology consisted of Palaeolithic, Mesolithic, Neolithic, Chalcolithic, Bronze Age and Iron Age. Such a model is, of course, subject to certain limitations. In practice it was quickly shown that the transition from one period to the next was not abrupt but rather took place over centuries or even millennia. As has already been discussed, in certain steppe cultures simple tools and arrowheads made of stone remained in use long after the introduction of bronze or even iron. Such a division according to the raw materials of tools and weapons is also not automatically meaningful for the entire developmental process of a culture, as shown by, for instance, the classical epoch of the Maya of Central America (200–900 AD), who lived in the Stone Age but had a sophisticated and precise astronomical calendar. Finally, the model cannot be applied worldwide, as certain cultures outside the Eurasian continent had no access to particular raw materials, such as copper. Nevertheless, for the history of Central Asia this scheme remains a generally recognised aid to orientation.[3]

In Central Asia the Chalcolithic followed the Late Stone Age. The name, derived from the Greek, means *khalkos*, 'copper', and *lithos*, 'stone', thus 'Copper Stone Age', which preceded the Bronze Age. In this period there appeared beside the dominant stone tools the first copper objects, such as first ornamental plates and soon thereafter simple tools.[4] The Copper Stone Age is sometimes hard to distinguish from the early Bronze Age, however, because at an early stage people began to blend additional arsenic with the small amount of naturally occurring arsenic in copper ore to harden it. The earliest copper ornaments appeared sporadically in Neolithic contexts of western Asia and Anatolia in the eighth and seventh millennia BC; true production, which included the forging and casting of everyday objects, began first in the fifth millennium BC, centred in south-eastern Europe, the southern Caucasus and southern Turkmenistan. In south-eastern Europe there arose the **Balkano–Carpathian Metallurgical Province** (*ca.* 4800–3700 BC), producing mostly pure copper objects, which extended from Serbia and Romania to the western part of the Ukraine and corresponded more or less to the region of the agrarian culture of Cucuteni–Tripolye.[5] The new material was not particularly suitable for the production of everyday objects, however, as copper bends even when cold and copper blades rapidly become dull. Thus attempts were soon made to improve the metal by alloying. This transitional period to the Bronze Age, in which artificial alloying played an important role, lasted several centuries. Following on the Balkano–Carpathian Metallurgical Province was the **Circumpontic Metallurgical Province**[6] (3300–1900 BC), which encompassed the Balkans, the Carpathians, the Caucasus, Asia Minor, the northern coast of the Black Sea and the western Central Asian steppes as far as the Urals. This 'province', which really represented a network of bronze-producing centres, played a leading role in the transmission of knowledge about metallurgy to the east as far as China.[7] A few of the richest copper mines were found in the Urals at the junction between western and eastern Central Asia, including the unique 500-km^2 Kargaly complex. The shafts, which ran as deep as 42 m under the surface of the earth, were hundreds of kilometres long, and it has been estimated that about 120 million m^3 of rock and marl were dug out with pickaxes and shovels, yielding 2 to 5 million tons of copper ore.[8] At the time the Urals formed a kind of export boundary to the east, as for a thousand years copper ore went only westwards, to the workshops on the Volga and the Don.

A hunter in the Russian Altai.

The first bronze alloy was presumably invented between 3750 and 3500 BC by the stockbreeding culture of Maikop on the south-western border of Central Asia.[9] This culture, which existed from 3750 to 3000 BC, extended into the northern Caucasus and had its centre in the valley of the Kuban River. Although the Kuban region lies just outside the geographic borders of Central Asia, its culture belongs to the cultural sphere of the Central Asian steppe. The Caucasus and especially the Kuban region met the requirements for early production of bronze, as they were rich in metal ores like copper, lead, silver and gold. Because tin was not available in the Caucasus, however, the early, high-quality bronze of Maikop consisted of a copper-arsenic alloy and later of copper and lead. Arsenic bronze is harder in a cold state than pure copper, easier to cast, and has a lighter colour. Because of its geographic location, the Caucasus formed a bridge between Mesopotamia in the south and the Central Asian steppe in the north, so the Maikop Culture exported its bronze in both directions as finished products or as bars. Soon the specialised forges of Maikop became the chief bronze producers for north-western Central Asia up to the Urals and had a decided influence on local workshops. Arsenic bronze also spread quickly west around 3250 BC as far as the Danube delta, but it only reached Central and Western Europe a millennium later.[10] Maikop also played a leading role with regard to another very significant invention: its people were the first in Central Asia to use heavy, four-wheeled wagons pulled by oxen.[11]

The superior tin bronze was developed not in the south-west of Central Asia like arsenic bronze, but rather in the north-east, in the forest steppes of the Urals and the Altai. Here lived bellicose, semi-nomadic herders, who began around 2000 BC to produce outstanding and superior weapons out of tin bronze, whose development is described as the phenomenon of Seima-Turbino.[12] This bronze was not only significantly harder and stronger than copper; it also had a bright gloss. The new technology was based on the enormous supply of tin in eastern Kazakhstan and the nearly inexhaustible reserves of wood for processing.[13] Thus these nomadic herders from the Altai broke the monopoly of the Caucasian arsenic bronze and began exporting new products and technologies to the west. Two millennia before the Silk Roads the tin and tin bronze roads emerged, stretching from the Russian–Mongolian Altai and eastern Kazakhstan to Eastern Europe. The early bronze technology based on arsenic or lead had spread from west to east, but the superior type of bronze using tin – whether in finished products or in bars – moved from east to west.

Tin bronze was also superior to unalloyed iron. In Iraq as early as the third millennium BC iron blades were fashioned out of meteorites, but because of their lack of purity they were often softer than comparable bronze blades.[14] Only when it became possible to produce iron alloys with small amounts of carbon – that is, steel – did iron become useful in weapons and tools. The blacksmith had to be aware that the red-hot steel needed to be plunged into cold water, in contrast to molten bronze, which requires slow cooling. The increasingly acute shortage of tin certainly also contributed to the triumph of iron.[15]

2. An initial proto-urban development

Towards the end of the sixth or beginning of the fifth millennium BC, the people of the Neolithic Jeitun Culture began to spread to the south-east, presumably under pressure from a rapidly growing population. They settled in the narrow, 350-km-long fertile band in the northern foothills of the Kopet Dag Mountains, where the many rivers that flow north from the Kopet Dag into the Kara Kum Desert enabled farming and the creation of new settlements.

In the early twentieth century Raphael Pumpelly conducted pioneering excavations at **Anau** in southern Turkmenistan; later excavations confirmed most of his observations and many of his conclusions. At the northern Tepe of Anau it is possible to observe the transition from small, single-room dwellings to multi-room structures, with the organisation of the buildings corresponding to a typical agrarian settlement of the Chalcolithic. It consisted of several groups of closely standing building complexes with ten to 15 rooms, which had their own hearths. Each complex had a shared inner courtyard with children's graves beneath it and a large storehouse for agricultural products. The multi-family complex with communal facilities replaced the earlier single-family house of Jeitun. Presumably the families were related and formed a clan. Between these groups of buildings, narrow streets ran through the settlement, which also had an especially grand building with plaster walls and floors. This building presumably served the entire population for common ritual purposes.

Particularly striking in Anau North are the buildings with a circular floor plan, since these not only served as storerooms but were also in some cases clearly inhabited and may have been used as observation towers. They seem to anticipate the somewhat later defence towers of the settlements of Yalangach and Mullali Tepe 200 km to the east (after 3500 BC), where mud brick walls connected the towers to one another and thus fortified the site.

The pioneer Raphael Pumpelly in Anau

The honour of discovering this proto-urban culture went to the American Raphael Pumpelly (1837–1923). Pumpelly was a geologist and mineralogist who undertook large surveys in Japan, China, and, in 1864–65, the Gobi Desert, after which he was named the first professor of mining science at Harvard University. After his retirement Pumpelly decided to work as an archaeologist in Central Asia, with a goal of making a scientific study of the connections between geological conditions, climatic fluctuations and the development of early civilisations. He wanted to test the hypothesis that climatic changes represented a decisive factor in geographic shifts of entire settlements and migrations. Thanks to his multidisciplinary approach Pumpelly was a revolutionary who not only assembled an interdisciplinary team but also, because of his geological expertise, understood the great importance of carefully documenting each stratigraphic layer. He was one of the first archaeologists to use stratigraphic surveys to determine the age of finds and to establish complex relationships.

At age 65 Pumpelly travelled to the site of Anau in the northern Kopet Dag region of Turkmenistan, 8 km south-east of the modern capital Ashgabat. During an earlier trip he had been intrigued by two free-standing mounds (known as ‘Tepe’ in Central Asia) here. One was 12 m tall and the other 15 m; to the east stood a third mound, inhabited until about 1850. When he investigated a deep test trench in the northern Tepe, which had been excavated by the Russian general Komarov and his soldiers in a quest for treasure in 1886, Pumpelly counted 20 layers of settlement lying one atop the other. He recognised that this was a very old settlement that, over the course of time, had been rebuilt again and again over the naturally eroded ruins of an earlier layer. In 1904 he returned to Anau in the company of his wife Eliza, the economic geographer Ellsworth Huntington and the archaeologists Langdon Warner and Hubert Schmidt and began excavations.[16]

Based on his discoveries Pumpelly concluded that the northern Tepe represented the older of the two settlements. He found simple, rectangular mud brick houses, made out of air-dried bricks of a standard size. Under their floors were buried children in the foetal position, a custom that can be seen in many later settlements of southern Turkmenistan. In the lowest, earliest layer of the northern mound graves of adults were also found under the floors of some residences, and in these cases the room above the graves was no longer used.[17] Pumpelly also found pottery made by hand and painted with geometric patterns, spindle whorls and a few copper needles. There were no metal weapons, only stone maces and slingshots. Clearly the people were farmers who cultivated barley and wheat and also raised sheep, goats, pigs and dogs. Pumpelly believed the climate at that time was considerably more humid than today.

This northern settlement, attributed to the early Chalcolithic, was gradually abandoned after more than 1000 years, and a new settlement was built about 800 m to the south, where public and ritual spaces played a more important role than they had in the northern mound. Here Pumpelly also uncovered children’s graves under the floors of the houses, from which he concluded that the inhabitants of the southern, Chalcolithic settlement belonged to the same people as those of the north. New, however, were vessels crafted on a potter’s wheel, bronze sickles, daggers, spear points and arrowheads, as well as the occasional weapon made of arsenic bronze. In the lower layers there were also many small terra cotta figurines of bulls and women with broad thighs, the latter often near the children’s graves. Finally there came to light a cube-shaped seal, on whose sides were carved a lion, a man and a griffin in the form of a winged lion with the head of a bird. The upper 12 layers, however, belonged to another, Iron Age culture, whose representatives resettled the southern mound after it had been abandoned for a couple of centuries. When the nearby meandering river shifted its course to the east, the people followed and established a new settlement at the eastern mound.[18]

Pumpelly divided the two excavated mounds into four cultural periods, which were later, omitting the post-Bronze Age layers, organised into Anau I A, I B, II A, and II B. His original dating of Anau I as about 10,000 years old proved to be too early, but his second, of 6,500 years, was correct and has been confirmed by carbon-14 dating.

In this sense the *ca.* 6,000-year-old round towers of Anau North could represent prototypes of the typical fortified desert oasis architecture of the Bronze Age in south-eastern Central Asia.

The air-dried bricks used for house-building in Anau North were vulnerable to the rare rainfall and had a limited maximum life of 30 to 35 years. If a building fell into disrepair, the inhabitants did not patch it up but rather tore down the entire house or even a whole complex and rebuilt on the 30- to 40-cm layer of rubble. Since houses and building complexes were built and rebuilt over generations on the same site, long-term land tenure can be hypothesised. Even after large-scale destruction, for example by conflicts or earthquakes, and short-term abandonment of the mound, the farmers did not leave the site of their settlement but rather razed the ruins and rebuilt the village. This meant that no fewer than 20 different architectural layers were found on top of each other at Anau North.[19] Presumably the large cultic space, which was rebuilt many times, formed a geographic anchor for the location of the settlement.

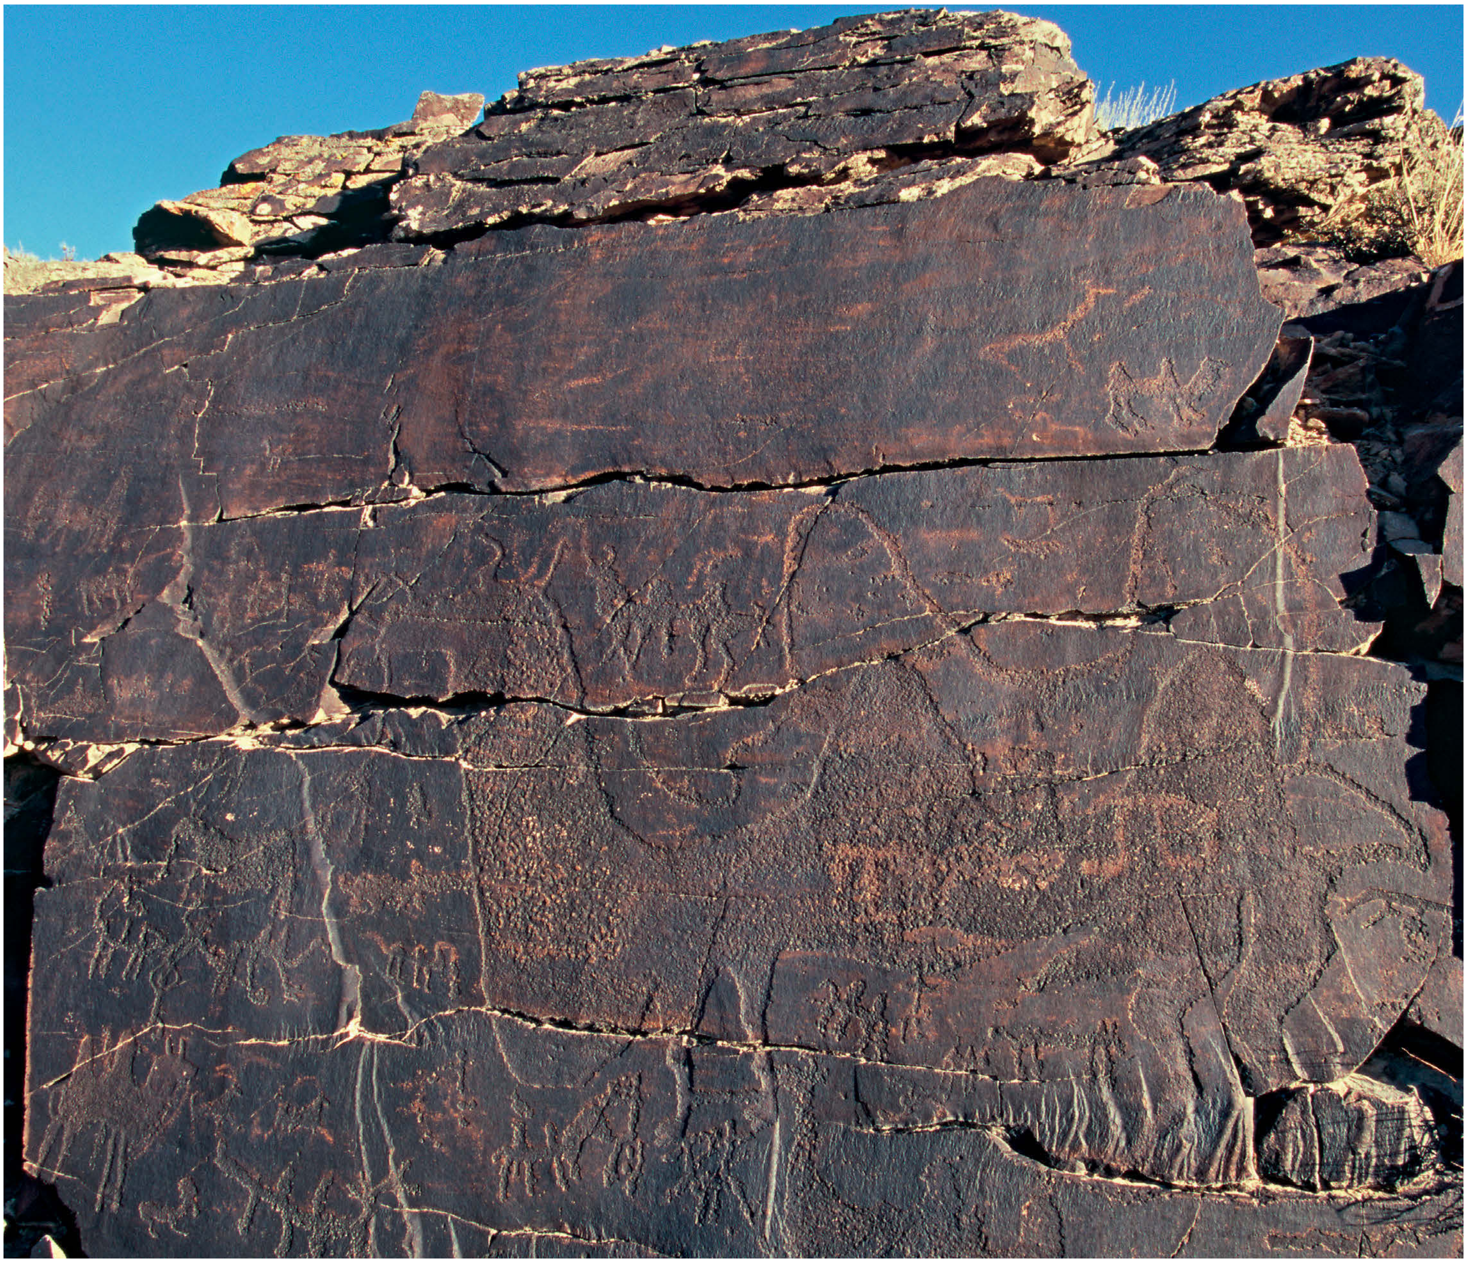
In contrast to the farmers of Jeitun, who depended on the collection of rainwater, those of Anau were familiar with the principle of tiered irrigation. They did not disperse the water that flowed out of the mountains when it reached the river delta but rather captured it upstream and directed it by means of clay and wooden canals, as well as low dams, over artificially built terraces, stepwise into the lower delta. In addition to farming, they raised sheep, goats, cattle, pigs and camels and hunted antelope and, in the mountains, ibexes. The discovery of the bones of Bactrian or two-humped camels in Anau as well as in settlements further south-east such as Altyn Tepe and Geoksyur from the time of Anau II B/Namazga III and IV suggests that in southern Turkmenistan the camel was for the first time not only hunted or raised for meat but also domesticated for transportation purposes as a pack or draught animal. Small, four-wheeled terra cotta wagon figurines from Altyn Tepe, approximately 4,500 years old, with a Bactrian camel as draught animal provide evidence of this. Their discoverer, Soviet archaeologist Vadim Masson, believed that the high population density of the small oasis at that time meant that food had to be acquired from far away, which encouraged the domestication of the camel and the development of four-wheeled wagons. At the same time the scarcity of resources forced people to construct complex organisations and societal structures.[20]

The original habitat of the two-humped camel extended from Inner Mongolia over the Mongol Republic as far as Kazakhstan, so that the name ‘Bactrian’ camel, given by Aristotle, refers not to its origin but rather to the approximate location of its earliest domestication.[21] The life expectancy of the camel is 35 to 40 years, of which it can work for 20 to 25 years. A well-fed animal can carry 200 kg for eight days without water if travelling on solid ground; in soft sand, however, it can go only five days carrying 120 kg without water. In the winter it can withstand temperatures as cold as -25 °C without problems, as well as heights up to 4,000 m above sea level, but extended periods of heat are intolerable, so caravans crossing the Gobi or Taklamakan desert traditionally avoided the summer months and travelled by night. In southern Central Asia people raised not only two-humped Bactrians but also, for cross-breeding purposes, single-humped

Chronology of the early settlements of Kopet Dag

CENTRAL KOPET DAG	EASTERN KOPET DAG: ETEK PERIODS	EASTERN KOPET DAG: GEOKSYUR PERIODS	MURGAB & BACTRIA: BMAC PERIODS	TIME (BC)
Jeitun				6500–4500
Anau I A (Anau northern mound)	Anau I A			4800–4000
Anau I B (Anau northern mound)	Namazga I	Dashli		4000–3500
Anau II A (Anau southern mound)	Namazga II	Yalangach		3500–3100
Anau II B (Anau southern mound)	Namazga III	Geoksyur		3100–2500
	Namazga IV	Altyn Tepe		2500–2200
	Namazga V	Khapuz Tepe	Kelleli	2300/2200–1900
Anau III	Namazga VI		Gonur, Togolok	2000/1900–1500
			Sapalli, Jarkutan	1700–1350

In 1952 Pumpelly’s four-period chronology of Anau was superseded by Kuftin’s ‘Namazga’ classification in six periods, which is used today for dating prehistoric archaeological finds in flat regions of south-eastern Central Asia up to the Iron Age. At the prehistoric site of Namazga, which lies 90 km south-east of Anau and consists of a 34 m settlement layer, B.A. Kuftin identified six cultural periods.[22]



Palimpsest of two male camels; the larger of which is more than 1 m high. Petroglyph complex of Arpa Uzen in the Karatau Mountains, southern Kazakhstan, Bronze Age.

dromedaries. The single-humped hybrid resulting from a male Bactrian and a female dromedary was significantly stronger than its parents. The 650- to 900-kg beasts were able to carry up to 450 kg, more than twice as much as a Bactrian. The descendants of hybrids proved to be ill-tempered and dangerous, however, so the male hybrids were castrated.[23]

Before camels were used to pull wagons in Kopet Dag, beginning at the end of the fourth millennium or start of the third millennium BC oxen had been yoked to single-axle carts, as depicted in miniature clay figurines. Because of the worsening drought, however, the more efficient camel replaced the ox as the preferred draught animal in the second half of the third millennium BC.[24]

In conclusion it seems likely the American archaeologist Frederick Hiebert is correct in saying that in Anau a local development from loosely organised farming villages of the Jeitun Culture to the proto-urban settlement of the southern mound took place, after which this type of settlement spread as far the Geoksyur oasis. These settlements had contact with northern Iranian cultures, although the migration of Iranian farmers to the northern Kopet Dag plain at the start of the fifth millennium BC that was postulated by the archaeologists Vadim Masson and Viktor Sarianidi is highly improbable.[25]

3. The first cities of Central Asia in southern Turkmenistan

In the second half of the fourth millennium BC there was a first wave of urbanisation in southern Turkmenistan, when farmers from the Anau region spread to the south-east and founded the settlements of Namazga, Ulug Tepe and Altyn Tepe.[26] After travelling about 200 km they reached the Tejen River, in whose delta they established, over the course of time, the nine settlements of the **Geoksyur oases**, which belong to the time periods of Namazga II and III. These stood on small, naturally occurring alluvial rises, which emerged like islands out of the swampy surrounding waters and whose banks were overgrown with thickets of reeds and riparian forests. The farmers of these small settlements began, with the help of clay spindle whorls, to turn the wool of domesticated sheep into yarn, so that the new materials replaced the earlier animal skin clothing.[27] The sheep *ovis orientalis* was first domesticated around 8000 BC in Mesopotamia as a source of meat, but its wool was first worked into yarn only 4000 years later. Now the sheep was valuable not only once as food but also daily as a source of milk, and annually or semi-annually for wool for textiles.

The earliest villages, established in the northern part of the river delta, such as Dashli Tepe, Yalangach Tepe and Aksha Tepe, were short-lived. The dramatically shifting Tejen River, which drifted westward, began, as a consequence of climate changes, to carry less water and no longer reached the mound settlements. The land dried up, forcing wild game to move to the south and making the cultivation of barley and wheat impossible. The farmers had to follow the water and built their dwelling farther south, but soon the steady disappearance of water forced the abandonment of Mullali Tepe and Geoksyur Tepe 9 as well. Geoksyur 1 was abandoned shortly after so that only the settlement of Khong Tepe in the south remained. The drying up of the delta continued unabated, however, and despite the construction of long irrigation canals the farmers had to leave Khong Tepe, too, after which they moved 18 km farther south to Khapuz Tepe (Namazga IV/V period).[28] This phenomenon, in which oasis settlements had to be abandoned as a consequence of dwindling water supply, was repeated many times in other agricultural oases, such as in the delta of the Murgab River east of the Geoksyur oases

or in the Taklamakan Desert in north-western China, in the deltas of the Keriya, Niya and Andier Rivers, as well as the Tarim.[29]

As at Anau the Geokysur oases had circular buildings fortified with thick walls, which may have been used as granaries or defensive towers. Even if they served primarily as storerooms, they had a defensive function, since they were, as at Yalangach and Mullali, connected to one another by a wall around the settlement.[30] The houses of the earliest settlement at Dashli Tepe appear to have taken up the old idea, familiar from the Jeitun Culture, of one-room, single-family structures, although at Yalangach Tepe multi-room buildings also appeared. Clay statuettes found beside some ovens there depict rams and large-bodied, seated women, often painted with geometric patterns. These figures suggest that these hearths served profane as well as cultic purposes.[31] The female figurines, whose thighs were sometimes also decorated with the profile of a goat, and the ram statues, can be interpreted as typical fertility symbols of a Chalcolithic agrarian society in then-fertile southern Central Asia. Other, somewhat older female figurines, such as those from Kara Tepe, have strange, birdlike faces with almond-shaped eyes.[32]

About 600 years after the founding of the settlement of **Altyn Tepe** around 3200 BC the site developed into a city with all the attributes of an early Bronze Age urban culture in southern Central Asia. The urban characteristics consist of high population density, compact architecture, monumental buildings, centralised administration, coordinated provision of food, specialised types of work and commercial activities and a means of security, in the form of a city wall or defensive troops. The 25-ha city stood on a natural rise with steep sides, and in its heyday from about 2600 to 2200/2100 BC (Namazga IV and early V) the 4- to 4.5-m-high city walls made of mud bricks protected a population of 6,000 to 7,000 inhabitants. On a wide road through the 7- to 8-m-high monumental gate, which resembles the imposing entrance gates of Mesopotamian cities, carts pulled by camels travelled into the inner city, where perpendicular streets connected the individual quarters to each other.

As can be seen from the various types of private homes, Altyn Tepe was divided into four social strata. The lowest class was made up of servants or household slaves, who did not have houses of their own but rather lived with their masters. The next level

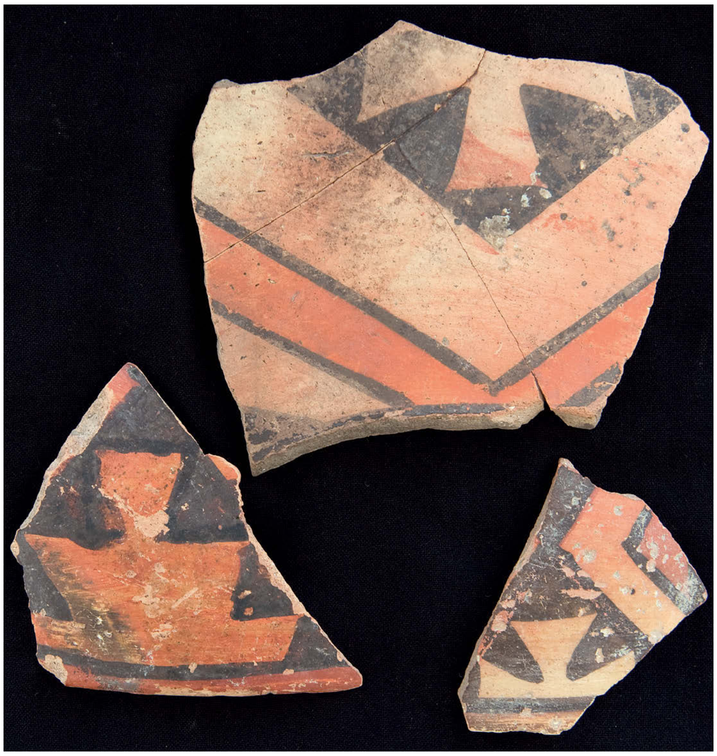
consisted of free artisans, who lived in their own quarters in large, multi-family complexes with living and work areas. Belonging to this class were potters who worked with potters' wheels; producers of the many small clay figurines of women; and blacksmiths, who worked with both arsenic-copper and tin-copper alloys. They most likely procured the necessary ores from the agrarian settlement of Sarazm in far north-western Tajikistan. Sarazm, whose founders came from the Kopet Dag oases, was one of the most important centres of metallurgy in south-eastern Central Asia and had, along with the nearby Fergana valley, rich sources of copper, lead, tin, arsenic, gold and silver.[33]

The affluent citizens had their own residential quarter made up of single-family houses, while the carefully constructed, spacious homes of the elite were concentrated along perpendicularly arranged streets around the cultic centre. As the graves with the richest inventory of grave goods were found in the cultic complex, the elite who lived and were buried here must also have served a cultic purpose. The cultic centre consisted of a 12-m-high, multi-storey pyramid with a rectangular base, which was topped with a tower made of mud brick. One side of the pyramid abutted a natural mound. This step pyramid, unusual for Central Asia, which could also be described as step terraces with an attached tower, strongly recalls the early ziggurats of Mesopotamia. This led the excavating archaeologist Vadim Masson to conjecture that this particular idea of sacred architecture was influenced by Mesopotamia and Iran.[34] Aside from the lack of ascending ramps, the similarities between the step pyramid of Altyn Tepe and the proto-Elamite step pyramid of Tepe Sialk, Iran, are indeed astonishing. The step pyramid of Tepe Sialk was built around 2900 BC on the ruins of a still older terrace shrine. Like Altyn Tepe, it had four increasingly smaller platforms one on top of the other. Right at the top was a small, tower-like structure, the symbolic home of the deity to which the pyramid was consecrated.[35] Another point of reference for the proto-Elamite culture may lie at the site of Tepe Yahya in south-eastern Iran. Here the massive step-style construction of Konar Sandal I from the mid-third millennium BC has been excavated. Individual chlorite vessels of a similar age from the neighbouring archaeological site of Jiroft are also decorated with schematic portrayals of ziggurats, so it is conceivable that Tepe Yahya and Jiroft provided inspiration for the step pyramid at Altyn Tepe.[36] Similar step pyramids are also found in the contemporaneous cities of Tureng Tepe south-east of the Caspian Sea, Mundigak north-west of the Afghan city of Kandahar, and Shahr-i Sokhta in south-eastern Iran.[37]

In Altyn Tepe there were two different cultic forms; an institutional one of the city and a private one of the households. In each house, in granaries and in some collective graves, there were schematically portrayed female terra cotta figurines with broad but flat hips, a flat torso with prominent breasts, a long neck, affixed eyes of a rhomboid shape, a hooked nose and snake-like braids falling on both sides of the face. The lower part of the body ended in a triangle instead of legs, since it would be stuck in the ground or in a recess beside an altar, analogous to the female statuettes of the contemporaneous agrarian culture of Tripolye in far western Central Asia and those of the Indus Valley Civilisation.[38] In other statues the lower part is bent forward at a right angle, representing a seated position.[39] These flat statuettes from the transition period from the Copper Stone Age to the early Bronze Age are fundamentally different from the voluptuous matrons of the mid-Chalcolithic, such as those from Yalangach Tepe.[40] In addition, many of the statuettes of Altyn Tepe have engraved symbols consisting of combinations of lines, which had a hidden meaning. Their unknown message is all the more intriguing because the symbols can be grouped and often appeared in identical form. Vadim Masson has compared these statuettes with the proto-Elamite marks of Mesopotamia and those of the Indus Valley Civilisation (*ca.* 2800–1800 BC), and found a few remarkable similarities.[41] The birdlike faces also indicate clear relations to Mesopotamia, as the snake-like braids do to the Indus Valley Civilisation, which may reflect an orientation toward Mesopotamia and particularly to the Indus delta.[42] These figurines of women presumably portray female deities, which were venerated in the context of private households.

Unlike in the profane dwellings, no female figurines were found in the civic cultic complex. In the grave of a man near the step pyramid archaeologists discovered rich grave goods that presumably had a cultic purpose. Among them was the 7.5-cm-high head of a bull made of pure gold, with horns made of silver covered in gold leaf. The eyes are made of turquoise and a third, crescent-shaped turquoise adorns the forehead. This golden bull's head recalls Sumerian toreutics,[43] especially the bulls' heads on the resonators of the lyres from the royal tombs of Ur.[44] Moreover, the Sumerian moon god Nanna-Sin, who could appear in the form of a bull, was the patron deity of Ur and the large, three-story ziggurat of Ur was dedicated to him. Thus Masson surmised that 'the cultic centre of Altyn Tepe was apparently dedicated to a male god, a local variant of Nanna-Sin, whose multi-story tower so obviously followed the prototype of the ziggurat of ancient Sumer'.[45] This means that in Altyn Tepe a private cult of mostly female fertility goddesses, which also protected the hearth and family, coexisted with a public cult of a patron god with roots in Mesopotamia. It is the moment at which male deities began to replace female deities at the top of the pantheon of south-eastern Central Asia. There was, in broad terms, a 'twilight of the goddesses', which heralded the transition from a purely sedentary agrarian society to nomadic trading societies and, before long, to bellicose stockbreeding societies.

The significance of the metal seals found here is still unknown. They are made of an alloy of bronze and low-grade silver with geometric or zoomorphic motifs, and they may have served as amulets. The most striking seal is in the form of a three-headed beast with the body of a big cat, two snake heads, and one head of a bird of prey, which was discovered in the grave of a woman in the temple district.[46] This fantastical creature seems to anticipate the three-headed demon Aži Dahäka from the Zoroastrian



With their decorative patterns of Maltese crosses and three-step pyramids, the ceramics of Sarazm II and III (3200–2500 BC) show close ties to those of the Geoksyur oasis of Turkmenistan. Local museum of Sarazm, north-western Tajikistan.

Avesta – one of the most feared servants of Ahriman, the destructive spirit.[47]

The inhabitants of Altyn Tepe continued the practice, begun in Anau, of 'intra muros' burial of infants. They were buried within houses, primarily in corners under the floor or beneath the threshold, rarely in containers. Adults, however, were buried in communal graves, which were either close to inhabited house complexes or in uninhabited, abandoned sections of the city.[48]

The domestication of the camel and the adoption of four-wheeled wagons made the transportation of goods much easier, enabling the oasis cities of Kopet Dag to engage in trade. They were part of a large trade network that stretched from Mesopotamia in the west to Sarazm (Tajikistan) in the north-east, Shortugaï (Afghanistan) in the east, and the Indus Valley Civilisation (Pakistan) in the south-east. Geographically speaking the oasis cities of Kopet Dag lay in the centre of this network. The distances from here, as the crow flies, to the Mesopotamian cities such as Ur was about 1,300 km; to Sarazm, 800 km; to Shortugaï, likewise 800 km; and to the Indus cities of Harappa or Mohenjo-daro, 1,400 to 1,700 km. The impulse behind this transcontinental trade was the insatiable hunger of the cities of Mesopotamia for ores and gemstones from eastern Central Asia.[49] These land routes supplemented the sea routes between the cities of the Indus Valley Civilisation and Mesopotamia. It is possible that merchants at that time were able to communicate directly with each other thanks to a common language, since similarities between the Dravidian languages of India and Elamite, which is now extinct, have led to the hypothesis of a shared precursor language. This proto-Elamite-Dravidian language would then have been the lingua franca between Elam and the Indus Valley Civilisation with its branches in the oases of Central Asia.[50]

One of the most sought-after commodities was tin, which was less widely available in Eurasia than copper or iron. One of the oldest and richest tin mines of the prehistoric world was found in the valley of Zerafshan near **Sarazm**, whose Tajik name Sar-i zamin means roughly 'beginning of the land'.[51] The proto-urban settlement of Sarazm lies near the city of Panjikent in north-western Tajikistan and was for a long time the most northerly settled agricultural centre in eastern Central Asia. Although only 5 ha of the 100-ha settlement have been excavated – the site is mostly covered by a farming village – four stratigraphic layers have been identified. Sarazm I (3500–3200 BC) was founded as a kind of colony of earlier oasis cities of Kopet Dag from the transition period from Namazga I to II in the fertile valley of the middle Zarafshan on a site settled since the Neolithic, as demonstrated by the discovery of pottery of the Kelteminar Culture. It was probably established for economic reasons, as the area around Sarazm is rich in ore and semiprecious gems such as turquoise.

That Sarazm developed from the blueprints of the immigrants, so to speak, can be deduced from the city plan of the well-preserved layer of Sarazm II (3200–2900 BC). The two- and three-room residences stood along straight streets, with public plazas with workshops and storehouses following sets of three to six houses. As in Altyn Tepe, monumental architecture enriched the

The 20-year-old Europid woman buried in Sarazm with a man and a girl was clothed in garments adorned with lapis lazuli, turquoise and carnelian, *ca.* 3000 BC. National Museum of Antiquities of Tajikistan, Dushanbe.

cityscape of Sarazm. One building, 7 m high and with a square floor plan of 15 x 15 m, was interpreted by the first excavator, Isakov, as the administrative centre, and a second as a temple, where first the sun was worshipped and later bulls were sacrificed. At the same time, small cultic niches stood in private homes, with a hearth for the sacred fire.[52] The close connection of Sarazm II and Sarazm III (2900–2500 BC) to Altyn Tepe and the Geoksyur oases can be seen in the nearly identically painted ceramic objects. Among the most striking patterns are white or red Maltese crosses on black or white backgrounds, as well as red three-level pyramids on a black background.[53]

The triple burial of a 20-year-old couple with a girl gives a sense of the prosperity of Sarazm at that time. The woman was buried in rich clothing adorned with beads made of lapis lazuli, turquoise and carnelian, and her head and arms were covered with dozens of gold and silver beads. Two bracelets made of seashells underscore her high social standing and indicate trade with the Indus Valley Civilisation. Craniological studies showed that both the adults were dolichocephalic – that is, they had long, relatively narrow skulls and a gracile build. Like the inhabitants of the northern foothills of the Kopet Dag and the Geoksyur oases, these people were Europids of the Mediterranean type.[54]

The final period, Sarazm IV (2500–1500 BC), flourished again for about 500 years, until the start of a widespread drought in Central Asia around 2000 BC, which also constrained life in the Kopet Dag and Geoksyur oases. Then, in the nineteenth/eighteenth centuries BC, stockbreeders from the Andronovo cultural horizon advanced from the north. They used the valley floor as grazing land and took over the mining of tin. At this time the last farmers of the Geoksyur–Sarazm Culture left the area.[55]

The trading cities of southern Turkmenistan were not satisfied with merely securing raw materials from the east; they also ensured their trade channels to the cities of the Indus Valley by founding the urban settlement of **Shahr-i Sokhta** in south-eastern Iran. This city was founded around 3200 BC and grew as large as 80 ha in area. Like Altyn Tepe, it had a monumental step pyramid. Shahr-i Sokhta lay halfway along the southern trade route, since it was 750 km from Altyn Tepe and 800 km from Mohenjo-daro. The distance to Ur in south-eastern Mesopotamia was 1,300 km. The city was not just a way station for trade caravans, however, but also a centre of artisanal production, where lapis lazuli, turquoise, carnelian, chlorite and seashells were crafted into objects that were usually exported to the city-states of Mesopotamia. At the same time as the collapse of Sarazm, at the start of the second millennium BC, this city fell and burned to the ground.[56]

The lapis lazuli and seashells discovered in the grave of the 'princess of Sarazm', as well as other finds, such as square clay seals, indicate that Sarazm conducted trade not only with the Altyn Tepe and Kopet Dag oases but also with Afghanistan and the cities of the Indus Valley Civilisation. Clay seals discovered in Altyn Tepe, as well as imported objects made of elephant ivory, underscore the trading relationships with the Indus Valley Civilisation, which had a trading post at **Shortugaï** in northern Afghanistan. This settlement in south-eastern Central Asia lies not far from the confluence of the Amu Darya and the Kokcha, close to Aï Khanum, where later Seleucus I (r. 305–281 BC) had a Persian settlement rebuilt as a Greek city. In the vicinity of Shortugaï there were also exceptionally rich reserves of lapis lazuli and turquoise.

Many objects found here were undoubtedly imports from the then-flourishing cities of the Indus Valley Civilisation. These include carnelian beads, worked agates, soapstone seals with carved images of rhinoceroses and ideograms typical of the Indus Valley Civilisation. Also other finds including bracelets made of seashells and game pieces made of clay, among them miniature zebus, camels and carts, as well as specially painted vessels were imports from the Indus Valley Civilisation. The gold, turquoise and faience objects were, however, fashioned by local artisans according to the techniques and taste of the Indus Valley Civilisation.[57] Shortugaï was a branch of one of the leading merchant cities of the Indus Civilisation, Harappa. Mohenjo-daro, like Sarazm, was a trading outpost of the Kopet Dag and Geoksyur oases of southern Turkmenistan.

In the first, urban period (2500–2100 BC), Shortugaï was a trading colony of the Indus cities with an outstanding production of pottery and brick buildings. Parallel to the collapse of the oasis culture of southern Turkmenistan, the post-urban period began in Shortugaï (2100–1700 BC) when a rustic tribal culture with traditional mud brick buildings replaced the urban trading culture. Contact with the Indus Valley Civilisation soon broke down, as that civilisation also reached its end. Trade dwindled and was conducted only with Bactria in the north. In the eighteenth century BC crude steppe pottery appeared – a clear indication that the nomadic stockbreeders who had earlier overrun Sarazm had now crossed the Amu Darya and advanced into northern Afghanistan.[58] Only 14 centuries later did Shortugaï experience a limited rebirth under Greek colonists.[59]

Although smaller cities with broad trade networks developed between Altyn Tepe and Geoksyur, the relatively large distances between the individual cities, as well as their limited militarisation, hampered the establishment of supra-regional entities like

The Indus Valley Civilisation, trade partner of Central Asia in the early Bronze Age

The cities of the Indus Valley Civilisation (*ca.* 2800–1800 BC), in today's Pakistan and north-western India, were the most important trade partners of the trading cities of southern Turkmenistan. The Indus Valley Civilisation was a unique urban culture that arose from the agrarian culture of Mehrgarh. It had highly productive agriculture and followed a revolutionary strategy of urbanisation. Over an area of 680,000 square kilometres traces of about 1,500 settlements[60] have been discovered. The most important cities, such as Mohenjo-daro, Kalibangan and Harappa, were constructed in a uniform manner according to a geometric master plan, whether this meant completely rebuilding older settlements or undertaking new construction from the ground up. The small upper city always stood in the west and was slightly elevated, and in the east lay the rectangular or parallelogram-shaped, much larger lower city with housing, workshops and storage facilities. The two- or three-storey houses were built of standard-sized clay bricks, 28 x 14 x 7 cm in size, which further increased the homogeneity of the architecture. Streets ran along the north–south axis of the cities, which had a secure water supply and a sophisticated system of waste water canals. In Mohenjo-daro, for instance, almost 700 wells provided fresh water for the 50,000 to 80,000 inhabitants, and from each house covered canals carried waste water to a communal canal that led to the nearby Indus.[61] In Mohenjo-daro there are no signs of monumental architecture, whether secular or sacred, which, considering the size of the city and its well-thought-out plan, is surprising.

The most important trading partners of the Indus Valley Civilisation were the cities of Mesopotamia, which were reached either by land through Iran or by sea. Trade between these parties was simplified by the introduction of standardised weights and measures. The second pillar of the domestic economy was agriculture, with crops transported to the cities by oxcart and barges. The Indus Valley Civilisation also developed its own script, which is preserved on small soapstone seals. To this day it has resisted all attempts to decipher it, since no multilingual documents like the famous Egyptian Rosetta Stone have been preserved. Making it yet more difficult is the fact that the inscriptions are very short; the longest consists of only 26 symbols or phonemes, and many of the more than 400 different symbols appear only rarely.[62] The script is presumably related to proto-Elamite, but the language affiliation remains unknown.

Another innovation of this culture is an early form of woven silk. The earliest evidence of silk worldwide comes from the Neolithic site of Qianshanyang in the Chinese province of Zhejiang, where silk threads about 4,570 years old were discovered. However, the most recent excavations at Harappa have brought to light silk fibres of almost the same age, dating to 2200–2450 BC.[63] The silk threads of China and of the Indus Valley Civilisation come from different moths, however: the Chinese from *Bombyx mandarina*, which was later domesticated as *Bombyx mori*, and those of Harappa from *Antheraea assamensis* and *Antheraea mylitta*. Interestingly, the threads of Harappa were spun in two different ways, which suggests the use of two different production techniques.[64] This most recent discovery has far-reaching consequences, because up until now early, pre-Christian discoveries of silk in Central Asia, Egypt or Europe were seen as indications of contact with China. In light of the long-standing isolation of China into the second century BC and, on the other hand, the transcontinental trade network already established in the third millennium BC of the Indus Valley Civilisation, exports from the northern Indian subcontinent now seem more likely.

The reason for the collapse of the Indus Valley Civilisation remains just as puzzling as its script. Presumably a variety of factors contributed, with both natural and human-caused ecological changes proving decisive. For one thing, at the start of the second millennium BC a pronounced drying of the climate in eastern Central Asia sped up, coupled with a weakening and a shift to the east of the monsoon rains. More dramatic effects were produced by tectonic shifts, most likely earthquakes, which led to the waters of the Sarasvati and Drishadvati rivers no longer reaching the Indus river system but rather moving eastward into the hydrological system of the Ganges. Thus the fertile, arable land also moved east, and the cities of the Indus began to suffer water shortages.[65] Furthermore, it may be assumed that the centuries-long intensive cultivation of the soil depleted it and that an irrigation system that paid little heed to drainage made the farmland too salty. In addition it is conceivable that overgrazing by goats and sheep – a phenomenon still seen in Central Asia and Mongolia today – also destroyed the vegetation that held the soil in place.

Finally, the enormous construction activity took its toll, as the production of bricks required vast amounts of wood. This led to radical deforestation of the surrounding environment with corresponding climatic consequences, as can also be seen in the fall of the cities of Mesopotamia.[66] External causes included the simultaneous collapse of trading partners in Mesopotamia and in southern Turkmenistan, as well as raids from the north. Although most scholars today believe that an attack by nomadic horsemen from the north did not take place, it is a fact that mass graves from the final period of Mohenjo-daro betray hasty and disorganised care for the dead. In addition, skeletons have been discovered lying in the streets, on thresholds and inside houses, indicating a violent end to a presumably already weakened city.[67] In any event, after the eighteenth century BC the agrarian-mercantile Indus Valley Civilisation disappeared, leaving behind no further trace.

principalities or kingdoms. This markedly local character of the municipal government remained a hallmark of later cultures in the region of Bactria and Margiana until the Kushan era in the first centuries AD.

At the turn of the third to the second millennium BC Altyn Tepe and the last settlements of the Geoksyur oasis broke down, for a number of reasons. Climatic and tectonic factors played their part, as did the action of humans, although no effects from hostile enemies can be seen. As already mentioned, in the second half of the third millennium BC a weakening of solar radiation in the northern hemisphere ended the ideal climate of the early and middle Holocene, which caused both temperatures and precipitation to drop. Steppes dried out and deserts advanced not only in Central Asia but also in the Arabian Peninsula and North Africa.[68] In addition, the rivers that wound through the flat landscape tended to change their course as they silted up with sand. Thus the Tejen River shifted its delta to the west as early as the second half of the third millennium BC, forcing the people of the ancient Geoksyur oasis to abandon their settlement and relocate to Khapuz Tepe in the south-west.[69]

Human beings helped bring about the impending catastrophe, although the causes and effects involved were still unknown to them. The population growth in Altyn Tepe led to increased deforestation, salinisation of the soil resulting from excessive irrigation without adequate drainage, and overgrazing by herds of goats. All of these factors reduced the amount of land available for life-sustaining agriculture, and Altyn Tepe began to shrink. First the cultic centre and the residential quarter of the elite were abandoned and a gradual decline set in. As living conditions worsened people began emigrating eastwards out of the Kopet Dag–Tejen oasis system towards the neighbouring delta of the Murgab River north of the modern city of Merv (Mary) in south-eastern Turkmenistan. This theme, of natural and man-made factors forcing people to abandon their oasis settlements for a more favourable environment, would recur frequently in Central Asia until modern times.

4. Agrarian and stockbreeding cultures in northern Central Asia

4.1 The cultures of Cucuteni–Tripolye and Usatovo

As in the Neolithic, Chalcolithic and early Bronze Age, this period in the history of northern Central Asia was marked by encounters between agrarian and stockbreeding societies. On the other side of the western border of Central Asia, in the second half of the sixth millennium BC during a Climate Optimum, there arose west of the Dnjestr River the sedentary agrarian culture of **Cucuteni–Tripolye** (*ca.* 5200–2800 BC), which also raised livestock.[70] In contrast to the steppe cultures, which are reconstructed largely on the basis of grave furnishings and classified by burial type, the Cucuteni–Tripolye Culture can be studied only by examining the architecture of its settlements and domestic finds. In the first period the small settlements consisted of either rough dug-out huts, which were easily flooded and needed regular repairs, or ground-level buildings made of stamped clay and used by nuclear families.[71]

Beginning in 4000 BC in the Ukraine, the second, middle period saw a population explosion, which led to the construction of gigantic settlements. They consisted of two or three – or, in extreme cases, even five – concentric circular or oval rings of two-storey houses, about 20–30 m long and 6–10 m wide, which were connected along their long sides into groups of four or five. The largest settlements reached an area of 450 ha and numbered 2,700 dwellings, which corresponded to a population of approximately 25,000 to 30,000 people.[72] These mega-settlements were earlier and larger than the first Sumerian cities, but they show no signs of a division of labour or of social stratification, and they had no public buildings, so they are seen not as cities but rather as gigantic settlements. As the self-sustaining farmers practised slash-and-burn agriculture, and the soil was quickly depleted, they were forced periodically to move eastward to seek new, virgin land, so the culture spread as far as the Dnieper. They ritually burned the abandoned settlements.[73] The Tripolye farmers obtained copper bars from what is today Bulgaria, working the metal into jewellery and also selling it to the nomadic stockbreeders north-east of the Dnieper.

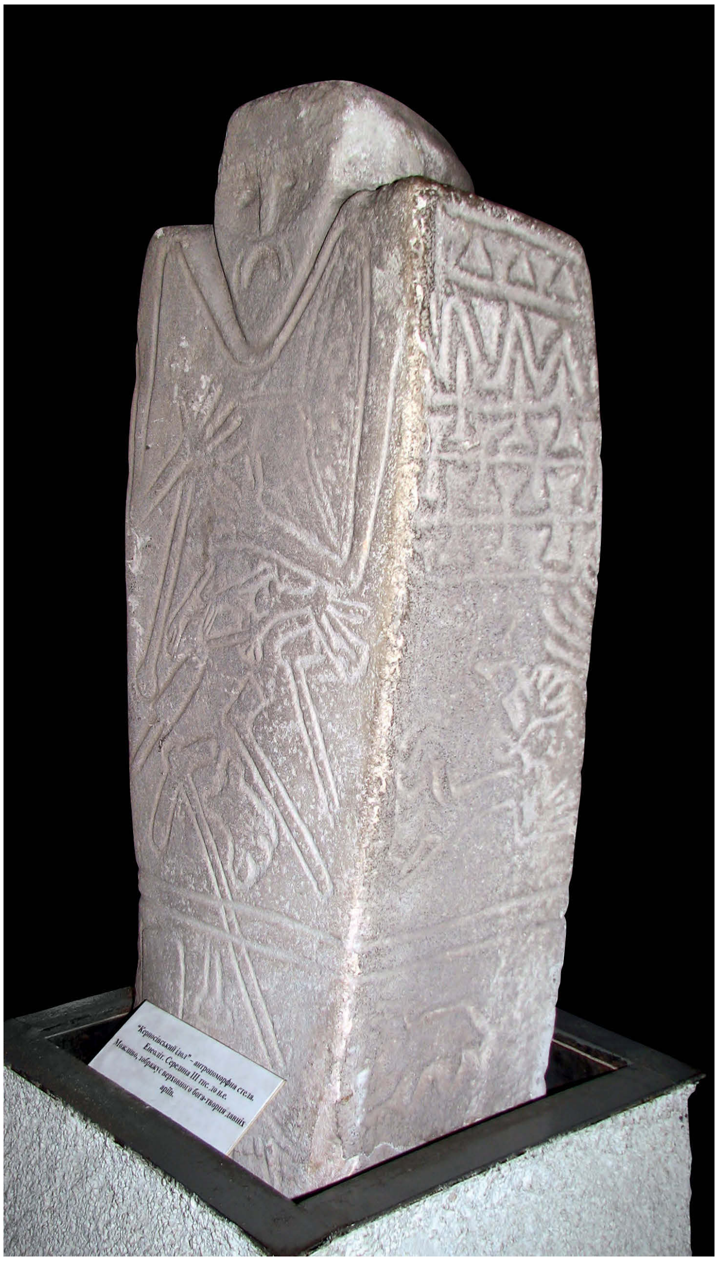
Female deities played an important role in the Tripolye Culture, as can be seen in the approximately 2,000 clay figures depicting either small, standing women or seated women with outstretched legs, broad thighs and backward-leaning torsos. Occasionally they sit on stools in a circle of as many as a dozen women. Such clay statuettes stood in houses near the hearth and presumably served a protective purpose. As the clay was often mixed with wheat and barley grains, they also symbolised fertility. In addition to the female powers, spirits associated with horned cattle also played an important apotropaic[74] role in the domestic cult, since in a few settlements the skull of a bull or a cow was found buried beneath each house.[75]

The Tripolye farmers were innovative not only in the way they built settlements but also in their means of transportation. Clay figurines of oxen pulling sleds and of oxen standing on two axles with four wheels indicate that in the winter these farmers used sleds on snow and frozen waterbodies, and knew that heavy loads could easily be moved by means of wheels and axles.[76]

Around 3300 BC Tripolye was overtaken by a severe, mostly self-inflicted crisis. A climatic cooling that had begun there around 3500 BC hampered farming, but the slash-and-burn agriculture that had been practised for centuries and the increasing depletion of the soil were more serious. Worse still, the slash-and-burn approach and massive deforestation for building and heating purposes reduced the forested part of Tripolye's area from 50 percent to about 9 percent.[77] In this way the Tripolye farmers destroyed their own natural barrier against the slowly advancing steppe nomads in the north-east, who at first could not cross this wall of forest with their herds. The stockbreeders in western Central Asia, who sought to escape the cooling climate by migrating to the south, began to infiltrate the cultural realm of the Tripolye. The new steppe landscapes exercised a pull on the herders to the north. They travelled on foot, as the use of the horse as a mount to overcome long distances began only about a millennium later.

Astonishingly, the Tripolye Culture did not collapse as a result of this migration but instead experienced a revival. In the third and final period of Tripolye the mega-settlements disappeared and smaller, better defended communities emerged. The farmers adopted the technologies of the advancing herders and used their land, which had been transformed into steppe, for grazing cattle, sheep and goats. It appears that the expansion of the steppe nomads' lifestyle to the west came about not so much through military attacks as by the adoption of technologies of animal husbandry appropriate to the changed climatic and ecological conditions.[78]

The steppe herders who advanced slowly into the territory of the Tripolye farmers, who now practised stockbreeding, belonged to the proto-Indo–European (PIE) language family and contributed essentially to its westward expansion.[79] Its culture can be seen as one of the precursors of the vast Yamnaya Culture. Most notably the two peoples who lived side-by-side, the local Tripolye farmers and the nomadic steppe herders, both maintained their own ancient cultural elements, which blended along the Dnieper and Dniester rivers into the hybrid **Usatovo Culture** (3300–2800 BC). In the flat graves near the settlements small female figurines were laid beside the dead. Such figurines are, however, not found in the kurgan graves, where the leaders of the steppe herders were buried. Instead of statuettes of women, their grave goods consisted of a pair of bronze weapons made of arsenic copper. The tumulus was surrounded



A 120-cm-tall stone statue portraying an older warrior from Kernosovka, Usatovo Culture, Ukraine, *ca.* 3300–2800 BC. Historical Museum of Dnepropetrovsk.

by a cromlech, a circular arrangement of megaliths (a custom that was also known to the culture of Mikhailovska that preceded the Usatovo Culture).[80] A few Tripolye graves also contained ceremonial stone maces with horse heads.[81] Presumably the newcomers, who helped spread the practice of using domesticated horses for meat, appointed themselves patrons of the local populace, but left their social structures and culture untouched. Metaphorically speaking, the subjected agrarian communities were like the goose that laid the golden egg, which only had value as long as it lived.

The burial sites also included stone steles, some simple and some anthropomorphic, made of granite, lime or sandstone and standing as tall as 270 cm, which were located south-west of the mounds.[82] The best-preserved anthropomorphic stele of Kernosovka portrays an older warrior with a drooping moustache, his hands folded on his chest. On the front are engraved weapons such as a battle axe and a pickaxe, as well as a lance, and under these are two horses. On the sides are a copulating pair, an ox, and geometric patterns; on the rear, two footprints and schematically drawn ribs and a spine.[83] The meaning of these steles is not known; perhaps they represent an idealised image of the deceased leader and his world in a coded form, which could indicate a marked social stratification and the elevated position of the leader. Alternatively, the steles may be an expression of ancestor worship, in which the dead do not disappear from the world but rather take on a new societal function in a changed form. With the demise of the honoured man, his 'afterlife' as an ancestor begins. In the subsequent Yamnaya period these steles were reused, whether for the building of stone circles or as tomb slabs inside kurgans.

Dimitri Telegin has suggested that the anthropomorphic steles had their origin in the related, settled stockbreeding cultures of Mikhailovska and Kemi Oba on the northern coast of the Black Sea and in the Crimea. The surprising similarities to contemporaneous steles of southern France and northern Italy are generic and coincidental, however, as there was little cultural contact between the Black Sea region and the western Alps.[84] The custom of erecting stone statues of the dead, usually armed, at the gravesite or on a cultic site dedicated to the deceased, found its way into the entire northern half of Central Asia as far as Mongolia, where the so-called deer stones represented a particularly stylised and symbolically rich variant.[85] It was widely practised for over four millennia into the fourteenth century AD, and in Mongolia and southern Siberia the ancient stone figures are still venerated.

◀ **A Mongol rider captures a horse from a herd, central Mongolia.**

The Usatovo Culture and its mixed economy of primarily stockbreeding and secondarily crop farming influenced the economic forms of the eastern Funnelbeaker Culture of north-eastern and central Europe, from which the Globular Amphora Culture (3400–2700 BC) emerged. These people were not semi-nomadic herders but rather settled farmers who also devoted themselves to stockbreeding. Out of the Globular Amphora Culture emerged later the settled, socially hierarchical Corded Ware Culture (2800–2200 BC), which bordered the Yamnaya steppe culture to the east. This influence of the Usatovo Culture to the west has been associated by some scholars with the spread of Indo-European dialects, such as the proto-Germanic, proto-Slavic and proto-Baltic languages.[86] In any case, this development proceeded peacefully and gradually; an Indo-European invasion of Europe from the east never took place.

4.2 Early stockbreeding cultures

North-east of the Chalcolithic Dnieper–Donets Culture II, in the steppe forests of the middle Volga, two cultures with similar burial rites arose. The **Samara Culture** (*ca.* 5000–4500 BC) is the older of the two. These people used horses, as well as sheep and goats, for meat. Ochre was spread over the shallow burial chambers of male leaders, and the skulls, hooves and jaws of horses, sheep and goats sacrificed by the grave were laid in flat bowls. Additional grave goods were horse figurines carved from bone as well as sharp flint

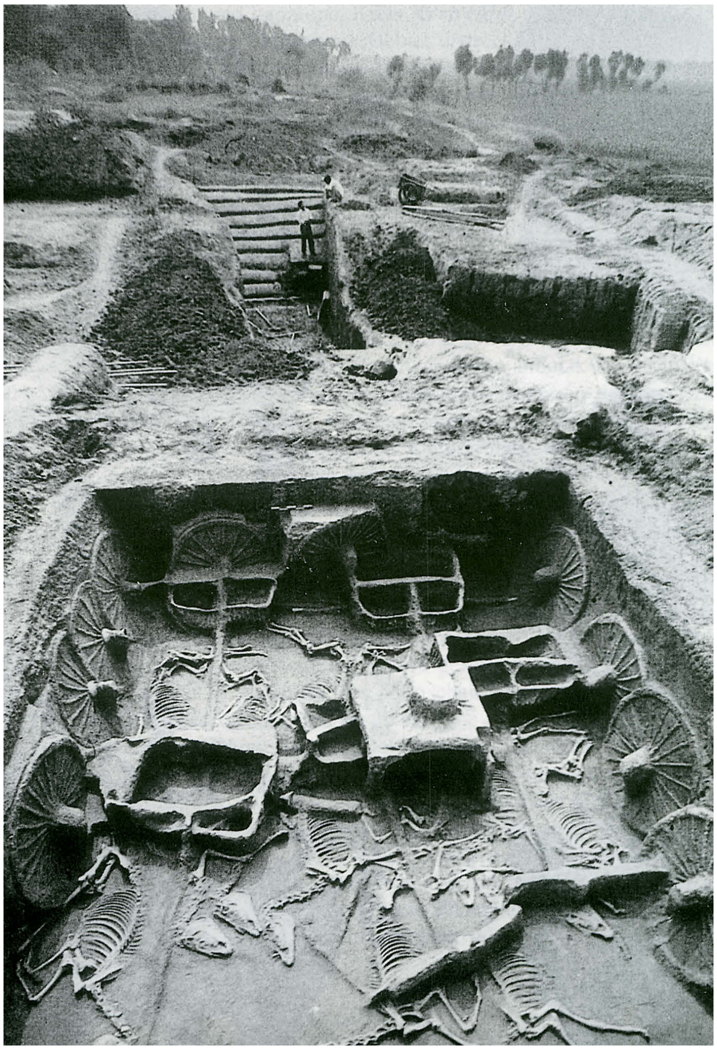
daggers. A few graves were covered with low mounds of earth or stone.[87] The **Khvalinsk Culture** (4700–3800 BC), found south of the Samara Culture, extended from Saratov on the Volga to the northern Caucasus in the south and the Urals in the east.[88] This culture overlapped in parts with the Samara Culture and also made reference to the culture of Dnieper–Donets II, as can be seen in the burials of adult men from ages 30 to 50. After death they were first laid in a communal ossuary, where their bones were cleaned and covered with ochre then placed in individual or communal graves. The grave goods were skulls, skins and hooves of sacrificed horses, copper jewellery, flint daggers and maces made of serpentine and soapstone, whose zoomorphic heads resembled that of a horse. Presumably these maces were status symbols.[89] A few of the graves were covered with a low stone mound.

These graves of the Samara and Khvalinsk cultures displayed several hallmarks of the burial practices of the subsequent stock-breeding cultures of the Central Asian steppe, which remained dominant for the warrior elite into the first centuries AD. The essential criteria were grave goods, varying in quality according to social status, weapons, status symbols associated with the horse, jewellery, and animal sacrifices, as well as the practice of covering the corpse with ochre and the erecting of a stone or earth mound. Later, at the great kurgan of Maikop or, above all, in the Scythian period, the burial of chiefs also included rituals of human sacrifice, in which a young woman, fellow warriors and servants of the deceased had to accompany the dead into the afterlife. The subsequent **Late Khvalinsk Culture** (3800–3300 BC) laid the foundation for the establishment of the important Yamnaya Culture on the lower reaches of the Volga and Don around 3300 BC.[90]

Contemporaneous with the Khvalinsk Culture, the **Srednyi–Stog Culture** (4500–3500 BC) flourished between the Dnieper and the Don, serving as the western counterpart of Khvalinsk and likewise playing an important role in the establishment of the Yamnaya Culture.[91] The farmers raised sheep, goats, horses and pigs, and they also fished. They lived in small, semi-nomadic communities and buried their ochre-covered dead on their backs with bent knees; a small, low mound of stone or earth was placed over the grave. The scholars David Anthony and, with a few reservations, J.P. Mallory, believe that this contiguous cultural area of Srednyi Stog and Khvalinsk, between the Dnieper and the Volga in the Ukraine and southern Russia, is the homeland of the proto-Indo–European language (PIE), which arose between the Dnieper, northern Caucasus, and western Urals between about 4500 and 3000 BC.[92] Anthony's hypothesis also states that toward the end of the Srednyi Stog Culture an Indo–European language group branched off from archaic proto-Indo–European, as successive groups of people moved south-west as far as Anatolia. This language group was proto-Anatolian, from which developed the languages of Hittite, Luvian and Palaic. Other authors, such as Kristian Kristiansen, relate this first expansion of an Indo–European language to the culture of Maikop (3750–3000 BC).[93]

It is not known precisely which culture began to use horses for transportation as well as for meat. Most authors presume that the horse was first domesticated as a food source in the fifth millennium BC on the steppes north of the Caspian and Black seas – that is, in the region between the Urals and the Dnieper.[94] These horses would not have been used as mounts, however. The bones of a buried stallion from the Srednyi Stog Culture found in Dereivka were cited by Marija Gimbutas as evidence for her theory of a 6,000-year-old invasion of 'Old Europe' by nomadic horsemen. However, this theory fell apart when it emerged that the horse burial dated to the period of the Scythians (*ca.* 800–200 BC).[95] In Dereivka domesticated horses were used not for riding, but rather as a source of meat.[96]

About a millennium later, also east of the Urals, the horse was not only hunted but also domesticated. In the 1980s the Kazakh archaeologist Victor Zaibert explored the site of **Botai** in northern Kazakhstan. Here he discovered a Chalcolithic hunter-gatherer culture dating from about 3700–3000 BC. The site held a settlement of 150 round or oval pit-houses, of which the dome-shaped roofs were covered with sod, as well as the bones of no fewer than 70,000 horses. At that time a more humid climate than today prevailed in northern Kazakhstan, and the steppe fed millions of wild horses. The people of the Botai Tersek Culture, who lived in settlements more than 150 km apart, hunted horses for their meat and also began to domesticate and breed them. Traces of simple cheek pieces from harnesses and signs of wear on teeth have led a few scholars to propose that primitive forms of bridles were in use beginning around 3500 BC, which suggests the use of horses for riding.[97] Presumably hunters used their horses during the hunt and while guarding their herds, certainly not for military purposes.[98] In any event, around the mid-fourth millennium BC there were two epicentres of horse husbandry, one east of the Urals in northern Kazakhstan and the other west of the Urals between the Don and the Dnieper. Both stockbreeding communities were not nomads but rather practised transhumance, moving their herds to different grazing areas according to the season.



Grave M 1100 in the necropolis of the Yan state with buried light chariots and harnessed horses. Liulihe, south-west of Beijing, dynasty of the Early Western Zhou, *ca.* eleventh century BC.

The first clear-cut example of the use of horses for riding that can be confidently dated is more than a millennium younger than Botai, however, and comes from Mesopotamia. It is a cylinder seal of Abbakalla of Ur, a scribe of King Shu Sin, who ruled from 2037 to 2029 BC.[99]

4.3 The emergence of horse riding

Besides the further development of metallurgy, the domestication of the horse and its use for riding was one of the most important innovations of Central Asia. Getting on horseback enabled the people to shift from largely stationary stockbreeding to an economy that was truly mobile. It also helped them take full advantage of the economic potential of the endless grass steppes of Central Asia. The combination of horse riding and the composite bow, invented before or around the middle of the second millennium BC, gave the steppe peoples unprecedented military might, against which the settled agrarian cultures could offer little resistance.

While innumerable wild horses grazed the steppes of Eurasia and North America during the Palaeolithic, in the Mesolithic they died out in North America and dwindled rapidly in Eurasia. Their last refuge was in the northern steppes between the Carpathians and western Mongolia, since in the dry and treeless steppes they were second to only the wild camel in their ability to survive. Thanks to their large, wide-set eyes, horses have a range of vision of about 300 degrees and are able to quickly spot almost any predator in an open landscape.

The further development and refinement of horse riding was a slow process. In the steppes bridle bits were originally made of organic material, such as wood or bone. In about 1200 BC, however, single-piece bronze bits started to be used. These enabled the rider

Two horses pull a light chariot; petroglyphs from Baga Oigor III, western Mongolia, late Bronze Age.

to steer the horse accurately and stop it in its tracks. Thanks to this newly gained control, he could enter battle on horseback. Like the solid bronze bit, the split, two-part bit was presumably invented in Egypt around the mid-second millennium BC; it was first introduced in the steppes beyond the northern Caucasus in the ninth century BC and from there it spread rapidly as far as Mongolia.[100] With it the rider could control his horse so well that he could simultaneously use the short recurve bow, whether riding forward into the wind or fleeing at a gallop, aiming the bow backwards at a pursuer and shooting with the wind. This tactic, called the Parthian shot, was mastered to perfection by the mounted archers of the Central Asian steppes.

At about the same time or somewhat earlier than the two-part bit the soft saddle made of cloth and leather appeared in eastern Central Asia, which Assyrian horsemen likewise used beginning in the ninth century BC. The horsemanship of the early mounted archers of Assyria appears to have been limited, however, as each bowman had to be accompanied by another rider, who held the reins of both horses. In this way they were inferior to the attacking steppe peoples of the Cimmerians and the Scythians, who were able to control their horses with their bodies and voices.[101] Another variant of 'two-man archery' was practised by Near Eastern warriors, who rode a camel in pairs, with the front man directing the animal and the rear man shooting.[102]

The oldest preserved riding saddle came from the south-eastern part of the Tarim Basin in north-western China. Here in 1985 in the cemetery of Zaghunluq near Qiemo Chinese archaeologists discovered the grave of a Europid man, approximately 50 years old, wearing wool trousers and felt boots. A leather saddle, as well as the skull and a hoof of a horse, had been laid beside him in the grave. The deceased was undoubtedly a horseman, who died around 800 BC and was accompanied into the afterlife by three women and an infant.[103]

Finally, the stirrup, combined with a solid saddle, was invented at the beginning of the fourth century AD in northern China, when Turko–Mongol steppe peoples began to conquer the area. The earliest representation of stirrups comes from a Chinese grave from 302 AD but this was in the form of a single short stirrup used as an aid for mounting. The first depiction of a complete stirrup pair comes from another grave, from 322 AD, and the oldest bronze stirrup was found in a grave of similar age containing the remains of a warrior of Xianbei, one of the nomadic federations of eastern Mongolia.[104] Such pairs of stirrups attached to saddles not only enabled riding in a squatting or almost standing position, which improved the rider's mobility, but also increased the impact of an attacking cavalry. They enabled armoured horsemen, sitting on likewise armoured horses, to attack with lances raised and support themselves with stretched legs against their saddles. It was the Xianbei tribe of the Toba that made a heavy, armoured cavalry the foundation of their army before the conquest of Northern China starting in 386 AD. The iron stirrup came to Europe only with the invading Avars in the second half of the sixth century.[105] The stirrup was not a requirement for the development of heavy cavalry, however, as the Scythians had begun protecting themselves with iron scale armour and lamellar shields beginning in the sixth/fifth century BC. At the same time, according to Herodotus, the horsemen of the Massagetae also covered the chests of their horses with bronze armour.[106] In combat the Saka and Massagetae first advanced with light cavalry or attacked repeatedly with lightning speed and released a hail of arrows at the enemy. This attacking force melted away as rapidly as it had struck, and moments later the heavy cavalry dealt the bewildered opponent the deathblow. The stirrup was also not a necessary condition for the introduction of long lances into cavalry, as can been seen in the armoured mounted warriors of the Sarmatians. The rider elite of the Sarmatians, who besieged the Scythians of the northern Pontic region as of the late fourth century BC, fought mainly with a lance of up to 5 m in length that they held in both hands.[107]

In most steppe nomadic cultures both girls and boys began to learn to ride at the age of three, growing into outstanding riders who constantly practised and refined their art in their everyday work of herding and hunting. 'Nature cannot bind the centaur more closely to his rear than the Hun sitting upon his horse', noted the Roman historian Claudianus (*ca.* 370– after 405 AD). In extreme cases every nomad, male and female, was a warrior from ages 15 to 30. The Chinese historian Sima Qian (*ca.* 145–*ca.* 87 BC) explained: 'The little boys start out by learning to ride sheep and shoot birds and rats with a bow and arrow, and when they get a little older they shoot foxes and hares, which are used for food. Thus all the young men are able to use a bow and act as armed cavalry in time of war.'[108] In the stockbreeding cultures of the Central Asian steppes women learned most of the skills that men did and sharing labour was necessary for survival, so that among the nomads social inequality between the sexes was much less pronounced than in agrarian or urban societies. To the nomad the idea of isolating his wife or wives in a house, as in urban civilisations, would be incomprehensible.

The riding and fighting abilities of the nomadic herders were necessary for survival as enemies often threatened to steal their herds. Besides, any increase in the size of the herd created a need for more grazing land and secure access to water, which extended the territory of a clan and increased the potential for conflict with other clans. For the nomads, everyday life was ideal training for warfare; because the handling of large, strong animals is more strenuous and dangerous than looking after plants, nomadic life prepared one much better for combat than did the settled life of the farmer. These skills were further developed by organised hunts. Leading large herds over sometimes unfamiliar territory also sharpened abilities in planning, coordination, and navigation. Now the horse changed from a hunted source of meat and milk to the vehicle of the steppe peoples. Nonetheless, during migrations and war horses were still used as food, whether a rider resorted to the emergency supply of dried horse meat that he carried in a saddlebag or opened the neck vein of a living animal and drank its blood.

The weapon system of the efficient cavalry emerged in the second half of the first millennium BC when horsemen no longer performed as heroic individual warriors but rather placed themselves under the command of a leader. He divided his riders into several disciplined bands, whose deployment he planned, coordinated and oversaw. Scythian, Sarmatian and later Hunnic bands of horsemen were able to maintain their cohesion during a battle and carry out tight shifts in direction on command. Combat was no free-for-all but rather a planned, corporate matter. During a campaign each mounted warrior had two or three horses, which he could ride in turn, so that such bands could move with extraordinary mobility and speed. This made them experts at surprise manoeuvres. The horsemen of the steppe were also masters of the feigned retreat from close combat. They would lead their pursuers on for days, so that they could stop and defeat the by-now disorganised enemy in a location of their choosing. The mounted warriors used the wide landscape as a tactical and strategic instrument; the armies of settled peoples usually found themselves completely at their mercy. It was this combination of skills with new technologies, honed in everyday life, and strategic leadership structures that made the bands of nomadic horsemen practically invincible for more than two millennia, except in the Mediterranean region.

The horsemen met their match in the disciplined and flexible Macedonian phalanx of armoured hoplites fighting with lances up to 6 m long, and against the Roman refinement of a phalanx divided into cohorts and thus even more flexible. As long as the phalanx maintained its fighting line and formation the horsemen made no headway and suffered severe losses. If the horsemen attacked with bows, the phalanx formed a dispersed and shallow line in an attempt to surround the horsemen or the Roman phalanx would alternatively take the tortoise formation. In this very tight formation the front and both side rows of soldiers held their long shields vertically up to their eyes in order to fully cover the front and sides and the soldiers further back would place their shields horizontally on the helmets of the front men. If the horsemen tried to advance on the infantry with drawn swords and battle axes in a shock attack, the soldiers immediately formed themselves into a dense phalanx with lances held forward that no riders could break through, or waited in the tortoise formation till the attack passed and then attacked themselves.[109] Alexander the Great's cavalry victories against Greek and Persian infantry formations stand as exceptions to this rule, attributed to his tactical genius and bravado. Alexander's extraordinary military skill also showed itself in the victories of the cavalry under his command over Bactrian, Sogdian and Saka cavalry units – victories in which the Greek spears played an important role.[110] Finally, as already mentioned, the humid climate with heavy rains that damaged or destroyed composite bows, and the dependence on grazing land for the horses, as well as on flat or rolling landscapes for the deployment of the mounted bands, remained their inherent weaknesses.

4.4 The invention of wheel and wagon

Two additional inventions not only encouraged the development of nomadic stockbreeding but also literally gave drive to human history. These are the wheel and the wagon, which required the interplay of three fundamental technological principles. These technologies developed independently of one another for uses other than the wagon. The first uses the principle of rotation of an axle and wheel, the basis of which was the potter's wheel. The second consisted of a flat bed resting on axles. A sled outfitted with skids,

of the type used in both Mesopotamia and the far north, could have been the forerunner of this invention. The third piece of knowledge was the use of animals for pulling.

It is not known where or by whom the wagon was invented, as the use of wheeled transport appears to have begun simultaneously around 3500 BC in connected regions within a vast territory stretching from Central Europe as far as Mesopotamia. This revolutionary technology must have spread very rapidly. Among the oldest certain discoveries are the clay cups in the form of a four-wheeled wagon from about 3500 BC from the Baden culture;[111] a depiction of a wagon on a funnel beaker from about 3500 BC from Bronocice, southern Poland;[112] wooden disc wheels from the Alps from the mid- to late fourth millennium BC;[113] and discoveries in peat bogs in Northern Europe from the end of the fourth millennium BC.[114] Further to the east, terra cotta vessels from the Tripolye Culture in the form of animals standing on two axles with four wheels, which date to the first half of the fourth millennium, testify if not directly to the use of wagons for transportation then certainly to the knowledge that objects could be pulled with axles and wheels.[115]

The importance of the wagon was shown by the discovery of a wagon grave of the Maikop Culture in the region of Kuban north-east of the Black Sea, presumably the oldest of its kind. In wagon graves a usually disassembled wagon was placed in the grave with the corpse, which had been brought to the burial on it. Presumably the wagon was an important status symbol and enabled the deceased to make the journey into the afterlife in a manner befitting his rank. The two solid wooden wheels from the kurgan of Starokorsunskaya in the Kuban region have been dated to the second half of the fourth millennium.[116] Soon thereafter the number of wagon burials in the Kuban region multiplied; of the nearly 200 wagon burials, with a total of 270 wagons, of the subsequent Novotitarovskaya Culture and the related Yamnaya Culture known today about half come from the Kuban region.[117]

About two millennia after the first wagon grave of Starokorsunskaya, the Chinese royal dynasties of the Shang (*ca*. sixteenth–eleventh century BC) and the Western Zhou (*ca*. eleventh century–771 BC) adopted this custom from the steppe peoples, as can be seen in the 41 wagon graves of the Shang. Thirty-seven of these graves appeared in the thirteenth to the eleventh centuries BC in the then imperial capital Anyang (today's Henan Province); in them single-axle chariots with spoked wheels, along with harnessed horses and charioteers, accompanied chiefs into the afterlife.[118] Three of the innovations of central China discovered in Anyang – wheeled transport, horse husbandry, and metallurgy – appeared all of a sudden in a highly developed form, which suggests that these skills were borrowed from the steppe cultures of Central Asia.[119] As in China, wagon graves also appeared in the Alpine regions of Central Europe in the thirteenth and twelfth centuries BC and, after an interruption, again in the eighth century and in the Hallstatt period.[120]

Regarding the much-cited evidence from the late fourth millennium BC for the invention of the wheel in Mesopotamia, these are either simply depictions of sleds on stone insignias and cylindrical seals or clay tablet pictograms of a sled that rests on wooden rollers or wheels. The earliest discoveries of actual wheels in Mesopotamia come from the first half of the third millennium BC – more than half a millennium later than the first finds from the Kuban region.[121] It appears that the technology of the wagon emerged in the north-western and eastern Pontic territory of the Tripolye and Maikop cultures and from there spread rapidly to central and southern Europe and Mesopotamia. The close trade relations between Maikop and Mesopotamia certainly contributed to the rapid transfer of technology to the south.[122]

In about 3200 BC[123] northern Central Asia began to experience drought and a climatic cooling. The wagon helped the stockbreeders, who until then were not fully mobile, to adapt successfully to the new ecological conditions. As drier grazing lands are more quickly threatened by overuse, the herders had to move their animals more

frequently. Thanks to wagons pulled usually by oxen but sometimes, beginning in the late third millennium BC, by harnessed camels, herders could take with them their modest possessions, supplies and simple tents. At the start of the first millennium BC at the latest the Scythians and their eastern forerunners perfected this kind of 'mobile home nomadism'. With their two- or three-axle wagons, pulled by oxen, they were able to carry with them their domed, yurt-like dwellings, made of felt and attached securely to the wagons, as well as their possessions and supplies, and to make wide-ranging use of the grass steppes.[124] On other wagons, the upper part of the wagon, covered with a barrel-shaped piece of felt tarpaulin, could be removed and reconstructed quickly on the ground.[125] The wagon and the riding horse allowed herders not only to manage large herds and retrieve straying animals but also to seek lush grazing lands and water sources over large distances. The wagon had an additional advantage, in that it did not have to be unloaded every night like a pack animal and goods stayed dry during rain without the need to set up special protection. As the increasing relative cooling, which was more pronounced in the east than in the west, forced the herders to seek warmer latitudes at least in the winter, there emerged a pattern of cyclical north–south migration. One result of this was that nomadic herders began to encroach on the territory of settled farmers.

Soon after the introduction of the wooden solid wheel and the three-part disc wheel, people sought to reduce its weight by hollowing out the discs and reducing the axles from two to just one. The breakthrough came with the introduction of the spoked wheel. This was not, as often assumed, invented in Mesopotamia, but rather in the Central Asia steppes east of the Urals. In wagon graves of the cultures of **Sintashta**, between the Rivers Ural and Tobol, and **Petrovka**, farther east in northern Kazakhstan, archaeologists discovered clear traces of spoked wheels as old as 4,100 years with eight to twelve spokes. They are about 200 years older than Anatolia's earliest seal impressions showing light chariots,[126] and 300 years older than the earliest evidence from Mesopotamia.[127] These funeral wagons of the Sintashta–Petrovka Culture are precursors of the light chariot, which is defined by two spoked wheels; a lightweight wagon body, open to the rear, which could carry at least a spear-throwing combatant; and a yoked harness for a team of horses controlled by bits. Both the light chariot on spoked wheels and the control by means of combined reins and bit, were inventions of the Eurasian steppe. Only with the invention of the light chariot with spoked wheels did the horse take on military significance.[128]

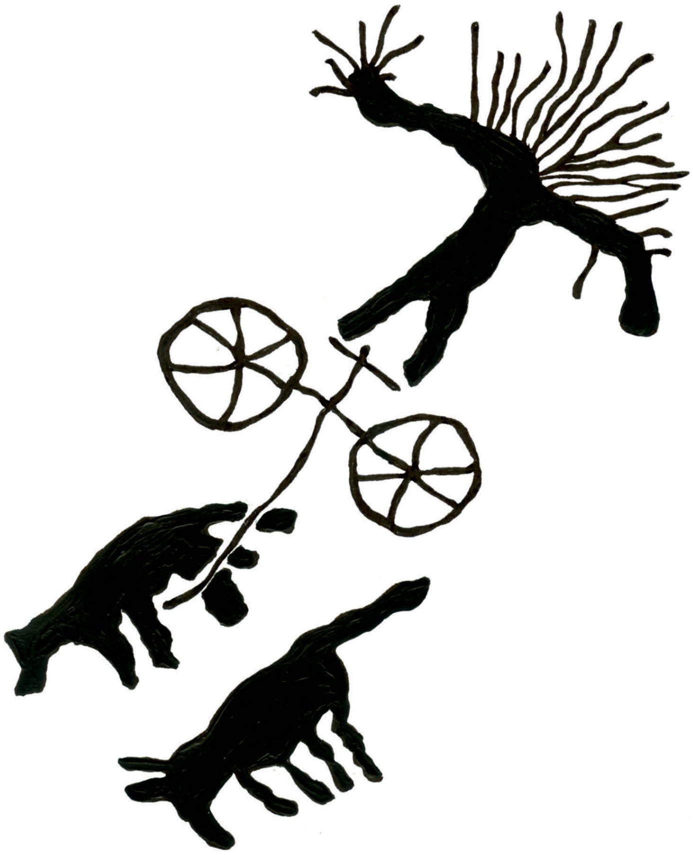
The chariot spread quickly from the steppe and reached a peak of its development in the Near East. From the eighteenth/seventeenth century BC in Egypt, the Hittite Kingdom and, to a lesser degree, in Assyria the chariot was one of the most prestigious and important implements of war. If the body of the chariot was small it carried only a single warrior, who either held the reins with one hand and threw spears with the other or wrapped the reins around his body and fought with a bow. Larger chariots normally carried two men; a driver and an archer. Because the wheels were attached to the axle independently of one another, they could move at different speeds when going around curves, enabling sharp turns. Chariots had the advantage over infantry of speed and surprise, as they could easily attack on the flanks or from the rear and could retreat just as quickly. They were suitable for carrying into battle a large quantity of 'one-way weapons' such as spears and arrows. On the other hand, chariots were highly vulnerable to salvos of enemy arrows and dependent on flat, dry land. Thus it should not be assumed that chariot battles took place on the grass steppes of Central Asia as they did in the Near East. In the grass steppes the chariot remained a means of transportation, also appropriate for raids and skirmishes, as well as an exclusive status symbol. When, in the ninth century BC, bands of mounted archers emerged in the Near East, they quickly superseded the chariot formations, since they were less vulnerable and more capable on rough terrain, as well as much more flexible.

The horse-drawn chariot was at the same time a fast means of transport, a dangerous weapon and an outstanding status symbol. It also had cultic functions, which is why it found a prominent place in art, even in impassable mountains at a height of 3,500 m above sea level, as in petroglyphs in the Pamirs or at Saimaly Tash in Kyrgyzstan. Interestingly, in the Near East chariots were usually portrayed in profile, while in the petroglyphs of Central Asia they are mostly shown in top view. This perspective resembled the view from above into an open grave, in which a chariot had been laid along with the sacrificed charioteer and horses in harness. In the petroglyphs of Central Asia all other depictions of people and animals are shown in profile, so such images of chariots can hardly be a coincidence. The chariot had symbolic significance as a grave good, presumably as a vehicle into the afterlife befitting the status of the deceased. In this way it was transformed into a cultic vehicle, which, depending on cultural emphases, took on different shadings of a common motif. In the steppes of Central Asia and in China it became a select vehicle for the dead; in northern Europe, the sun chariot, as in the sun chariot of Trundholm, Denmark; and in the Hellenistic territories of south-eastern Europe, as well as in the later Greco-Buddhist cosmology of Central Asia, it was the vehicle of the sun god.
In countless petroglyphs of Central Asia the spoked wheel also symbolised the sun, which was also the focus of a cult in Iron Age steppe cultures, such as the Massagetae, who sacrificed horses to the sun.[129]

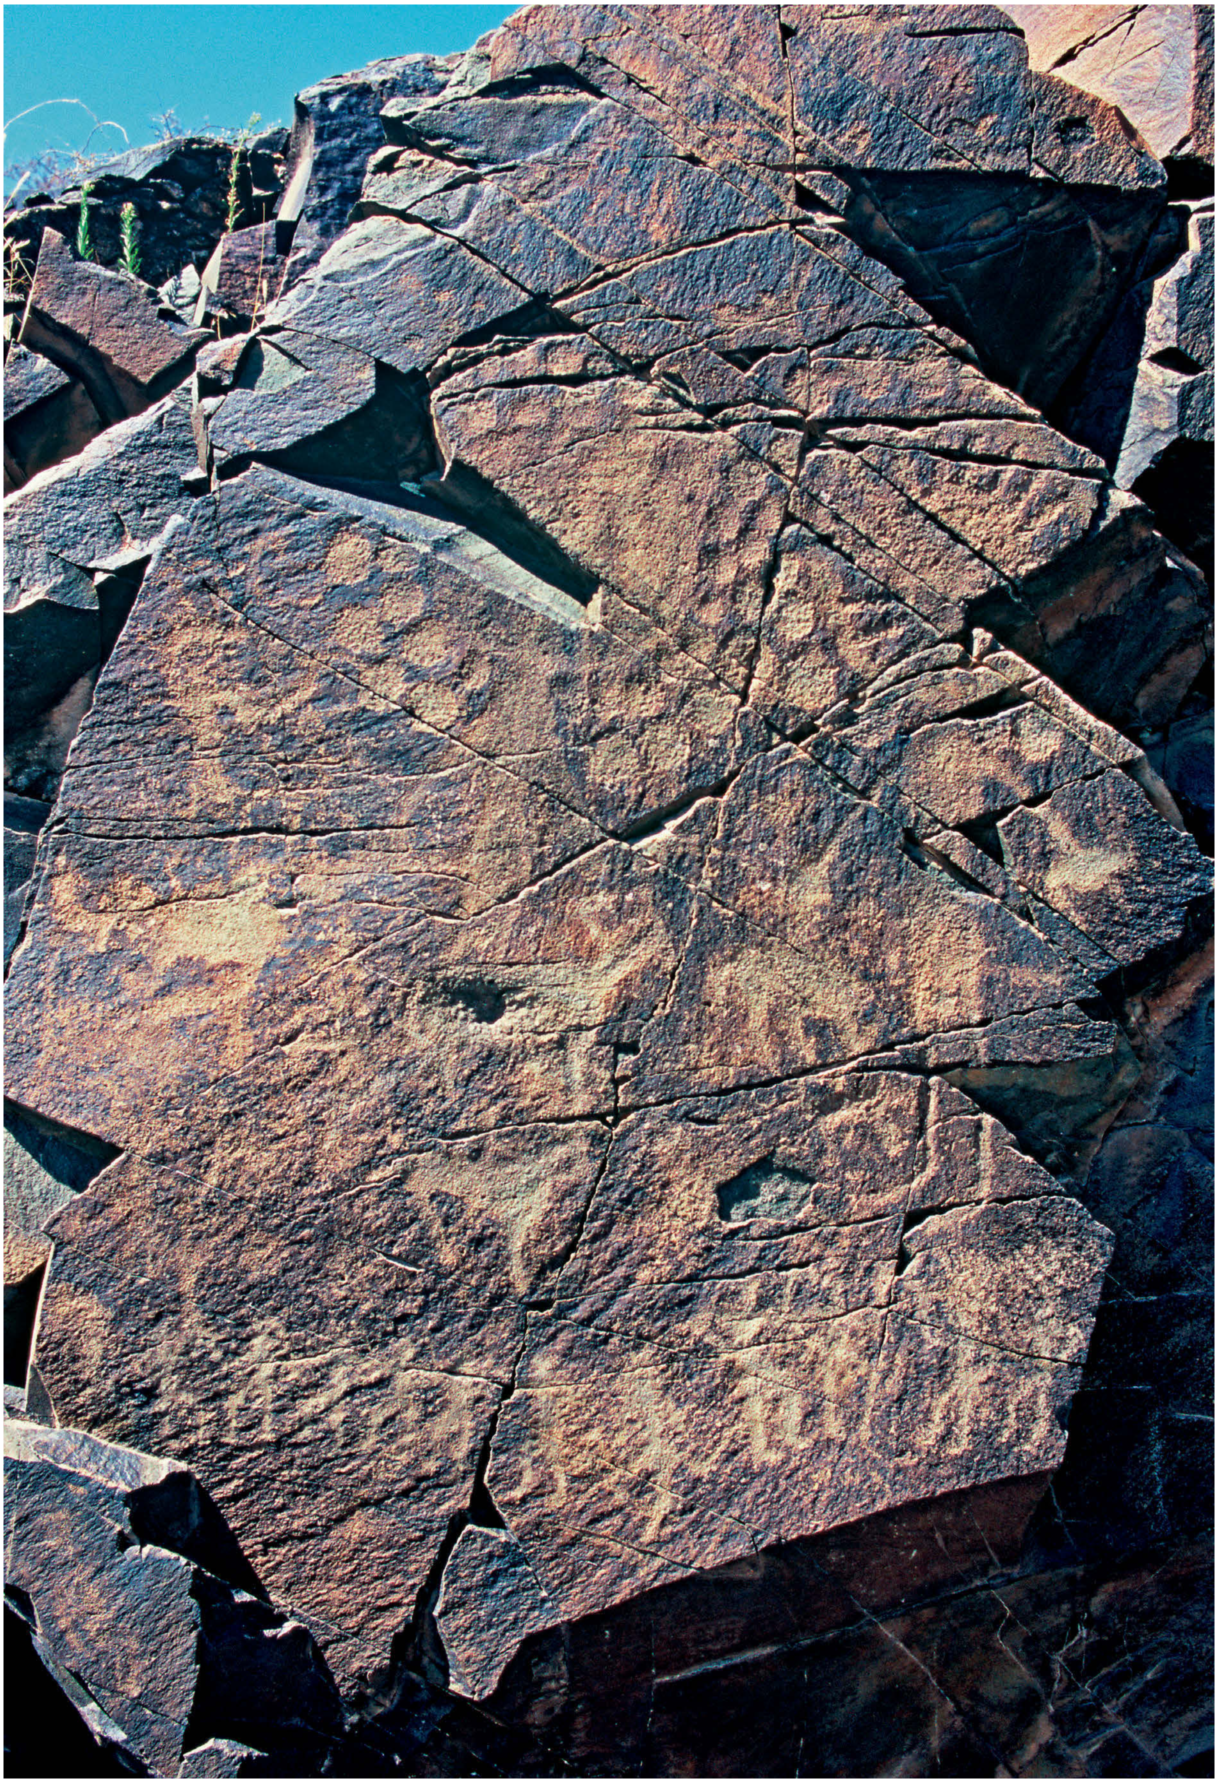
Finally, in the hymns of the Indian Rig Veda, composed in the late Bronze Age by speakers of an early Indo–European language, there resonates a bygone age of heroic charioteers and rich wagon burials, whose original homeland may have been in the cultural sphere of Sintashta–Petrovka.[130] In the Rig Veda not only do the most noble warriors fight in chariots, but the gods also ride them through the heavens; the sun god Surya, for instance, drives a wagon pulled by seven horses. In the Rig Veda the light chariot also serves as the metaphor par excellence for the nobility, as a hymn to the fire god Agni reveals: 'Him [Agni] have the Gods established at the region's base, doer of wondrous deeds, Herald of heaven and earth; Like a most famous chariot, Agni the purely bright, like Mithra to be glorified among the folk.'[131]

4.5 The culture of Maikop

The northern Caucasian **Maikop Culture** (3750–3000 BC), which superseded the settled agrarian culture of Svobodnoe and preceded the Yamnaya Culture, was in many regards groundbreaking. They probably invented bronze in a process of alloying arsenic and copper, were among the first to use two-axle, ox-drawn wagons, and introduced into the western steppes of Central Asia the large burial monuments called kurgans, reserved primarily for the elite and for warriors, along with certain rituals of sacrifice and grave goods. The Maikop Kurgan on the Belaya River was made between 3700 and 3400 BC and originally stood 11 m high with a diameter of 100 m. It was explored in 1897 by the archaeologist Vesolovskji, who discovered the mortal remains of an adult man in a grave



A man with a sun-like head drives a light chariot. Indian ink drawing of a petroglyph from Eshki Olmes, eastern Kazakhstan, Bronze Age.



Two sun figures stand above and 12 people dance below, petroglyphs from Tamgaly, southern Kazakhstan, Bronze Age.

covered with red ochre. He was clearly a high-ranking chief, as two women, presumably concubines, had been made to follow him into the grave. The site held rich grave goods. The deceased was laid under a baldachin supported by six or eight narrow poles, four of which were decorated with figurines of bulls with long horns. Two of these were made of solid gold and two of solid silver, crafted using a lost wax process. It is notable that the Russian scholar Rostovtzeff recognised as early as 1913 that the burial style of a 'grave tent', widespread among the Iron Age Scythians and described by Herodotus, traced back to the great kurgan of Maikop.[132] In a few of the burial chambers the walls and floor were plastered, perhaps to create a sacral reproduction of a house.[133]

The head of the deceased was adorned with a diadem of golden rosettes, most likely an import from the culture of Uruk in Mesopotamia. There were also decorated silver vessels and vases imported from Mesopotamia; small gold discs in the form of lions and bulls sewn onto clothing; weapons made of arsenic bronze; and necklaces with turquoise from north-eastern Iran and Tajikistan, red carnelian beads from western Pakistan, or lapis lazuli perhaps from Badakhshan in northern Afghanistan.[134] All of these discoveries attest to the wide-ranging trade relations of Maikop, which also served as the contact zone between the Tripolye Culture and the dynamic urban culture of Uruk.[135] The burial ritual of the Central Asian stockbreeding elite, fully in evidence for the first time at Maikop, consisted of a grand burial with the sacrifice of associated persons and horses, as well as the deposit of grave goods. These included weapons, jewellery, and, until some time in the middle of the second millennium BC, light chariots, over which an earth or stone mound was erected. In the cultures of Yamnaya and Sintashta–Petrovka, which followed Maikop, this burial practice and the worldview associated with it spread throughout northern Central Asia.

Interestingly, similar but still more spectacular grand burials took place in Ur, Mesopotamia, at the time of the Early Dynastic IIIA period (*ca*. 2600–2500 BC), in which concubines, musicians, soldiers and ox- and donkey-drawn wagons accompanied the king into the afterlife. The burials of Mesopotamia were embedded in a different worldview, however, founded on cyclically recurring agricultural events. Just as the plants die each autumn and sprout anew the following spring, Dumuzi, lover of the fertility and war goddess Inana, dies at the end of the year and is reborn in the spring. Presumably the royal burials of Ur are to be understood as representations of such myths.[136]

The heyday of Maikop coincided with that of Uruk from 3700 to 3100 BC. Regular trade occurred between the two cultures, driven by Uruk's insatiable appetite for ore, bronze bars and gemstones. In exchange the elite of Maikop obtained finished gold and silver jewellery from Uruk. Maikop was not only an important hub on the trade routes of Mesopotamia to the east and west; a fascinating mixed culture also developed there, as semi-nomadic stockbreeders took over the legacy of a settled agrarian culture. Maikop society was based on the raising of cattle, pigs, sheep, a few horses, and some cultivation of the land; the dead of the elite were buried in sites that were periodically visited. Evidence of this life style is gleaned from the fact that in the cultural sphere of Maikop about 150 necropolises have been discovered, but only 30 small settlements of sunken and round houses.[137]

The culture of Maikop also took part in the 'fibre revolution' of the second half of the fourth millennium BC, when in Mesopotamia wool from sheep began to replace flax in the production of textiles. This change had the great advantage of freeing high-quality soil from the cultivation of flax in favour of crops. It also meant that otherwise unusable land could be used for the rapidly growing herds of sheep. This gave rise to the new job of shepherd, often taken by women or children. Archaeological finds alone cannot tell us whether sheep were first raised for wool in Mesopotamia or the northern Caucasus, partly because this new technology spread very quickly. In any case, robust wool sheep were bred at the same time in Maikop and Mesopotamia, and in the kurgan of Novosvobodnaya 2 archaeologists discovered the earliest wool fragment.[138] The culture of **Kura–Araxes** (3500–1900 BC), originally located in the north-eastern and central Caucasus, served as intermediary between Maikop and Mesopotamia. Discoveries on the western coast of the Caspian Sea show that the Kura–Araxes people were influenced by the steppe culture of Maikop, constructing kurgans as well as flat graves.

4.6 The Yamnaya–Afanasievo Cultural Complex

At about the time the Maikop Culture was at its peak the **Yamnaya Culture** (*ca*. 3300–2250 BC) emerged on the Don and the Volga. The Russian word 'yama' means 'pit' and refers to the typical burial style, in which the dead rested in a pit-like grave. Hence this culture is also called the 'pit grave culture'.[139] It developed out of the horse- and stockbreeding culture of **Repin** on the middle Don (3600–2900 BC)[140] and the neighbouring culture of **Late Khvalinsk** (3800–3300 BC). In terms of lifestyle the Don represented a boundary within the Yamnaya Culture, since west of the river archaeological remains of partially fortified settlements indicate a sedentary community, while east of the Don the signs of settlement disappear, suggesting a semi-nomadic stockbreeding economy. The Yamnaya culture and its semi-nomadic form of economy represents an adaptation to an ecological crisis around 3500–3300 BC, when a change to a significantly cooler and drier climate led to a loss of agricultural production west of the Don and to sparser steppes east of the Don. These new baseline conditions forced the mostly settled livestock- and horse-breeders between the Don and the Volga to change the grazing lands for the herds more often; they had to shift to a semi-nomadic herding lifestyle. They transported their dwellings, possessions and supplies on two-axle wagons drawn by oxen and, perhaps starting early in the third millennium BC, they began to watch over their herds on horseback. In isolated, more humid forest regions, however, the cultivation of crops still took place.[141]

This semi-nomadic economy of the fourth to second millennium BC, in which the herders returned each winter to their grazing lands on a valley floor, is fundamentally different from the Iron Age nomadism of the first millennium BC, when Scythian and Sarmatian nomadic horsemen swept across the Eurasian steppes with their herds and wagons and often without a fixed home.

As a consequence of the absence of clear signs of settlements, the Yamnaya Culture is defined by its thousands of burial sites. The great necropolises lie in the open steppe near lush grazing lands, where the herders regularly brought their herds in particular seasons. The concentration of final resting spots in certain places indicates that the semi-nomadic herders organised their lives according to a defined system, coordinated with other clans and groups, and changed their grazing lands along established routes, following the rhythm of the seasons. The dead were buried on their backs with knees bent. Both the body and the ground were covered with ochre, which is why the Yamnaya Culture is also called the ochre grave culture.[142] Laid beside the dead were elongated, egg-shaped ceramic vessels of a yellowish colour, bone needles, and daggers and axes made of flint or bronze, as well as the skulls and bones of sacrificed sheep, cattle, and dogs. For chiefs or warriors, a wagon and a horse were sometimes also placed in the grave. In some cases anthropomorphic stone steles from earlier cultures were reused to close the burial chamber. Finally a kurgan of stone and earth was built over primary burials. This was not the case for secondary burials when additional dead were buried in the same kurgan, as many kurgans were used over decades or even centuries.

Around 3100 BC representatives of the Yamnaya Culture began to spread to the west and south-west, infiltrating the Circumpontic Region of the erstwhile culture of Srednyi Stog and the territory of Usatovo, until they reached the Carpathians and the lower Danube valley. The lack of archaeological evidence of destruction suggests that this migration of Yamnaya herders happened without significant warfare, and moreover, that the local settled populations adopted the economy of the newcomers.[143] The archaeologist and anthropologist David Anthony believes that this migration of Yamnaya people, whose homeland is identical to that of the proto-Indo–European language, was the vehicle for the rapid expansion of archaic western Indo–European dialects, out of which developed proto-Germanic, proto-Italic and proto-Celtic.[144] Anthony also believes that the migrants also took up elements of settled agrarian cultures, as can be seen from their burial rituals. In the west they encountered cultures that had female deities and buried statuettes of women beside the dead. This may explain why there are considerably more burials of women in the western part of the Yamnaya culture than in the east, where almost exclusively men and children were buried in the kurgans. This inequality changed, however, in the second half of the first millennium BC, the time of the Scythians, Sauromatians and Sarmatians – whose highest deity, Tabiti, was female. For example, some 20 percent of the Sauromatian kurgans with weapons as grave goods dating from this time held female 'Amazons', who, like male warriors, were buried armed and ready for battle.[145]

More than 3,300 km east of the origin of the Yamnaya Culture and at about the same time the **Afanasievo Culture** (*ca*. 3300–2350 BC) flourished in the Minusinsk Basin of southern Siberia. Its name is derived from Afanasyeva Gora in Khakassia, where the first three graves of this culture were excavated in 1920.[146] Although it is often considered a distant branch of the Yamnaya Culture, new carbon-14 analyses suggest that Afanasievo emerged at least contemporaneously if not somewhat earlier than the pit grave culture.[147] Anthony proposes that a group from the Repin Culture broke off and turned east before the establishment of the Yamnaya Culture, perhaps in a quest for new grazing lands or ore mines, which they found in abundance in the Minusinsk Basin and in the Altai. They settled here and brought to the local hunters and fishermen the skills of raising horned cattle and horses, as well as metallurgy and the construction of wagons. Out of this arose the culture of Afanasievo, which is considered by most Russian scholars to be the first real metal steppe culture east of the Urals.[148] Since these migrants came into contact with the Botai Culture while crossing the northern Kazakh steppe, it is not surprising that a few elements of this horse-hunting and -breeding culture found their way into the Afanasievo culture.[149]

The burial customs of the Afanasievo and Yamnaya cultures are so similar that one can speak of a widespread cultural complex. The dead were laid on their backs with knees bent in a rectangular pit, which was covered by a very low earth or stone kurgan; this was encircled by a cromlech or a rectangular stone fence. The dead and the floor of the burial chamber were sprinkled with ochre. Small vessels for smoke offerings in the form of footed bowls, clay vessels with pointed bases, metal items, the occasional wagon, and the bones of sheep, cattle and horses served as grave goods. The bones have been interpreted as the remains of a funeral feast that took place as part of the burial.[150]

The far-reaching correspondence between the material discoveries of the Afanasievo Culture and that of the Yamnaya suggests that its representatives were also Europids, and this has been confirmed by mitochondrial DNA and craniological analyses.[151] As in the case of the Yamnaya peoples who advanced to the west, those that moved east brought with them not only their economic and cultural forms but also their proto-Indo–European dialects. The splitting off of the proto-Tocharian language from proto-Indo–European followed after 3500 or 3400 BC, and it spread toward the end of the third millennium BC as far as the Tarim Basin in Xinjiang in north-western China. The early expansion of the Indo–Europeans far to the east explains why the Tocharian language did not implement many linguistic innovations of the Indo-Iranian language family, which was close to Tocharian in a geographical sense. In linguistic terms the proto-Tocharians were separate from all other Indo–Europeans from the second half of the fourth millennium BC onward.[152]

Early in the second half of the third millennium BC the pendulum of ethnic migrations swung back for the first time. After the spread of the Europids from the Volga as far as the Yenissei on the border of western Mongolia, Mongolid groups of the northern Siberian type advanced slowly to the west and began to exert pressure on the Europids in the Minusinsk Basin, where they developed the Okunev Culture (2400–1750 BC). Perhaps this migration of foreign groups provoked the ancestors of the proto-Tocharians to move southwards and settle towards the end of the third millennium BC in the Tarim Basin.

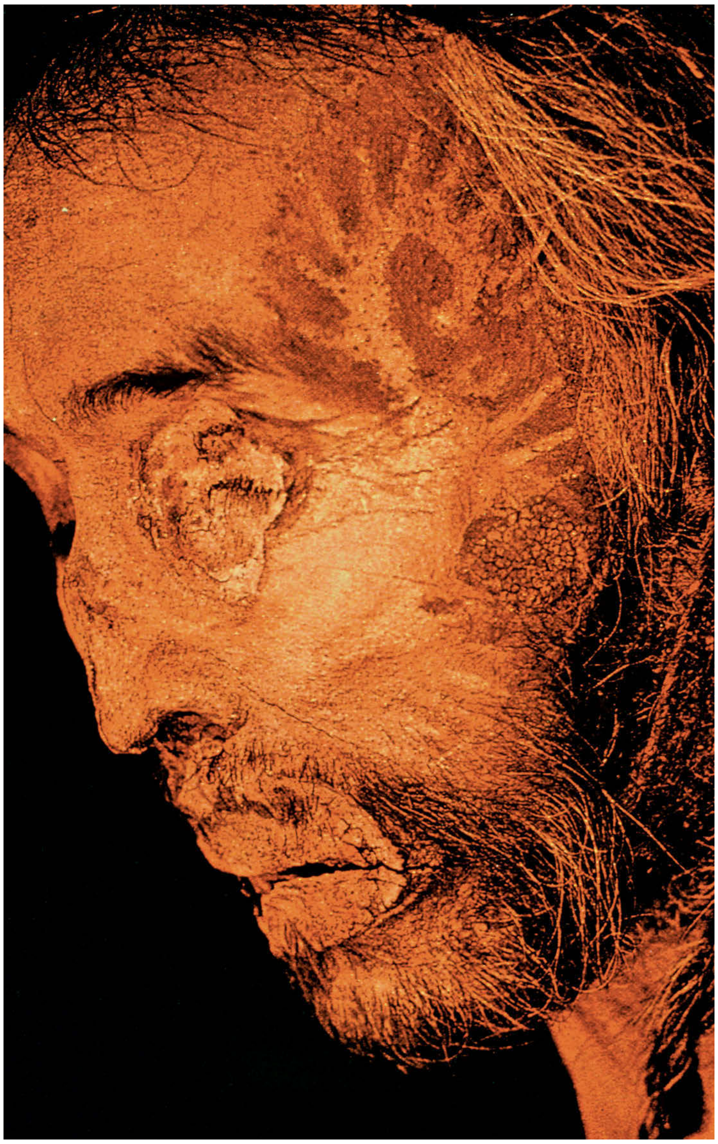
4.7 Sun deities and horse sacrifices

As a consequence of the lack of written sources we know little about the religious ideas of the Afanasievo Culture and its successors, apart from the fact that its representatives presumably worshipped the sun. The stone slabs of the cists[153] of Karakol in the Altai, which date to around 2400 BC and thus belong to the transition period from Afanasievo to Okunev (2400–1750 BC) provide one clue. These slabs were reused in the graves of the Okunev Culture and in earlier times stood as free-standing steles. Painted on them in red ochre, soot and black and white minerals are coloured portrayals of anthropomorphic and theriomorphic (in animal form) standing figures, whose heads are decorated with sunbeams and feathers and who can be interpreted as sun deities.[154] As the paintings were found on the inside of the cists, they were turned towards the dead and also had a ritual purpose.

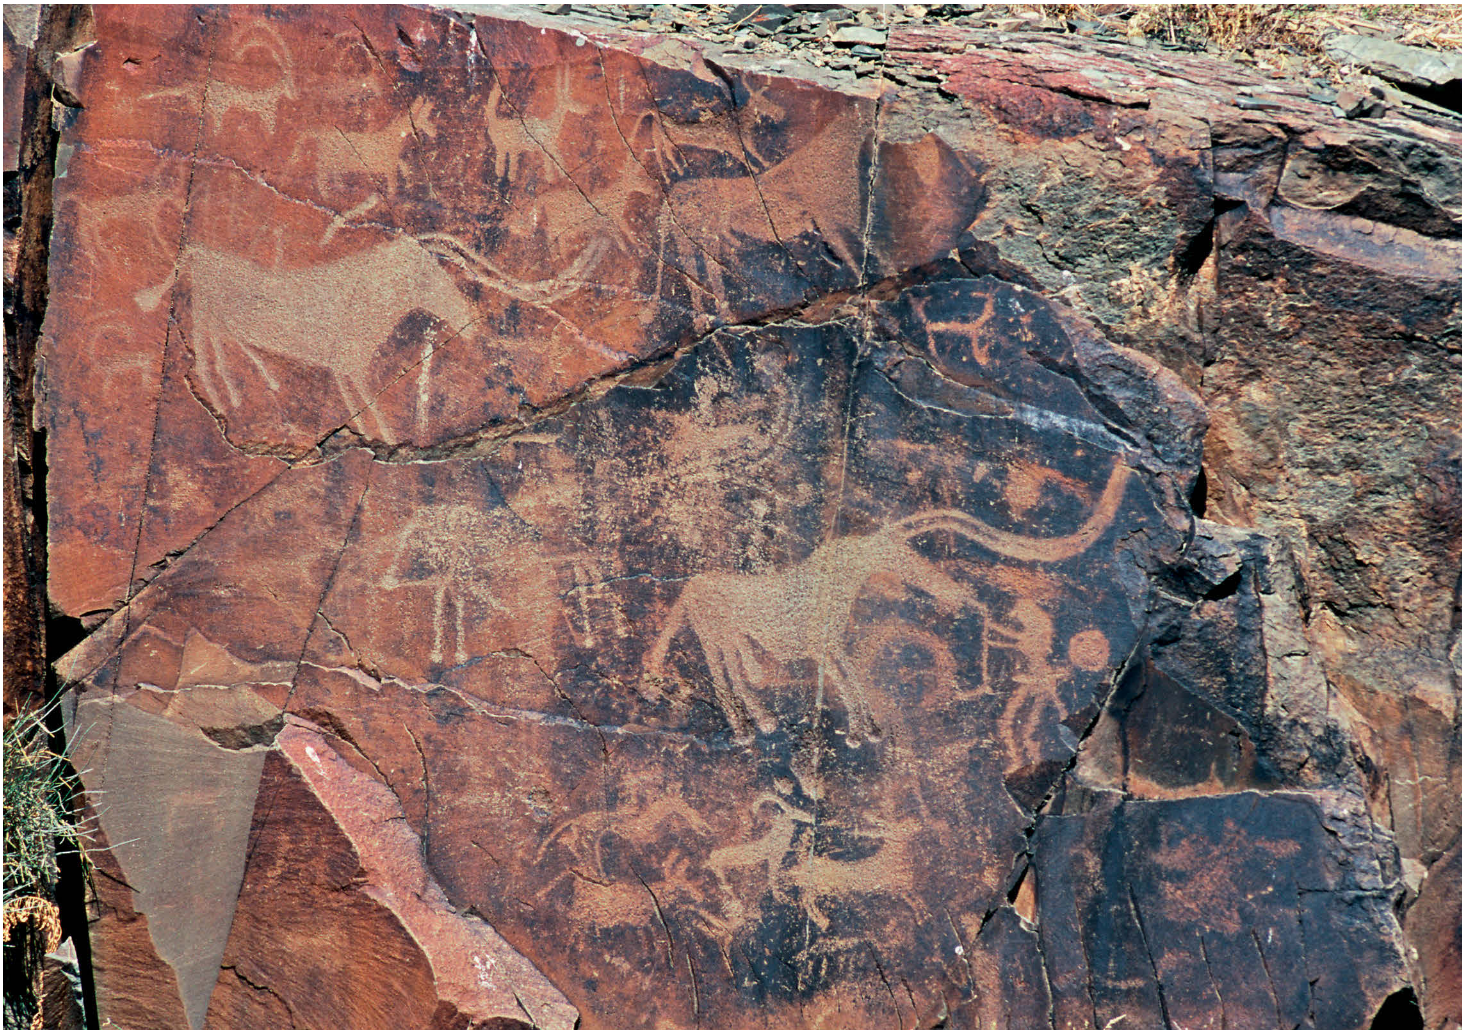


Sun symbols painted with ochre decorate the temples of a naturally mummified Europid corpse. Necropolis of Zaghunluq, grave M 2, Xinjiang, north-western China, *ca.* 800 BC. Xinjiang Uyghurs Autonomous Region Museum, Urumqi.

The motif of an anthropomorphic figure with a sun-like head was widespread not only on the steles of the Okunev Culture based in the Basin of Minusinsk[155] but also in the petroglyphs of the subsequent cultural complex of Andronovo (widely defined *ca.* 2200–1250 BC), which extended from the Urals to the Altai and was related to the proto-Indo–Iranian language and the Indo–Aryans. Such stone engravings are found in Kazakhstan and in the Altai, for example in Eshki Olmes[156] (eastern Kazakhstan) and in Elangash[157] (Russian Altai), where in each case a 'sun figure' drives a chariot, calling up associations with the Indian sun god Surya. In Saimaly Tash (Kyrgyzstan) and in the open-air shrines of Tamgaly in southern Kazakhstan sun figures are chiselled into the rock in several places, whether alone or as part of a lively scene in which twelve armed, Lilliputian people dance before two large sun figures.[158] It was not only humans who were portrayed with sun-like heads, however, but also such animals as deer, mountain goats, and perhaps oxen, with the sun disc placed either over the animal's head or at the end of its horns.[159]

A few scholars have linked these apparent sun deities with the ancient Indo-Iranian god Mithra.[160] In the Vedas the god of fairness and contracts, Mithra, brings forth the morning light and is correspondingly invoked at dawn in the Rig Veda.[161] In the Zoroastrian scriptures Mithra is not identified with the sun god but rather venerated as the god of truth and contracts. Later, at the time of the Iranian Parthians (247 BC–224 AD) and the Sassanids (224–651 AD), he was also worshipped as the sun god. In images he drives a chariot pulled by white horses or wears a crown of sunbeams. In the Avesta he is glorified as the 'lord of wide pastures', who drives 'a high-wheeled chariot … drawn by fiery horses', which indicates an origin in a stockbreeding culture that used horse-drawn transport.[162] Finally, Mithra enjoyed great popularity in the Roman Empire, especially in the army, where he was worshipped as Sol invictus Mithras, 'invincible sun god Mithra'. It is quite possible that the idea of a male sun and light deity had its origin in the Central Asian cultural spheres of Afanasievo, Okunev and Andronovo.

Further traces of a sun cult practised by the Indo–Europeans can be found in the eastern Tarim Basin in north-western China, such as in the 3,600- to 3,800-year-old necropolis of Gumugou. Here there are six burial chambers in each case located below a ring of wooden poles tightly placed next to each other and four to seven deep. Around this 'hub' stand seven to nine additional concentric circles of thicker wooden poles, placed further apart. Seen from above, they look like rays streaming outwards from the ring-shaped



In the centre, an anthropomorphic figure uses a Bronze Age axe to kill a stallion with large horns, Bronze Age. The small rider figure on the sacrificed stallion was engraved later. Petroglyphs from Tamgaly, southern Kazakhstan.

centre – the sun symbolism is obvious. As in Gumugou, *ca.* 2,800-year-old Europids were buried in Zaghunluq. A sun symbol is drawn with ochre on the temples of the naturally mummified rider buried with his saddle, mentioned above.[163]

The petroglyphs of Tamgaly also show a burial ritual widespread in the steppes of Central Asia, which played an important role in the religious ideas of the Indo–Europeans. In at least two scenes an anthropomorphic figure kills a horned horse with a typical Bronze Age axe.[164] Horse sacrifices on the occasion of the burial of members of the upper class have been found over a span of nearly 6,000 years, from the steppe cultures of Khvalinsk and Maikop to the Mongol peoples of the late Middle Ages. Besides archaeological discoveries, written sources from Herodotus (*ca.* 484–424 BC) to Rubruk (*ca.* 1215–1270) report the sacrifice of horses at such burials. Particularly informative are the descriptions by Herodotus of horse sacrifices among the Iron Age Scythians and the Massagetae, who lived east of the Caspian Sea. Archaeological finds in dozens of kurgans between the Altai and the Black Sea have confirmed Herodotus' detailed accounts of the burial rites of Scythian kings, but with regard to the Massagetae he directly describes the sun cult and the horse sacrifices: 'The only god they worship is the sun, to which they sacrifice horses: the idea behind this is to offer the swiftest of mortal creatures to the swiftest of the gods.'[165]

The ritual of horse sacrifice, including corresponding grave goods, was fully developed at the latest in the culture of Sintashta (2200–1700 BC), the early form of the Andronovo Culture, east of the Urals.[166] These burial rituals form a surprising link to the Rig Veda. The horse sacrifice described in the Rig Veda, which was performed not at a royal burial but rather by a living ruler to acquire power and glory, recalls the archaeological discoveries made in the elite graves of Sintashta, so that one may surmise a common proto-Indo-Iranian ritual heritage.[167]

The Middle and Late Bronze Age

A talent for following the ways of yesterday is not sufficient to improve the world of today.

KING WULING OF ZHAO, when in 307 BC he introduced mounted archers to replace war chariots[1]

1. The Bactria–Margiana Archaeological Complex BMAC

The concept of a Bactria–Margiana Archaeological Complex, abbreviated BMAC, from the Middle and Late Bronze Age, is attributed to the Russian archaeologist of Greek descent Viktor Sarianidi (b. 1929), who has since 1972 led groundbreaking excavations in the ancient delta of the Murgab River in the Kara Kum Desert of Turkmenistan. This complex was an oasis culture that flourished from about 2300/2200 to 1500 BC along rivers in the mostly arid regions of Turkmenistan, southern Uzbekistan, western Tajikistan and northern Afghanistan. The last three areas are subsumed under the term 'Bactria' and the first, farthest west region is called 'Margiana'. The cultural region of the third and second millennia BC known as Bactria extended along both sides of the ancient Oxus.[2]

The heart of Margiana was the broad ancient Murgab delta, north of the medieval city of Merv. 'Margiana' is the Greek version of the Persian name Margush, which is mentioned in the famous trilingual inscription of Bisotun, Iran, dating from about 516 BC. In the Old Persian, Elamite and Babylonian text, King Darius I (r. 522–486 BC) glories in his victory over the princes and provinces that had rebelled against his elevation to the throne: 'I'm Darius, the king: the country of Margush became rebellious. They chose one man, a Margushian, with the name of Frada to be their chief. Later I sent for a Persian, Dadarshish by name, my slave and satrap of Bactria, and told him: "Go and defeat that army." [...] By the grace of Ahura Mazda, my army smashed the rebellious army.'[3] The extent to which the Achaemenid Margush corresponds to the Bronze Age Margiana is unclear.[4]

This culture of Bactria–Margiana arose between 2300 and 2200 BC when migrants from the Kopet Dag–Tejen oasis system, who brought with them their irrigation techniques and elements of the material culture of Namazga IV and V, mingled peacefully with the local inhabitants, who lived in the early Chalcolithic stage of Namazga III.[5] The corresponding discoveries of ceramics in the style typical of the early Namazga V stage contradict the proposal put forward by Sarianidi that these immigrants came from Iran or even northern Mesopotamia. The similarities that do exist between discoveries from the BMAC culture and some from the Mesopotamian cultural sphere are explained by intensive trade contact, without the necessity to resort to unsubstantiated theories of migration.[6] In the oases of Margiana the migrants from southern Turkmenistan found fertile soil, which allowed both the cultivation of millet and various types of wheat and the raising of sheep, goats, horned cattle and camels. Most oases also offered inexhaustible sources of free building material in the form of alluvial clay, which they mixed with water and ashes as a degreaser and, using a wooden mould, produced standardised, air-dried bricks. In Margiana no expensive, water-resistant, fired bricks were produced, unlike in Mesopotamia where they were used to build irrigation canals. Another material basis for this culture was the rich mineral lodes in the east, where certain settlements, such as Sapalli in southern

Uzbekistan and Dashli in northern Afghanistan, were located. Great stores of gold, silver, tin, copper, lead, and gemstones like lapis lazuli and turquoise were found here, enabling a profitable and enduring trade with Iran and Mesopotamia, as well as the Indus Valley.

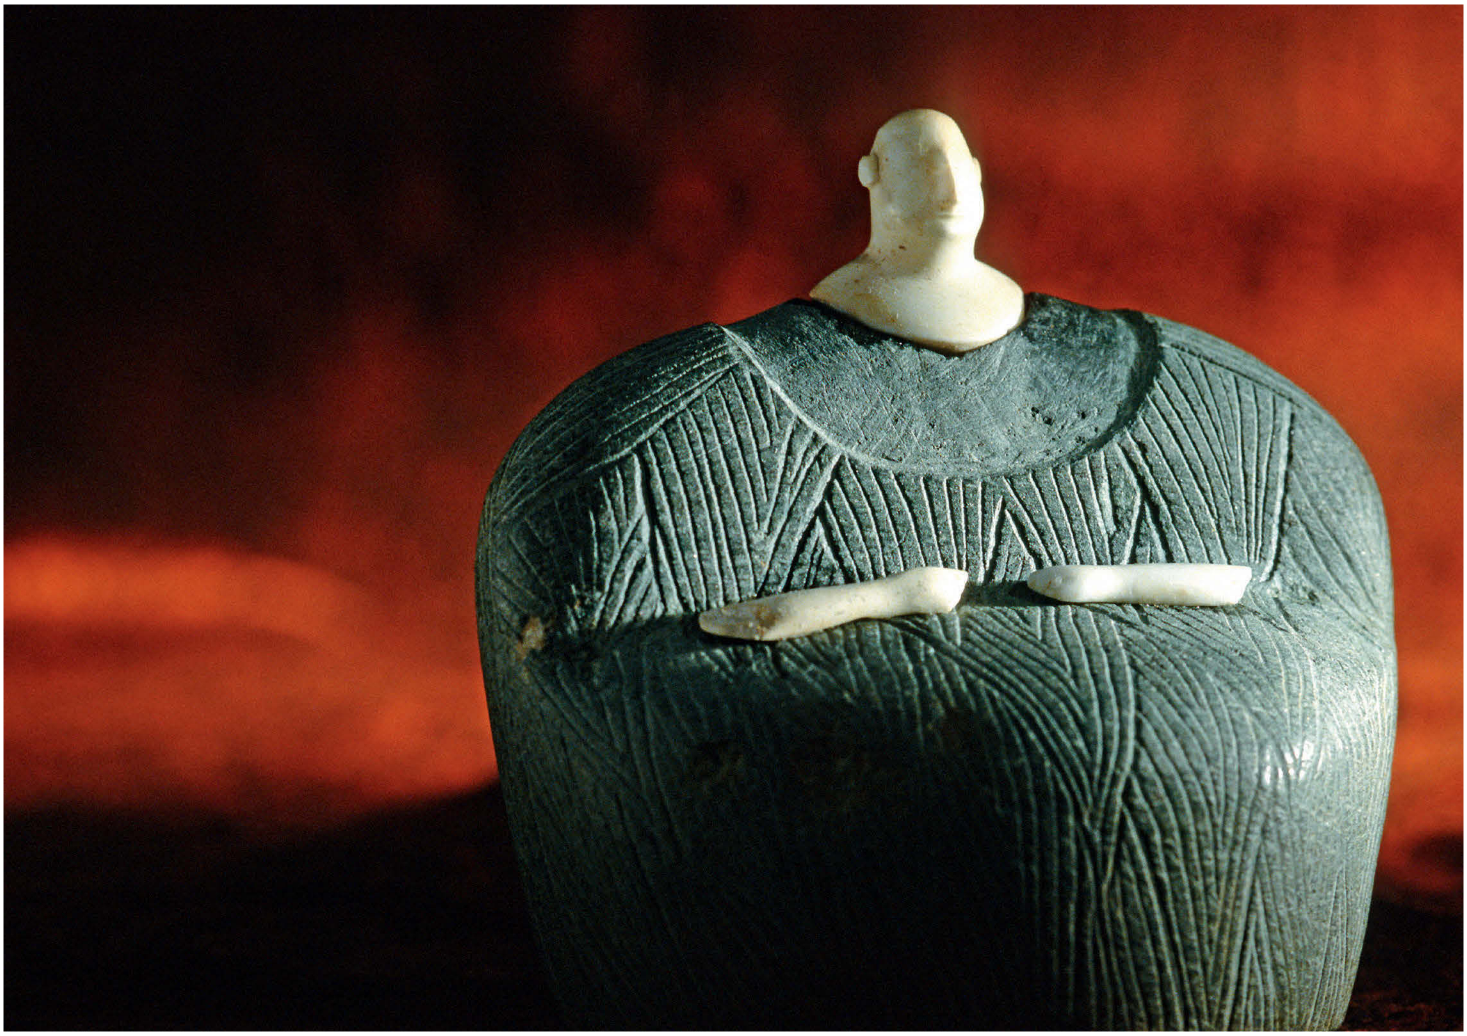
1.1 The BMAC Culture of Margiana

Because of comparable hydrological and tectonic conditions in the Murgab delta and the region of Geoksyur, the settlement history of Margiana followed a course similar to that of Geoksyur 1,500 years earlier. Over the course of the last 4,000 years, small tectonic disturbances and dramatic changes in the River Murgab's course as a consequence of sedimentation, combined with increasing aridity in the region where the river rises, have caused it to shift about 40 to 45 km to the south and the desert to advance accordingly.[8] Thus the settlements followed the water and likewise moved south.

The urban Margiana Culture can be divided into three Bronze Age periods, followed by the three Jaz-Periods, of which the last two extend far into the Iron Age:[9]

I. Period of Kelleli

The earliest, initially unfortified settlement of the BMAC is that of **Kelleli**, the farthest north in the delta. The ceramic objects found here represent transition forms from the classical Namazga V period of the Kopet Dag-Tejen oasis culture and the later ceramics of Gonur. In addition to finely crafted vessels made on the potter's wheel, Sarianidi discovered terra cotta female figurines, as well as statuettes of rams, goats and cattle, that all accorded with finds from the Kopet Dag-Tejen oasis culture. Since ceramics from the late phase of this first period have been found spread over the entire delta, from rich finds in Kelleli in the north to the occasional piece in the lowest level of Togolok 1 in the south, it may be conjectured



Female composite figurine from Gonur Tepe, Turkmenistan, *ca.* 2000–1650 BC. The body consists of soapstone; head and forearms are of limestone. National Museum of Turkmenistan, Ashgabat.

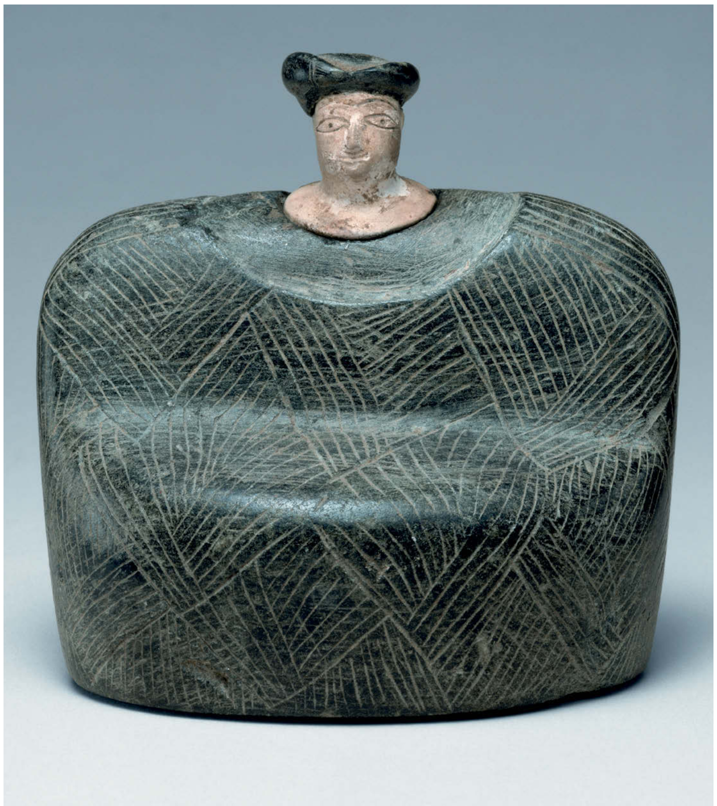
that towards the end of the Kelleli period the whole delta was settled by representatives of the same cultural form.[10]

II. The period of Gonur

At the turn of the third and second millennium BC the fortified settlements of **Gonur**, about 30 ha in size, arose 50 km south-east of Kelleli. Gonur was divided into a large northern and a smaller southern mound. In the centre of **Gonur North** rose a mighty fortress made of clay bricks, 120 x 115 m in extent. Its walls were reinforced by 20 rectangular towers. Inside the citadel archaeologists discovered along the inner walls small buildings with relatively few hearths, which presumably served as housing for members of a particular profession, such as administrators or civil servants, and were also used for storage. They also found a regularly laid out, clearly planned complex of monumental architecture and smaller spaces. The elite of the oasis probably lived here, along with its ruler, so Sarianidi interpreted this complex as the palace of the prince, whose authority may have extended to the entire delta.[11] In any case, such monumental architecture within a citadel indicates a hierarchically ordered societal structure. Residential quarters were found along the outer walls of the citadel. Here each house had its own hearth. This quarter was protected by another defensive wall 180 m by 170 m, with rectangular towers. Gonur North represents a forerunner of the classical structure of medieval urban architecture in eastern Central Asia, which consisted of a residential quarter, called *shahristan*, within a city wall, and a more fortified citadel, called *kala* or *ark*. The widely scattered buildings lying outside the second wall are comparable to the outer quarters called *rabat*.

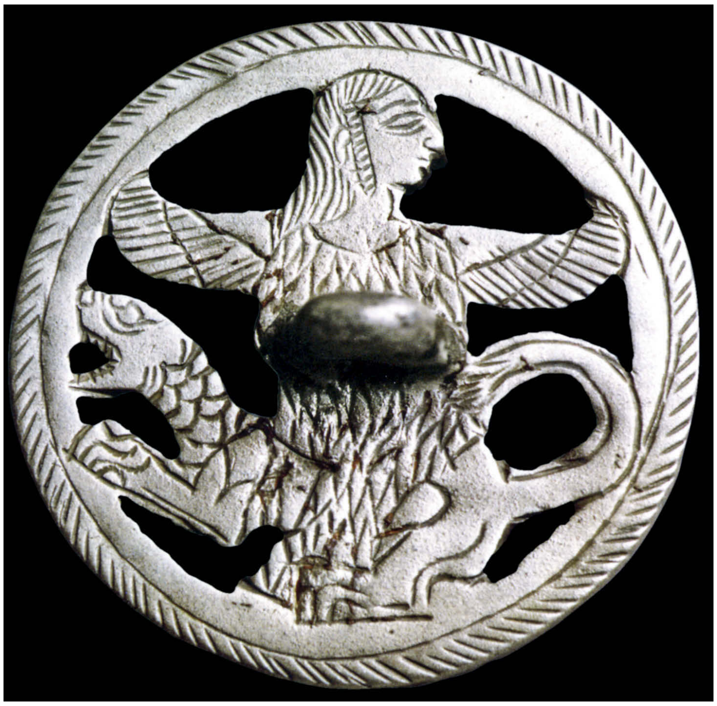
The complex of **Gonur South** was built somewhat later than Gonur North and consists of a walled parallelogram with sides of 115 m, with the outer wall fortified with 12 round towers. In the centre rose a square citadel, 65 x 65 m in area. The outer wall of this citadel had round towers at the corners and a projecting entrance bulwark on each side, also guarded by two round towers.[12] Rectangular towers are easier to build than round ones but have a more limited firing line and can be undermined and destroyed more easily than round towers. As in the earlier Kopet Dag-Tejen oasis culture, in the early layers of Gonur South graves and cenotaphs – grave-like structures that honour dead not buried there – were found under the buildings. Sarianidi interpreted Gonur South as a temple site, but today the complex is understood as a mature settlement that included both residential areas and workshops.[13]

Both settlements of Gonur came to a sudden end: the northern part burned down between 1700 and 1600 BC,[14] and the southern site was abruptly abandoned during the same time period. Discoveries of storehouses with full clay vessels, valuable stone mortars, and unfired pottery beside kilns indicate that the people fled in great haste.[15] The simultaneous increase in crude, handcrafted ceramics, of the kind common in the steppe culture of Andronovo – and especially its variant, the culture of Tazabagyab south of the Aral Sea – suggests that the demise of the BMAC Culture in Gonur was connected to the invasion of semi-nomadic representatives of the Andronovo Culture. These people spoke an Indo–Iranian or Indo–Aryan dialect.[16] This rough pottery of the Andronovo steppe culture had already begun to spread to Gonur a century before the settlement's fall, however, so Vadim Masson is probably right to suggest that there was a 'mutual interaction of two cultural worlds – the sedentary civilisation of the Bronze Age and the steppe tribes of herdsmen/farmers'.[17] The attacks from the steppes and the likely change in the course of the Murgab left the once-fertile land of Gonur desolate.



Female composite figurine, Bactria–Margiana, *ca.* 2000–1650 BC. The body and the hat consist of soapstone; the head is made from limestone. The Metropolitan Museum of Art, New York.

The construction of strong defensive walls is likewise an indication of an early threat from the north. About a millennium later, when the Murgab delta and with it the centre of an agro-urban culture had shifted about 50 km south to Merv,



Silver seal from Gonur Tepe, Turkmenistan, *ca*. 2000–1650 BC. A winged deity wearing a kaunakes, perhaps the Sumerian fertility goddess Inana or the war goddess Ishtar, rides a hybrid creature, part panther and part snake. National Museum of Turkmenistan, Ashgabat.

oasis dwellers used walls not only to protect their cities from marauding steppe horsemen but also to guard their most important agricultural lands. Strabo reports that the Seleucid King Antiochus Soter (r. 281–261 BC) had the expanded city and its fertile surroundings enclosed by a wall measuring 1,500 Roman stadia, equivalent to 278 km.[18] Such walls also served as a dam against advancing sand and prevented encroachment by the surrounding desert. The archaeologist Frederik Hiebert assumed that the central citadel of Gonur South had been built or rebuilt on the ruins of the settlement after its abandonment, so he assigned the building to the post-BMAC culture. Such citadels, like the neighbouring one of Togolok 21, were later converted into storehouses and hostels, becoming the caravanserais of the Silk Roads of Central Asia.[19]

Both complexes, Gonur North and Gonur South, stood, like nearly all other settlements in the delta, on natural rises not suitable for agriculture. A system that paid attention to maximising the use of arable land, oversaw the construction and operation of a capillary-like irrigation system, and carried on a wide-ranging trade network required governmental structures with a single ruler at the head. The irrigation system was complex; it consisted of a 50-km main channel, from which side channels extended to water a cultivated area of approximately 45 x 20 km. The basic requirement for the existence of a state is a controlled social organisation that holds power for an extended time, whether legitimately or by means of force, and can prevent splits along tribal lines. Social development in Gonur also showed signs of later economic shifts, so that the source of prosperity and wealth was no longer agriculture but rather trade.

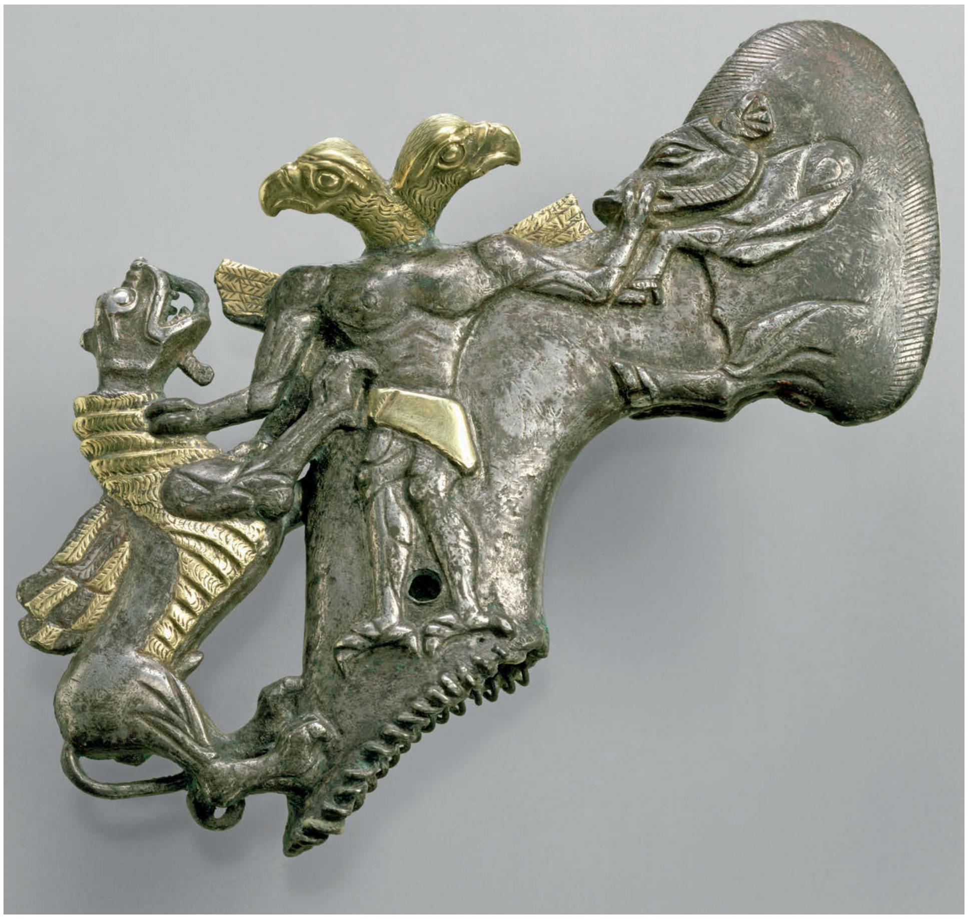
In Gonur Sarianidi discovered two cemeteries, a large one with thousands of graves, where the common people found their final resting place, and, in 2004, a much smaller one for the elite. In both necropolises the tombs mimicked the houses of the living, with a table in the centre of the room, a bench along one wall, shelves holding pottery, and a hearth. At both sites the graves served as family crypts that could be opened and closed as needed. A dromos or entrance corridor led to the seven excavated elite graves, which were 30 x 40 m in size and sometimes had several chambers. Although nearly all the graves of both cemeteries had already been plundered in ancient times, the elite graves still show signs of the coloured mosaics that decorated the walls and clay coffers. An Egyptian makeup pencil made of ivory discovered here and a seal from Harappa, engraved with an elephant and an inscription that was found in the residential district of Gonur, offer evidence of the international trade network.

Four elite graves contain extraordinary treasures, including two complete two-axle wagons in two graves and a single-axle cart in each of the other two. A camel was harnessed to one of the wagons, two camels to another one. All of the vehicles had large wooden disc wheels, reinforced by bronze fittings. Whether the practice of wagon burial was adopted from the steppe peoples to their north or from trading partners in Mesopotamia is not clear from the evidence, but the solid disc wheels and the absence of horse bones, with the exception of a sacrificed foal, points to Mesopotamia.[20] In one of the wagon graves the skeletons of ten young men lay beside the wagon; in a second the bones of 15 adults were mixed in with those of various animals such as camels, oxen, and dogs, and in the third grave – no. 3900, excavated in spring 2009, seven men and seven dogs were buried. Since neither grave appears to contain a primary person, they must either be cenotaphs or, as Sarianidi proposes, the remains of a ritual sacrifice, in which the still-living prince was only symbolically represented.[21]

As in the earlier period of Kelleli, in Gonur and the neighbouring oasis of Adji Kui fine polychrome ceramics, fashioned on the potter's wheel, were discovered, as were zoomorphic and anthropomorphic figurines. Among the latter were flat female statuettes, of the type familiar from Kelleli and Altyn Tepe. Many of them display a bird-shaped head with eyes slit sideways and a beak-like nose. The female figurines had a purely domestic protective function, as they were found in practically every house but in only three of nearly 4,000 excavated graves.[22] In the late phase of Gonur there appeared for the first time flat male figurines with similarly birdlike faces, which may signal a religious paradigm shift.[23]

The polar opposites of the flat female statuettes were the 8- to 15-cm-tall seated composite figures of matronly, full-figured women, whose bodies and head coverings were made of green steatite or chlorite, with heads and lower arms of chalk or marble and eyes of lapis lazuli. The women wear a so-called kaunakes, a typical Sumerian cloak of Mesopotamia, made of either sheep- or goatskin or sheep's wool, which was woven into a feather- or leaf-like pattern. The kaunakes was worn not only in Mesopotamian Sumer (*ca*. 2800–2000 BC) but also in neighbouring Elam in south-western Iran. About 40 such stone female figurines from Margiana and Bactria are known, of which 11 came from excavations and the remainder from the antiquities market.[24] The only complete figurine was found in 2001; it lay in an unplundered grave in Gonur, immediately behind the head of a 30- to 35-year-old woman.[25]

While the source of inspiration for such composite figures is to be found far to the west, where they had spread as far as Ebla,



Silver ceremonial axe with a shaft hole, decorated with gold inlays, Bactria–Margiana, twenty-first to twentieth century BC. A winged man with talons and two raptors' heads tames a winged lion and a boar. The Metropolitan Museum of Art, New York.

Lord and Mistress of animals

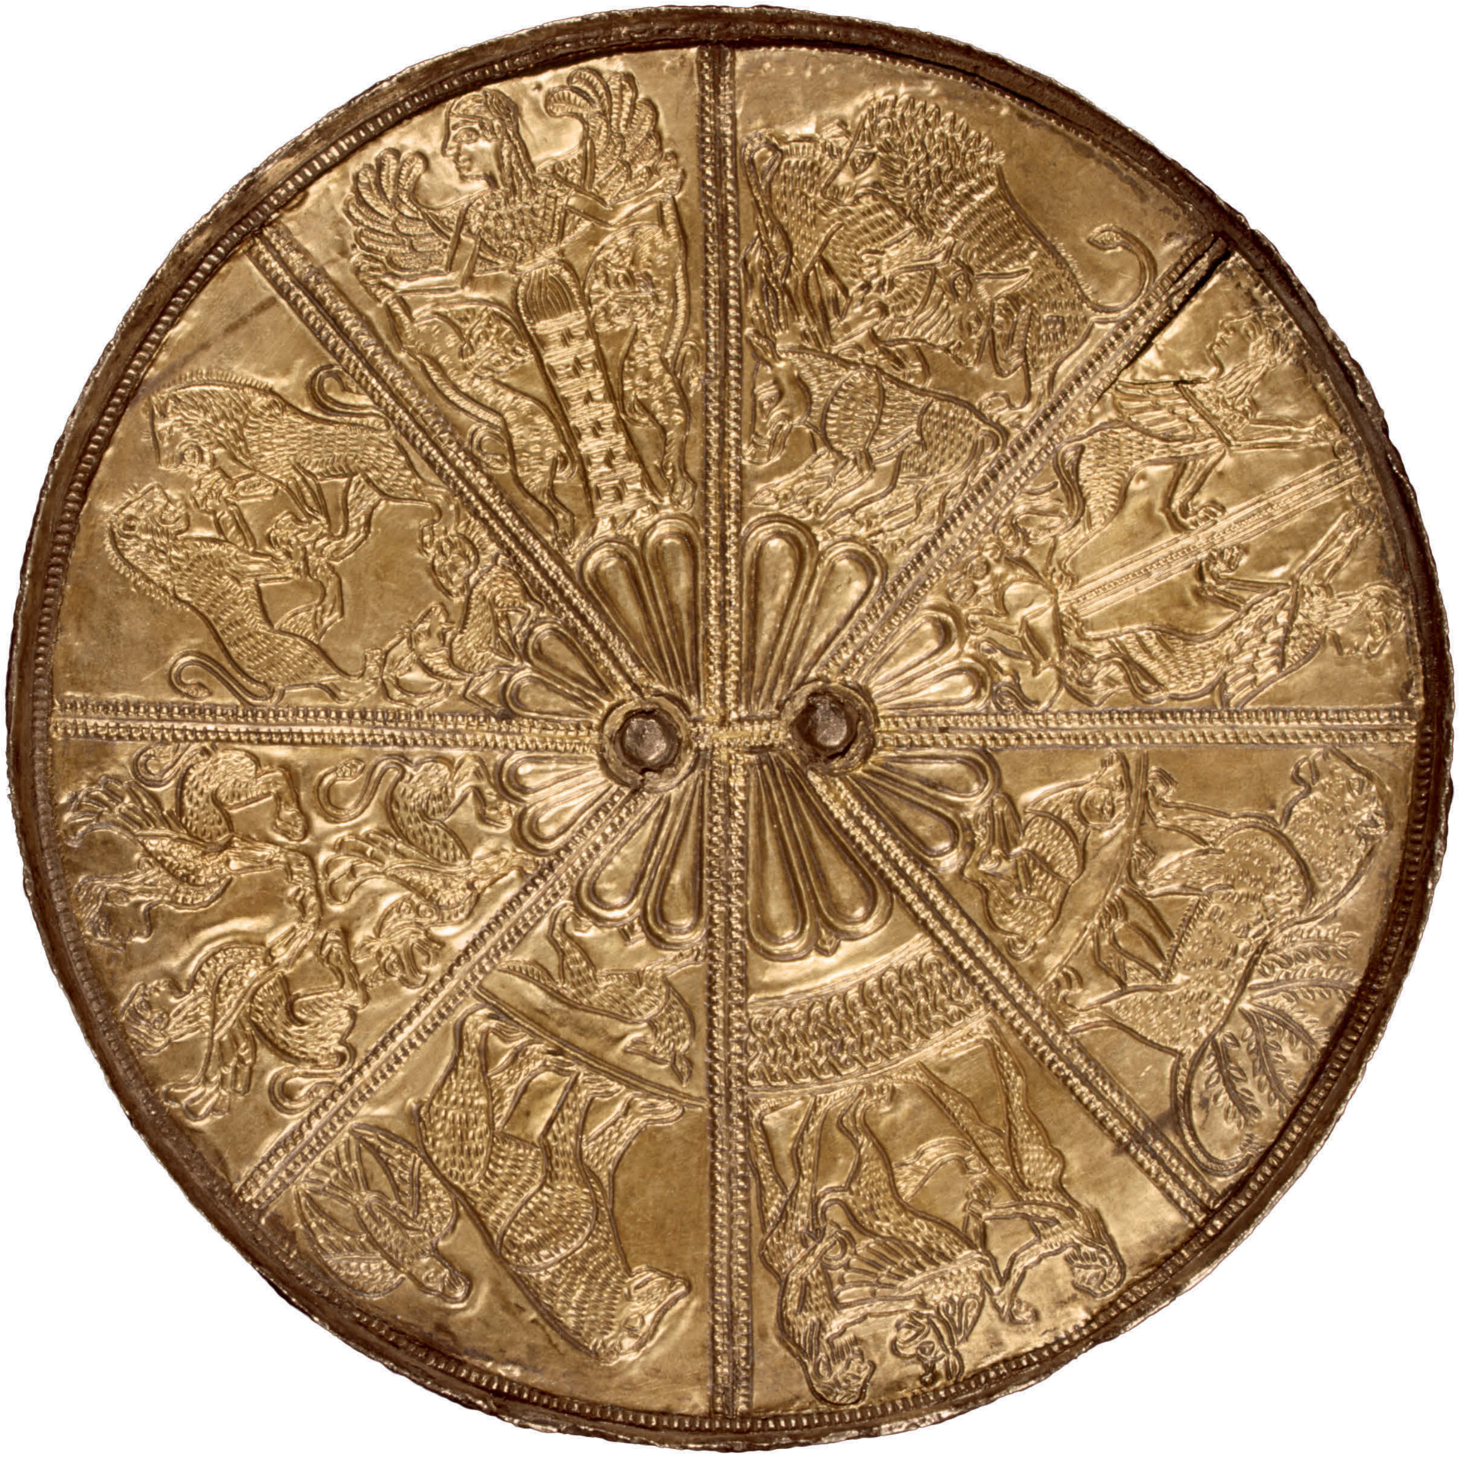
The motif of an anthropomorphic being standing between two or, rarely, among four or six animals represents an archetype that was known in pre-Christian times throughout Eurasia, from southern Italy to Mongolia, and presumably arose in Mesopotamia. Among the earliest portrayals is a 5,000-year-old cylinder seal from Uruk, on which a ruler stands between two goats, a tree of life sprouting from his shoulders.[26] Around the middle of the third millennium BC the motif took on a mythological dimension, as the semi-divine and semi-legendary king of Uruk, Gilgamesh, was depicted as the sovereign and invincible lord of animals. On the great lyre from the royal grave of Ur he holds two bulls with human heads, standing on their hind legs, and the bearded, anthropomorphic heads of the animals display the same features as Gilgamesh's face, indicating the closeness between the demigod and the two animals.[27] Additional images on the lyre likewise make reference to the BMAC Culture, since they show animals performing human religious activities. Similar scenes are found on cylinder seals from Margiana.[28]

On a Sumerian cylinder seal from the second half of the third millennium BC, however, Gilgamesh stands on two winged lions with crowned, bearded human heads and with each outstretched arm he holds a living lion by the hind leg.[29] In south-eastern Iran at the time unique vessels and weights were made of engraved green chlorite; their particular decoration is referred to as Intercultural Style.[30] The lord of the animals is portrayed in many variations on several vessels. For instance, he is standing on two lions and holding two snakes or standing on the ground while holding two panthers, snakes, or humped oxen.[31] The lord of animals can also himself appear in animal form, however, for example as an eagle subduing two snakes.[32] Portrayals of the lord of the animals were also quite popular in the first half of the first millennium BC in western Iranian Luristan, a centre for the production of metal snaffle bits.[33]

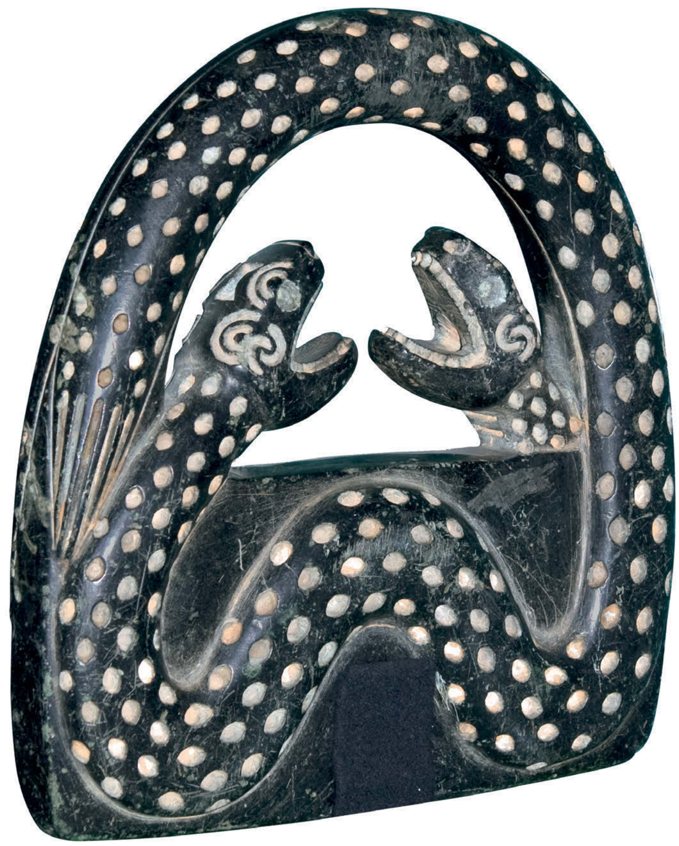
In the Near East in the second half of the second millennium BC a spectacular form of the mistress of the animals appeared.[34] This was the goddess Asherah, who was glorified in inscriptions from the ninth–eighth century BC as the wife of the Israelite god Yahweh.[35] On a gold disc from Ugarit she stands on a lion and holds two ibexes firmly in hand, while two snakes appear behind her hips. On a pyxis lid from Ugarit dating to the thirteenth century BC, she takes the form of the fertility goddess Astarte with a naked upper body and feeds two ibexes.[36] We find a similar composition on the famous 'Grächwil hydria' (570 BC), a bronze water jar from southern Italy. Here the mistress of the animals tames four lions, two rabbits, two snakes and an eagle. The animals symbolise the three spheres of life: the bird of prey, air; the lions and rabbits, earth; and the snakes, the connection to the underworld.[37] Familiar goddesses of antiquity that included aspects of the 'mistress of animals' were Artemis and Cybele.[38]

In the east this motif appeared in Bronze Age petroglyphs from Oglakhty,[39] Minusinsk and Tsagaan Salaa as well as in the Sirven Mountains of the southern Mongolian Gobi Desert, where the lord of the animals stood between two powerful yaks. These portrayals were presumably related to hunting rituals. In the context of these hunting cultures, the human being stands *in* nature, not *over* nature. Animals have souls and deserve respect; they may be killed only for food or clothing. Purposeless hunting is forbidden and could lead to the disappearance of wild game because the souls of animals that had been killed but not used could refuse to be reincarnated in the same area. In the same way the bones of slain animals were to be handled with reverence. Finally, the motif of a man taming two birds of prey can also be found on clay and soapstone seals of the Indus Valley Culture.[40] These seals were produced locally, but the motif originated in Mesopotamia, which did brisk trade with the cities of the Indus.

The motif later enjoyed popularity, in both its male and female forms, among the horse-riding peoples of the Saka and the Scythians, as several gravesites show. Among these is the famous silver mirror of Kelermes, decorated on the back with electrum – an alloy of gold and silver. It was uncovered in 1903 in the burial site 'Kurgan 4', of a Scythian prince north of Maikop. One of the eight triangular electrum sections, which form a universal cosmogram, shows a winged mistress of animals holding two big cats. The mirror was produced between 650 and 620 BC by a Greek-Ionian or Lydian workshop for the Scythian market.[41] Also spectacular are two finds from a small cemetery on the south-eastern edge of Central Asia in Tillya Tepe in northern Afghanistan. Here Sarianidi discovered the graves of an Alan prince of the Kangju tribal group and his five sacrificed wives. The graves contained two pairs of gold pendants with turquoise, lapis lazuli and garnet inlays from the first century AD. One pair portrays a mistress of animals with two wolves, and the other a lord of the animals with two dragons.[42] In Christianity, finally, the motif acquired new symbolic meaning in the depiction of Daniel in the lion's den. The Christianised archetype symbolised the victory of the righteous man over the powers of death – in a certain sense, the resurrection of the individual.[43]



The reverse of the silver mirror of Kelermes, decorated with sheets made of electrum, a gold-silver alloy, which was manufactured in Greek Ionia or Lydia. Kuban region, south-western Russia, around 650–620 BC. In the eight triangular segments, moving clockwise from the upper left, the following scenes are portrayed: the winged mistress of animals holds two panthers; a lion attacks a bull standing on the back of a boar; two winged hybrid creatures made up of predatory cats and women's heads turned backwards flank an Ionic column, while a small panther crouches beneath them; a powerful leopard stands on a crouching ram; two bearded men with thick hair or dressed in pelts attack a griffin. The scene presumably illustrates a story referred to by Herodotus in which the Arimaspi in the far east tried to steal gold guarded by griffins. In the next segment a bird of prey flies over a large bear, which stands over a small dog; two sitting sphinxes face each other above a winged griffin and two lions standing on their hind legs confront each other over an ibex. The State Hermitage Museum, St. Petersburg.



Weight or amulet made of dark green chlorite in the 'Intercultural Style', Soch, Fergana region, eastern Uzbekistan, second half of the third millennium BC. On each side the handle is formed by a snake with a wide-open mouth. Historical Museum of Uzbekistan, Tashkent.

Syria, as early as 2400 to 2300 BC,[44] similar seated or standing female figures were depicted on Elamite silver vases of the same time. R. Ghirsman identified a slender standing female figure, clad in a kaunakes, as the Elamite goddess of war and victory, Narunde, and a crouching, voluptuous figure, by contrast, as the fertility and mother goddess Pinikir.[45] Presumably the composite figurines of Margiana and Bactria were examples of the latter.

Another female deity with Near Eastern roots can be seen on a silver seal found in a grave of Gonur in 1998.[46] On it a winged woman, wearing a kaunakes, sits backwards on a kind of dragon, consisting of a panther's body and a snake's head with an open mouth. She could be the Sumerian fertility goddess Inana or the related war goddess Ishtar, whose symbol was the lion and who was often portrayed with outstretched wings.[47] On another, gold seal – made, like the silver example, using the lost-wax process – two lions flank the winged, standing goddess Ishtar. In the mid-first millennium AD Inana/Ishtar became the Sogdian goddess Nana, who rode a lion and played an important role in the territory of northern Bactria.[48]

The pantheon of Margiana and Bactria also included male deities who tamed wild animals and had one or even two bird heads. One such hybrid is portrayed on both sides of a silver-gilt shaft-hole axe from the twenty-first or twentieth century BC. In the centre stands a winged man with two raptor heads and bird talons, wearing only a loincloth. With one arm, which ends not in a human hand but in three claws of a bird of prey, he manhandles a boar, which forms the cheek of the axe; with the other, he holds at bay a winged lion with bared teeth.[49] This man-animal hybrid is complex. He surely belongs among the various portrayals of the 'lord of animals', the archetypal image of a dominant human asserting power over animals and nature. Since here, as also in the vast majority of depictions of the 'lord' or 'mistress of animals', the tamed animals are living rather than dead. This archetype does not symbolise final victory of good over evil, as with St George slaying the dragon, but rather is related to the lifecycle of plants over the course of the seasons and with the royal responsibility to maintain order within cosmic chaos. By subduing instead of killing these two dangerous animals, the 'lord of animals' forces them to become his helpers. The owners of such ceremonial axes may have believed that they could partake in the extraordinary powers of the 'lord of animals'.

Similar ceremonial axes appeared in Elam and Mesopotamia and have been interpreted by H.-P. Francfort as symbols of power.[50] The winged hybrid of a human with the head of a raptor, which is also found in Bactrian metal and clay seals,[51] resembles the winged genies with eagles' heads of the Syrian-Anatolian world.[52] Such figures also appeared in the significantly later Neo-Assyrian Empire.[53] Another possible interpretation suggests the mythical first king of Sumer, Etana. He rode on the back of an eagle searching for a magical fertility plant to enable his childless queen to bear him a son. The myth of Etana developed around 2300 BC, at the same time as the epic of Gilgamesh, who in turn was figuratively depicted as the sovereign lord of the animals. On the basis of the selected examples it is clear that Bactria and Margiana were in close cultural contact with Elam and Mesopotamia, some 1,500 km away, and figuratively expressed religious and mythical content from them independently.

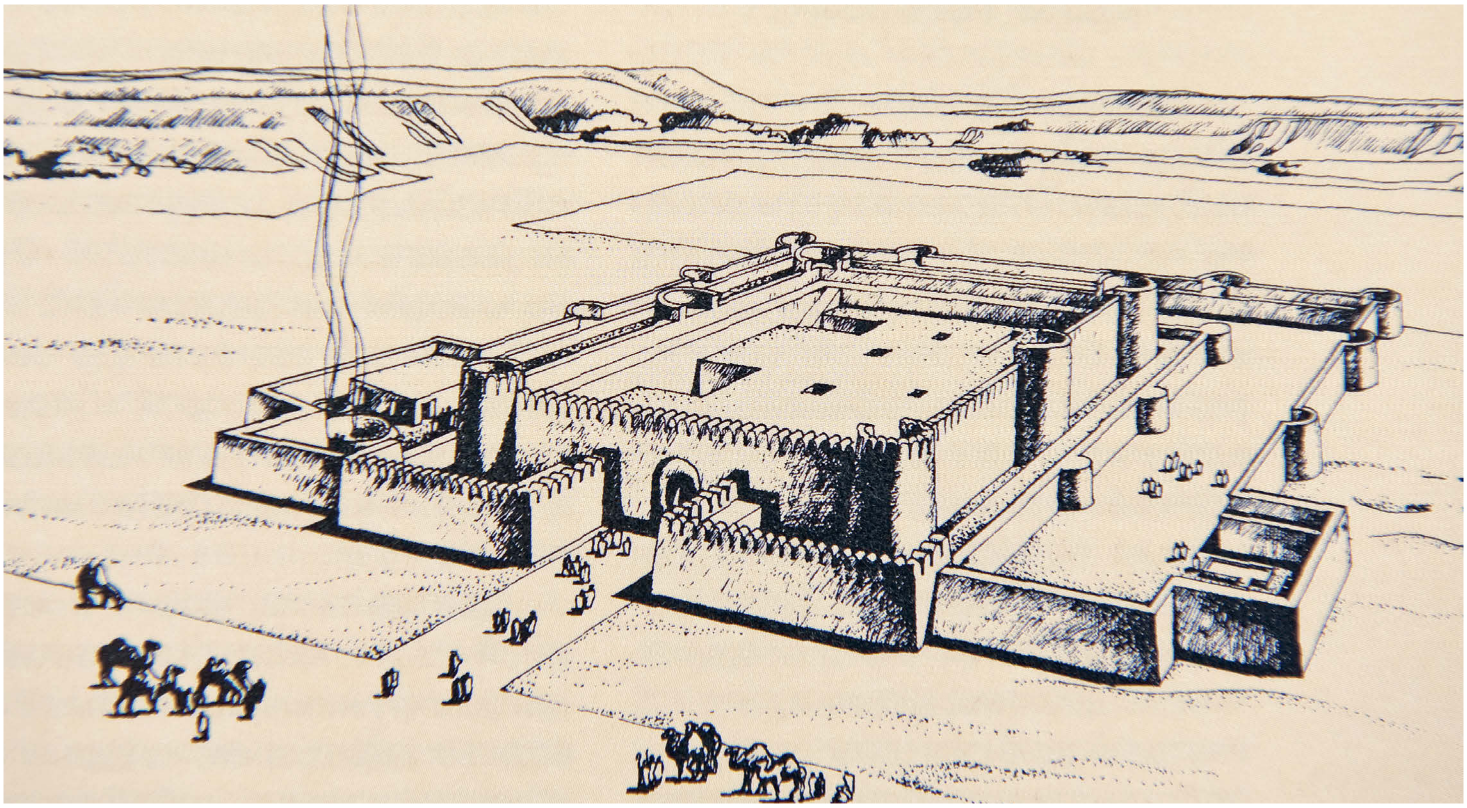
In 1974 and 1975, 16 km north-west of Gonur, at **Adji Kui**, I.S. Masimov discovered the ruins of nine settlements, four of which had vanished without a trace at the start of the joint Turkmen–Italian excavation project of 2003–2006 because these four sites had been used meanwhile for farming.[54] Of the remaining five ruins, which flourished in the second period of Gonur, the excavations of AK-1 and AK-9 are especially interesting. While the smaller structure of AK-1 was presumably a kind of caravanserai with particular administrative tasks, AK-9 had various functions over the course of its 1,500-year history. As early as the time of Namazga III around 3000 BC, long before the start of the BMAC Culture, the first simple houses were built. In their ruins archaeologists found not only flat clay figures of schematically rendered women but also so-called 'foundation pegs', made of fired clay. In Mesopotamia at the time it was common practice when building a temple to embed such foundation pegs at the corners. They took the form of a standing deity or an animal dedicated to him. This deity was often the personal patron deity of the ruler sponsoring the temple's construction and was his advocate to the patron god of the city, to whom the temple was dedicated. Since these objects were often inscribed, they convey valuable information about the context of the temple's construction.[55] The fact that this ritual was also known in Margiana underscores the intensive contact between the two regions.

In the Namazga V period around 2100 BC AK-9 experienced an appreciable consolidation of housing and erected a defensive wall in the shape of an irregular parallelogram, 4,932 m^2 in area, which was reinforced with at least 14 rectangular towers. Between 1600 and 1500 BC the 600 to 700 inhabitants had to abandon their settlement and make room for advancing migrants from Andronovo. The site remained inhabited sporadically until the fourteenth century AD.[56]

III. The period of Togolok

Togolok is the most important oasis of the third BMAC-period and lies 17 km south of Gonur. The oasis consisted of 30 smaller settlements, the fortified main site of Togolok 1 and the large, triply defended citadel of Togolok 21. The construction of strongly defended settlements and citadels at the start of the second millennium BC in Togolok, as in Gonur South, suggests the presence of external threats. **Togolok 1** was excavated by Sarianidi. Standing on a slightly elevated hexagonal site just 4,600 m^2 in extent, it was surrounded by a defensive wall fortified by round towers. A 30 x 30 m citadel stood in the northern part, integrated into the settlement.[57]

Togolok 21 was originally an impressive structure. In the centre stood a defiant 60 x 50 m citadel, with 8-m-tall walls outfitted with battlements and strengthened by six round towers. Two additional defensive walls surrounded the citadel, with the outer wall being 130 x 120 m. There were many buildings within the citadel and the inner wall, but the area between the two walls to the south and the west remained clear of buildings. Since there were only a few domestic hearths in the outbuildings of Togolok-21, it may be assumed that the well-fortified complex provided protection to the elite and selected workshops.[58] After the BMAC Culture, which



Sketched reconstruction of the fortress of Togolok 21 south of Gonur, Turkmenistan, early second millennium BC. According to Viktor Sarianidi, *Margush*, 2002, p. 172.

died out around 1500 BC, the culture of Jaz followed, marking the transition from the late Bronze Age to the Iron Age.

1.2 The BMAC Culture of Bactria

The agro-urban BMAC Culture expanded into Bactria somewhat later than it did to Margiana. In Bactria fortified settlements like Sapalli and Jarkutan emerged in southern Uzbekistan, as well as **Dashli** in northern Afghanistan, which displayed architectonic similarities with the two most important settlements of Togolok, as well as Gonur. According to Askarov and Ionesov this eastern cultural realm can be divided into four periods named after major archaeological sites: I. Sapalli (1700–1500), II. Jarkutan (1500–1350), III. Kuzali (1350–1100), IV. Molali/Bustan (1100–900).[59]

However, the fortuitous find of the '**Tepe Fullol** treasure' in 1966 south-east of Dashli in northern Afghanistan, which is tentatively dated between 2200 and 1900 BC, suggests that an outpost of the BMAC culture may have existed in Bactria a couple of centuries earlier than Sapalli. The hoard consisted of locally made gold and silver vessels which were hacked to pieces with an axe by the finders and later recovered by government officials. Later excavations unfortunately revealed no further artefacts. The procession of bearded bulls on a gold bowl is likely of Mesopotamian inspiration from the end of the third or the start of the second millennium BC, but the cruciform or stepped decorations on two other vessels are reminiscent of similar motifs at least five centuries older that were found at Sarazm II and III as well as Altyn Tepe, and which correspond to Namazga III. The classification of Tepe Fullol in relation to neighbouring cultures has not yet been settled.[60]

In **Dashli** two monumental structures from the beginning of the first Sapalli period have been discovered. The citadel Dashli-1 dominated the city, it had a square groundplan and was fortified with round towers. Dashli-3 was originally built as a palace, 88 x 84 m in size, with a double wall. After its destruction it was replaced by a fortress with a round defensive wall, which was reinforced by nine square towers.[61] **Sapalli Tepe**, for its part, consisted of eight symmetrically laid out residential quarters, which were arranged around a central plaza and separated from each other by straight streets; a square wall, 82 m long on each side and with no apparent military purpose, surrounded the settlement.[62] In the necropolis archaeologists discovered fragments of silk, approximately 3,700 years old, but it is unclear whether these came from China or the Indus Valley.[63]

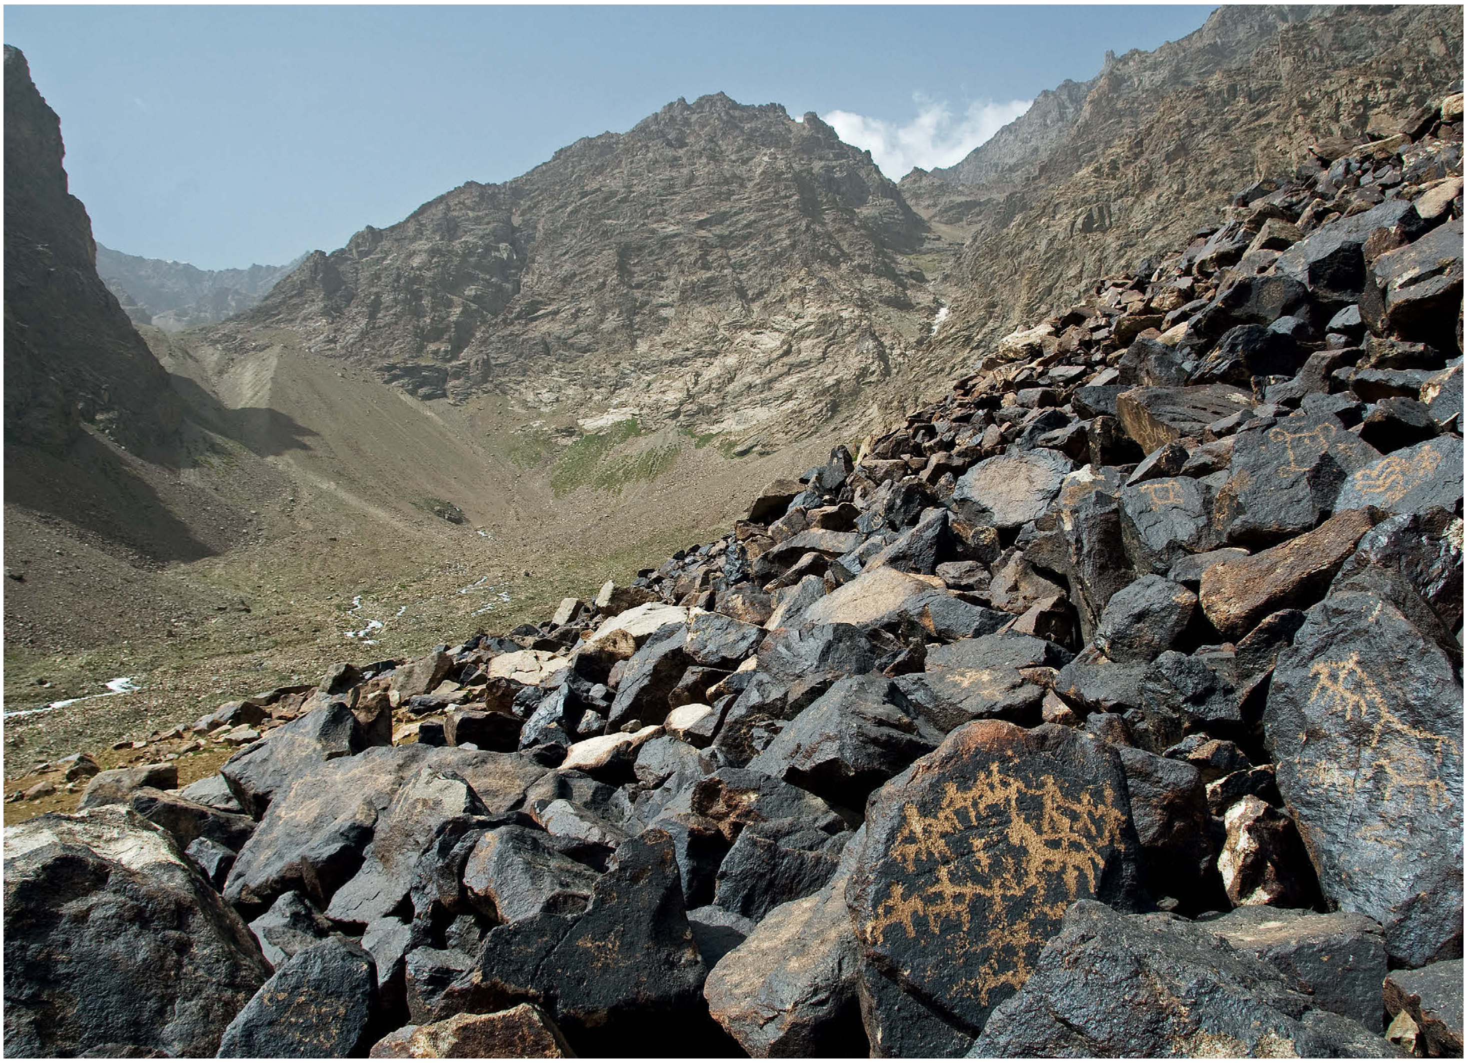
The city of **Jarkutan**, founded around 1500 BC and located north of the Oxus River was, in comparison to Dashli and Sapalli, a metropolis, with about 20,000 inhabitants. It lay 60 km north of the modern city of Termez. Jarkutan was made up of residential and workshop quarters, a fire temple, and a palace that stood within the citadel. While the citadel was surrounded by a wall reinforced with 13 square towers, the city did not have a defensive wall. In contrast to Sapalli, where each household had a kiln, the residential quarters in Jarkutan were divided up according to type of handcraft.[64]

The fire temple of Jarkutan, surrounded by a thick wall, dates from the mid-fourteenth century BC and is one of the oldest of its kind, centuries older than the earliest fire temple of Iran. The temple had no fewer than seven fire altars called *atashgah* and basins to collect the sacred ashes, but also three cultic fountains.[65] In this temple the two opposing elements of fire and water were worshipped together. This cult of two contrary elements recalls a myth of the Rig Veda that says that the fire god Agni was born in water in the form of Apam Napat.[66] The pre-Zoroastrian combined fire and water temple of Jarkutan anticipates two developments: first, its architecture looks forward to the early fire temples of Iran, such as those of Bard-i Nishanda and Masjid-Suleiman in Khusistan[67] or of Mele Hairam at Sarakhs[68] on the border of Iran and Turkmenistan, where fire was worshipped as a symbol of vitality and purity. Secondly, it foreshadows the Oxus Temple, dating to 1,000 years later, which was dedicated to both the cult of fire and the river god Oxus.[69] Both cults must have been active in Jarkutan until the abandonment of the temple toward the end of the Molali/Bustan period in the tenth century BC. This is apparent because the sacred fountains were filled up and the entire complex was 'buried' under a 20-cm-thick layer of clay. Soon thereafter the city was plundered and destroyed.[70]

In the graves and necropolises of Dashli, Sapalli, and especially Jarkutan a notable development in burial practices and the corresponding religious ideas can be seen. In the first period of Sapalli the dead were buried intra muros, under the thresholds, walls, and floors of houses, continuing the custom of the early Bronze Age Kopet Dag-Tejen oasis culture. In contrast to Altyn Tepe, where only infants found their last resting place inside houses, in the first period of Sapalli all people were buried intra muros. They then existed no longer as living people but rather as guardian ancestors within the home. With the second period of Jarkutan the burial rites began to change. The dead were now buried in cemeteries outside the city, or cenotaphs were erected and anthropomorphic clay figurines and sacrificed sheep were placed in them. In Jarkutan a river separated the city from the necropolis, a symbolic boundary between the world of the living and that of the dead.

With the construction of the fire–water temple at the start of the third period of Kuzali the rituals developed further. Production and sale of anthropomorphic clay figurines and the newly appearing votive gifts in the form of miniature bronze weapons and tools became monopolies of the new temple, which presumably also had a herd of sheep exclusively for sacrifice. In this regard the temple of Jarkutan also anticipated the one on the Oxus. At the same time the construction of cenotaphs with accompanying sheep sacrifices and anthropomorphic statuettes increased, though it is unclear if this increase is attributable to wars and the lack of remains from fallen soldiers or to the beginning of cremation. Presumably both were factors because, on the one hand, at the start of the Kuzali period Jarkutan experienced serious attacks, as can be seen in the traces of conflagrations, and, on the other hand, several graves show marks of fire, indicating ritual burning. In the fourth period of Molali/Bustan cremation emerged, as did burial after maceration, the removal of the corpse's soft tissue. Another innovation was the placing in cenotaphs of cylindrical ceramic vessels with roof-like covers, which recall yurts and anticipate later Zoroastrian ossuaries.[71] Burying the dead with dogs, intermediaries between the worlds of the living and the dead, was also a new phenomenon.[72]

Towards the end of the second millennium BC an expansion of the late Bronze Age form of the BMAC Culture of Bactria spread to Tajikistan, where the local culture of **Beshkent-Vakhsh** (1100–900 BC) arose, showing characteristics of both sedentary farmers and nomadic herders. Their pottery consisted of crude, handmade wares, and their dead were buried in so-called catacomb graves, in which the dead lay side-by-side in niches and the main chamber held the grave goods. The treatment of the dead was not uniform, however, because cremation was practised as well as burial. Clear testimonials of the urbanisation process triggered by the BMAC Culture in south-western Tajikistan were found in the necropolis of Gelot near the present city of Kuljab.[73]



Petroglyphs of horsemen at Vibist in the Pamirs, Gorno-Badakhshan, south-eastern Tajikistan, late Bronze Age and Iron Age.

Certain burials of the Beshkent-Vakhsh Culture also included standardised fire rituals, as the burial chambers had small fireplaces, as well as charcoal and ashes that came from a pyre burned outside the chamber or from a fire ring. At the necropolis of Tigrovaia Balka in southern Tajikistan signs of burning were found under the largest kurgans, which are surrounded by stone circles. During the funeral a circular fire was lit above the burial chamber and then earth was thrown on it to put the fire out.[74] A similar ritual was also performed from the early Iron Age at the Scythian burial and cultic site of Arzhan-2 in Tuva. The kurgan was surrounded by a huge fourfold ring made up of a total of 336, 352 or 368 small stone rings. Calcined animal bones and ashes were found beneath each one, indicating a corresponding burnt offering. It is not known whether all these sacrifices were performed at the same time or stepwise.[75] Another variation of this widespread fire ritual is found in the contemporaneous or slightly later kurgans of Tagisken South and Ujgarak east of the Aral Sea, Barsučij Log in the Minusinsk Basin, and Kostromskaja in northern Caucasian Kuban, where, at the conclusion of the burial ceremony, the wooden structure built over the dead person was ritually set on fire.[76] This custom, widespread among the Saka and Scythians, was also found among the Sarmatians, as can be seen at the Nogajčik kurgan in the Crimea. At the burial of a prominent Sarmatian from the first century AD the 6-m-tall kurgan was covered with petroleum (naturally occurring crude oil) and set ablaze.[77] Presumably this ritual was thought to anticipate the universal fire that would purify all things at the end of time.

The so-called 'Beauty of Loulan', a naturally mummified Europid woman from the early Bronze Age, Töwän, Lop Nor Desert, Xinjiang, north-western China, *ca.* 2000–1800 BC. Xinjiang Uyghurs Autonomous Region Museum, Urumqi.

In summary, the radically changed burial rituals of Jarkutan reflect several significant innovations in the religious thought of Bactria, which can serve as a herald of Zoroastrianism. Among these proto-Zoroastrian aspects are the worship of fire and the construction of fire temples, maceration and the subsequent interment of the bones and the placement of these bones in ossuaries. Finally, dogs played an important role in Zoroastrian burial rites and served as guardians of the dead in the afterlife.[78] The practice of giving the deceased a dog as a companion can be seen not only in the late phase of the Sapalli Culture but also about a millennium later among the Sarmatians, nomadic horsemen who spoke an Iranian dialect. Zoroastrianism forbade cremation, however, as the practice contaminated the fire.

This change of belief in Bactria, which, like eastern Iran and Sistan, is associated with Zarathustra's earliest alleged areas of activity, could be related in part to the migration of Indo–Iranian stockbreeding tribes from the Andronovo Culture. In this regard one of the sources of Zoroastrianism would lie in the synthesis of the Indo–Iranian steppe culture of Andronovo and the agro-urban Sapalli–Jarkutan Culture of Bactria, which had intensive contact with Mesopotamia and, to a lesser degree, the Indus Valley. Further evidence of the advance of steppe nomads from the north is provided by changes in the material culture of Bactria, such as the decline of cultivation of the land in favour of increased stockbreeding, the ebbing of international trade, and the replacement of fine pottery crafted on the potter's wheel by crude, handmade wares. In the eighth century BC, however, the trend reversed, as trade and agricultural production began to increase rapidly. At the

start of the period of Jaz III brisk construction work began with the erection or founding of cities guarded by strong defensive walls reinforced with towers.[79]

Margiana offers a similar picture to that of Bactria. With the start of the first period of **Jaz** around 1500/1400 BC the large cities were depopulated; cultivation of the land declined in favour of the raising of cattle and, in a new development, horses; international trade ground to a halt; and crude pottery replaced sophisticated ceramics, with the first weapons and tools made of iron emerging soon thereafter. This change is the result of the expansion of a steppe culture from the north to the south. It first reached Choresmia, north of the Kara Kum Desert, where it encountered the late phase of the **Zamanbaba Culture** (2400–1500 BC), which had expanded along the lower Zerafshan River west of Buchara. Their ceramics were 90 percent handmade and undecorated.[80] Forms of the Andronovo Culture then moved in a second step into Margiana.[81] From here they spread the production of iron to the east into the Fergana Valley, where they absorbed the settled, late Bronze Age culture of **Chust** (1400–900 BC), which was characterised by the production of thin ceramic tableware. Influences of this culture spread rapidly farther east into the Tarim Basin, as can be seen in new forms of bronze and the start of iron production.[82]

As in Bactria, starting in the third Jaz period the people began constructing strongly fortified settlements with well-defended citadels, such as Jaz Tepe, Ulug Tepe and Elken Tepe. There was also a rebirth of agriculture.[83] Burial rituals also changed radically in the transition from Bronze Age to Iron Age. It was no longer corpses that were buried, but instead containers holding macerated bones. Sometimes the dead were exposed to corpse-eating animals. Both these new rituals foreshadow later Zoroastrian commandments, according to which the elements of earth, fire and water must not be defiled by impure corpses.

The conclusion must finally be made that the infiltration of stockbreeding steppe nomads from the cultural sphere of Andronovo brought an end to the material agro-urban BMAC Culture, but the immigrants gave up their own burial rites, which included building a kurgan over a wooden pit-tomb. The absence of earth burials in Margiana and Bactria from the end of the Bronze Age to the invasion of the Greeks some 1,000 years later supports this conclusion.[84] The proto-Zoroastrian innovations can be explained not only by the infiltration of the steppe nomads; they also arose out of changes in belief within Bactria and Margiana. Thus the mixed economic zones of a mostly settled population in Bactria and Margiana mark the boundary with the world of the steppe nomads in the north, with their bodily burials, until the invasion of Saka, Yuezhi and Alans into Afghanistan in the late second century BC.[85]

In this context, one should note that the migrations from the north were not movements of entire tribes, carrying their material culture with them en bloc, but were rather presumably an incursion of young warriors, who succeeded thanks to superior weapons and mobility. After seizing power they mixed with the local populace, analogous to the founding of the kingdom of Mitanni in northern Syria around 1500 BC, when immigrants or mercenaries, who spoke the ancient Indic language of the Rig Veda, seized power over the non-Indo–European Hurrians.[86]

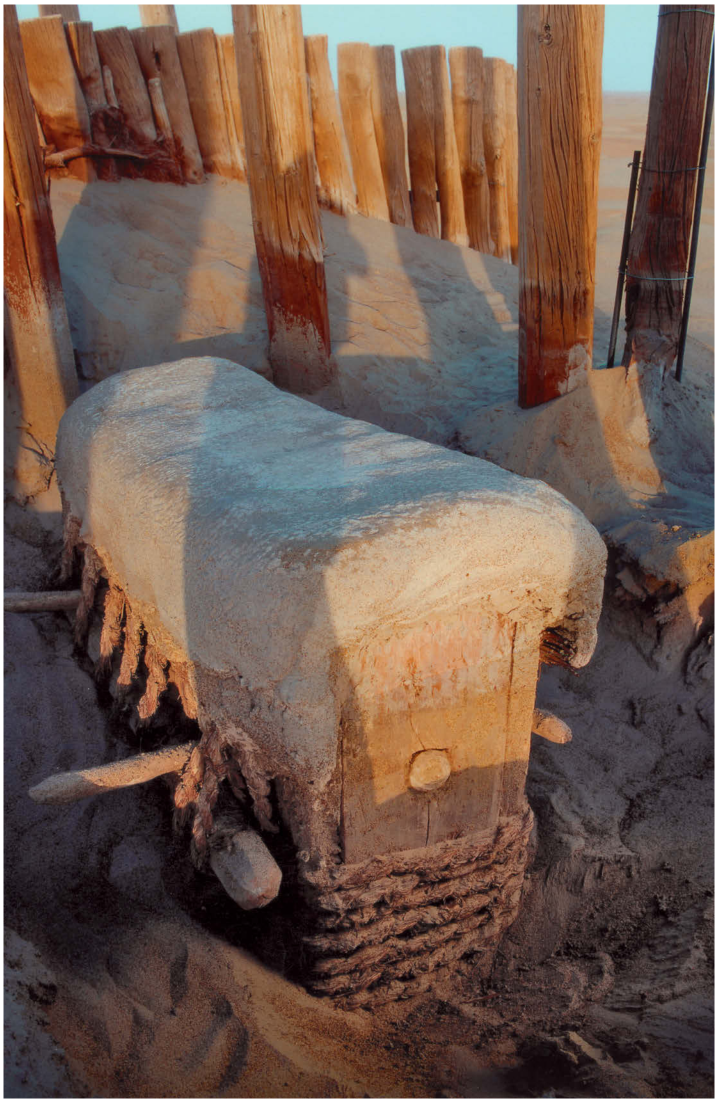
The mummy stretched out in the sand and the mummified head behind it were presumably left behind by grave robbers. The wooden palisade to the left divides the graveyard into two halves.

2. Indo–European mummies in north-western China

For more than a century China has been a rich source of sensational archaeological finds. Among these are not only *Sinanthropus pekinensis* and the royal graves of Anyang, but also the Indo–European mummies of Xinjiang. The question of the origin of metallurgy in China was long debated. Chinese scholars believe that there was an autochthonous development of metallurgy in central China. This view does not take into account the fact that the forging and casting of metal began in the fifth millennium BC in south-eastern Europe and the Caucasus, spreading on the one hand via the Circumpontic Metallurgical Province and on the other across the Near East and southern Turkmenistan to the east. In China, however, metallurgy began immediately in the form of alloying on the north-western edge of the region, in the late phase of the culture of **Qijia** in Gansu (2500–1900 BC). Here horses and wheat also appeared for the first time in China, just before the rise of the Bronze Age culture of **Erlitou** (2000/1900–1600 BC), widespread in northern central China. In 1927 the highly developed Bronze Age culture of **Shang-Anyang** (thirteenth–eleventh century BC) was discovered in Anyang, Henan. This culture saw the emergence of several fully developed technological innovations, but the question of its origin remained open.[87]

In 1979–80 Chinese archaeologists around Wang Binghua made important discoveries in the Lop Nor Desert, Xinjiang, which were also political dynamite: they uncovered dozens of well-preserved mummies, about 4,000 years old, of obviously Europid people! Since these Europids must have come from the west or north-west, hypotheses emerged that the bronze discoveries of Anyang could be related to these mysterious people, their predecessors or their descendants.



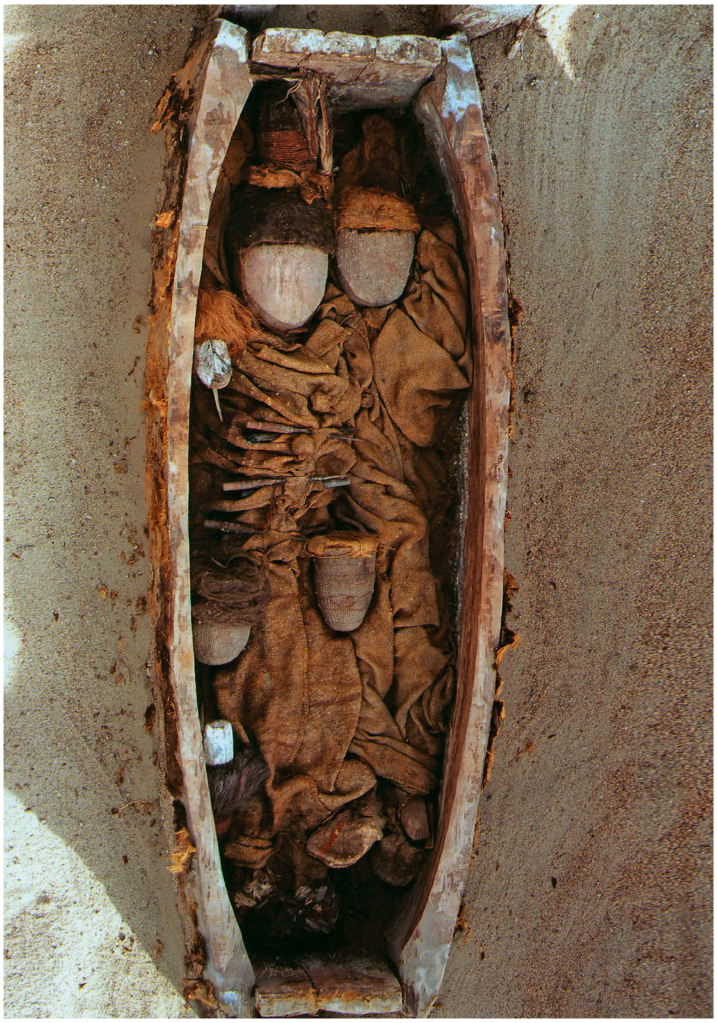
Clay capsule grave of a woman, covered with an ox hide from the top layer of graves at Xiaohe, *ca.* 1650–1450 BC. Lop Nor Desert, Xinjiang, north-western China.

2.1 The origins of metallurgy in China

The excavation of the royal graves of Anyang brought to light single-axle light chariots with horses in harness and their charioteer, as well as sophisticated bronze objects, which show that northern central China suddenly mastered innovations in metallurgy, horse husbandry, the use of draught animals, wagons and carts in a highly developed form, which undoubtedly accelerated the cultural-technological development of China at that time.[88] Since these technologies appeared in northern and north-western China without any preceding developmental steps, it may be assumed that they were provided by neighbouring steppe peoples, most likely from the sphere of the late Afanasievo and early Andronovo cultures. Interfaces for this cultural transfer may have been the Bronze Age cultures of Xinjiang and Gansu or the steppe peoples of Inner Mongolia. The simultaneous arrival in central China of wheat and barley, horses and sheep, which could not have been domesticated within China due to a lack of wild ancestors, supports the hypothesis of a mediating role for Afanasievo and Andronovo.

In fact, bronze objects in Xinjiang appeared at the same time as in the neighbouring culture of Qijia in Gansu and at least a century before Erlitou.[89] Evidence that the royal dynasty of Shang-Anyang had trade contact with Xinjiang at that time is provided by the grave of the military leader and royal wife Fu Hao (d. *ca.* 1200 BC), discovered unplundered in 1976, since all 755 jade objects found in her grave were verified to have come from the region of Khotan, south of Xinjiang and over 3,000 km away.[90] Further evidence for contact between Shang-Anyang and Xinjiang is offered by the fact that many ancient Chinese words relating to the wheel, the chariot and the horse have their etymological roots in Tocharian, whose early form, proto-Tocharian, was probably the language of the Europid mummies of Xinjiang.[91] All indications suggest that in the thirteenth century BC central China adopted from the proto-Tocharian-speaking Indo–Europeans – who had been in close contact with the Central Asian Andronovo cultures – not only the technological cluster of horse, wheel and chariot but also the corresponding terminology.

Iron was also adopted toward the end of the sixth century BC from Xinjiang or Gansu, where it had spread as early as the end of the tenth century BC.[92] About two centuries after the introduction of iron King Wuling of Zhao (r. 325–299 BC) adopted from the horse riding tribes on the northern border the concept of mounted archery, including riding apparel, which initiated two millennia of active trade with Mongolia and Tibet for the acquisition of horses.[93] Thanks not least to the introduction of cavalry, the Early Han Dynasty (202 BC–9 AD) was able to force the powerful tribal confederation of Xiongnu back to the north and to wrest from them control of the Silk Roads through Gansu and Xinjiang.[94]



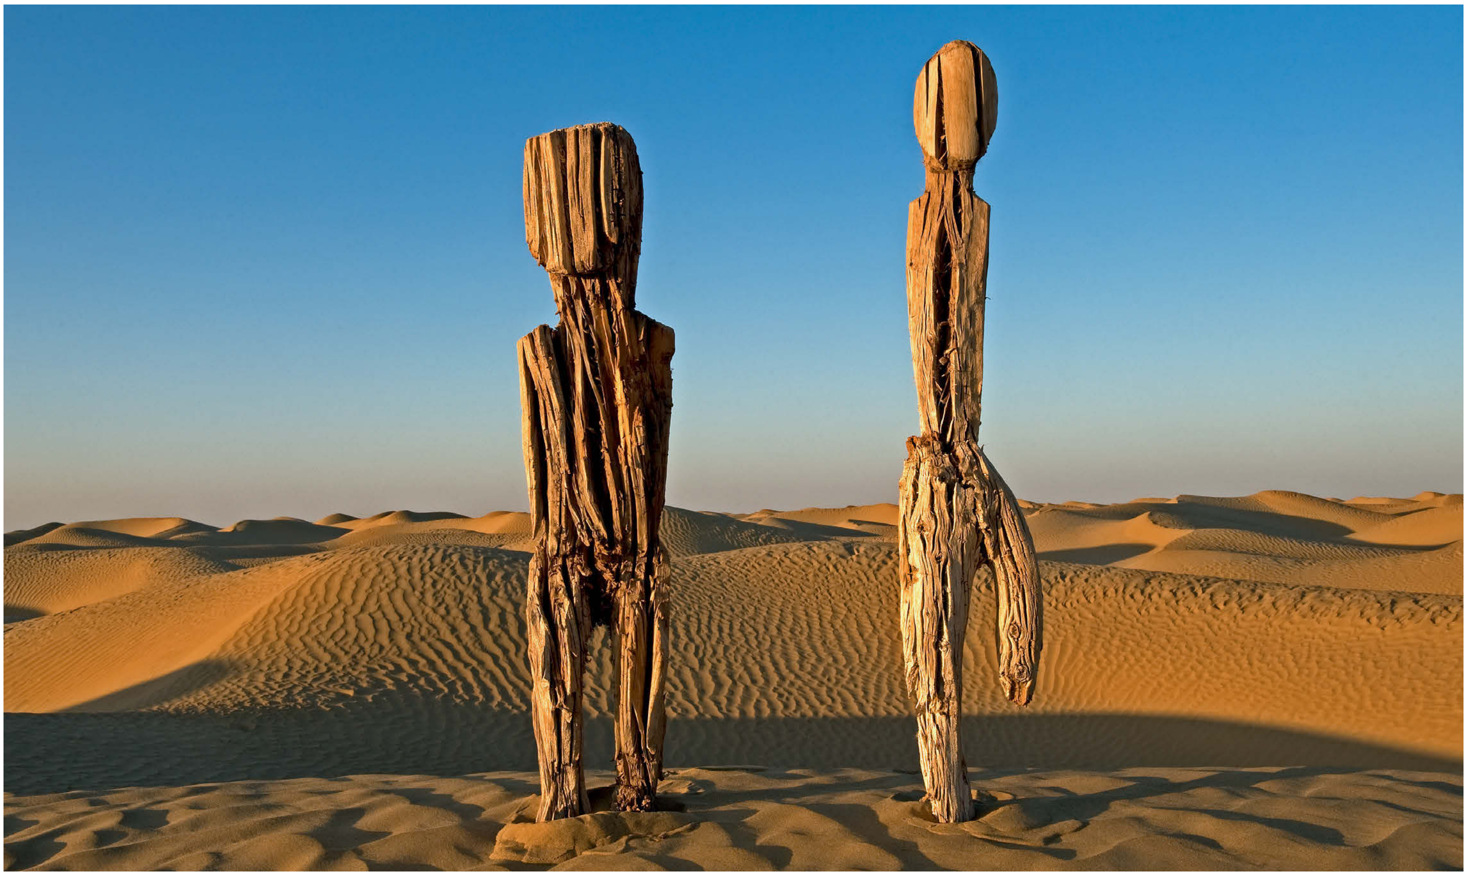
Two wooden dolls buried with all the traditional grave goods, Xiaohe, Lop Nor Desert, Xinjiang, north-western China, *ca.* 1650–1450 BC. In the centre lies a small vessel plaited out of tiny willowy branches, fine roots and stems of grasses; it was filled with grains of millet and wheat.

In summary, the Bronze and Iron Age cultures in eastern Central Asia contributed to the cultures of central China bronze and iron metallurgy, wheat and millet, the use of sheep for wool, the light chariot, the composite bow, the horse and its use as a draught animal and the light cavalry.

2.2 The Ayala Mazar-Xiaohe Culture

As early as 1914 the British archaeologist Sir Aurel Stein (1862–1943) was struck during excavations in the northern Lop Nor Desert by the non-Chinese but rather Europid appearance of the perfectly preserved, naturally mummified man from grave L.F.1, especially his dolichocephalic face, the deep eye sockets, the prominent nose, the moustache and the thick beard. He therefore classified him as the Europid 'Homo Alpinus'. A year later he discovered farther west, at the graveyard L.S., less well-preserved mummies of the 'local herding and hunting populace'.[95] The adjacent deserts of Lop Nor and Taklamakan offer the ideal conditions for natural mummification of buried corpses. First the climate, with annual precipitation of 16.8 mm and a 170 times greater potential evaporation of 2,885 mm, is hyper-arid,[96] and, second, the saline ground absorbs all moisture, which deprives bacteria of nourishment. Third, the wooden caskets were not completely sealed, which would have preserved the moisture in the corpses, and they had no bottoms, so the dead, wrapped in woollen cloths, lay directly on the saline ground. Fourth, during winter burials the extreme cold temperatures, as low as -45 °C, contributed to the killing off of decomposing bacteria.

In the last 30 years archaeologists have discovered about 500 more or less well preserved mummies in the two deserts.[97] The craniological and genetic investigations of Han Kangxin have yielded surprising results. In an extensive study of 302 skulls from nine different cemeteries of southern Xinjiang, dating from 1850 BC to 300 AD, 89 percent displayed a clearly Europid morphology and only 11 percent Sino–Mongolid features, and the 18 skulls from the oldest cemetery, Gumugou, are exclusively Europid.[98] Later studies have confirmed Han Kangxin's results, in particular that the older the mummies and skulls are, the more likely that they are



Two of the eight wooden figures found at Ayala Mazar, Taklamakan Desert, Xinjiang, north-western China, *ca*. 1890–1660 BC. China.

Europid and, conversely, the more recent the sample, the more likely they are of Sino–Mongolid heritage. From this it can be inferred that Europids settled in Xinjiang around 2000 BC at the latest, that Mongolids first appeared in small numbers in eastern Xinjiang around 1300 BC, and that a mass migration of Mongol and Chinese people occurred shortly before the start of the Common Era.[99] Since the necropolises of Tianshan Beilu, Wupu and Yanbulake in Hami in eastern Xinjiang revealed the Europid mummies found farthest east, and no Europids were found in the adjacent province of Gansu, eastern Xinjiang marked the boundary of the spread of Europid people to the east in pre-Christian times.[100] To summarise, there was 'a fault-line between Western Eurasian and East Asian population groups that runs from the territory around the Baikal lake through the Altai region in Western Mongolia, down to the [Xinjiang]-Gansu region' in China.[101] The present inhabitants of Xinjiang, the Uyghurs, first settled in the region in large numbers after 840 AD.[102] Whether the Tarim Basin had been settled by another group before the Europids is not known.[103]

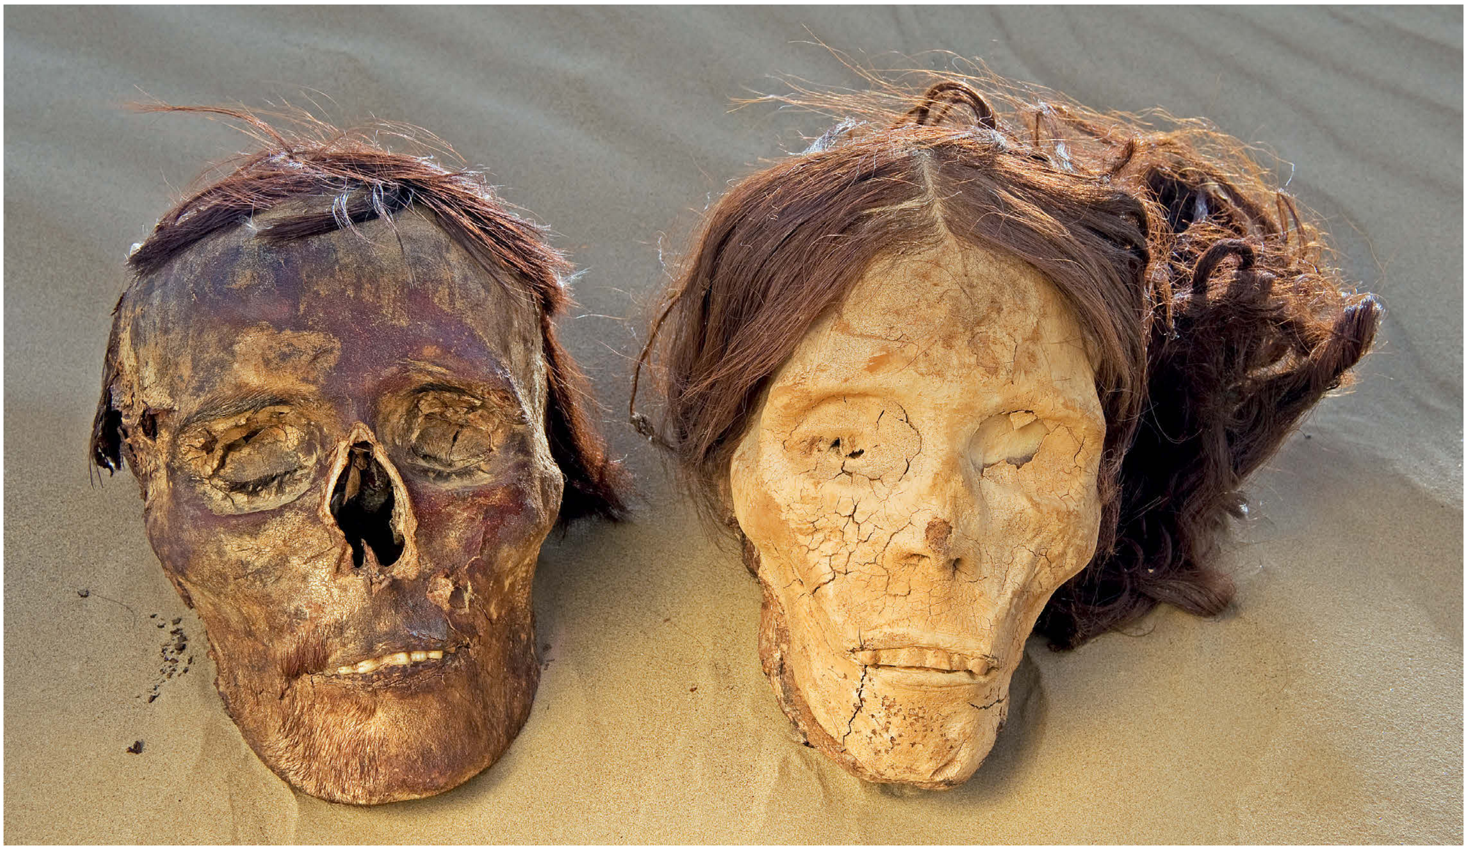
Assuming the ancestors of the mummies from the necropolises of Gumugou, Töwän, Xiaohe and Ayala Mazar came from a neighbouring cultural sphere of Afanasievo, it may be posited that they spoke proto-Tocharian, part of the PIE family. In the second half of the third millennium BC these forerunners presumably yielded to the pressure from the bearers of the Mongol culture of Okunev by advancing to the south-east into the Tarim Basin. The initial, earlier migration of the proto-Tocharians to southern Siberia had isolated them linguistically from the rest of the PIE-speakers, so they did not practise the linguistic innovations of their distant Indo–Iranian relatives. Tocharian is most closely related to Celtic and Italic.[104] The later Europid immigrants of the first millennium BC, however, spoke Iranian dialects. The proto-Tocharian language is extinct but can be reconstructed from the three Tocharian languages of the Tarim Basin, which are known from written documents of the sixth to ninth centuries AD. Tocharian A, also called Turfanian, was used at that time primarily for religious purposes; Tocharian B, Kuchean, was a local vernacular; and Tocharian C, Krorainan, was an older language in Lop Nor that died out around the fourth century AD.[105]

The most important necropolises of the Bronze Age in southern Xinjiang are Qäwrighul and Töwän, Xiaohe, Ayala Mazar and Wupu/Hami.[106]

Töwän (Chinese **Tieban**): One of the oldest Europid mummies of Xinjiang is the 'Beauty of Loulan', discovered in 1980 on the lower reaches of the one-time river Konqi He near Töwän on the northern edge of the Lop Nor desert. The mummy, which has been dated to between 2000 and 1800 BC, is of a 45-year-old woman. She had light brown hair, wore short boots made of leather, and a pointed felt cap made of sheep's wool with a feather stuck in it, and was wrapped in a woven wool blanket. Beside her lay a carefully braided basket made of grass and tamarisk twigs, filled with grains of wheat. On her breast lay ephedra twigs, whose alkaloid ephedrine has both anti-inflammatory and stimulant effects. This discovery shows not only that nearly 4,000 years ago Europid people lived along the river but also that they raised livestock, including sheep for wool, had mastered the weaving of wool and felt, practised agriculture, and knew of the pharmaceutical properties of ephedrine.[107]

Qäwrighul (Chinese **Gumugou**): The necropolis of Gumugou, discovered in 1979 on the northern bank of the 'peacock river', Konqi He, dates from the same time as Töwän. Its Chinese name means old (gu) grave (mu) [in the] small valley (gou). The excavations revealed 42 graves, which could be divided into two groups. The first group consists of 36 shaft graves sunk into the sand, with the graves marked by pillars rising out of the sand to the east by the head and to the west by the feet. The caskets, shaped like canoes, consisted of two slightly concave poplar planks, facing each other on their long sides. Slats placed crosswise closed the casket, which was open on the bottom, and sheep- or goatskins were laid over them. As these dried, they shrank and sealed the top of the casket. The dead lay in the position typical of the Yamnaya-Afanasievo Culture, on their backs with knees drawn up. They were bedded in a wool blanket closed by wooden or bone needles and dressed only in leather boots and a felt cap. Grave goods were braided baskets with ephedra twigs and wheat, jewellery made of bones and deer antlers, jade beads, unidentified bronze objects, wooden vessels and anthropomorphic figurines made of wood and stone, but no pottery.

The interior of the graves of the second group was identical to that of the others, but the six men's graves are distinguished by their sophisticated construction. Over the chamber stood as many as seven very narrowly laid out circles of pillars made of poplar wood, which were surrounded by seven to nine ray-like and more widely arranged rings of pillars. Stein had noticed a similar construction in 1915 east of Gumugou at grave L.S. 1: 'Of these



Naturally mummified skulls of a Europid man and a Europid woman in Ayala Mazar, Taklamakan Desert, Xinjiang, north-western China. Presumably the two were not originally buried together. Accelerator Mass Spectrometry (AMS) carbon 14 dating of the woman's hair gave a calibrated date of 1890–1660 BC, with a 95.4% probability.

The author’s camel caravan on the way to Ayala Mazar, Taklamakan Desert, Xinjiang, north-western China, October 2009.

Wooden mask, 10 cm tall, with an apotropaic function, Ayala Mazar, Taklamakan Desert, Xinjiang, north-western China.

Wooden phalli, 9–10 cm long, placed in the graves of women, Ayala Mazar, Taklamakan Desert, Xinjiang, north-western China.

[half a dozen graves] the central grave [L.S. 1] attracted special attention by its sevenfold stockade of wooden posts neatly fixed in the ground to form an oval, 14 feet long from east to west and 10 feet across.'[108] The spectacular arrangement at Gumugou, with a diameter of up to 15 m, recalls the stone cromlechs encircling kurgans or flat graves in the steppe of Afanasievo and Andronovo. Most likely such stone and wooden cromlechs had solar symbolism, like the sun symbol painted with ochre on the mounted mummy of Zaghunluq, which is why the cemetery of Gumugou is also called Täyamu, 'sun grave'. For each of these graves, some 600 trees had to be felled, which strained the already fragile ecological conditions.

While Han Kangxin's analysis of 18 skulls from Gumugou resulted in their classification in the group of Nordic proto-Europids, on the basis of their 'definitely Western racial characteristics,'[109] carbon-14 measurements led to a dating of Group I to 1880 (+/-95) BC and of Group II to about 100 years later. Thus Wang Binghua associated the older graves with Afanasievo and the second with the 'sun graves' of Andronovo.'[110]

Xiaohe: Near the 'Little River' of Xiaohe, a feeder of the Konqi He in the north-western part of the Lop Nor Desert, Folke Bergman first briefly explored the necropolis, which lies 50 km south-west of Gumugou, in 1934. It quickly returned to obscurity, however, and was rediscovered only in 2000 and excavated between 2002 and 2005, although it was unfortunately beset by grave robbers in 2003. The necropolis, which stands on a 7-m rise, consists of 330 graves, placed over one another in as many as five layers, of which 167 have been excavated from the two upper layers, bringing to light more than 30 well-preserved mummies of Europids. Carbon-14 analyses of all five layers yielded dates between 2000 and 1450 BC, with the two upper layers, the most recent, dating to between 1650 and 1450 BC.[111]

The excavations revealed the fertility cult of a society of herders, who also practised some farming. In front of the women's graves stood polygonal, torpedo-shaped wooden posts, painted red on top, presumably phallic symbols, and in front of men's graves were paddle-shaped pillars, interpreted as vulva symbols. As at Gumugou, the dead wore red-painted leather boots and a felt cap; they were wrapped in wool blankets and laid in canoe-shaped caskets, which were covered with the skins of cattle and sheep, presumably sacrificed at the site. Since Xiaohe and Gumugou lay close to rivers, which were used for transportation, the 'ship burials' could also symbolise crossing a river into the afterlife. In the four largest clay capsule graves women lay with the richest grave goods of the necropolis, which could indicate preferential treatment for women.

The various types of wooden statues are striking. The five nearly life-size statues, once painted red, originally stood before a grave and may have represented a guardian deity or an ancestor.[112] They are distinctly different from the six simpler and crudely carved male figures, made of wood and wearing leather boots and felt caps, which were buried in Xiaohe with a full set of grave goods, presumably as stand-ins for absent corpses. As in Gumugou the dead were given small portions of wheat and *Ephedra sinica*, whether in braided baskets or in small pouches, which were tucked into corners and edges of the shroud. Very surprising for archaeologists were two additional discoveries, as in almost all the burial

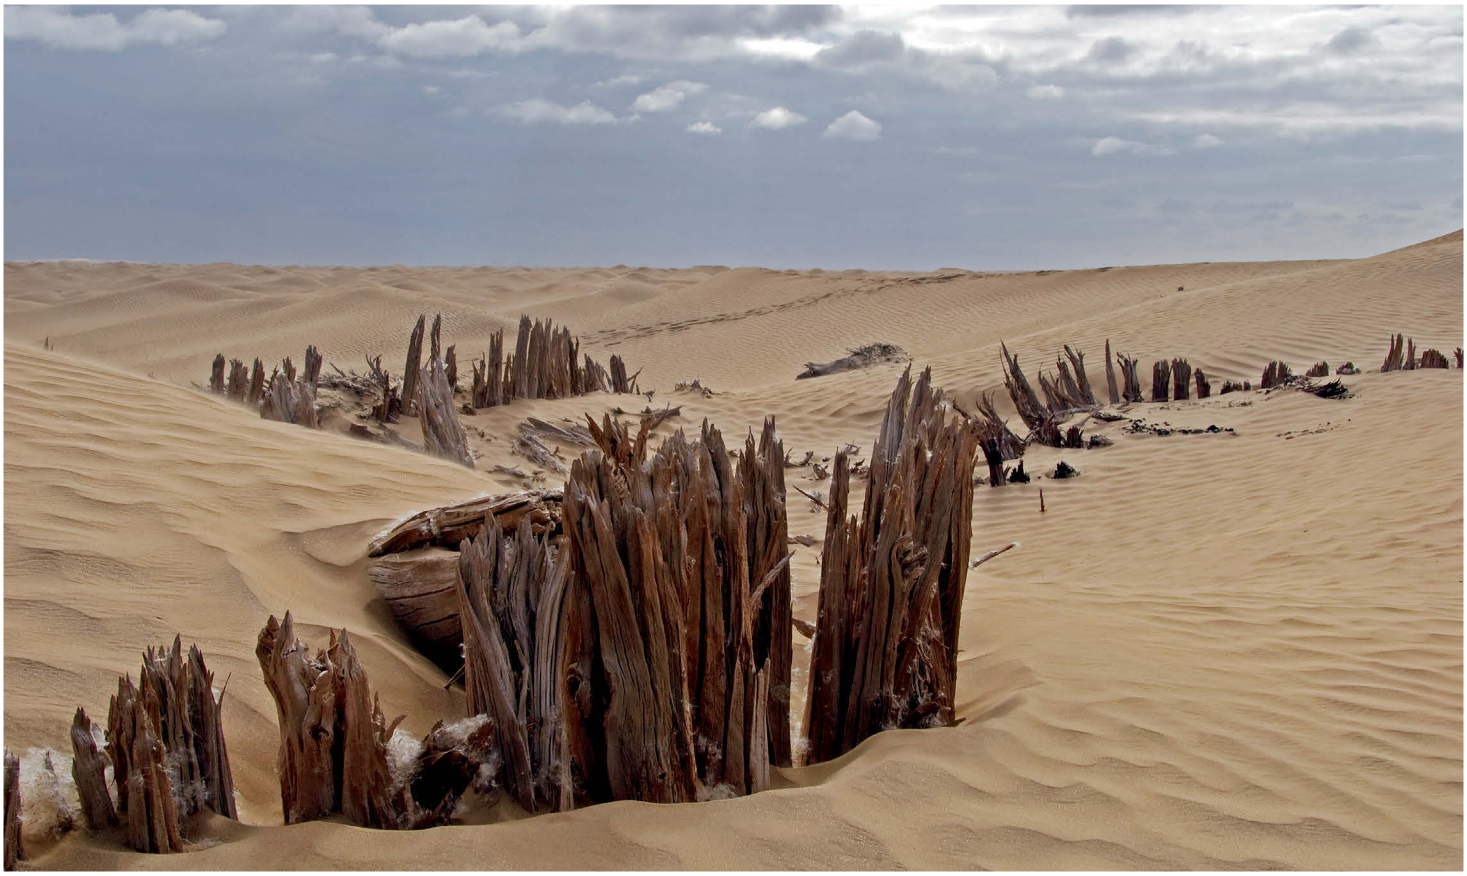
Characteristics marked with an asterisk (*) are occasionally also shared with other Bronze Age burials of northern Lop Nor such as Gumugou, Töwän or single sites on the Konqi He.

sites they found small wooden masks with over-sized noses,[114] which presumably served as protection from evil spirits, and many women's graves also held small wooden phalli, consisting of two halves bound together with red-brown wool. Some of the male corpses had been given miniature bows and arrows, and women wore bracelets with one to three jade beads. A few skulls had been painted with red stripes, as had a few cattle skulls.[115]

A study published in 2010 of mitochondrial and Y-chromosome DNA from 20 mummies from the lowest layer at Xiaohe, which date, according to carbon-14 analysis, to 1980 (+/-40) BC, yielded results largely supporting current hypotheses. All the male genetic lines came from a genetically European population; the females were mixtures of European and Asiatic, most likely southern Siberian, populations. The results were interpreted by the authors to mean that early Europids migrated to southern Siberia long before 2000 BC and interbred with local women there. Toward the end of the Afanasievo Culture they left their homeland and settled in the Tarim Basin.[116] Until 2009, however, Xiaohe was puzzling in two regards. First, the search for neighbouring settlements remained fruitless, and second, Xiaohe appeared to represent a culturally isolated case in that it was only here that a prominent cult of human reproduction was discovered.

Ayala Mazar: Until late 2009 it was believed that there were virtually no signs of the Bronze Age (*ca.* 2000–900 BC) in the interior of the Taklamakan Desert, as the oldest finds dated to the Iron Age (900–202 BC). These came from the fortified city of Jumbulakum (Yuan Sha), on the one-time lower reaches of the Keriya Darya River.[117] But in autumn of 2009, 80 km north of Jumbulakum, the author discovered the Bronze Age necropolis of Ayala Mazar, located on a 5-m rise west of the former riverbed of the Keriya Darya.[118] Although the necropolis had been plundered once or twice and badly damaged before the author's visit, discoveries on the surface revealed clear evidence that it was very similar to that of Xiaohe, 594 km farther east. The graveyard, 1,200 m^2 in size, was half as large as Xiaohe and originally held 80 to 100 coffins. Of the 45 skulls lying on the ground, two-thirds were presumably female, which is why the site was named Ayala Mazar, 'cemetery of women'. An AMS (accelerator mass spectrometry) ^{14}C measurement of human hair sampled at the cemetery confirmed a calibrated date between 1890 BC and 1660 BC at a 95.4% probability.[119]

A direct comparison of the objects found shows that of the 25 archaeological characteristics of Xiaohe, at least 20 are attested to in Ayala Mazar. As in Xiaohe, the dead wore only red-painted, short leather boots and a felt cap. They were wrapped in a wool blanket and buried in canoe-shaped coffins, which were placed



Interior side of the eastern wall of the Bronze Age settlement of Sebier, Taklamakan Desert, Xinjiang, north-western China, *ca.* 1500–1200 BC.

on top of one another in at least two layers and covered with cowhides and sheepskins. There were also torpedo- and paddle-shaped wooden posts, eight standing wooden statues, at least one wooden mock-corpse, tiny wooden masks with over-proportioned noses,[120] and red-painted, two-part wooden phalli. The objects included miniature bows and arrows with a notched triangular pattern, cattle horns, braided baskets holding wheat and ephedra twigs, amulets made of white-grey soapstone, as well as jade beads. Finally, all the completely preserved skulls of adults displayed dolichocephalic facial features, and one man and six women still had their hair.

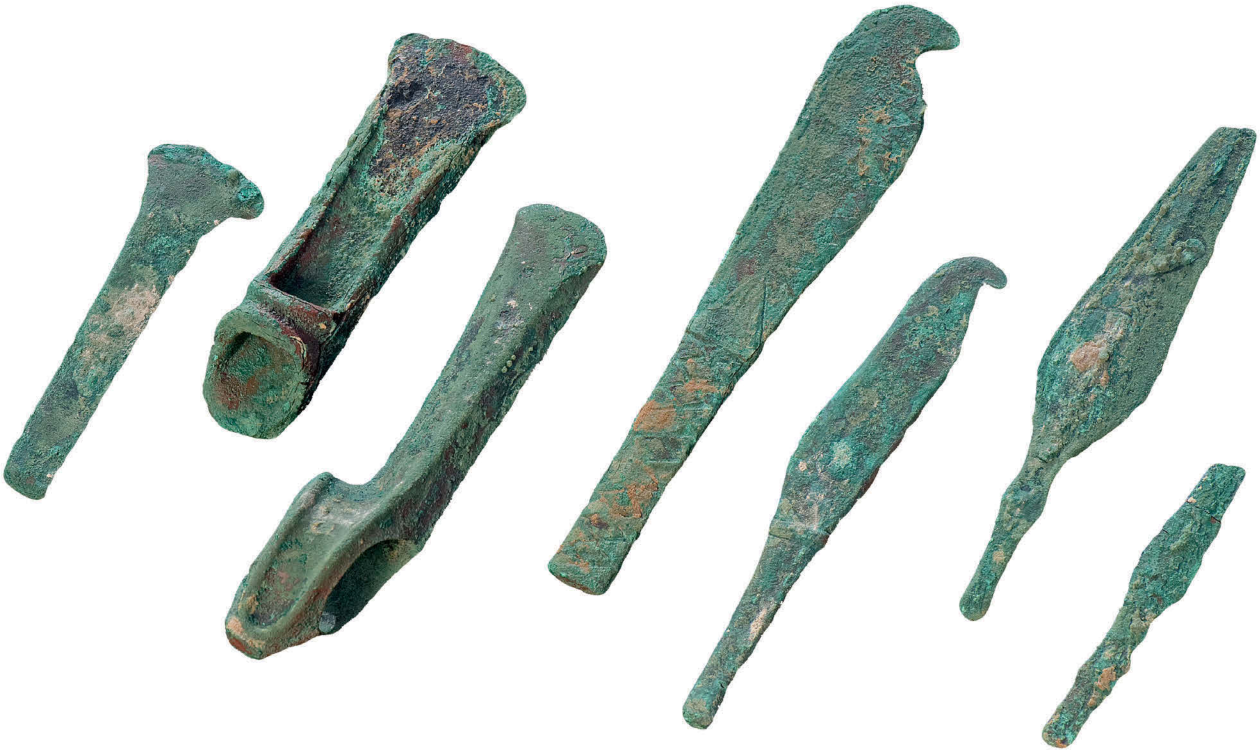
The apparent celebration of human reproduction was presumably a reaction to the difficult living conditions and high infant mortality rate – several mummified infant skulls were found, as well as 60- to 80-cm coffin planks – so that the community of that time was aware that they needed to maintain a stable population by means of frequent births.

◀ **Four re-erected wooden figures and coffin planks placed atop one another at the early Bronze Age necropolis of Ayala Mazar, Taklamakan Desert, Xinjiang, north-western China.**

In contrast to Xiaohe, near Ayala Mazar at least two Bronze Age settlements, were found.[121] '**House 18**' stood 14 km north-east of Ayala Mazar and consisted of a complex of living spaces and stables that was wilfully destroyed in very recent times. The other settlement lay 14 km south-east of the necropolis and was a fortified community at least 3,350 m^2 in extent called **Sebier**. Its defensive wall, originally 4 m high, consisted of seven layers of crude mud bricks, reinforced with horizontally laid tamarisk branches, over which stood dense rows of clay-plastered poplar posts. South-west of the settlement ran a 90-cm-wide irrigation channel. Red cylindrical or spherical ceramic vessels with flat bottoms and carved fishbone patterns show characteristics of the pottery of the Xintala Culture (1700–1300 BC), a complex near Kuqa on the northern edge of the desert, which was influenced by the Andronovo Culture and produced bronze objects.[122] A few kilometres south of Sebier a small hoard of bronze objects was found on the surface. The hoard consists of two tanged flat small lance- or spearheads, two possibly ritual knives or knot openers, a shaft-hole axe-head, a flanged adze and a chisel. It indicates connections to both Andronovo and Aga'ersen in north-western Xinjiang, as well as Tianshan Beilu near Hami.[123]

With the finds at Ayala Mazar it is evident that in the first half of the second millennium BC a unified cultural sphere extended over a distance of more than 600 km; we call this the **Ayala Mazar-Xiaohe Culture** (*ca.* 2000–1400 BC), and it stretched from Ayala Mazar in the west to Xiaohe and farther east to as far as Gumugou, L.S., and Töwän.[124] The respective ^{14}C measurements at Ayala Mazar and Xiaohe suggest that this culture started in the Keriya Delta around Ayala Mazar and subsequently spread eastward to Xiaohe in Lop Nor. Their representatives were Europids who practised a fertility cult and had a mixed economy of artificially irrigated farming and the raising of cattle, sheep, and goats. They were in contact with both the jade-producing centres in the south and with Andronovo-affiliated cultures in the north. When the Keriya Darya began to carry less water towards the end of the second millennium, however, the Bronze Age settlements were abandoned in favour of oases farther south. The change from red to grey pottery, from bilobite bronze arrowheads to socketed trilobite arrowheads with barbs, as well as the appearance of iron objects and slag, supports a geographic transition from the Bronze Age to the Iron Age at between 39° and 39° 15' northern latitude. A millennium later the Iron Age settlements like Gäze and Jumbulakum – the latter of which had a clever system of irrigation channels – also had to be abandoned on account of water shortages, and life moved about 40 km further south to the fortified caravanserai of Karadong (*ca.* first century BC–fourth century AD).

Assuming that 3,000 to 4,000 years ago in the terminal inland delta of the Keriya, along creeks and in small oases like Sebier, a subsistence economy flourished, practising artificially irrigated farming and raising livestock, we can speak of a Bronze Age oasis culture. Withered tree trunks recall the lowland forests that once grew here, providing the settlements with necessary wood. Since the most important elements of this economy, such as wheat, barley, wool sheep, goats and metallurgy, came from the west, the question of their origin arises. The notable similarities in the ecological conditions and the corresponding economic forms between the oases of Bactria and Margiana and those of the Tarim Basin allow us to presume that the origin of this economy was the BMAC Culture.[125] In light of the results of the craniological and genetic research mentioned above, we can proceed from the hypothesis of a first social stratum of Europid, livestock-raising immigrants, who soon came into contact with representatives of the BMAC Culture and adopted from them irrigated farming. Thanks to sustained relations with steppe peoples of Andronovo, their advanced bronze metallurgy, the horse and the wagon soon spread throughout the Tarim Basin, as did gorgeous weavings in the tenth century BC and iron, presumably via Fergana's Chust Culture (1400–900 BC).



Chance discovery south of Sebier, from left to right, a bronze chisel, an adze, a shaft hole axe, two (ceremonial?) knives or joint openers decorated with rhombic patterns and two small lance heads with shafts. Taklamakan Desert, Xinjiang, north-western China, *ca.* 1500–1200 BC.

The petroglyphs of Kangjia Shimenzi near Quergou, dating largely from the late Bronze Age, are found at the foot of a 100-m-high rock wall, Xinjiang, north-western China.

2.3 The wheel, the horse and fertility rites

Toward the end of the Bronze Age the influence of the steppe on the Tarim Basin increased, as can be seen in the introduction of the wagon and horse riding. At the same time, a unique fertility cult flourished at the northern foot of the Tian Shan Mountains.

Wupu: In the cemetery of Wupu, 60 km south-west of Hami in eastern Xinjiang, archaeologists discovered more than 100 shaft-pit graves from the late Bronze Age (1300–900 BC), in which the majority of the dead were Europids with tattoos on their arms and hands. Notable among the discoveries were textiles with diagonal weave and embroidery made of wool, trousers like those worn by riders, and a three-part disc wheel from a wagon burial dating to about 1200 BC. Trousers, the wheel and the wagon burial, as well as the tattoos, which are known from later graves of the Altai, indicate a close connection to the northern steppe cultures.[126] The discovery in Zaghunluq near Qiemo of a man wearing riding trousers with a gusset, along with his saddle, shows that in the ninth century BC horse riding had spread as far as the southern rim of the Tarim Basin.[127]

Quergou: The petroglyphs of Kangjia Shimenzi near Quergou, Hutubi District, are found 150 km south-west of Urumqi on the northern side of the Tian Shan, the celestial mountains. The little-studied petroglyphs are unique in Central Asia in both design and content, since they celebrate an obvious fertility cult that recalls the older cult of the Ayala Mazar-Xiaohe Culture. Some 300 almost exclusively anthropomorphic figures are spread over a 14-m-long shelf 5 m above the ground that nestles against a natural protrusion in a 100-m-high rock wall. The figures range in size from a few centimetres to more than 2 m, and they come from different periods. The foot of the rock face, beneath the shelf, is decorated with archaic hunting scenes, ibexes and wave patterns from the late Neolithic.

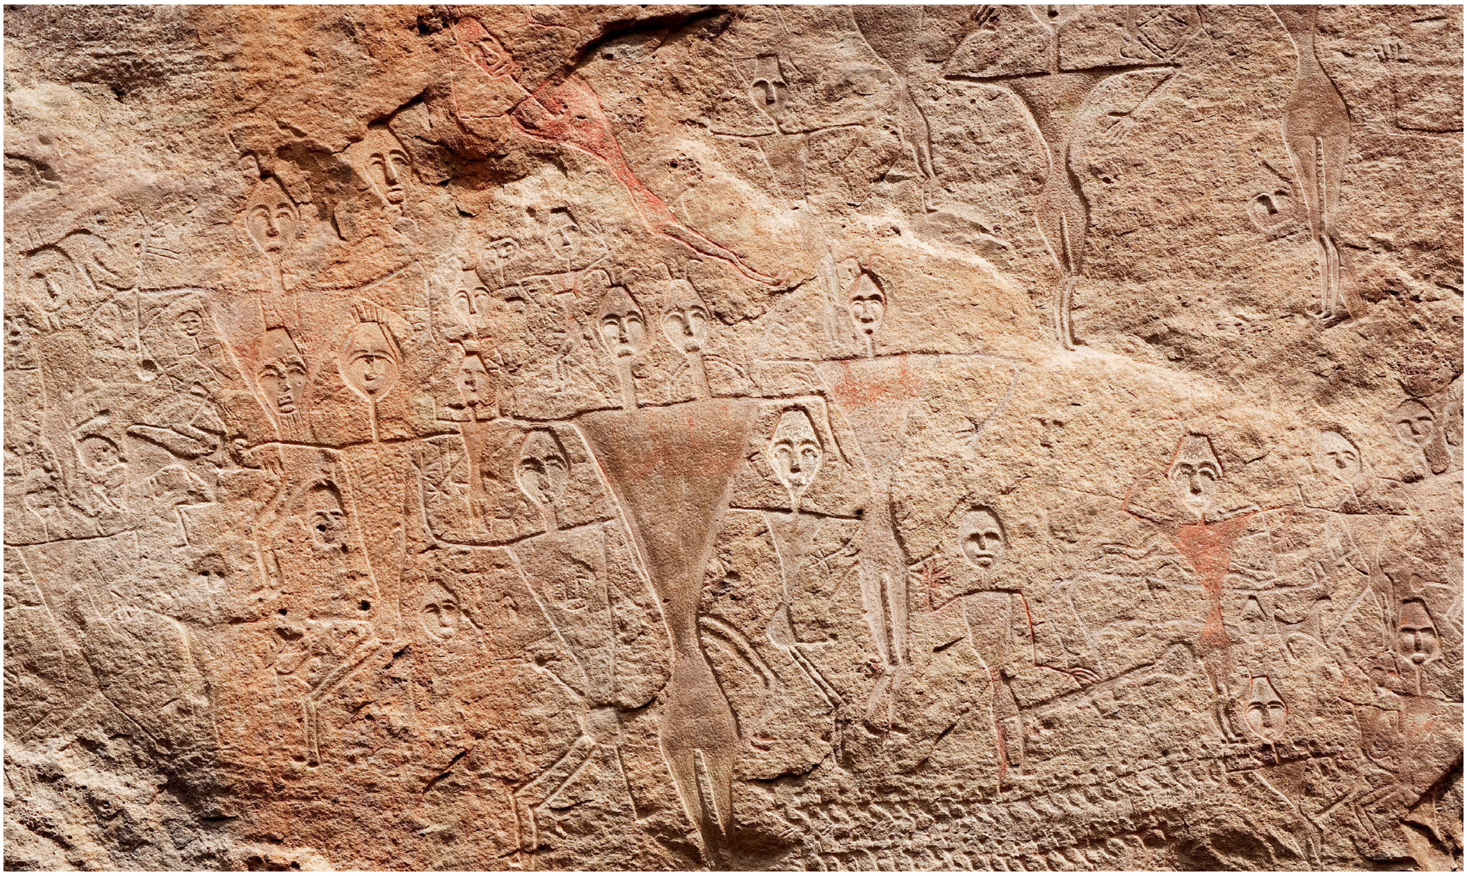
The large composition, stylistically unified and consisting of seven or eight scenes, exudes a palpable vitality and eroticism. Dance scenes predominate, sprinkled with depictions of sex acts, men with giant erect penises, masks, and two-headed women or hermaphrodites. Most of the figures have a triangular upper body with broad shoulders and a narrow waist, and oval heads; a few of them wear a kind of mask with two antenna-like attachments.

The narrow, small faces with prominent noses and brow ridges suggest Europid people. Between the figures are engraved dozens of masks, a few even on the upper bodies of the dancers. In the uppermost scene only women dance beside a prone ithyphallic man; in two lower registers small figures, each a few centimetres tall, dance in front of a standing ithyphallic man. The large figures are deeply chiselled and polished to a shine; a few retain traces of their paint. The sight of this composition, originally painted red and white, must have made an overwhelming impression; perhaps corresponding fertility rites once took place here.

Without comparable examples, these petroglyphs are hard to date, but a few later chiselled pairs of figures provide clues. There are two pairs of horses, presumably heraldic, standing on their hind legs across from each other, from the middle of the first millennium BC, as well as two tigers, depicted in the Scythian animal-style, from the sixth–seventh century BC. Thus we can date the large composition, which was produced in at least two or three layers, one over the other, presumably over the course of centuries, toward the end of the Bronze Age in the last quarter of the second millennium BC. The latest petroglyphs of a few riders and camels come from the thirteenth century AD.[128]

3. The steppes of Central Asia: 'origin' of the Indo–European languages?

The history and development of at least three large language families are closely tied to the steppes of Eurasia. The first is the Altaic family with the Turkic, Mongol, and Tungusic subfamilies, with 160 million native speakers. The second group is the Uralic with the Finno-Ugric and Samoyedic subfamilies, which count 25 million native speakers. The third is the Indo–European, and, with more than 3 billion native speakers worldwide, it is the most widespread. The British official Sir William Jones was the first to hypothesise a common birthplace for different languages such as Sanskrit, Persian, Greek, Latin, Germanic and Celtic – which was later shown to be correct – though he also added Egyptian, Chinese, Japanese and Peruvian, which was clearly wrong.[129] The term 'Indo–European', which is supposed to encompass the geographic expanse of this language family, was coined by Thomas Young in 1813, and outside of Germany it replaced the description 'Indo–Germanic', introduced by Conrad Malte-Brun in 1810.[130] Since Tocharian was deciphered in 1908, the term 'Tocharo–Celtic language family'



Erotic dance scene in the petroglyphs of Kangjia Shimenzi, Xinjiang, north-western China, *ca*. 1250–1000 BC. The central figure has two heads.

might really be more appropriate, because the languages farthest apart geographically are no longer Germanic and Indic but rather Celtic and Tocharian.

Otto Schrader (1855–1919) was the first to state the hypothesis in 1890 that the original homeland of Indo–European should be sought among the steppe nomads between the Black Sea and the Aral Sea.[131] Since the oldest well-documented languages, such as Hittite, Mycenaean Greek or Old Indic, represent independent languages, the hypothetical Indo–European ur-language, called Proto-Indo–European, PIE, had to be reconstructed. In a second step linguists attempted to reconstruct a corresponding proto-lexicon. This revealed that PIE-speakers used the wheel and wagons, raised horses, cattle and sheep, planted corn, wove wool fabrics, collected honey, and sacrificed horses, sheep and cattle to the gods. They lived as farmers who practised stockbreeding and planting. On the basis of the common vocabulary of the descendant languages, supporters of the 'steppe theory' were able to locate PIE chronologically by means of dating the skills listed above. Since the wheel and the weaving of wool were introduced around 3500 BC and are thus the most recent innovations, no descendant languages could have branched off before this time. Soon after 3500 BC proto-Anatolian split off from PIE, followed by proto-Tocharian, then proto-Italic and proto-Celtic some time before 2500 BC, proto-Greek after 2500 BC, and proto-Indo–Iranian around 2200 BC. Proto-Indo–European, which emerged around 4500 BC, had disappeared by shortly after 3000 BC. It is assumed that the Indo–Iranian language family, which appeared around 2200 BC, was related to the cultural complex of Andronovo in eastern Central Asia. Around 1800 BC or earlier it began to split into three subgroups: Iranian, Indo–Aryan and Nuristani.[132]

In any case, the linguistic similarities between the Vedic Sanskrit, the language of the oldest part of the Rig Veda, which appeared around 1500 BC, and the older Avestan of the Gathas, the language of the earliest sections of the Zoroastrian Avesta, composed around 1200 BC, are so striking that a few scholars claim that 'Avestan looks less like an Iranian language than like a phonologically Iranised Indic language'.[133] The two language groups, the Iranian and the Indo–Aryan, separated around 1800 BC, presumably as individual groups from the Andronovo cultural complex began to leave their homeland between the Volga and the Yenisei. The factors that provoked the emigration of small groups of young men remain unknown. Probably not only overpopulation and overgrazing, as well as regional drought, but also the superior weapons of the emigrants played a role. One group set out to the south, toward Bactria and the Pamir Mountains, where the mythical homeland of the Aryans, called Aryana Vaeja, is presumed to have been;[134] the other headed south-west to the Iranian high plateau. In the second half of the second millennium BC in north-western Iran the sudden appearance of innovations like polished grey ceramics and horse burials, as in Hasanlu and Marlik, has been associated with the arrival of Indo–Europeans from regions east of the Caspian Sea such as Gorgan. These distant ancestors of the Medes and the Persians, who are mentioned for the first time in the inscriptions of the Assyrian king Shalmaneser III (858–824 BC), may have settled

Monumental stele of the Okunev Culture with an anthropomorphic face, Khakassia, southern Russia, 2400–1750 BC. Photograph from the early twentieth century.

in Hasanlu, south-west of Lake Urmia, where most of the grey pottery was found. Around 800 BC Assyrians or Urartians burned the city to the ground, and towards the end of the eighth century BC the Persians moved south-east.[135]

The sacred books of the Hindus and the Zoroastrians present a rural world of primarily stockbreeders and secondarily farmers, not an urban world.[136] How close the two language groups were to each other at the time their scriptures were composed is shown by two shared terms with opposite meanings. The Indo–Iranian word *daiva* maintained in the Vedas as *deva* its original sense of 'deity'; in the Avesta, however, *daeva* are demons, false gods. In the Vedas the term *asura* describes sinister and even demonic beings; they are the adversaries of devas.[137] In Zoroastrianism, by contrast, *Ahura Mazda* is the one true god.[138]

Regarding the question of the geographical homeland of the PIE speakers, two contrary views exist: the 'Anatolia hypothesis' of Colin Renfrew[139] and the 'steppe hypothesis', outlined above, of James P. Mallory[140] and E. Kuzmina.[141] For Renfrew Indo–European, or Indo–Hittite, emerged around 7000 BC among the Neolithic farmers and stockbreeders of Anatolia. In around 6700–6500 BC, when they began to spread the technologies of planting and husbandry to Greece and farther west and north, Proto-Indo–European branched off from Indo–Hittite.

The Indo–Hittite hypothesis elegantly combines the spread of Indo–European with that of the Neolithic revolution, but also reveals an indissoluble problem: how can the vocabulary of the wagon and woven wool have emerged within Proto-Indo–Hittite as early as 6500 BC, 3,000 years before their invention? Is derivation of the Chalcolithic steppe cultures from agrarian cultures conceivable? Is it imaginable that settled farmers spread their language over the entire Eurasian continent? The appearance of proto-Greek within Greece as early as the seventh millennium BC is improbable. Why did Anatolian adopt in its original homeland so many non-Indo–European loan words? Most linguists believe speakers of proto-Hittite were immigrants into an agriculturally advanced but non-Indo–European environment of Hattic, Hurrian and Semitic languages.[142]

The steppe theory, which proceeds from a combination of linguistic palaeontology and archaeology, locates the nucleus of a common linguistic and cultural sphere, i.e., the homeland of PIE, in the eastern Ukrainian and Russian steppes between the Dnieper, northern Caucasus and the Urals. In tandem with the largely peaceful migration of groups of stockbreeders and farmers who also practised some agriculture, individual language families began, in about 3500 BC, to spread to the east and to the west. Although the steppe hypothesis is coherent and does not conflict with archaeological dating, it remains unclear *why* the older populations, who spoke non-Indo–European languages, adopted the languages of these immigrants. Was it because of the greater prestige of the bearers of new technologies, as well as their more significant economic power and more effective social organisation?[143]

4. Mysterious stone steles of the Okunev Culture in Khakassia

Around 2400 BC an ethnic and cultural rupture took place between the Irtysh and Ob rivers in the west and Khakassia and the Altai in the east. For the first time Mongolids of the Siberian type began to spread west and curb the expansion of the Europids, resulting in the emergence of an ethnically heterogeneous population. At the

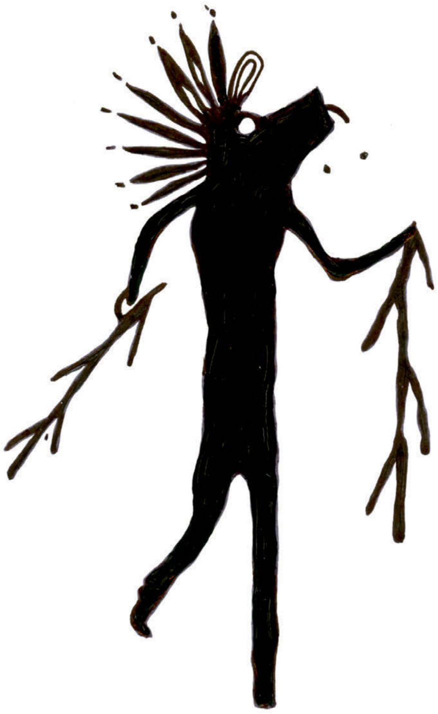
Rock figure of Chortcha Kho near Kazanovka, Okunev Culture, Khakassia, southern Russia, 2400–1750 BC. The figure is brought offerings of food and drink to this day.

same time new burial practices appeared in the **Okunev Culture** (2400–1750 BC) of Khakassia, the Minusinsk Basin and northern Tuva. Rectangular and square stone enclosures made of upright slabs, 100 to 200 m^2 in size and sunk into the ground, replaced the stone circles of the earlier Afanasievo Culture. Inside the Okunev stone fences there were as many as two dozen small stone casket graves, used several times over an extended period, with the bones of those buried earlier pushed into a corner to make room for a new burial. Although the economy of the Okunev Culture was simple and based on hunting and fishing, supplemented by the raising of sheep, cattle and horses, they made notable advances in the development of metallurgy. Metal objects not only appeared much more often than during the Afanasievo Culture; simple copper objects were also superseded by tin alloys. Thus the Okunev Culture and the neighbouring, contemporaneous **Samus Culture** on the Ob and the Irtysh produced the first tin bronze in north-eastern Central Asia. The type of settlement found in the Okunev Culture is unknown, however, except for traces of a few high fortresses.[144] Their economy was complex, as the people practised not only stock-breeding and hunting but also some farming, which suggests a settled lifestyle for at least part of the society.[145]

In contrast to the simple decoration of the pottery, the Okunev and Samus cultures left behind three groups of extraordinary, canonical examples of representative art: small amulets, stone steles up to 4 m tall, and petroglyphs. Among the amulets are 3- to 7-cm-long, schematic human figurines made of white-yellow soapstone, bone or horn, that were laid in graves with the dead; presumably they had an apotropaic function.[146] The bear figurines of the Samus culture, which were of about the same size, had a similar purpose; they were either worn as bronze pendants or placed in graves in the form of clay statuettes.[147]

The impressive stone steles of the Okunev Culture were originally erected at gravesites and were subsequently reused more than a millennium later in the Scythian-era kurgans of the Tagar Culture.[148] Anthropomorphic and zoomorphic faces or masks with geometric patterns are carved into these monumental steles, often many on the same stele. Such abstract masks also adorn ceramic vessels of the Samus Culture. Some Okunev steles end in a human



Indian ink drawing of a hybrid creature with an anthropomorphic body and the head of a bear, surrounded by a wreath of feathers or sunrays, petroglyph of Karakol, Altai, southern Siberia, *ca.* 2400 BC.

head, bent slightly forward; others have a ram's head. In other stone statues breasts and a swollen belly indicate the portrayal of a pregnant woman. On other steles the lowest face wears a conical head covering that extends the length of the stele, in which other masks are engraved. On still other steles, sun-headed faces are carved, which are very similar to the painted grave slabs of the contemporaneous **Karakol Culture** (2400–1750 BC) in the neighbouring Altai. Solar symbols are also discernible on the front and both sides, as are bears with their teeth bared. All the steles were oriented to the east-southeast and often stood immediately beside a cultic site where animal sacrifices were performed, allowing one to presume that they were related to cyclically celebrated rituals of a fertility and sun cult. Finally, the same motifs as on the steles are found in petroglyphs and on stone slabs: sun people and solar symbols; figures with very tall, conical headdresses; ithyphallic men; open-mouthed bears pursuing elk; masks; two-axle wagons pulled by oxen; horses; ibexes; snakes; cattle; elk and red deer.[149]

On the stone slabs of Karakol, which were originally freestanding steles with animal carvings and were repurposed as grave slabs, the standing anthropomorphic and theriomorphic figures are striking; their heads are encircled by sunrays or a wreath of feathers or they wear horned masks or take the form of a snare. These are joined by hybrid creatures with human bodies and bears' heads adorned with feathers, holding a branch in each hand, or a human figure with elk antlers or a bird's head.[150] Perhaps the numerous depictions from Okunev and Karakol of a bear pursuing an elk are related to the ancient myth in which an elk carries the sun through the heavens on his antlers. The bear chases the elk and abducts the sun into the underworld, so that day is followed by dark night.[151]

The approximately 300 Okunev steles are connected to particular rituals and were created with standard requirements for content and form, yet their religious significance eludes us. In any case, they anticipate both the later Scytho–Siberian animal style and the deer stones found in Mongolia, Tuva and the Altai.[152]

5. From the Volga to the Yenisei: homeland of the Indo–Iranians?

The broad region between the Volga and the Yenisei serves as the nucleus of the early Indo–Iranians before the language family split into Iranian and Indo–Aryan. Although most representatives of this culture lived east of the Urals and are included in the general term of the cultural complex of Andronovo, the Urals were not an insurmountable barrier, since isolated cultures west of the

Cultures of the Bronze Age and the Iron Age in the Minusinsk Basin

Thanks to the systematic excavation of the multi-period graveyards of Suchanicha near Minusinsk between 1995 and 2003 and the subsequent carbon-14 dating of the discoveries, calibrated to their corresponding layers, archaeology has a new dating scheme, supported by modern methods, for a nearly 4,000-year-old epoch.[153] Although the dating presented here refers to the Minusinsk Basin only, it provides important clues about chronological divisions outside of the basin as well.

CULTURE	TIME SPAN	NOTES
Afanasievo	3300–2350 BC	Related to Yamnaya and Botai
Okunev	2400–1750 BC	
Andronovo	1750–1400 BC	In a narrower sense, since Okunev is not counted as part of it
Karasuk	1450–1000 BC	Coincides with the culture of Kamennyi Log
Tagar	1000–200 BC	
Bainov	1000–800 BC	Start of the Iron Age
Podgornovo	800–450 BC	Transitional stage
Saragash	450–200 BC	
Tes'	200 BC–50 AD	Migration of the Huns
Tashtyk	50–500 AD	

mountain range appear also to have belonged to the homeland of the Indo–Iranians. They stood in the tradition of the Yamnaya Culture and shared a few essential hallmarks of the cultures east of the Urals.

5.1 Cultures west of the Urals

The **Abashevo Culture** (2200–1900 BC) extended west of the Urals as far as the Don in a forest steppe zone.[154] It continued the burial customs of the Yamnaya Culture; most of the cemeteries consisted of about a dozen small kurgans with individual interments, a few animal sacrifices and comparatively poor grave gifts, including shaft-hole axes made of arsenic bronze. An exception is found in the kurgan of Peplino, which contained 28 young men, who probably fell in combat: 18 had been beheaded and the remainder bore severe injuries caused by the blows of an axe.[155] Representatives of this culture raised cattle, sheep and pigs, but few horses, which suggests a semi-sedentary lifestyle.

Like the Abashevo Culture, the Katakombnaya Culture in the south-west and the Poltavka Culture to the south-east stood in the tradition of Yamnaya. The distinctive feature of the **Katakombnaya Culture** (2450–1950 BC), which extended from the Dnieper to the Volga, was that they placed the dead in niches or catacombs.[156] Grave goods included bronze weapons and tools, ceramic vessels with funnel-shaped or cylindrical necks and sometimes decorated with spiral patterns, smoking bowls and, for members of the elite, animal sacrifices and one- or two-axle wagons.[157] Another hallmark of the elite was the shaping of a clay mask over the skull of the deceased.[158] Such masks appear again in the much later culture of Tashtyk (first–fifth centuries AD) in the Minusinsk Basin. In the second half of the third millennium BC the drying of the climate between the Dnieper and the Don gathered pace and the forests in the river valleys receded further. For this reason the economy of the Katakombnaya Culture was based primarily on semi-nomadic herding and secondarily on the raising of pigs, as well as cultivation of the land surrounding the permanent settlements, which also served as winter camps and were partially fortified.

The culture of **Poltavka** (*ca.* 2700–2100 BC) was likewise a successor culture to Yamnaya and extended from the Volga to

north-western Kazakhstan.[159] Its pottery was differentiated from that of Yamnaya in that its vessels were no longer pointed at the bottom but rather flat. Wooden arbours covered some of the gravesites, so in this regard it anticipated the timber-grave culture of Srubnaya. Like the culture of Sintashta, that of Poltavka belonged to the circle of early Indo–Iranian cultures.

The **Srubnaya Culture** (*ca.* 1950–1200 BC)[160] was a successor culture of Poltavka, Abashevo and Katakombnaya, and is closely related to the neighbouring complex of Andronovo, with the Ural River, which flows into the Caspian Sea, forming the border between the two cultures. Offshoots of each culture were found on each riverbank, however. It extended from the Urals across the Volga as far as central Ukraine, and its name, Timber-Grave Culture, refers to its log-cabin-like grave structures, found under kurgans; in Russian *srub* means essentially 'timber framework'. These wooden burial chambers resembled underground replicas of the above-ground winter quarters. Such timber graves, which were presumably thought of as subterranean houses of the dead, were the exception, however, since they appear in fewer than 5 percent of all Srubnaya graves.[161] Most of the dead lay in ordinary earthen graves, sometimes covered by horizontal wooden poles. In one regard the Urals formed a clear boundary, since in the Andronovo tombs grave goods made of tin bronze predominate, while in those of Srubnaya arsenic bronze ones do. The subsistence economy of the Timber-Grave Culture was based primarily on settled stockbreeding and, in the regions west of the Don, it used the moister climate to practise modest farming.

5.2 Cultures east of the Urals: The Andronovo complex

The term **Andronovo** (*ca.* 2200–1250 BC) refers in general to an enormously widespread archaeological complex of the Bronze Age. It extended from the Urals in the West to the Yenisei in the east and from Margiana in the south-west to the Tian Shan of Xinjiang in the south-east. Despite the variety of elements of material culture, essential common features are identifiable: whether as bodies or cremated remains, the dead were buried in timber chambers covered with a low kurgan; the economy was oriented toward semi-nomadic herding and limited farming; and people lived in sunken log cabin dwellings. Representatives of the Andronovo Culture are classified as members of the early Indo–Iranian language family, and they serve as inventors of the light chariot with spoked wheels and further refiners of tin bronze east of the Urals. At burials of the warrior elite horses and cattle were sacrificed and a chariot was sometimes placed beside the deceased in the grave. Early forms of the Andronovo Culture include the cultures of **Sintashta** and **Petrovka** (2200–1700 BC) between the Urals and northern Kazakhstan. The cultures of **Alakul** (2100–1400 BC), which stretched from the Tobol River almost as far as the Ob, and **Fyodorovo** (1850–1250 BC), which extended from the Irtysh to beyond the Yenisei, belonged to its heyday.[162] Later representatives of Andronovo included cultures south of the 47th parallel, such as Tazabagyab (mid-second millennium BC)[163] south of the Aral Sea, and the post-BMAC cultures.

5.2.1 The culture of Sintashta – fortified circular settlements and chariot burials

Shielded by the Urals from the moist air masses from the west, the distinctive continental climate between the Urals and northern Kazakhstan experienced a period of increasing drying beginning around 2300 BC. The southern forest line shifted northwards and the steppe expanded correspondingly, creating ideal conditions for the raising of livestock. Semi-nomadic herders from the region between the Volga and the Urals took advantage of this opportunity towards the end of the Yamnaya Culture, which was likewise exposed to an increased climatic drying.[164] They turned to the east, went around the southern foothills of the Urals, and founded the culture of **Sintashta** (*ca.* 2200–1700 BC) in the region south-east of the modern Russian city of Magnitogorsk between the Ural, Tobol and Ishim rivers.[165] The wealth of copper ore and gold increased the attraction of the region. The Sintashta Culture is characterised by two spectacular features: light chariots, with spoked wheels and very compact wooden settlements, built according to a master plan, with double protective walls, which could reach a size of 35,000 m^2. The 21 known fortified settlements were distributed over an area of 30,000 km^2 and surrounded by numerous unfortified villages. They lay along rivers and were each constructed in a short time according to a previously defined plan. Six of them have a circular layout; six more an oval one; and the remainder, a rectangular layout. During the annual snowmelt in early summer they emerged like islands out of the flooded landscape.

The approximately 4,000-year-old settlement of Arkaim, first discovered in 1987, is similar to that of Sintashta, in whose cemetery the first light chariots dated 2100 BC, were excavated,

▶ Illustration according to archaeological data of the circular settlement of Arkaim, south-eastern Ural steppe, southern Russia, *ca.* 2000–1700 BC. but it is considerably better preserved. The circular settlement with a diameter of 145 m is enclosed by an outer stone wall, 2.5 m high, which included an open walkway, as well as an equally deep moat 4 to 6.5 m wide. Beyond this was a 5- to 6-m-thick defensive wall, up to 6 m high, which was topped by a walkway covered by a roof sloping outward. The wall was built from large mud bricks, in parts reinforced by stones stacked on top of each other. The interior side of the compact outer wall was attached to the first, outer ring of buildings, which consisted of 39 narrow, trapezoidal houses, built against one another along the long sides. The rear, short sides of the houses, about 7.5 m wide and without entrances, formed the exterior of the settlement, reinforced by the defensive wall. The single-storey houses had common long sides 19 to 22 m long. The front short sides of the houses were up to 6 m wide and their entrances faced the 4-m wide circular street in the interior of the settlement. After this circular street came a second ring of buildings, consisting of about 23 somewhat smaller houses 16 to 18 m long with shared long sides. The entrances of these houses also stood on the inward-facing short side and opened onto a plaza with a diameter of 30 m. The rear side of this inner ring of buildings was, at over 7 m high, taller than the outer ring. The houses were built out of mud bricks, the roofs out of wood. No building displayed a size or shape that departed from the norm.[166]

The settlement, which once numbered about 1,200 to 1,600 inhabitants, had an approximately 12 m-wide main entrance to the south-west and three small, labyrinthine side entrances. Since the only entrance to the inner circle of houses was also found on the south-west side but was a few degrees farther to the south and separated from the main entrance by a wall, anyone who wanted to reach the interior of the settlement had to walk clockwise along the ring street, which was paved with timber. From above the settlement looked like a giant wheel with two concentric spoked rings.

The houses, sunk about 30 cm into the ground, displayed standardised interior arrangements and furnishings. Each consisted of a living and a working area, as well as an antechamber, and had a hearth in the centre or the back. Each house also had its own well with a domed oven beside it, as well as a covered drain that carried wastewater to the sewer that ran beneath the ring street. Such sewerage systems became widespread in Europe only at the beginning of the nineteenth century AD. Dross that still remains in the ovens indicates the production of copper and arsenic copper objects.[167] The necessary ore was found in the many nearby copper mines, such as that of Vorovskaïa, 40 km north of Arkaim.[168]

The rectangular cities, such as Olginskoe, also featured standardised structures. The settlement had a ring of fortifications with two gates strengthened by towers, which protected four rows of 20-m-long buildings, compactly arranged against one another along their long sides. Each of the two middle rows numbered seven buildings and each outer row had six. As in Arkaim each house had a well, an oven and a wastewater drain. Just under half of the area remained unbuilt, and here archaeologists discovered not only slag from copper smelting but also a small mine with gold ore. This indicates that Olginskoe was a small centre of metallurgy, where gold and copper ore were processed.[169] The economy of Sintashta was based on metalworking, the export of copper objects and bars to the BMAC cultural sphere,[170] stockbreeding, and some farming of millet and barley.

Such reinforced settlements were an innovation in this steppe region of Central Asia and suggest a need for security in a conflict-ridden environment.[171] The many weapons found in graves of the elite support the impression of an age marked by raids and skirmishes. In graves of the Sintashta Culture there are not only many more weapons than in earlier periods but also new types of weapons, which were particularly suited for battles with light chariots, such as light spears with long flint blades and spears with heavy copper or bronze spearheads. Added to these were traditional weapons such as daggers, battle axes and arrowheads as well as tools like adzes, barbed harpoon heads and fishing hooks. The discovery of numerous bone reinforcements for bows suggests that forerunners of the composite bow were also developed here.[172]

The burials of the Sintashta culture are concentrated in 12 necropolises, which correspond to the lifestyle of settled populations. The importance of stockbreeding is reflected in the elaborate

Kirghiz nomads build their yurts beside Karakul Lake, 3,610 m above sea level; in the background stands Muztagata, a mountain rising 7,546 m above sea level, Xinjiang, north-western China.

animal sacrifices, and the importance of readiness for combat in the rich grave goods of weapons, harnesses and even light chariots along with entire horses. The graves also reflect the social stratification of the society of Sintashta. Only a third of the dead were posthumously honoured with the construction of a kurgan and only 14 percent of the men's graves were distinguished by the privilege of a chariot buried in them. These were presumably the graves of the warrior elite. With the exception of daggers and knives, which also served as tools, only men had weapons laid in their graves; women received jewellery as grave goods. These were bracelets and frontlets, from the side of which a light chain made of bronze discs and glass beads hung to the chin, framing the entire face. From the back of the frontlet hung a long leather band, covering the neck and back and decorated with bronze ornaments and glass beads. The average life expectancy at the time of the Sintashta Culture was, at 28 years, quite low.[173]

Animal sacrifices also accorded with social considerations: horses were sacrificed only at the burials of men; sheep and goats mostly at those of women. A kurgan at Arkaim, where 115 animals – among them 22 horses, 29 cattle, 48 sheep and 11 goats – were sacrificed for the burial of 24 or 28 dead, was unusual.[174] With the exception of horses killed right beside the chariots, the meat from the sacrificed animals was used to feed the many mourners. In Sintashta animal sacrifices were an indispensable part of a burial, since more than 90 percent of Sintashta graves show evidence of animal sacrifices. In comparison, only 15 percent of Yamnaya graves of the lower Volga indicate animal sacrifices, 16 percent in the Timber-Grave Culture, and 17 percent at Alakul in the region of Chelyabinsk.[175]

A few graves of the military aristocracy were arranged like a three-storied house. In the lowest wooden chamber was the chariot with its harness and its charioteer. In the middle, somewhat smaller wooden chamber, the clothed corpse lay on his back with knees bent beside his weapons and with containers filled with symbolic food for the afterlife. In the upper chamber sacrificed horses, cattle, sheep and dogs lay beside a small hearth. After the sealing of the upper chamber a ritual fire was lit and an earthen tumulus mounded up.[176] In light of the complexity of the burial rites and the organisation necessary for the construction of the large settlements, one can posit the existence of hierarchical social structures; presumably large settlements were a kind of chiefdom.

The distinctive features of the burial rituals and grave goods in Sintashta suggest distant resonances with the world of the Rig Veda. Archaeological investigations have brought to light that members of the warrior elite were honoured with lavish burials,

The motorcycle fits seamlessly into the traditional life of Mongolian nomads.

which included the sacrifice of horses, cattle, sheep and dogs, as well as light chariots with eight, ten or 12 spokes, weapons and horse harnesses as grave goods. Towards the end of the ceremony a ritual fire was lit over the grave, and the kurgan was erected. In the Rig Veda warriors were praised as charioteers[177] who proved themselves in chariot battles[178] and races.[179] The lordly chariot also serves as the vehicle of the gods[180] and the sun.[181] The hierarchy of sacrifices of horse, ox, and ram/sheep[182] also corresponds to the findings in Sintashta. Although in the Rig Veda the dog is not a special kind of sacrificial animal, in a funeral oration the deceased is called upon as Yama, 'And those two dogs of thine, Yama, the watchers, four-eyed, who look on men and guard the pathway ...'[183] The dog is a guardian of the deceased and shows him the way. Then the fire god Agni is invoked to purify the deceased with fire but not to burn him up or consume him.[184] After this the earth is called upon to create a tumulus for the deceased as a final resting place: 'Heave thyself, Earth, nor press thee downward heavily: afford him easy access, gently tending him. Cover him, as a mother wraps her skirt about her child, O Earth. Now let the heaving earth be free from motion: yea, – let a thousand clods remain above him. Be they to him a home distilling fatness [richly furnished], here let them ever be his place of refuge.'[185]

The six towns of Sintashta with a circular plan show some similarities to the triple-walled circular complex of Dashli-3, dating to a millennium later, and Kutlug Tepe in northern Afghanistan, as well as the doubly fortified cultic site of Koi Krylgan Kala in western Uzbekistan on the one hand and the mythical circular city of Var from the Avesta on the other.[186] Although composed later, both the Rig Veda and the Avesta are rooted in an originally shared tradition some 3,800 to 3,900 years old.[187] The first ruler of the world and livestock, Yima, built the mythical, circular city of Var at the behest of Ahura Mazda to protect the healthy and pure living beings from the deadly winter Ahura Mazda will conjure.[188] The radial architecture of the circular settlements of Sintashta could also be a distant forerunner of kurgan 1 at Anchil Chon from the Karasuk period (1450–1000 BC), the Tuvan kurgan of Ulug Chorum, and the radial wooden construction of the early Scythian royal kurgan of Arzhan 1 in Tuva.[189] In this last case the radial tomb architecture could symbolise an underground form of the mythical city of Var and the interred prince would be symbolically associated with Yima, who saved pure beings from death.

The factors that led to the end of the Sintashta Culture are debated. A drying climate and increasing deforestation may have led to renewed migration, with the departing people ritually burning down their towns, such as Sintashta, which bears traces of fire, analogous to the settlements of Tripolye, 2,000 years older.[190] The unfortified and circular hamlets on the Tobol River of the forest-steppe **Tashkovo** Culture, which lay about 200 km farther north-east and existed contemporaneously with Sintashta, were also ritually burned down without being affected by conflict.[191]

Nomad woman in front of the wooden door of her yurt, central Mongolia.

East of the Sintashta Culture the culture of **Petrovka** (2200–1700 BC) flourished at the same time in northern Kazakhstan. It is so similar to Sintashta that a common Sintashta–Petrovka Culture is also spoken of.[192] Certain differences can be seen, however. The compact settlements of Petrovka were smaller and less strongly fortified. They did not have a circular or oval layout but were always rectangular. Although the houses also had a well and an oven for metalworking, the discovery of infant burials beneath the floors was surprising.[193] As the Petrovka Culture expanded over time toward western and central Kazakhstan, the burials became less complex; the number of animal sacrifices and weapons provided as grave goods decreased and wagon burials ceased. These changes indicate less social stratification and a decline in the militarisation of society.

While the forges of Sintashta almost exclusively produced copper, arsenic bronze and slightly ferrous arsenic copper,[194] around 2000 BC in the forest steppes between the western foreland of the Urals and the Altai, as well as in the Sayan Mountains, high-quality weapons made of tin bronze appeared. In the absence of common burial rituals,[195] settlement types and pottery, these discoveries do not provide the basis for a culture, but they are described as the phenomenon of **Seima Turbino**, named for two of the five most important discovery sites.[196] The term really defines a group of outstanding weapons crafted of tin bronze in a certain style. In particular, the tin bronze spear points with a cast, closed socket, daggers, axes and arrowheads with sockets were, thanks to their superior hardness and better quality, superior to similar weapons made of arsenic bronze. The numerically small warrior elite who used such weapons also increased their advantage in close combat by wearing breastplates made of long discs of horn, sewn together in an overlapping pattern.[197] The weapon-makers of the Seima Turbino bronze industry were also artists, as they produced single-edged knives and double-edged daggers whose hilts end in an animal protome, or where an animal standing on the flat end replaces the knob.[198] These skilfully produced knives anticipate not only similar bronze knives of the Karasuk Culture but also to a certain degree the animal style that spread throughout Central Asia in the first millennium BC.[199]

This advanced production of bronze weapons was presumably developed by blacksmiths in the area around the Altai, who made use of the rich local sources of tin and supplied the warrior

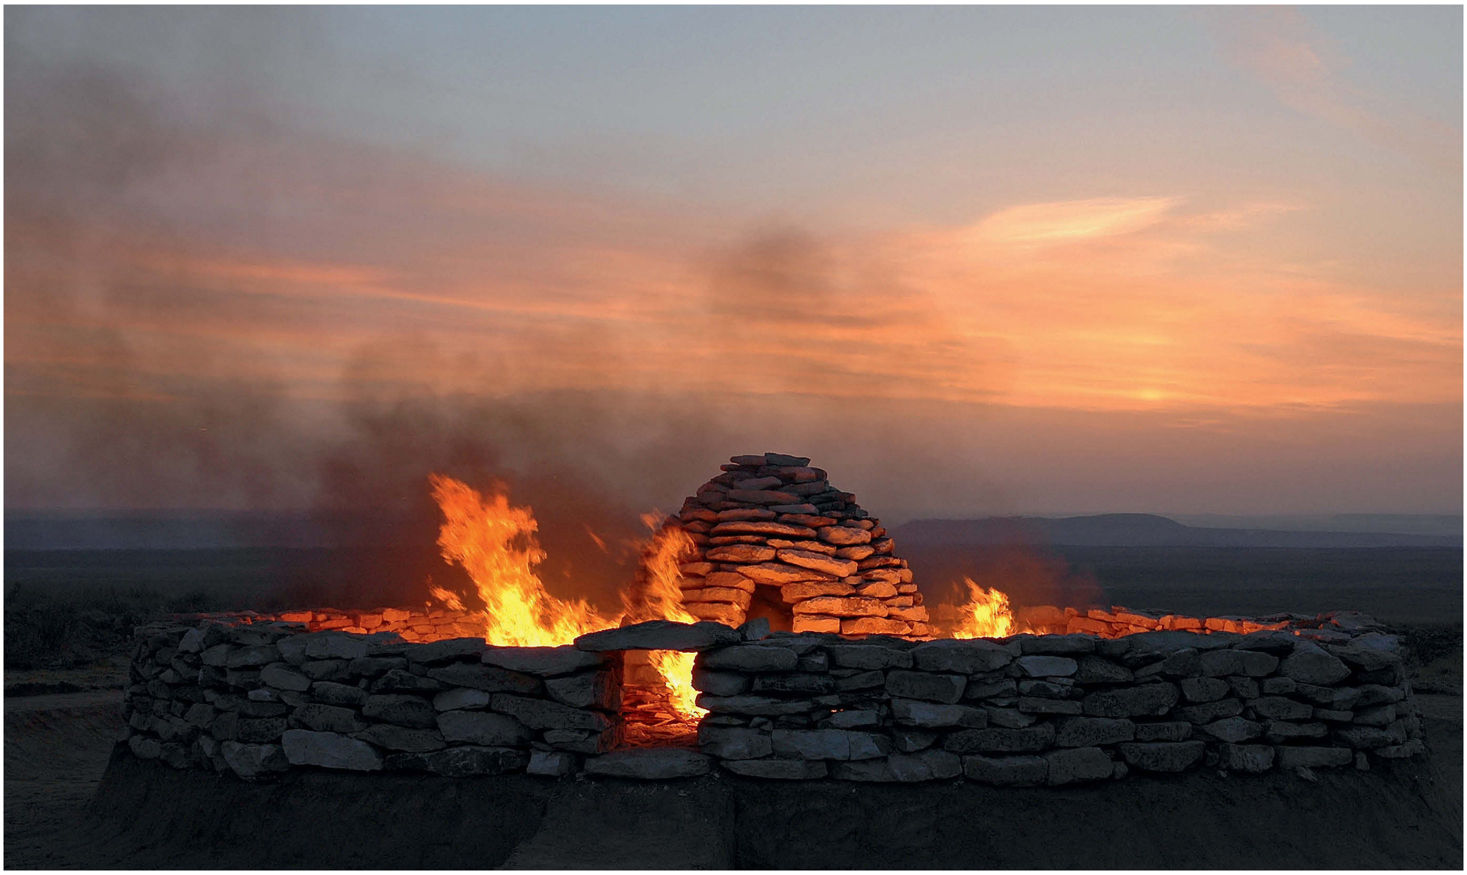
Single-axle ox carts with heavy wooden wheels at a nomad camp near Khanuy Gol River, Arkhangai Aimag, central Mongolia.

elite with superior weapons. Koryakova argues that the blacksmiths of Seima Turbino were organised as clans and spread to the north-west, following the flow of their goods, so to speak.[200] The technology of Seima Turbino, which bore fruit in the emergent cultural complex of Andronovo, changed trading patterns as the earlier export of Caucasian arsenic bronze from west to east was superseded by the export of tin bronze from the Urals in the opposite direction.

5.2.2 Alakul and Fyodorovo

Around the turn of the third to the second millennium BC four related and partially overlapping cultures belonging to the Andronovo cultural complex flourished or arose east of the Urals. They were, from west to east: Sintashta and Petrovka (2200–1700 BC) between the Urals and the Irtysh, **Alakul** (2100–1400 BC) between the Tobol and nearly to the Ob, and **Fyodorovo** (1850–1250 BC) from the Ob to beyond the Yenisei.[201] Seeing that the earliest culture lay in the west and the most recent in the east, one can assume not only further development of the local cultures but also a migration out of the region between the Volga and the Urals. Together with the cultures west of the Urals, there arose a chain of similar steppe cultures that stretched over an expanse of 4,000 km from the Dnieper to beyond the Yenisei and was in contact with settled civilisations at both ends. Not only were goods exchanged along this steppe corridor; innovations were also spread, as can be seen in the appearance of battle chariots simultaneously in central China and Greek Mycenae.

The bearers of the Andronovo Culture were Europids and belonged to the Indo–Iranian language family.[202] Thanks to a more humid climate the pastures between the Ob and the Yenisei



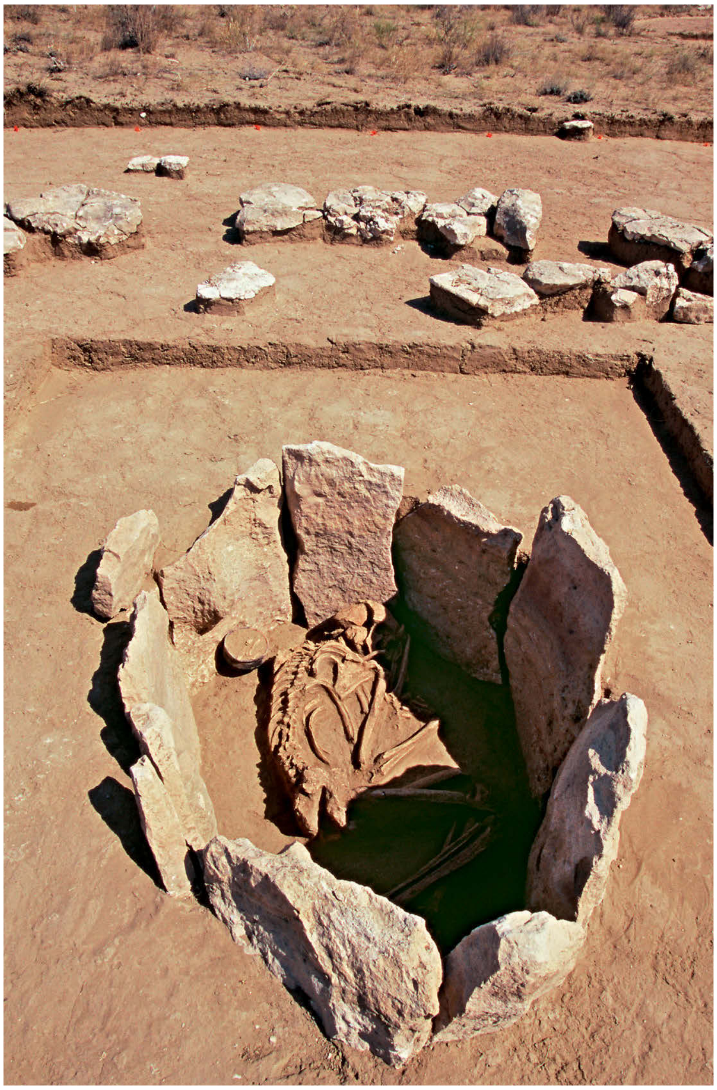
Staging of the fire ritual at the conclusion of a late Bronze Age burial near Ulken Kuduk, Mangyshlak Peninsula, western Kazakhstan, *ca*. 1350–1250 BC. The egg-shaped stone dome over the grave corresponds to the contours of the egg-shaped cist grave beneath.

were lush, and the people of Alakul and Fyodorovo lived as settled stockbreeders. They had smaller, permanently inhabited settlements along the riverbanks, which also served as winter camps for the herders who moved around over short distances during the summer, and their livestock. Discoveries of bronze sickles and corn grinders suggest that farming was probable. The small villages included grazing lands and a necropolis. Each village had one or two dozen sunken houses, initially with an area of 25 to 100 m^2 and later up to 300 m^2 in extent. Presumably extended families lived in the houses and the village consisted of a single clan. As the fields were soon consumed and trampled by the larger herds, the inhabitants of the settlement had to change its location every 20 years or so.

In the first half of the second millennium BC walls and moats protected many settlements, but from about 1500 BC unfortified settlements became more common. This suggests either peaceful times or, more probably, increasing mobility.[203] At that time many herding families lived in an early type of yurt, which they either dismantled when changing camps and transported on pack animals such as camels or kept them mounted on a two-axle wagon pulled by camels or oxen. In this way emerged the new style of settlement that marked the steppes for more than three millennia: mobile yurt cities and villages. The fact that in the last quarter of the second millennium BC the unfortified settlements were also depopulated provides clear evidence for the transition of a largely settled stock-breeding economy to a semi-mobile and soon thereafter nomadic one. Petroglyphs of quadrigas, two-axle chariots drawn by four horses, from the epoch of Karasuk (1450–1000 BC) show that the people of that time possessed the necessary draught power.[204]

Graves and kurgans were grouped into cemeteries near rivers, unlike the later Iron Age kurgans that stood on elevated sites visible from afar and a certain distance from rivers. The graves were surrounded by either a circular or a rectangular fence made of stone and they were covered by a usually low mound of earth or stones, of which the outer edge was held in place by a ring of stones. The fence marked the physical boundary of the grave complex – the transition from profane to sacred space. Such a boundary fence was meant to protect the dead from hostile people or spirits and also to prevent the dead from infiltrating and troubling the land of the living. This symbolic function of the kurgan is expressed in the Rig Veda: 'Here I erect this rampart for the living; let none of these, none other, reach this limit. May they survive a hundred lengthened autumns, and may they bury Death beneath this mountain [kurgan].'[205] In the eastern part of the Andronovo cultural realm, the graves consisted of a cist made of large slabs; in the west, they were timber chambers.[206]

Regarding the handling of dead bodies, a significant innovation arose in the Fyodorovo Culture. While the Alakul Culture carried out only bodily burials and placed entire grave complexes under a single kurgan, in the southern Siberian regions Fyodorovo practised mostly cremation and individual graves. Cremation took place outside the graves, and, in a second step, urns containing the ashes and remains of bones were laid in the grave. In some cases entire kurgans were set on fire.[207] In northern Kazakhstan, however, the burial of corpses remained the norm even at the time of Fyodorovo, but on the Mangyshlak Peninsula in western Kazakhstan cremation was also practised and the barrows were often put on fire.[208] Only certain tribes introduced the innovation of cremation; the others maintained traditional burial rites. A distinctive feature of the Alakul Culture was the occasional burial of infants within the settlements, surely a continuation of an archaic custom from the Petrovka Culture. Finally, one other innovation appeared in the Fyodorovo Culture, which later spread to the elite graves of the Scythians, since in a quarter of the graves in the Minusinsk Basin two corpses, a man and a woman, lie in the cist. In some cases, the woman, who died a natural death, had been buried a few years later than the man; in others, however, both were laid in the grave at the same time. This means that at the burial of the man the chief wife or one of his other wives was killed in order to follow the man into the grave.[209]



Burial of an approximately 45-year-old woman in the foetal position in an egg-shaped cist grave, near Ulken Kuduk, Mangyshlak Peninsula, western Kazakhstan, *ca.* 1350–1250 BC.

As in the other Andronovo cultures, at burials a funeral feast was held and animal sacrifices were performed. The sacrifice of dogs increasing rapidly from about 1500 BC, while the sacrifice of horses and the use of horse gear for grave gifts declined just as rapidly. This probably attests to the disappearance of the chariot.[210] Practically all the dead were given pottery, but of two different qualities. More than 90 percent was of a crude type with simple forms and ornaments; the remainder was elegantly shaped and decorated with complex geometric patterns such as bands of zigzag lines, fishbone patterns, hatched rows of triangles, meanders and swastikas.

6. Karasuk and the cultures of Khirigsuurs and Slab Graves during the transition to the Iron Age

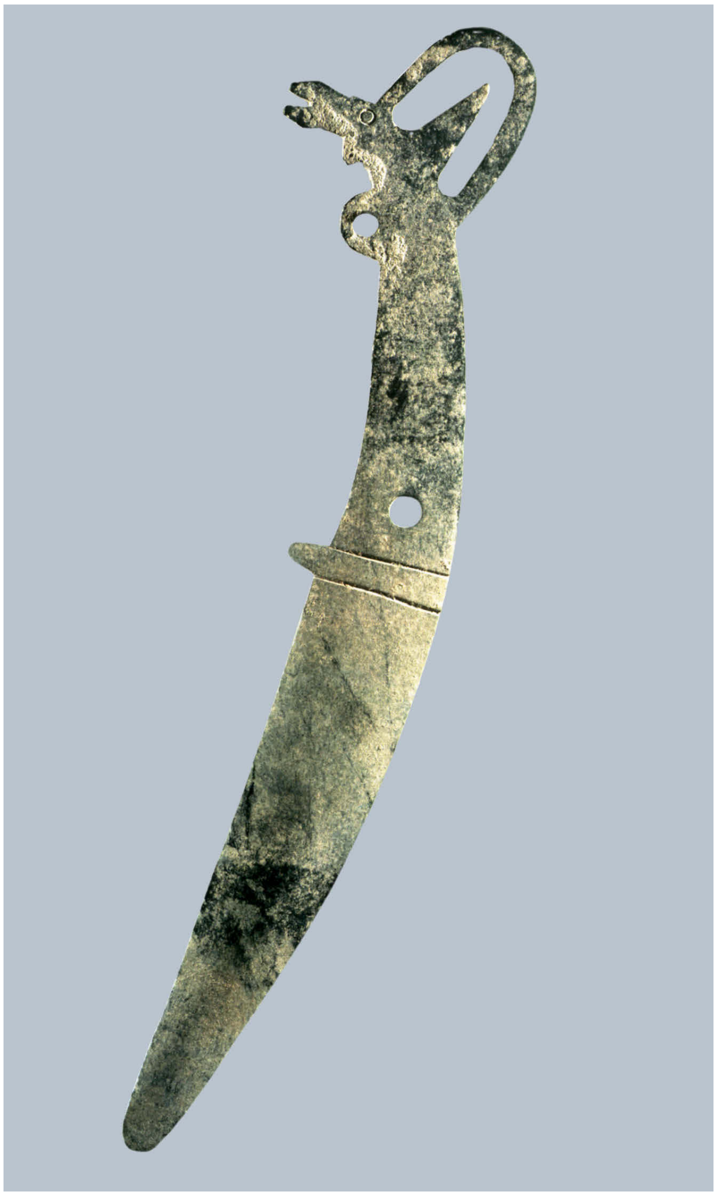
In the late Bronze Age, after 1400 BC, the culture complex of Andronovo began to collapse and regional cultures[211] emerged again, of which the most important in the northern steppe were that of Karasuk in the Minusinsk Basin and the Khirigsuur and the Slab Grave cultures farther east. North of the Andronovo cultural realm, in the forest steppe belt between the Irtysh and the Ob, the **Irmen Culture** (1450–800 BC) followed, with its people living in small settlements of pit-houses and practising stockbreeding.[212] The previously mentioned regional cultures of Jaz, Tazabagyab and Beshkent-Vakhsh emerged south of Andronovo.

In the northern steppe climatic and economic factors brought about the end of the settled or moderately mobile Bronze Age and led to the Iron Age of nomadic steppe horsemen. In southern Siberia the transition period shaped the culture of **Karasuk** (1450–1000 BC). Migration out of Mongolia and northern China, as well as mixing with the local Fyodorovo population, played a role.[213] The representatives of the Karasuk Culture practised nomadic herding, concentrating on sheep, goats and some cattle. A few groups maintained permanent winter settlements, such as that of Kamennyi Log on the Yenisei, which consisted of spacious sunken houses. 'The houses in these winter settlements looked from the outside like earthen mounds; but under the mounds were spacious rectangular structures with an area of 100 or 200 square m, sunk into the ground to a depth of 1½ metres or so.' A 'ladder in the form of a tree trunk with notches cut into it' allowed the chimney, 'an aperture to admit light and let out smoke from the fire', to be used as an entrance.[214]

The metallurgy of Karasuk was distinguished by its outstanding quality, which continued the tradition of Seima Turbino, and by special forms of knives and daggers. The bronze ring-pommel knives were either slightly concave or flexed at the transition point between hilt and blade; they may have been the inspiration for the knife coins with ring hilts that were widespread in China in the first millennium BC.[215] Other Karasuk knives and daggers either had animal protomes as the knob or a standing animal on the flat end. These daggers enjoyed great popularity and were found from the Urals over the Ordos as far as northern and central China; it is conceivable that they may for a time have served as a form of currency. The graves of the Anyang Dynasty, such as the one of Fu Hao, have yielded not only such bronze daggers with animal protomes, but also some daggers made of jade. The question of where this special type of dagger originated is unknown. This point is significant because these daggers and knives are among the forerunners of the Scythian animal style. The Minusinsk Basin, Anyang, the Ordos, or even Iran have been named as their birthplace.[216] The last two may be ruled out, and China is improbable for two reasons. The finds in the grave of Fu Hao (d. *ca.* 1200 BC) are later than the earliest exemplars from Khakassia, and the zoomorphic dagger knobs appear foreign to the Chinese aesthetic tradition of the time, which usually decorated bronze vessels with dragons, tigers and snakes. Thus the culture of Karasuk is not only the origin of the daggers with animal protomes but also an essential source for the animal style that spread to all the steppe peoples of the Scythian period. Discoveries of cowry shells in Karasuk graves suggest that it engaged in trade with China.

In contrast to the smaller cemeteries of Andronovo, in Karasuk the burials were concentrated in huge necropolises with thousands of graves. The dead lay in narrow cists, which were sometimes sealed by one or two stone slabs. Rectangular or circular stone enclosures surrounded the graves. As food for the afterlife they placed one or two jars containing beverages by the head and pieces of mutton, from the shoulder, breast and both haunches, beside the feet.[217]

One of the most interesting kurgans of Karasuk is the above-mentioned kurgan 1 of Anchil Chon near Kazanovka, Khakassia. The central cist is surrounded by a circular enclosure made of standing slabs, which were themselves surrounded by ten radially arranged stone settings. Not only was the neighbouring kurgan 5 also laid out 'like sunrays' but both kurgans were oriented to the



Chinese jade pendant, 35.6 cm in length, in the form of a dagger with an animal protome in the style of Karasuk, central China, late Shang to early Western Zhou Dynasties, *ca.* 1300–1000 BC. Throckmorton Fine Art, New York.

rising and setting sun, as well as to the North Star. 'Graves 1, 2 and 6 of kurgan 1 lie in a line. On the day of the autumnal equinox (September 22/23), the final rays of light before the sun disappears behind the mountains strike the centre of these graves.'[218] Since the graves are laid out according to astronomical criteria it is conceivable that they also had an astronomical function, provided they remained marked after the sealing of the kurgan. Kurgans 1 and 5 of Anchil Chon share their architectonic principle of a ring-shaped central structure around which other enclosures or structures are arranged radially with not only the 'sun graves' of Gumugou, the circular cities of the Sintashta Culture, and the fortress of Dashli 3, but also the 'sunray-like' layout of the great kurgans of Arzhan 1 and Ulug Chorum. Thus Nikolaj Bokovenko classifies the two kurgans of Anchil Chon as 'an important link between Arkaim and Arzhan'.[219]

In Khakassia the graves of **Lugavskoe** from the tenth/ninth century BC mark the transition from the late Bronze Age to the Iron Age, which is characterised by a different burial topography. The people of Lugavskoe belonged to the early warrior horsemen of southern Siberia, who, as a consequence of their increased mobility, no longer constructed large necropolises but rather erected considerably smaller and isolated kurgans. The numerous discoveries of weapons and horse gear underscore the martial character of this new culture of nomadic horsemen.[220]

During the transition period from the Bronze Age to the Iron Age two cultures emerged east and south-east of the Minusinsk Basin that were characterised not only by different types of burial but also by differing ethnic affiliations. The shared geographic borders divided two ethno-cultural complexes from each other. They had in common, however, the integration of the so-called deer stones into their gravesites. In the region of Baikal east of Khakassia and in the eastern half of Mongolia the **Slab Grave Culture** (*ca.* 1250–100 BC) predominated. The gravesites consisted generally of rectangular, sometimes square or oval enclosures made of large, flat or cigar-shaped stone slabs sunk into the ground; occasionally steles marked the corners of the enclosures. Sometimes older deer stones, which originally fulfilled other purposes, were

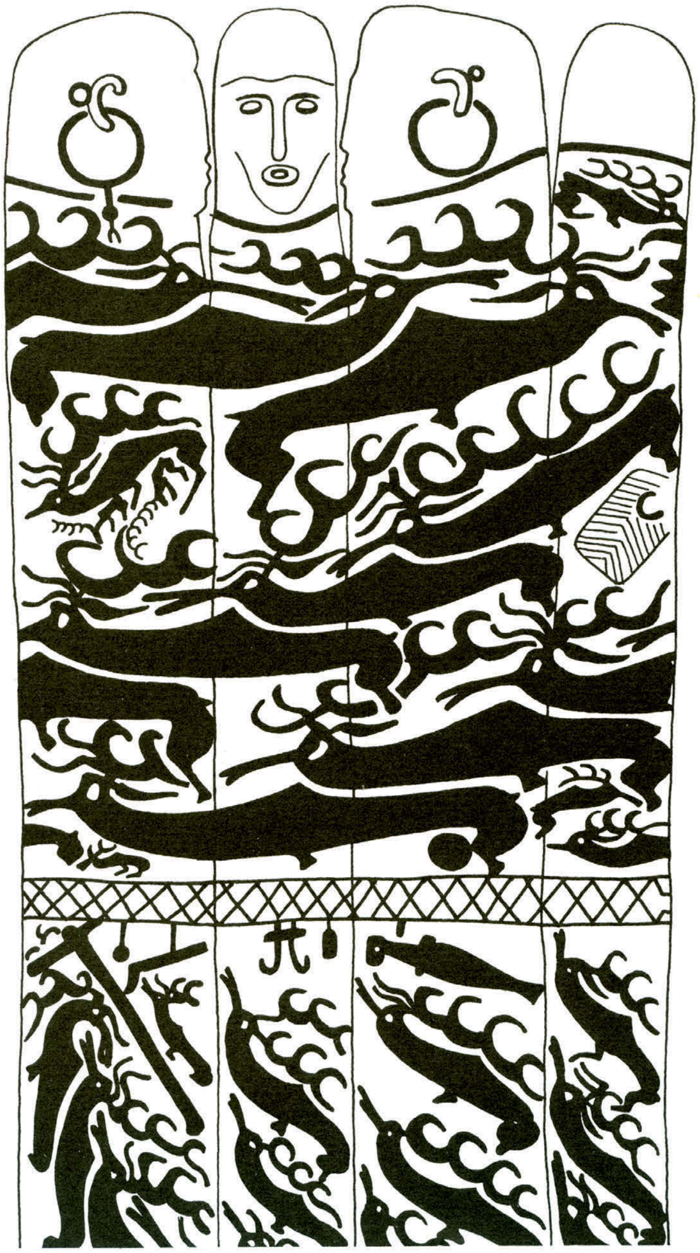
reused, whether standing as corner steles or lying down as part of the enclosure fence. The interior of the enclosure was filled with stone paving, under which the deceased was laid on his back in a cist or a simple pit, with his head always oriented toward the east. On the one hand the dead were given as grave goods animal skulls, especially horse skulls, a custom continued by the Xiongnu, and on the other, bronze objects in the Karasuk style such as ring hilt knives, daggers with animal-shaped knobs, and small decorative platters with pictures of animals.[221] Two discoveries of heavy bronze helmets, like those used in China at the time of the Western Zhou (*ca.* eleventh century–771 BC), indicate contact with their southern neighbours.[222] Examination of the skeletons suggests that they came from a Mongolid population.[223] These people lived mostly by herding; signs of settlement have not been found.

South-west of the Slab Grave Culture, in western Mongolia and the Altai, Slab Graves are very rarely found; there are instead stone kurgans, called Khirigsuurs. Both types of burial are found in central Mongolia and Khirigsuurs are occasionally found in eastern Mongolia, too. In the **Khirigsuur Culture** (*ca.* 1400–300 BC) the dead lay in shallow pits or stone caskets or in a wooden chamber, always with the head oriented toward the west. A stone tumulus stood over them, and it was surrounded by a round, square, or rectangular stone enclosure with a diameter of 25–30 m. The kurgan and the circular fence were sometimes connected by four or eight ray-like rows of stones, oriented to the four cardinal directions and the intermediate directions, which gave the site a sun symbolism and strongly recalls the radial wooden architecture of Arzhan 1.[224] The Khirigsuurs, which lay along rivers, did not contain Mongolids, as the Slab Graves did, but rather Europids.[225] One such burial ground was that of Ulangom (second half of the first millennium BC) on the border with Tuva. In the 22 timber graves and 20 stone casket graves a total of 143 people of the Europid type were buried, with 17 percent of the men having died a violent death.[226]

There are also many Khirigsuurs, however, that were not gravesites but rather places of sacrifice. During the transition from the Bronze Age to the Iron Age there were in Mongolia two realms, differentiated along ethno-cultural lines: in the east the world of Mongolids and Slab Graves, and in the west the world of Europids and Khirigsuurs. Central Mongolia formed a contact zone where the two spheres intermingled. Despite these clear differences, the deer stones were a common denominator, as they are found by both Slab Graves and Khirigsuurs, so one can almost speak of a '**deer stone culture**' (*ca.* 1400–500 BC), with representatives among both Europids and Mongolids.



Rubbing traced with Indian ink of the anthropomorphic deer stone of Ushkin Uver, Khövsgöl Aimag, northern Mongolia, *ca.* 1400–850 BC. (The lowest part is not in the picture.) Twenty-seven images of deer cavort on the stele; late Bronze Age weapons hang from the belt that divides the middle part of the stele from the lower. The statue has a five-pointed shield on its back.

6.1 Deer stones: flying deer as companions in the afterlife?

Western and central Mongolia is a land not only of petroglyphs but also of deer stones. The latter are free-standing stone steles, up to 4 m tall, with low relief carvings, in which deer and weapons are the dominant motifs, followed by horses, big cats and boars. Of the approximately 700 known deer stones, 90 percent are found in Mongolia, with the remainder in the Altai, Tuva and Xinjiang.[227] They continue the tradition of cultic stone steles of earlier steppe cultures, such as those of the Usatovo Culture (3300–2800 BC) in the northern Pontic region and the Okunev Culture (2400–1750) in the Minusinsk Basin and Khakassia. This tradition was further developed in the second half of the first millennium BC in the anthropomorphic stone sculptures of the northern Pontic Scythians[228] and the Sarmatians on the Mangyshlak Peninsula.[229] A few centuries later the stone statues of the Turkish khanate[230] began to appear in the regions to which the deer stones had spread. Later came the stone portrayals of both warriors and women by the Polovtsi (Cuman) people,[231] who ruled over a band of steppe stretching from the Ukraine to central Kazakhstan from the eleventh to the thirteenth century. Such statues still enjoy veneration today from Mongolians and Tuvinians; they tie blue bands around their necks, rub fat into their hands and bellies, and bring them flasks of vodka as offerings, after which they ask for the blessing of their ancestors. This veneration impressed the German explorer of Siberia Daniel Gottlieb Messerschmidt (1685–1735) in the Minusinsk Basin. In 1722 he wrote, 'The heathen Tatars [of Abakan] showed much reverence for these [statues] and rode three times around each one, after which ceremonies they offered them some of their own provisions or placed these on the pedestal under the grass so they [the statues] could eat from it according to their appetite.'[232]

A long block of granite or, more rarely, sandstone or marble, served as material for the deer stones. The artists first carefully polished the surface, before they carved figures on all four or at least on both wide sides, according to a defined iconographic canon. All the stones were divided into three parts. The top represented the head, which was portrayed three-dimensionally only in very rare cases[233] and was usually represented simply by a necklace, a pair of curved lines, and earrings. The 318-cm-tall, well-preserved stele 14 from the cultic site of Ushkin Uver in northern Mongolia makes clear with its human face, oriented

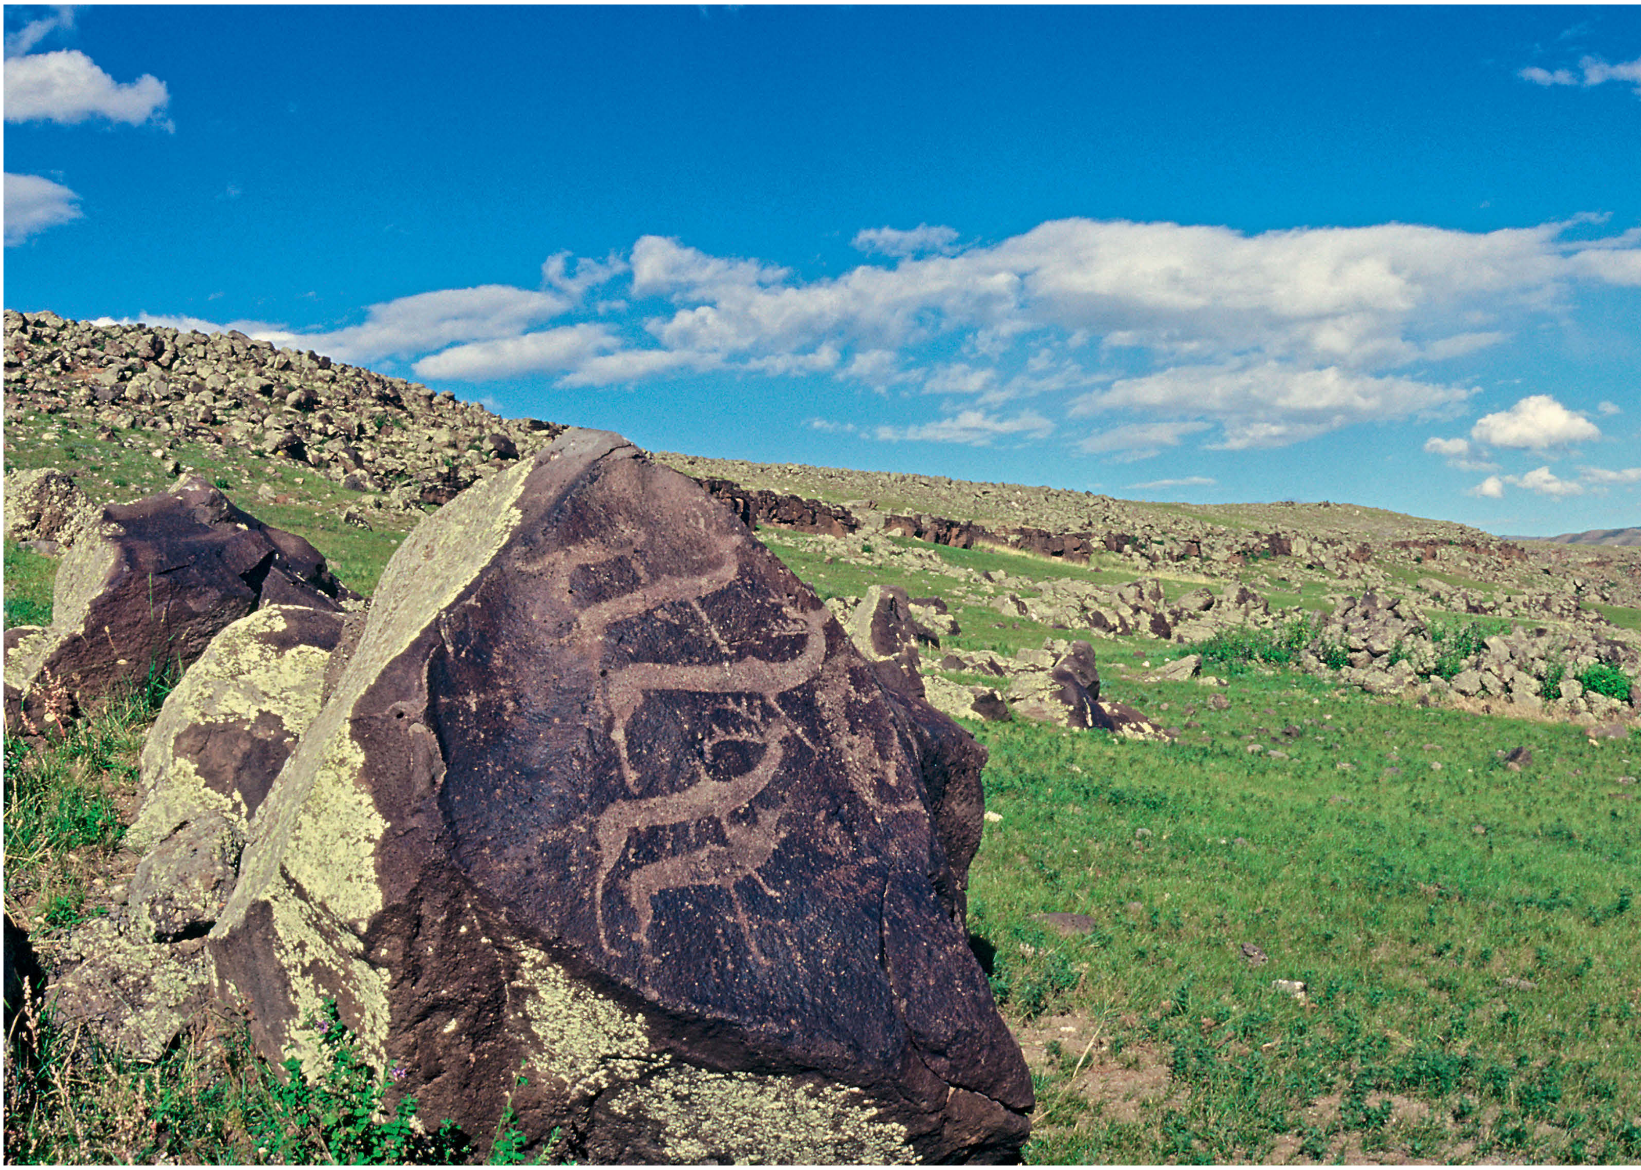
toward the east, that the deer stones were anthropomorphic representations, even though, unlike the Old Turkic statues, they have no arms. The weapon belt that divides the upper from the lower section supports this interpretation. On this belt are found the typical weaponry of steppe horsemen of the time, such as a sheathed bow, an axe, a decorated dagger, a knife and a whetstone, so that the deer stone may be seen as a codified portrayal of an armed warrior from the late Bronze Age and early Iron Age. In addition to the weapons, five-pointed shields, which were also widespread in China, adorned the lower third, as did small deer. In the centre section stylised deer frolic, some bearing disproportionately large, broadly branching and upright-standing antlers. Others have a long, bird-like snout and antlers that cover their entire backs, and are flying heavenward at full gallop. On a few cigar-shaped steles, the deer circle around all sides, moving dynamically upward. On other steles are carved horses, gazelles, boars or hunting scenes, in which predatory cats eat a horse or a kulan. Sometimes on the narrow sides obvious sun symbols replace the earrings, and a sun symbol occasionally tops the upper section of the front side. That the deer stones were anthropomorphic representations of a warrior is further suggested by the fact that the elongated trunks of the stylised deer have exactly the same shape as a typical Karasuk dagger, as highlighted recently by Anatoli Nagler.[234]

The deer stones may be divided into three chronologically sequential groups:[235]



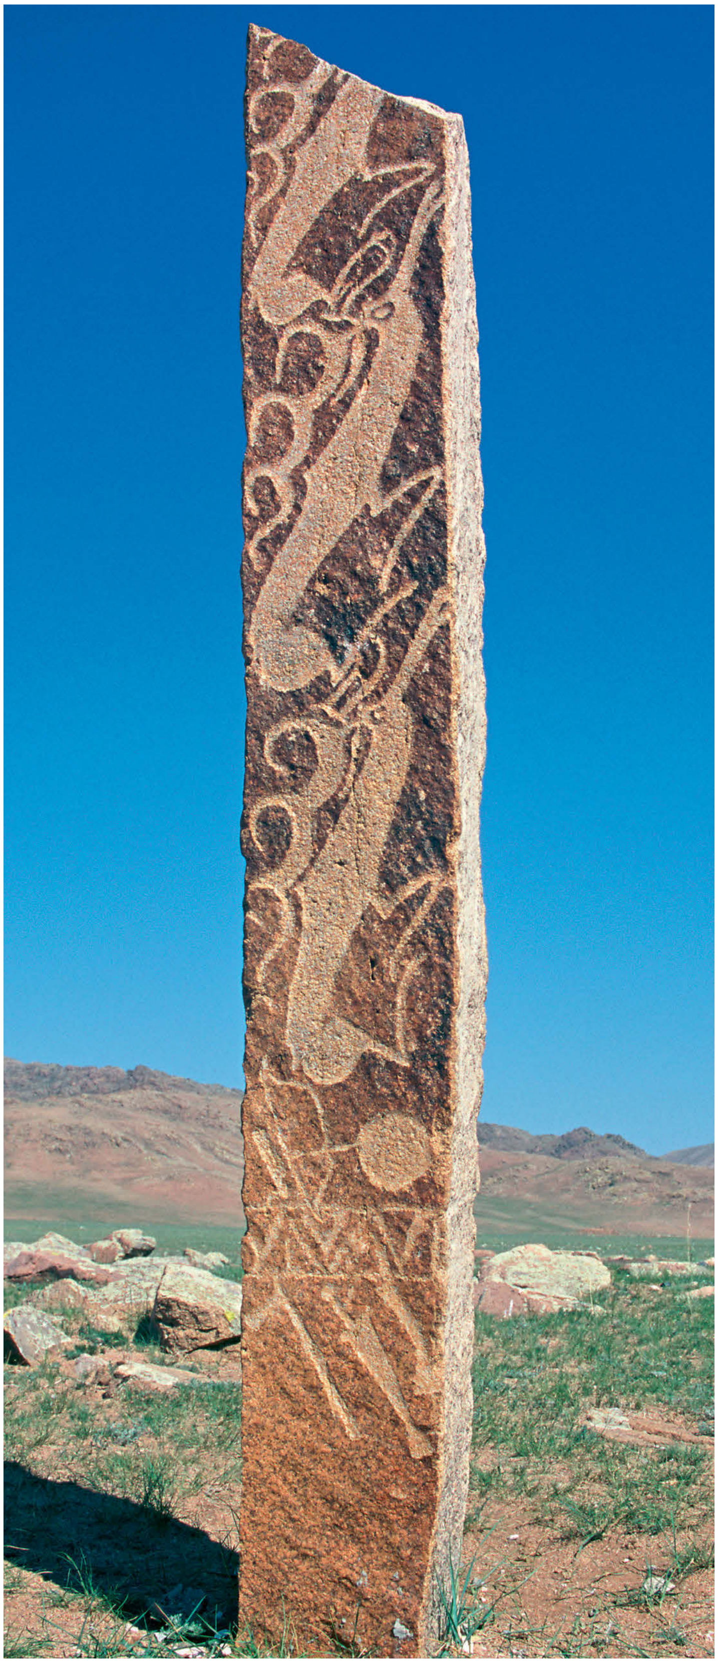
Petroglyphs of stylised deer at Eltsin Bulak, *ca.* 900–700 BC, Arkhangai Aimag, central Mongolia.

First group (1400–850 BC): In the earliest group stylised deer and knives and daggers with animal protomes, typical of the Karasuk Culture, predominate, suggesting a dating in the late Bronze Age. The 15 steles of the cultic site at Ushkin Uver come from this early time, as typical Karasuk weapons are engraved on several of them. The motif of deer flying heavenward is also found on contemporaneous petroglyphs and on later tattoos of Scythian warriors of the Altai.[236] Together with the Okunev stone steles, Seima Turbino bronze objects, and the decoration on the knobs of Karasuk daggers, this first group of deer stones represents the most important element of the Scytho-Siberian animal style of the Iron Age.

Second group (900–700 BC): In this group both the dynamism of movement and the stylised deer have disappeared and the weapons lack any decoration. Now deer standing on tiptoe, boars, leopards, horses and kulans are depicted realistically, and they are joined by coiled up predatory cats. Petroglyphs of deer and boars standing on tiptoe are also widespread in Tuva, in north-eastern Xinjiang and in southern Kazakhstan, for example at Usek, Ur-Maral and Arpa Uzen.[237]

Third group (700–500 BC): On the stones of this final, numerically small group the tendency toward simplification reached its austere highpoint. Animals have practically disappeared, while simply sketched weapons in the lower section and slashes and circles in the upper remain.

The primary function of the deer stones is not easy to determine. While it appears that they were later reused as building



Deer stone at the sacrifice and burial site of Ushkin Uver, Khövsgöl Aimag, northern Mongolia, *ca.* 1400–850 BC. In the upper section stylised deer with bird-like noses and oversized antlers 'fly' heavenward; below are engraved weapons such as a bow and a quiver, a battle axe and daggers.

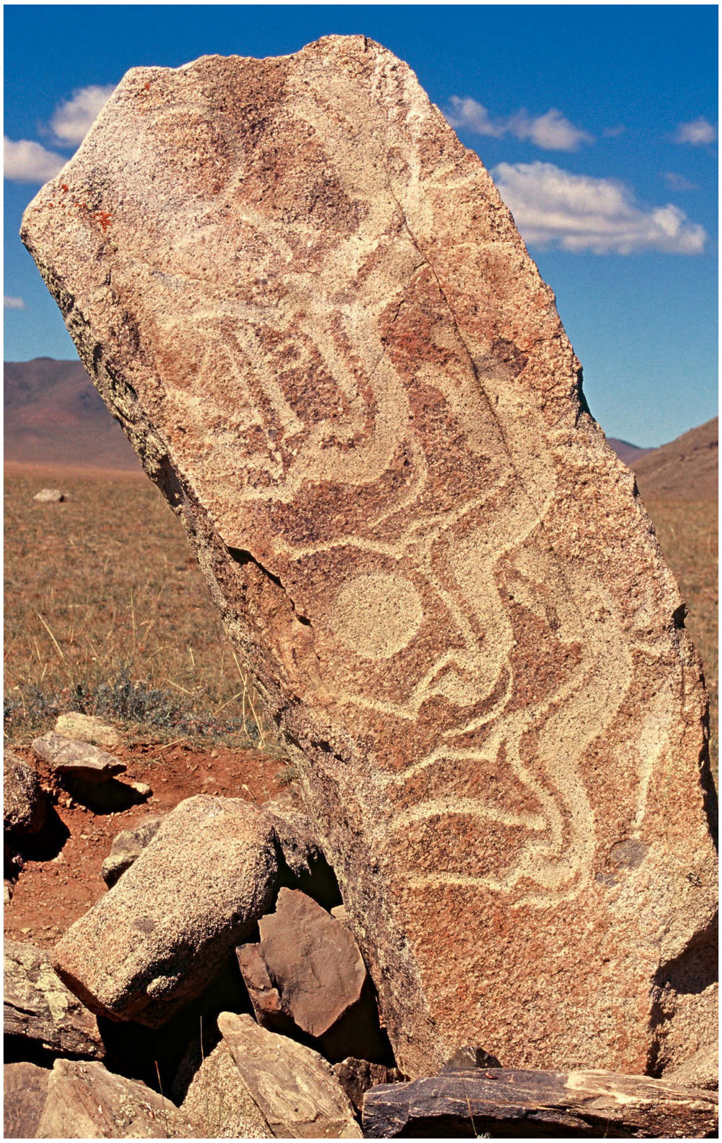
material in the Slab Graves and Scythian graves such as Arzhan 1 (late ninth century BC) and Arzhan 2 (last quarter of the seventh century BC), they are also part of large khirigsuur complexes, as in Ushkin Uver, and of slab grave sites, as in Jargalant and Altan Sandal, both found in Arkhangai Aimag (province). The complex of Ushkin Uver lies in Hövsköl Aimag, central Mongolia, on the Delger Saikhan River, and measures about 950 x 400 m. It is part of an approximately 25-km^2 sacred site with more than 200 stone structures. In the northern half of the complex a slab grave, a stone platform and 15 Khirigsuurs are found in an enclosure, alongside small piles of gravel. In the southern half 15 deer stones made of granite are arranged in two rows and oriented with their front sides facing east.[238] Small stone circles lie between the steles. Since many of the steles, which are mostly carved on all four sides, lay beneath the ground until the 1970s, they are very well preserved. Stele 14, with its peak shaped into a human face of uncertain gender, is especially outstanding.[239] In the centre and lower sections at least 27 deer romp, crowding against one another. On the front of the weapon belt is a yoke-shaped fastener; on the right side, an axe and a whetstone; and on the left a dagger with an animal knob in the classical style of Karasuk. The figure has a pentagonal shield on the back at shoulder height.

Partial excavations carried out in 2003 brought to light human burials in only two of the 15 Khirigsuurs, although five horse burials were found at each group of the Khirigsuurs and the deer stones. The sacrificed horses were buried in the same way in both places: the skulls were laid with noses pointed east and accompanied by neck vertebrae and hooves.[240] This common burial practice suggests that the Khirigsuurs and deer stones were erected at the same time. Ushkin Uver was primarily a sacrifice site, where horse sacrifices were performed in the context of an ancestor cult. It is conceivable, however, that Khirigsuurs with empty cists beneath them served as cenotaphs.

Similar sacrifice sites were originally also found at the slab grave complexes of Jargalant and Altan Sandal in the Arkhangai Aimag in central Mongolia, where most of the deer stones were repurposed for the construction of slab grave enclosures. Similar to Altan Sandal, at Jargalant 1, on the Khanuy Gol River, one deer stone of the first type stands in the eastern part of the site; two others have been overturned. A field 50 x 250 m in extent lies just to the west of the three steles. It contains more than 100 round gravel mounds and three large Slab Graves. In these graves nine, eight and five earlier deer stones respectively are reused. Bones of horses, rams, sheep and goats are found beneath the miniature kurgans.[241] An analogous arrangement is found at Altan Sandal, where three horses are carved into one of the two steles still standing. Near the Slab Graves at Altan Sandal, also built of deer stones, there are also two ancient Turkic stone men from the mid-first millennium AD, giving evidence of over a thousand years of use for the site. Like Ushkin Uver, Jargalant I and Altan Sandal served primarily as cultic places for ancestor worship and were later used as cemeteries.

In attempting to divine the deeper meaning of the stylised deer, comparisons to petroglyphs, animal-style objects and Iron Age burials of the Altai are worth considering. The motif of a standing, unmoving deer with tall, many-branched antlers is first found in petroglyphs, such as those of Tsagaan Salaa in western Mongolia, Tamgaly in southern Kazakhstan[242] and Kara Oy in northern Kyrgyzstan. The motif was also popular for gold grave goods, such as the 26 50-cm-tall wooden statues overlaid with gold foil from the Sarmatian grave of Filippovka in the southern Urals (fifth/fourth century BC),[243] the gold decorative plaque with two small deer figures shown in mirror image with their antlers growing together at the tips from Zhalauly and Čilikty in southern Kazakhstan (fifth–third centuries BC),[244] and on a gold plaque from Arzhan 2 (end of the seventh century BC).[245] Since antlers, which are shed after mating season in late autumn, grow back annually, deer antlers serve as a symbol of fertility and cyclical renewal, analogous to the tree of life. Thus an archaic myth of the Evenks, who lived in Siberia and northern Mongolia, said that the tree of life grew out of the head of a deer lying on the ground.[246] Perhaps the fusion of deer and raptor, in which the heads of the birds grow from the antlers, symbolises the same idea of a spring-like burst of new life.[247]

Excavations also provide evidence that deer, together with the ibex, accompanied the dead into the afterlife. Among these were discoveries from the graves of Pazyryk and Tuekta in the Russian Altai and from Berel in the Kazakh Altai from the sixth–fourth century BC. Here archaeologists discovered sacrificed horses wearing masks made of felt, leather and wood and depicting deer, elk or ibexes. In some cases gold leaf covered the antlers and horns.[248] The small winged horse figurines, covered in gold leaf and bearing ibex horns or deer antlers, which adorned the felt caps of the dead, belong in the same context.[249] Thanks to these grave gifts, the horse acquired the attributes of the deer and its regenerative power, or that of the ibex, which was venerated as an 'inhabitant of heaven'[250] and a symbol of fertility. It appears that the horse, symbolically transformed into a deer or ibex, served as guide and mount for the deceased in entering the afterlife. This idea was present in south-western Eurasia in the Caucasus earlier as well. In 1941 Soviet archaeologists discovered near Hanlar in Azerbaijan a grave from the fifteenth/fourteenth century BC, in which the mortal remains of the deceased had been placed on a sled to which two deer were harnessed; a horse had also been sacrificed.[251] This burial recalls a petroglyph from Baga Oigor in western Mongolia, in which a deer is harnessed to a chariot. It is thus conceivable that on the deer stones the deer with bird-like noses galloping toward heaven are symbolically accompanying into the afterlife the deceased person to whom the stele is dedicated.



Deer Stele at Altan Sandal with three engraved horses, *ca.* 900–700 BC, Arkhangai Aimag, central Mongolia.

VII

The Iron Age

The horseman lives day and night on his horse, which is not only his seat but also his dining table, his divan and his bed, and such a horse herdsman has the remarkable ability to carry out all activities, for which we need all kinds of equipment, upon his horse, from whose four legs he may be no more easily separated that a centaur from his.

JOHANNES GEORG KOHL, *TRAVELS IN SOUTHERN RUSSIA*, 1841[1]

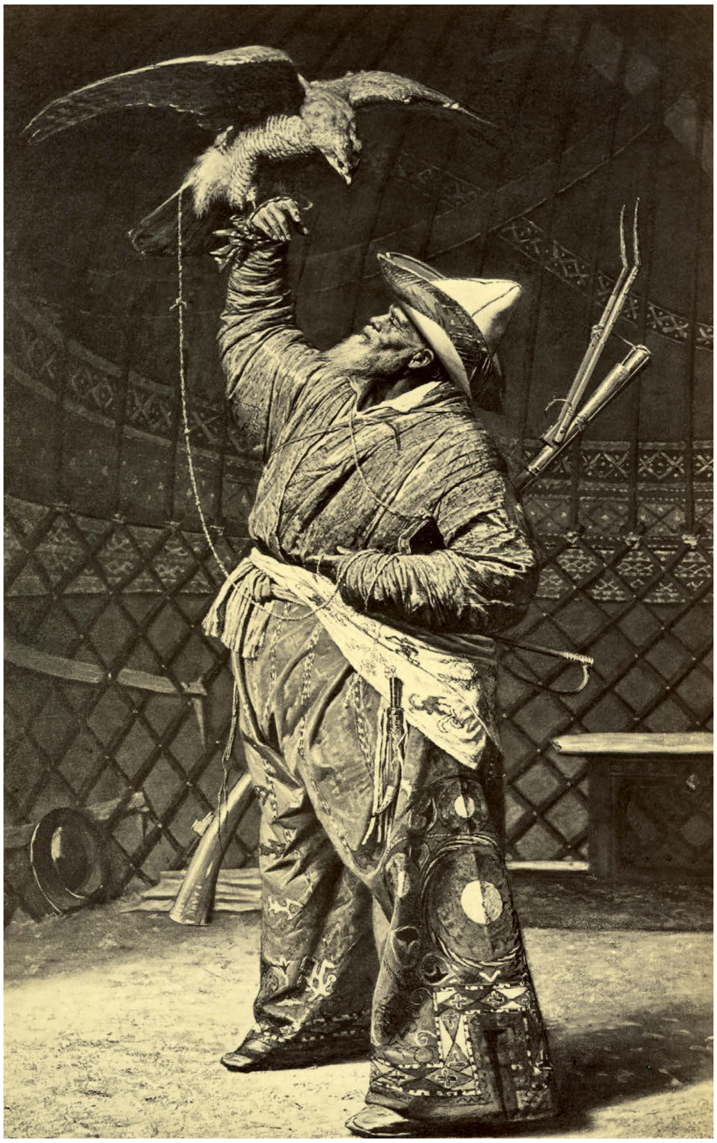
Canyon of Sharyn, south-eastern Kazakhstan.

The end of the culture of Karasuk around 1000 BC marked the start both of the Iron Age and of genuine nomadism. Iron was already known but until then had been used only for ritual purposes. A drastic shortage of tin around the mid-second millennium BC led first to a significant reduction in bronze production and then, in the region between the Don and the Urals, a return to archaic stone and bone tools. Iron soon offered an alternative. The Greek historian Hellanikos of Lesbos (490/480–*ca.* 400 BC), a contemporary of Herodotus, attributed the invention of iron to the Scythians, who came from Central Asia.[2] Whatever the truth of this, in the early centuries of the first millennium BC, with the development of early types of smelting furnaces, blacksmiths west and east of the Urals began to produce iron with low carbon content, which was suitable for the manufacture of weapons and heavy tools.[3]

At the same time climatic changes in the north-eastern part of the steppes of Central Asia encouraged the transition from a largely settled grazing economy to one based on nomadic stockbreeding. In a few regions, such as the Minusinsk Basin and, beginning in the ninth century BC, in Tuva, reduced solar activity produced a more humid climate, so that steppe-like landscapes blossomed into lush grazing lands. This led to a rise in population.[4] Indications are that the subsequent expansion of the moister climate to the west and the corresponding spread of rich pastureland encouraged the migration of Scythian and later Sarmatian nomadic horsemen westward to the Dnieper and Crimea.[5] The Iron Age in the northern half of Central Asia shows that stockbreeding practised by nomadic horsemen was not an archaic economic form but rather an appropriate and intelligent adaptation to new ecological conditions.

Their skills as horsemen and possession of the horse-drawn wagon facilitated the transition of these people to the nomadic lifestyle. Increased mobility meant they could move on more quickly to new grazing lands and maintain larger herds. Despite this increased mobility, the nomadic horsemen of the Iron Age had fixed sacred points in the arrangement of their royal necropolises. In 513/512 BC the Achaemenid ‘king of kings’ Darius I accused the northern Pontic Scythian king Idanthyrsos of avoiding a decisive battle out of fear and pursuing a strategy of scorched earth and poisoned wells. Idanthyrsos angrily responded: ‘In our country there are no towns and no cultivated land; fear of losing which, or seeing it ravaged, might indeed provoke us to hasty battle. If, however, you are determined about bloodshed with the

Kurgan at Kuten Buluq, Khakassia, southern Russia, fourth century BC.



Kyrgyz eagle hunter. 1874 photograph of a painting by W.W. Wereshhagin (1842–1904).

least possible delay, one thing there is for which we will fight – the tombs of our forefathers. Find those tombs, and try to wreck them, and you will soon know whether or not we are willing to stand up to you.'[6] The guerrilla strategy of the Scythians was successful and Darius was able to save himself and his decimated army only because the Scythians had failed to destroy his pontoon bridge over the Istros (Danube) River.[7]

With the growth of herds and their increasing mobility the nomadic societies also became more militarised, as water sources, grazing lands and winter camp sites had to be defended against both other stockbreeding groups and settled tribes. Winter pastures in particular had to be guarded throughout the year and defended by force when necessary, to ensure that the herds returning in late autumn would not find their pastures had been devoured by foreign herds. The remaining farmers, who represented tempting targets for plunder, had to either subordinate themselves or adopt the nomadic lifestyle of their belligerent neighbours. Only centrally controlled states such as the Achaemenids or the kingdoms of northern China were able to defend their borders by making massive investments in defensive measures. In the steppes the militarisation of society led to the creation of clear hierarchies, which were reflected in burial rituals. As Michail Grjaznov notes, 'War now became, therefore, almost a permanent occupation. Military leaders at different levels gained enhanced importance in the social structure and grew rich on the spoils of war. It became necessary to evolve a new and more efficient organization of the whole life of the community on a military footing.'[8]

1. Nomadic horsemen in north-eastern Central Asia

1.1 The kurgan steppe of Minusinsk

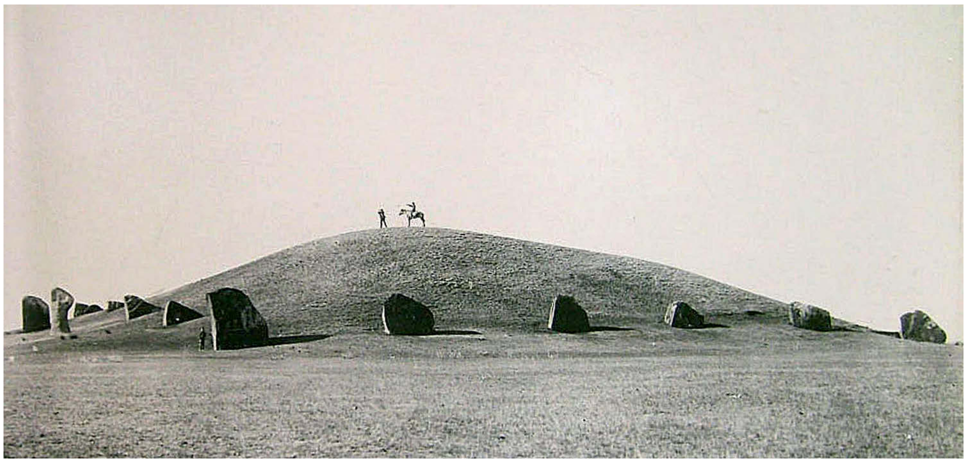
During the Iron Age the southern Siberian Minusinsk Basin in the modern Russian republic of Khakassia had lush grazing lands and rich ore sources, which drew nomadic stockbreeders like a magnet. Today an impressive concentration of grave markers testifies to the population at that time: Khakassia has more than 30,000 kurgans and cist tombs! The burial sites, marked by earthen mounds, stone slabs or pillars, soon attracted grave robbers. They usually melted down the objects made from precious metals, especially gold, or, beginning in the early eighteenth century, sold them to European collectors. Thus the first scientific excavation in Russia, undertaken in 1722 by the German physician and scientist D.G. Messerschmidt (1685–1735) a few kilometres west of the city of Abakan, discovered only an empty tomb. Equally fruitless were the excavations of kurgans in the Minusinsk Basin made by the pioneers J.G. Gmelin (1739), P.S. Pallas (1772) and V.V. Radlov (1865).[9]

In the Minusinsk Basin the Iron Age may be divided into two cultures, Tagar (1000–200 BC) and Tashtyk (50–500 AD), between which lies the transition period of the Tes' phase (200 BC–50 AD).[10] The common hallmark of all kurgan graves of the **Tagar Culture** is their four-cornered enclosures made of thick stone slabs and the four elevated cornerstones that act as steles. Today the slabs are often missing and only the stone pillars remain. The division of the nearly thousand-year culture was developed by the archaeologist Grjaznov.[11] In the **Bainov phase** (1000–800 BC) small enclosures, of an area of *ca*. 4 x 5 m and made of stone slabs, with cornerstones standing up to 2 m high, were built over cists with individual burials, while in the **Podgornovo phase** (800–450 BC) timber graves often replaced the stone cists, the cornerstones usually rose just 20–30 cm above the ground and the enclosure surrounded one to four burials. Flat earthen mounds now also appeared over the graves. Clay vessels adorned with simple linear patterns, objects decorated in the early animal style and bronze weapons predominated as grave goods. Iron weapons were either too valuable to be buried or they still played a lesser role. Decorations included sword chapes in the form of coiled animals, buckles in the shape of recumbent deer with tucked in legs and stylised birds' beaks on the sockets of knives.[12]

During the **Saragash phase** (450–200 BC) the individual graves were replaced by collective graves, family and clan crypts with as many as 100 corpses. Among the grave goods, symbolic miniature weapons stand out. At the same time individual cornerstone kurgans grew to monumental, indeed Cyclopean dimensions, such as in the necropolis of Salbyk with its 14 great kurgans. The largest kurgan, from the fourth century BC, was originally 11 m tall and covered an area of 70 x 70 m. It was encircled by 23 gigantic dressed stones up to 5.4 m in height and 40 metric tons in weight, which must have been transported from a quarry 60 km away. As revealed by the excavations of 1954 to 1956, adult and child burials were found under the cornerstones, attesting to building sacrifices. Unfortunately in the excavated central timber grave the archaeologist S.V. Kiselev found only the Europid skeletons of a man and a woman, as well as three additional male skeletons in the dromos; the dead were presumably a tribal royal couple with selected servants.[13]

Thirty kilometres north-east of Salbyk is the kurgan of Barsučij Log, dating from the early Saragash-phase towards the end of the fifth century BC. In the kurgan, which was originally 11 to 12 m tall, archaeologists discovered traces of a fire ritual. As in the kurgans of the Saka in Tagisken South and in Ujgarak, the dead were buried in a 7 x 7 m grave, over which was erected a wooden chamber covered in birch bark. After a certain length of time the whole wooden structure was set on fire and destroyed. The grave was then filled in and the kurgan built of thickly layered sod. To ensure the stability of the kurgan, clay mortar bound together the individual layers of sod. An elaborate, 54 x 54 m enclosure wall surrounded the kurgan and prevented the mound from sliding. This wall was made of layered stone slabs, reinforced with orthostats and upright steles. Twenty-eight of these orthostats and steles featured petroglyphs. Some of these were obviously older than the kurgan and had been deliberately taken from older sacral monuments. Among them figure Bronze Age hunters wearing mushroom-shaped hats and animals standing on tiptoes in the early Scythian style.[14] It seems that the builders of Barsučij Log wanted to sanctify the burial with venerated relics from bygone cultures.

Finally the kurgan got its unique pyramidal shape, with the gently sloping southern side and the three other steep sides covered with orange-red clay blocks and a flat top.[15] Glowing like a fiery crystal, the kurgan must have been a spectacular landmark in the grass-green steppe. Like other great kurgans of the Iron Age, Barsučij Log was not only a huge mound of earth over a grave but also a planned work of architecture, which was embedded in particular rituals. At the beginning of the following phase of Tes' (200 BC–50 AD) the burial chamber was not only plundered but also wantonly vandalised and the four skeletons of the main burial 1 widely scattered. The intruders left the head of a dog in the tomb. The leading excavator of Barsučij Log, Anatoli Nagler, believes, that representatives of the new rulers of Tes' desecrated this und other princely burials form the previous Saragash rulers in order to end a

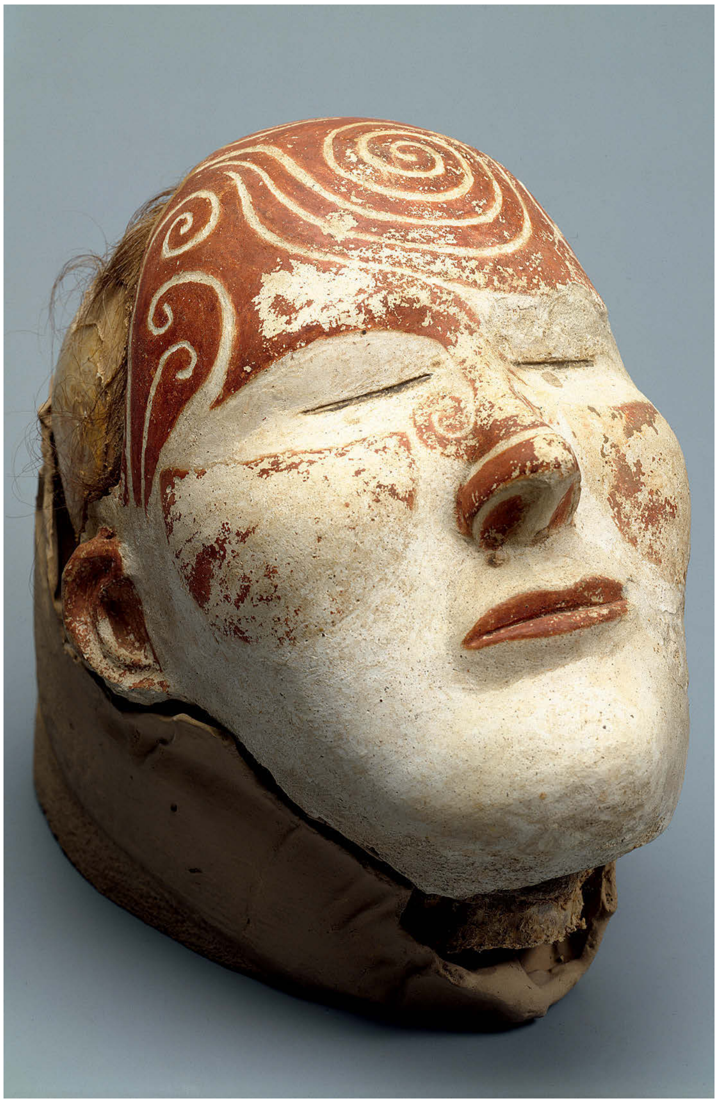


Great kurgan of Salbyk, Khakassia, southern Russia, fourth century BC. Photograph from 1910, M.W. Fjodorowa.

likely ancestor cult and to erase the glory of the former sovereigns from memory, a kind of 'damnatio memoriae'.[16]

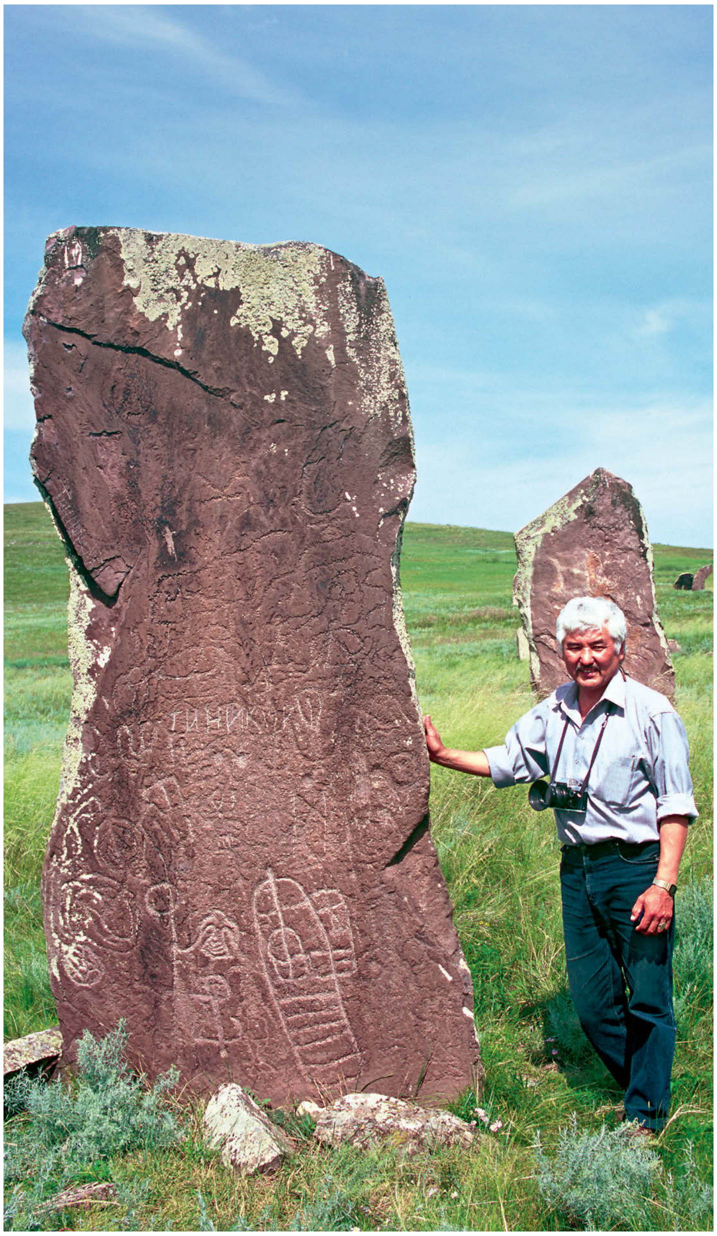
The representatives of the Tagar Culture were Europids, who presumably spoke an Iranian dialect and were related to the Scythians of the northern Pontic region. They were semi-nomadic stockbreeders, and it is not known what form their shelters took. Although a few spur fortresses have been discovered, their purpose remains unknown; were they refuges, protected cultic sites or places used over a long period? In the subsequent transition phase of **Tes'** (200 BC–50 AD) the people lived in tomb-like block houses and in yurt-like residences, consisting of a round wooden frame covered with felt, as can be seen in the petroglyphs of Bojarskie pisanicy.[17] In forested regions birch bark may also have covered the yurts. At this time weapons made of iron, as used by the Xiongnu of the Transbaikal region, prevailed; only miniature weapons without practical value used as grave goods were made of bronze. At the same time Hunnic bands began migrating to Khakassia, so the proportion of Mongolid people in the total population grew rapidly. Dating from this time are branding irons for cattle, evidence of the need to recognise private property in the relatively densely populated Minusinsk Basin. The Tes' Culture continued the practice of collective burials in monumental kurgans but also had cemeteries with stone cist graves laid close together without earthen tumuli.

In the Tes' phase and the subsequent **Tashtyk Culture** (50–500 AD) a new burial custom arose. Skulls were trepanned and the brain and soft tissue removed, after which a silk cloth was laid over the face and covered with a clay mask, which usually had Mongolid, rarely Europid, features. These clay heads were partially covered with a thin layer of plaster and painted red. Although there is no reason to believe they have a cultural connection, they resemble the famous mummy of Yingpan from the fourth/fifth century AD, discovered in 1995 in the north-western Lop Nor Desert. The face of the dead person was covered by a mask made of hemp, and fine black lines on a white background indicate a Europid face. The deceased was presumably a Sogdian merchant.[18] In the Tashtyk epoch other new tribes migrated from the east, presumably ancestors of Yenisei Kirghiz, who spoke a Turkic language. At the same time other innovations appeared in burial rituals, since now corpses were mummified and embalmed or cremated. In the latter case they buried a clothed leather figure stuffed with grass, with a painted face sculpted out of clay, in whose belly were placed pouches containing the burnt bones of the deceased. The dolls wore silk clothing or fur coats, trousers, lined boots and mittens.[19] As part of the cult of the dead, animal and human sacrifices were performed at neighbouring stone steles.[20]



Ochre-painted plaster death mask over the trepanned and mummified head of a woman. Tashtyk Culture (50–500 AD), Minusinsk steppe, southern Russia. The State Hermitage Museum, St. Petersburg.

The complex burial rituals of the Tes' phases and the Tashtyk Culture show us how widespread was the fundamental need to ensure a more or less symbolic but still physically perceptible afterlife. Such desires found consummate expression not only in pharaonic Egypt but also in the steppes of the Urals. During the Catacomb Culture (2450–1950 BC) the head was sometimes separated from the body of the deceased and trepanned, with the brain and soft tissues removed, after which it was covered with clay and the facial features sculpted and painted in colour. The prepared head was then returned to the body in the grave. More rarely, the entire body was stripped of soft tissue and the skeleton served as the basis for the creation of a doll.[21] That this desire lives on in the twenty-first century is shown in the costly attempts to cryogenically preserve corpses for the future.



1.2 Herodotus's geography of Central Asian peoples

'The nomadic tribes of Scythians [...] lived in Asia',[22] reported the Greek historian and geographer Herodotus of Halicarnassus (490/480–*ca*. 424/420 BC). Thanks to him, we have access for the first time to a written source for the cultural history of Central Asia.[23] He devotes sections of the first and fourth books of his *Histories* to the nomadic horsemen of Central Asia. The value of Herodotus's nine-part history consists in his extensive travels, which led him from southern Italy to Babylon and from Egypt to the northern coast of the Black Sea. Here he stayed in the Miletian colony and trading city of Olbia, in the delta of the Dnieper (Greek Borysthenes) and the Bug (Hypanis), east of the present-day city of Odessa. There Herodotus is said to have spoken before 460 BC with the agent (epitropos) of the Scythian king Ariapeithes, Thymnes.[24] Regarding the Scythians of the northern Black Sea region, Herodotus concentrated on their wars against the Persians, their geography and their myths and customs. Since the nineteenth century Herodotus's history has served as a source not only for historians but also for archaeologists. Three significant questions come to the fore: Where was the nucleus of the Scythians? Where was the royal necropolis of Gerrhos? Did the descriptions of spectacular burial rituals correspond to reality? Despite doubts, archaeology has confirmed the third question practically in its entirety, revealed a kernel of truth in the partially fantastical geographic descriptions and developed a plausible hypothesis in response to the second question.[25]

Herodotus refers to four traditions about the origins of the Scythians, who lived in the northern Pontic region between the Dnieper (Borysthenes) and the Don (Tanaïs) and who called themselves the Scolotoi.[26] The Scolotoi believed they were a native

The archaeologist Dr. Valery Balachtchin, Abakan, beside an engraved megalithic stone belonging to one of the 13 kurgans of Safronovo near Poltakovo, Tes' Phase of the Tagar Culture (200 BC–50 AD), Khakassia, southern Russia.

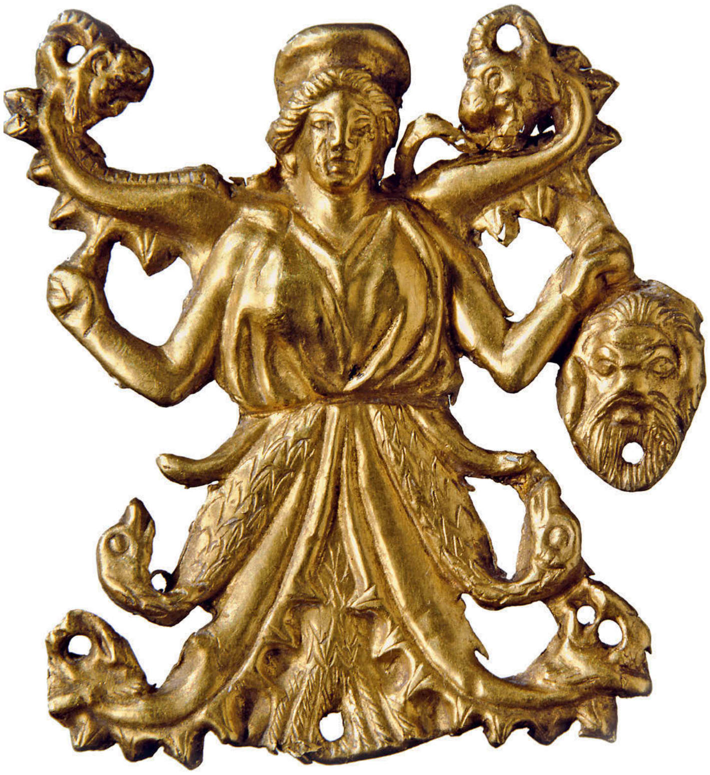
people and were descended from Targitaos, a son of Zeus (Papaios) and a daughter of the river god Borysthenes. In this mythical system three spheres are represented: as son of the sky god Zeus, Targitaos represents the upper world; the daughter of the river god, the underworld; and the ancestors of the Scythians, the earthly middle world. Targitaos had three sons, each of whom presided over a tribe: Lipoxaïs, Arpoxaïs and the youngest, Scolaxaïs.[27] When they were grown, 'there fell from the sky a golden plough, a golden yoke, a golden battleaxe, and a golden cup.' The two older brothers both tried to pick up the objects, but 'the gold caught fire' as they approached them. The youngest, however, picked them up and carried them home and was declared king of all the Scythians.[28] From then on the various Scythian tribes called themselves 'Scolotoi' after the name of their first ruler. Scolaxaïs established three lordships for his sons.[29] From this myth a few conclusions may be drawn about the governing structure. Succession passed from the father to the youngest son, but the son could only receive his inheritance after passing a test. His position as king of all Scythians was not absolute, however, since he could be deposed on account of dishonourable behaviour and replaced by one of his brothers, as illustrated by the example of the unfortunate King Scylas. When Scylas began around 440 BC to adopt Hellenistic customs, worshipping Greek gods and participating in Dionysian mysteries, the assembly of the people and the army deposed him. They named as king his half-brother Octamasadas, who wasted no time in beheading Scylas with his own hand.[30]

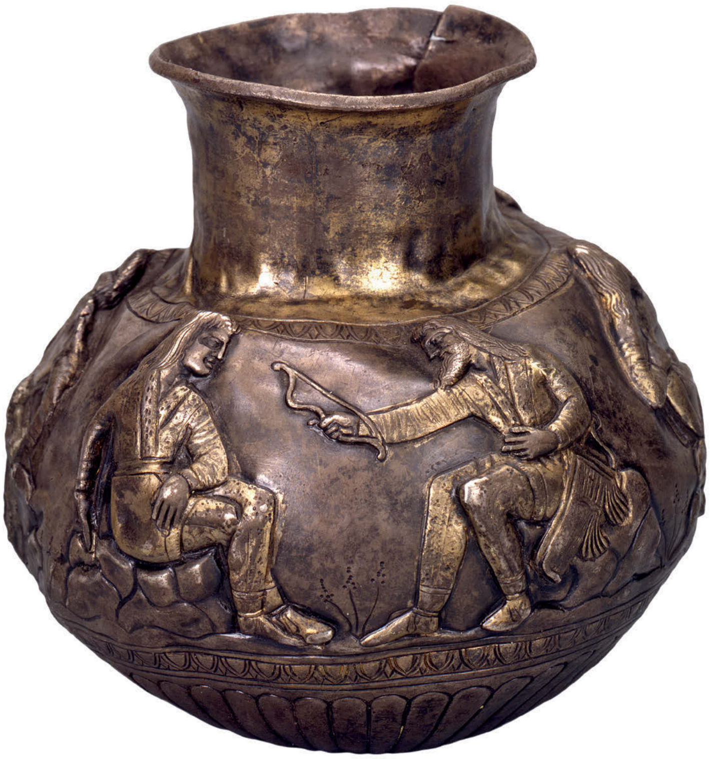
The myth also suggests a tripartite division of power, which Herodotus confirmed in another place. When the Persian kings of kings Darius attacked the northern Pontic Scythians in 513/12 BC, the Scythian supreme king and commander of the Scythian Idanthyrsos determined the defensive strategy and gave his subordinate rulers Scopasis and Taxakis corresponding tactical instructions.[31] On account of the nomadic lifestyle, during peacetime there was no need for a strong central government, but one was certainly required in times of war. Thanks to the existing political structure of the Pontic Scythians of a chief king, two lower kings, and a number of subordinate nomarchs (prefects), the Scythians could very quickly mount a large army, which the chief king commanded as general.[32] The Xiongnu later adopted a similar three-part power structure with a central chief king, the *shanyu*, and two viceroys, one on each flank.[33] In contrast to the Xiongnu, the Scythian kings who ruled in the northern Pontic region appear not to have created a stable state structure.

The Greeks who lived on the Black Sea believed, however, that the ancestor of the Scythians was Scythes, whose parents were Hercules and a creature that was half woman, half snake. This tradition is similar to the first insofar as the youngest of the three brothers was made the first king of the Scythians after proving himself in a test. When Hercules rested his horses and fell asleep in Scythia, a snake-woman stole them. She agreed to return the horses only after Hercules had fathered three sons with her. In order later to select the most capable of his three sons, Hercules left behind his second bow and his war belt. Only the youngest, Scythes, was able to put on the belt and bend the bow of his father, and thus he bested his older brothers.[34] The test of bending the bow recalls the story of Odysseus's bow. When Odysseus returned to Ithaca tests of strength were being held for the suitors of his wife Penelope. However, the great man's bow could be bent by no one other than himself.[35] A gilded silver vessel from the necropolis of Častye near Voronezh in southern Russia illustrates a transfer of power in which an older warrior hands a drawn recurve bow to a young man.[36]



Gold clothing plaque, Kul Oba Kurgan, eastern Crimea, Ukraine, *ca.* 350 BC. The plaque shows a female creature with snake-like legs, who holds in her left hand the decapitated head of a bearded man. Two horned birds of prey grow from her shoulders and two more raptors' heads emerge from her waist. The figure is ambiguous and could represent both the ancestress of the Scythians who was impregnated by Hercules and a mistress of animals. She also displays characteristics of the tendril-limbed woman popular among the Scythians and in the Mediterranean region, whose limbs took on plant-like forms and who symbolised fertility and the annual rebirth of nature. The State Hermitage Museum, St. Petersburg.

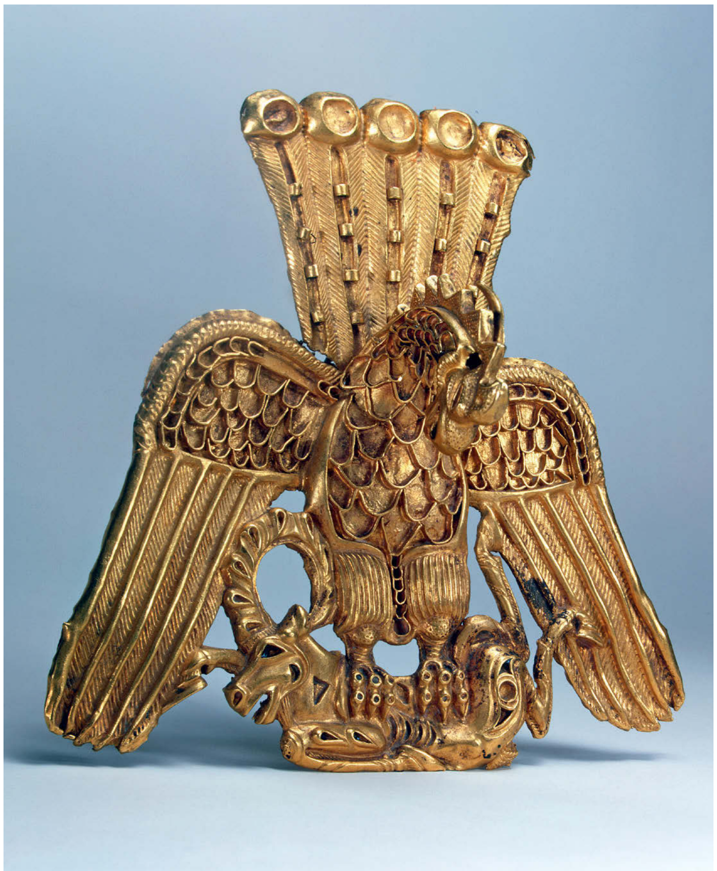
Herodotus himself described a third tradition, according to which Scythians living east of the Caspian Sea were driven out of Central Asia, after which they chased the Cimmerians out of the Black Sea region.[37] From a geographic standpoint, however, the fourth version, which reports a domino-like migration of peoples from north-eastern Central Asia, is the most interesting. To elucidate the tradition, known to both 'Hellenes and non-Hellenes', Herodotus turned for help to the fantastic-sounding geography of the Greek poet Aristeas of Prokonnesos from the seventh century BC. According to him, east of the northern Pontic Royal and Nomadic Scythians lived the related Sauromatians; south-east of the Sauromatians were the warlike Massagetae; and east of them the Issedonians. At the burials of patriarchs, the Issedonians are said to have mixed the flesh of the corpse with that of slaughtered cattle and eaten it at a funeral meal. They were also reputed to gild the skulls of the highly regarded dead and to venerate them. North-east of the Sauromatians lived the bald-headed and snub-nosed Argippaoi in white felt yurts, to whom Scythian and Greek merchants travelled. North-east of the Issedonians lived the 'one-eyed' Arimaspians, and still farther north-east their enemies the 'gold protecting griffins', as well as the Hyperboreans, whose land bordered on the hyperborean ocean, the Arctic Sea. The Arimaspians once forced the Issedonians from their homeland, after which the Issedonians drove out their western neighbours, the Scythians, who subsequently chased the Cimmerians from the northern Caucasus and the Black Sea region.[38]



Partially gilded silver cultic vessel from kurgan 3 of the necropolis of Častye, Voronez Oblast, central Russia, fourth century BC. The vessel shows three scenes from Scythian mythology; shown here, the ancestor of the Scythians, Hercules, gives his youngest son, Scythes, his bow as a sign of handing power over to him, since only he was able to bend it. The State Hermitage Museum, St. Petersburg.

The story describes how a single migration can lead to further migrations, much like falling dominoes. The background is formed by the historical military campaigns of the Cimmerian and Scythian tribes from Central Asia, which advanced as far as the Ionian cities of Asia Minor and on to Egypt. Such interconnected waves of migration are also found historically in later migrations of peoples, such as those of the Sarmatians, Alans and Huns. With regard to the peoples described by Herodotus and Aristeas, the historical peoples of the Cimmerians were originally found in the Pontic region and the northern Caucasus; the Sauromatians between the lower reaches of the Don and the Volga or the Ural; and the Massagetae between the Caspian Sea, the Aral Sea and the Syr Darya. The snub-nosed Argippaoi were probably of Mongolid heritage and had migrated from the east; they also spoke a non-Iranian language, since Herodotus says that the Scythians visiting them needed interpreters to understand them.[39] Presumably these nomadic horsemen lived in the central or eastern Kazakh steppe.[40] Their elusive Issedonian neighbours may have lived on their southern border on the Syr Darya, north of the Saka, relatives of the Scythians, who also lived as cattle-raising nomadic horsemen.[41] The Arimaspians were probably found in north-eastern Kazakhstan or south-western Siberia. Herodotus was, however, misleading in stating that their ostensibly Scythian name refers to one-eyed people, because *arima* means 'one' and *spu* means 'eye'.[42] In fact, the Iranian name contains the word *aspa*, meaning 'horse', so the name may be understood to mean 'owner' or 'friend of horses', implying nomadic horsemen.[43]

The homeland of the gold protecting griffins may have been in the Altai, whose Turkish name means roughly 'golden mountain' and which has rich deposits of gold. Their conflicts over gold with the neighbouring Arimaspians are alluded to on the famous Kelermes mirror, in which two men who are either very hairy or wearing animal skins attack a griffin.[44] The assumption that gold-prospecting tribes who took as their totem the griffin, a mythical animal with the head of a bird of prey, lived in the Altai, is supported by the fact that griffins played a prominent role in the Scytho-Siberian animal style in general and in the Altai in particular. As the northern Pontic Scythians had no sources of gold themselves, they had to import it, presumably from the north-western Caucasus, as well as from Kazakhstan and the Altai.



Gold aigrette from the Siberian collection of Tsar Peter I (unknown provenance), fifth–fourth centuries BC, depicting a bird of prey attacking an ibex with its talons. The State Hermitage Museum, St. Petersburg.

The trade contact between the Scythians and the Argippaoi, referred to by Herodotus, suggests the existence of a trade route for gold between the southern Ukraine and the Altai. This is all the more likely as toreutics made in the Scytho–Siberian animal style, whose roots lay in the southern Siberian of Tuva bordering the Altai, developed works of art similar in content and style throughout the Scytho–Eurasian steppe.

1.3 Tuva, nucleus of the Scythian peoples and the Scytho–Siberian animal style

Was Herodotus correct when he located the kernel of the Scythian homeland in distant north-eastern Central Asia? Or were the Scythians the descendants of representatives of the Srubnaya Culture between the Volga and the Urals?[45] And where did the Scytho–Siberian animal style, characterised by a very lively depiction of individual features of certain animals, arise? In Central Asia under possible northern Chinese influence or in the Pontic–Caucasus region under strong Near Eastern influence?

The Russian Republic of Tuva is separated from the Minusinsk Basin by the Sayan Mountains, where the popular general and governor of Krasnoyarsk, Alexander Lebed, died in a helicopter crash on 28 April 2002. The valley of Ujuk on the south-western edge of the Sayans has lush, green pastures, and at Arzhan there is a necropolis stretching over kilometres with hundreds of Iron Age and Old Turkish kurgans, including monumental great kurgans. These give this part of the valley the Russian name *dolina zarej*, 'valley of the kings'. During the second millennium BC the climate in Tuva was quite arid and led to a depopulating of the region during the Andronovo period. At the start of the first millennium, however, it became considerably more humid, allowing for the development of fertile grazing lands and the arrival of nomadic herders from the surrounding area. The proximity to the immeasurable ore deposits in the Minusinsk Basin further increased the attractiveness of the Ujuk valley. Even today strong winds prevent snow from accumulating in the winter on the hills around the Ujuk valley, making the area an ideal winter camp.[46] It thus appeared that the ruling families of Tuva chose the valley as their dynastic necropolis, a kind of Tuvan Gerrhos.

It was here in 1971–74 that Michail Grjaznov set his spade on the largest kurgan, called Arzhan 1, which was no earthen tumulus made of sod but rather a 3–4-m-high stone platform with a diameter of over 100 m, which was surrounded by another stone wall, a krepis, 2.5 m in height. A deer stone once stood on the kurgan, and on it were engraved deer and wild pigs standing on tiptoe and a belt with weapons hanging off it.[47] In the kurgan, which had unfortunately been completely robbed of its contents, Grjaznov discovered a wooden structure that remains unique to this day. Over 70 rectangular and slightly trapezoidal wooden chambers made of century-old larch surrounded in the shape of six concentric circular rings the almost square central wooden chamber, forming a wheel- or sunray-like design. In the plundered central chamber lay the mortal remains of a once magnificently buried royal couple, surrounded by six sacrificed horses and eight trough-shaped wooden caskets. These were the coffins of eight sacrificed henchmen. In 13 of the over 70 trapezoidal chambers lay seven additional men and more than 160 bridled, saddled and decorated horses. Thus a total of 15 attendants had to accompany the royal couple into the afterlife; all 17 of the dead were dolichocephalic Europids.[48] As the sacrificed horses were adult stallions and geldings, they did not represent a herd but had rather been selected from various herds of the tribes subjugated by the defunct chieftain and sacrificed as a final tribute to him. A typological study of the horse-gear showed that not only were neighbouring tribes from

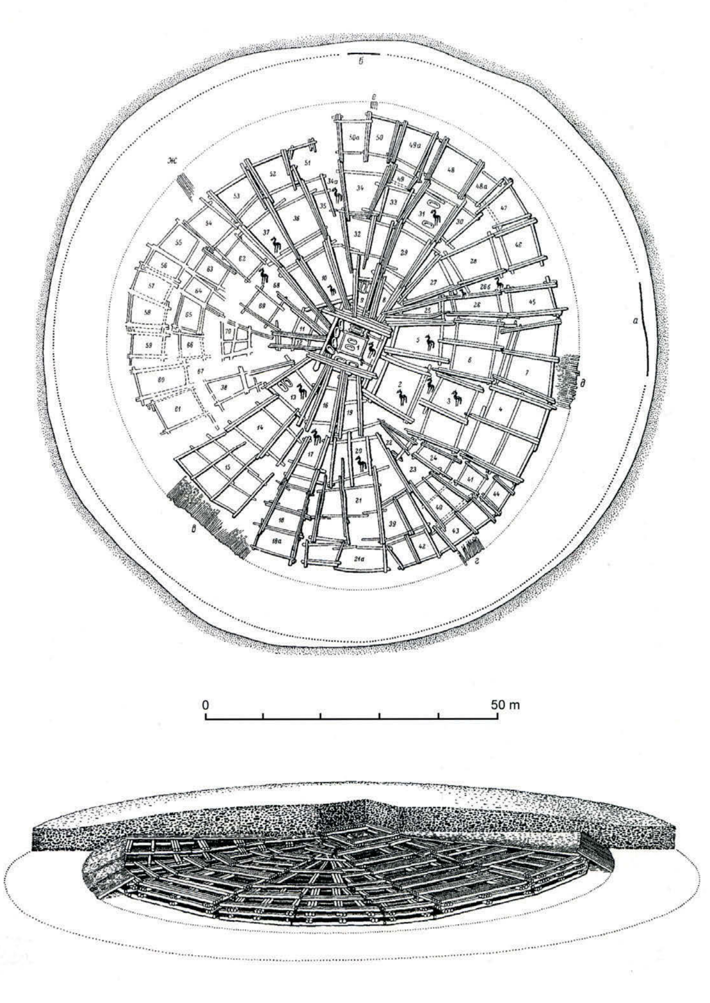
Tuva, the Minusinsk Basin and the Altai represented at the burial but also more distant tribes from Kazakhstan and Mongolia.[49] At the foot of the kurgan about 300 stone mounds, 2–3 m in diameter, were laid in a semicircle, under which lay the remains of an enormous funeral feast, such as choice bones of cattle, sheep, goats and especially horses. The skins of the slaughtered animals were ceremoniously hung. Grjaznov estimated that around 300 horses were slaughtered on the occasion of this commemoration.[50] It is unknown how long such memorial ceremonies lasted. Within the bounds of the funeral events a total of approximately 460 horses were killed.[51]

Despite the grave robbing, the picture emerges of a magnificent burial. There were remains of splendid sable robes, gold beads and appliqués, gold earrings with turquoise inlays, a gold choker, gold clothing plaques and many turquoise inlays. The last were typical inlays for large gold objects, as are familiar from Tsar Peter I's Siberian collection in the Hermitage. The comparable gold objects stolen from Arzhan 1 were most likely completely melted down. To these were added discoveries of early Scythian bronze daggers, a battle pick, bilobite bronze arrowheads and a dagger with a boar on tiptoe at the end of the hilt. Other early Scythian objects included the harness with its complete bronze bridle, decorated with stirrup-shaped cheek pieces (psalia), three-holed knobs and pendants made of pierced boar's teeth. There was also a bronze plate with a diameter of 25 cm in the form of a coiled big cat, presumably from the breastplate of a horse. Such coiled animals belonged to the code of the early Scytho–Siberian animal style; the wide-open mouth with bared teeth in the coiled panther from Arzhan 1 recalls portrayals from the late Bronze Age.[52]

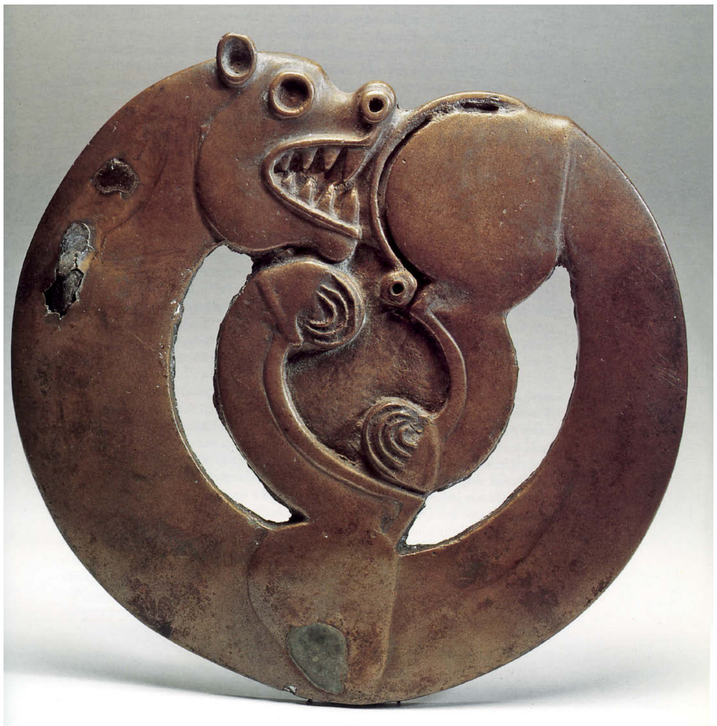


Elevation and plan of the kurgan of Arzhan 1, Tuva, southern Russia, around 800 BC. The kurgan has more than 70 compartments, and the drawings of a horse indicate those compartments with horse burials. According to Michail Grjaznov, *Der Großkurgan von Arzhan in Tuva, Südsibirien*, 1984, p. 18.

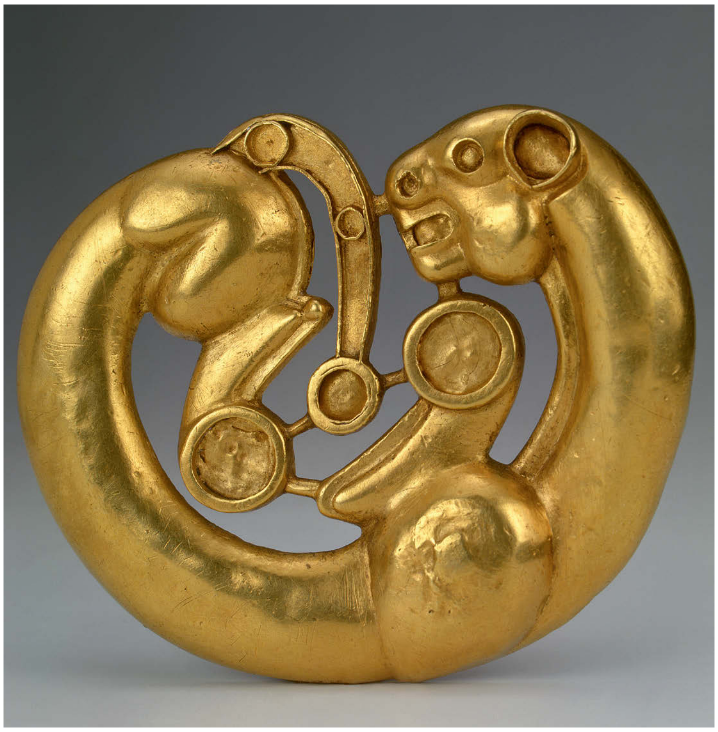
A pair of bronze finials topped with figures of mountain rams also belongs to the early Scytho–Siberian animal style.[53] The first known pole-tops were found in the great kurgan of Maikop (3700–3400 BC), where rods held up the baldachin over the deceased prince. Such bronze supports with depictions of animals and deities were also widespread in the Pontic region.[54] As Schiltz surmises, the rods topped with animals served not only to support the baldachin above the dead but also to mark off a sacred space.[55] While sedentary peoples enclosed 'sacred' cultic sites with walls, steppe nomads indicated their cultic places with portable standards topped with animal figures; the symbolic appearance of animals or a deity like Papaios, founder of the Scythian royal dynasty, defined the cultic space. Just how magnificent the royal tomb of Arzhan 1 must have been can be seen in the stunning discoveries made at the nearby undisturbed kurgan of Arzhan 2 from the late seventh century BC.

On the basis of dendrologically calibrated radiocarbon dating, **Arzhan 1** has been dated to the late ninth/early eighth centuries BC and is the oldest known kurgan of the Scythians.[56] This **Arzhan 1 phase** of Tuva (850–700 BC) can be synchronised with the Tagar-Bainov phase in the Minusinsk Basin. From this dating and the discoveries made, despite the extensive plundering, highly significant conclusions can be drawn regarding the early Iron Age of Central Asia:

1. The kurgan of Arzhan 1 reveals a mature form of nomadic Scythian culture more than a century before the earliest Scythian kurgans of the Eastern European Black Sea region, such as the kurgans of Kelermes in the Kuban region from the mid-seventh century BC.[57] Herodotus was right: the Scythians and their culture originated in Central Asia.
2. Both the Scythians and the Saka belonged mainly to Europid peoples, descendants of representatives of the cultures of Andronovo and Karasuk. Neither the Scythians nor the Saka



Bronze bridle decoration in the form of a coiled carnivore, Arzhan 1, Tuva, southern Russia, around 800 BC. National Museum of Tuva, Kyzyl.



Gold bridle decoration in the form of a coiled panther, unknown provenance, Siberian collection of Tsar Peter I, sixth–seventh centuries BC. The State Hermitage Museum, St. Petersburg.

were homogeneous peoples, however, but rather a cultural community of mostly Europid nomadic horsemen who spoke Iranian dialects. From the perspective of the Pontic Scythians, one may concur with Parzinger that 'farther to the east of the Eurasian steppe belt there lived similarly structured bands of nomadic horsemen, who were progressively less ethnically related to the Scythians of the northern Black Sea region but remained culturally connected to them'.[58]

3. The early Iron Age horse-based nomadism of the steppe belt of Central Asia arose in Tuva in the tenth/ninth centuries BC. In the following centuries, the early Scythian material culture as well as their customs and rituals, spread through migrations from the Tuvan epicentre westward as far as Crimea.[59] In the Pontic region Scythian material culture was influenced by the Near East and Greece.
4. Between the Altai and the Pontic region there was intense trade contact, something like a transcontinental steppe road for gold.
5. The common thread that drew together all the Scythian groups of the Central Asian steppe belt, the so-called 'Scythian triad', had its start in Tuva, as can already be seen in Arzhan 1. This encompassed a particular composition of grave goods, consisting of three elements: first, Scythian weapons such as double-edged, straight daggers, arrowheads and a gorytos (a combined case for a bow and arrows); second, parts of the horse-gear such as bronze bits with stirrup-shaped psalias and pierced bid rods, and third, animal-style artwork.[60]
6. The unique motif of a coiled predatory animal, first a panther and later, during the Sarmatian period, a wolf, arose in north-eastern Central Asia, with the earliest influences perhaps originating in northern and north-eastern China. There, depictions of coiled animals were common not only during the contemporaneous epoch of the Western Zhou (*ca.* eleventh century–771 BC) on cheek pieces for draught horses but also in the C-shaped jade dragons of the Neolithic Hongshan Culture (fourth millennium BC).[61]
7. The third element of the Scythian triad, the Scytho–Siberian animal style, also began in north-eastern Central Asia. These animal images, portrayed according to a strict code, emphasise certain features of the animal that had particular symbolic content in the Scythians' hierarchy of values. In the animal style there is the representation in animal form of elements of a worldview that is difficult for us to decipher today.[62] The animal-style discoveries at Arzhan 1 refute hypotheses that the animal style developed first out of decisive influences from Assyria and Urartu, Anatolia or the Maeotian Kuban region.[63] The inspirations for the animal style should be sought in the

east; in southern Siberia, in the petroglyphs and deer stones of Mongolia and, as the Russian historian Rostovtzeff (1870–1952) surmised as long ago as 1929,[64] in northern China, especially in the hunting and stockbreeding cultures in north-eastern Inner Mongolia.[65] Even before Rostovtzeff, in 1913, the archaeologist Ellis Minns (1874–1953) had emphasised the tight relations between the Scytho-Pontic animal style and the Siberian animal style and spoken of 'Scytho-Siberian art'.[66] Beginning in the seventh century BC the Scythian animal style began to adopt iconographic elements from Urartu, Assyria and later Iran.

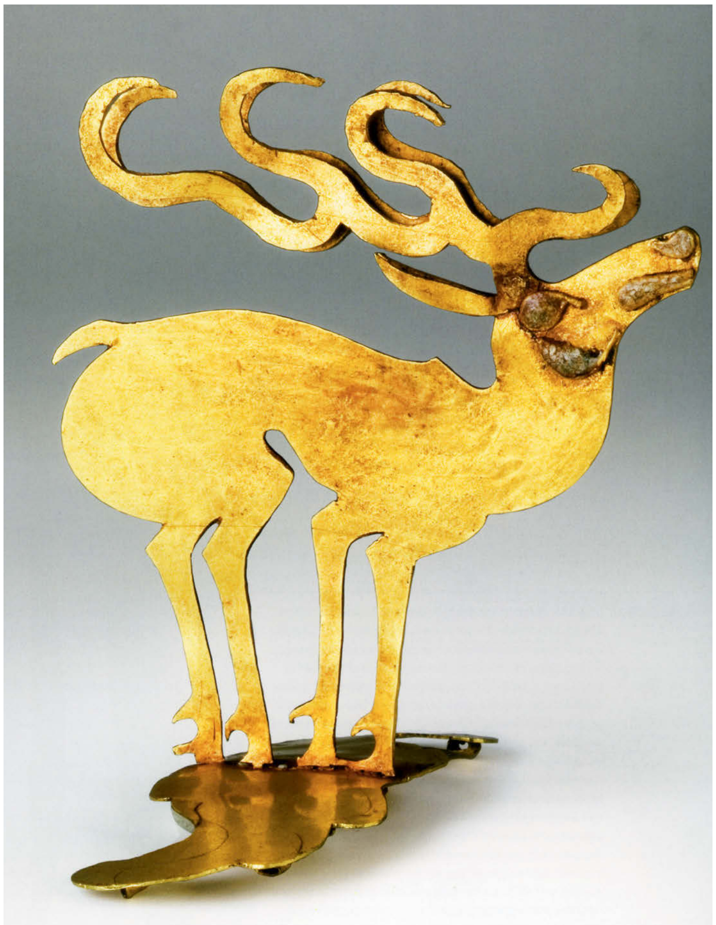
8. A few of the most striking burial rituals described by Herodotus are confirmed by Arzhan 1. After the deceased ruler assumed his final resting place in the grave, 'various members of the king's household are buried beside him: one of his concubines, his butler, his cook, his groom, his steward and his chamberlain [messenger] – all of them strangled. Horses are buried too and gold cups. [...] This ceremony over, everybody with great enthusiasm sets about raising a mound of earth.'[67] The younger woman buried at Arzhan 1, the eight attendants in the central chamber and the approximately 160 sacrificed, uneaten horses correspond with Herodotus's account. By comparison, the 38 largest kurgans of the fourth century BC in the northern Pontic region contained between three and ten additional corpses.[68] In the Kuban region the contemporaneous Elisavetinskaja Kurgan held 200 sacrificed horses and kurgan 1 at Ul'skji contained 360 horses.[69]

The discovery in 2001 by a German–Russian archaeological team of the undisturbed tomb of a Scythian prince in the kurgan of **Arzhan 2** marked a breakthrough in the archaeology of Siberia.[70] For the first time it could be shown that the Siberian Scythian kurgans were not only as magnificently appointed as those of the Pontic region but also that they predated the latter. Like Arzhan 1, Arzhan 2 consisted not of an earthen tumulus but rather of a 2- to 2.5-m-high stone platform, in the centre of which stood a deer stone. Inside the kurgan there were two additional deer stones, as well as pre-Scythian and Scythian stone slabs with engravings of deer, elk and boars walking on tiptoe in the then-common style. Arzhan 2 had no interior wooden structure, however. The excavations, which took place from 2002 to 2004, showed that the complex had been built over an older settlement layer from the Okunev period. The main grave resisted multiple attempts at plunder thanks to a ruse, as the two central pits were mock graves and a peripheral side grave was the main burial. The archaeologists

The Siberian collection of Tsar Peter the Great

The first scientific collection of Scytho–Siberian objects was initiated by Tsar Peter the Great (r. 1682–1725), who met the scholar and mayor of Amsterdam N.K. Witsen (1641–1717) during his stay in Amsterdam in 1697/98, where he studied shipbuilding in the dockyards. Witsen came from a family who engaged in trade with the Moscow principality and spent 1664/65 in Moscow. There he saw Scytho–Siberian gold and bronze objects that had come from grave robbing. At that time the governors of Tomsk and Krasnojarsk – the latter government also included the Minusinsk Basin, Tuva and the Altai – organised expeditions to find natural deposits of gold and plunder Scythian kurgans, called 'Tatar graves'. The gold objects were usually melted down or sold to collectors like Witsen. Presumably Witsen made his illustrious Russian guest aware of the gold artefacts. The core of Tsar Peter's collection was made up of shipments from Prince Gagarin, the first governor of Siberia, who between 1711 and 1719 sent the tsar many objects from the burial mounds of Siberia. Peter ordered the collection of objects made not only of gold but also of other metals and especially 'everything that appears very old and unusual'.[71] A few of the most spectacular pieces in the collection were donated to the tsar and his wife, Katharina, by the industrialist Akinfiy Demidov (1678–1745) in 1715 on the occasion of the birth of their son Peter. After Witsen's death the tsar tried in vain to acquire his collection. It was sold at auction in 1728 and the art objects vanished without a trace; only Witsen's book *Noord en Oost Tartarije*, which appeared in 1705, bears witness to them.[72]

Tsar Peter collected gold objects not to melt them down but rather because of their scientific value in explaining ancient history. For this reason he ordered that all discoveries be documented by sketches. His second decree, that apprehended grave robbers be put to death, yielded the opposite result from that intended, since now illegal finds of gold were melted down immediately, in order to destroy all possible evidence. D.G. Messerschmidt believed that even in the 1720s the richest burial mounds had long since been plundered.[73] In fact archaeologists succeeded in discovering in southern Siberia an undisturbed Scythian kurgan with rich gold finds only in 2001 at Arzhan 2. Stylistic similarities between the collection of Tsar Peter, numbering 240 gold objects, which can be admired in the Hermitage in St Petersburg, and the discoveries in controlled excavations suggest that the Siberian collection comes largely from the steppe region between the Ob and Irtysch rivers but also from the forest steppes east of the Urals.[74]



A golden deer figure crowned the headdress of the prince of Arzhan 2, Tuva, southern Russia, last quarter of the seventh century BC. National Museum of Tuva, Kyzyl.

Fourteen sacrificed horses were buried in grave 16 of Arzhan 2, Tuva, southern Russia, last quarter of the seventh century BC.

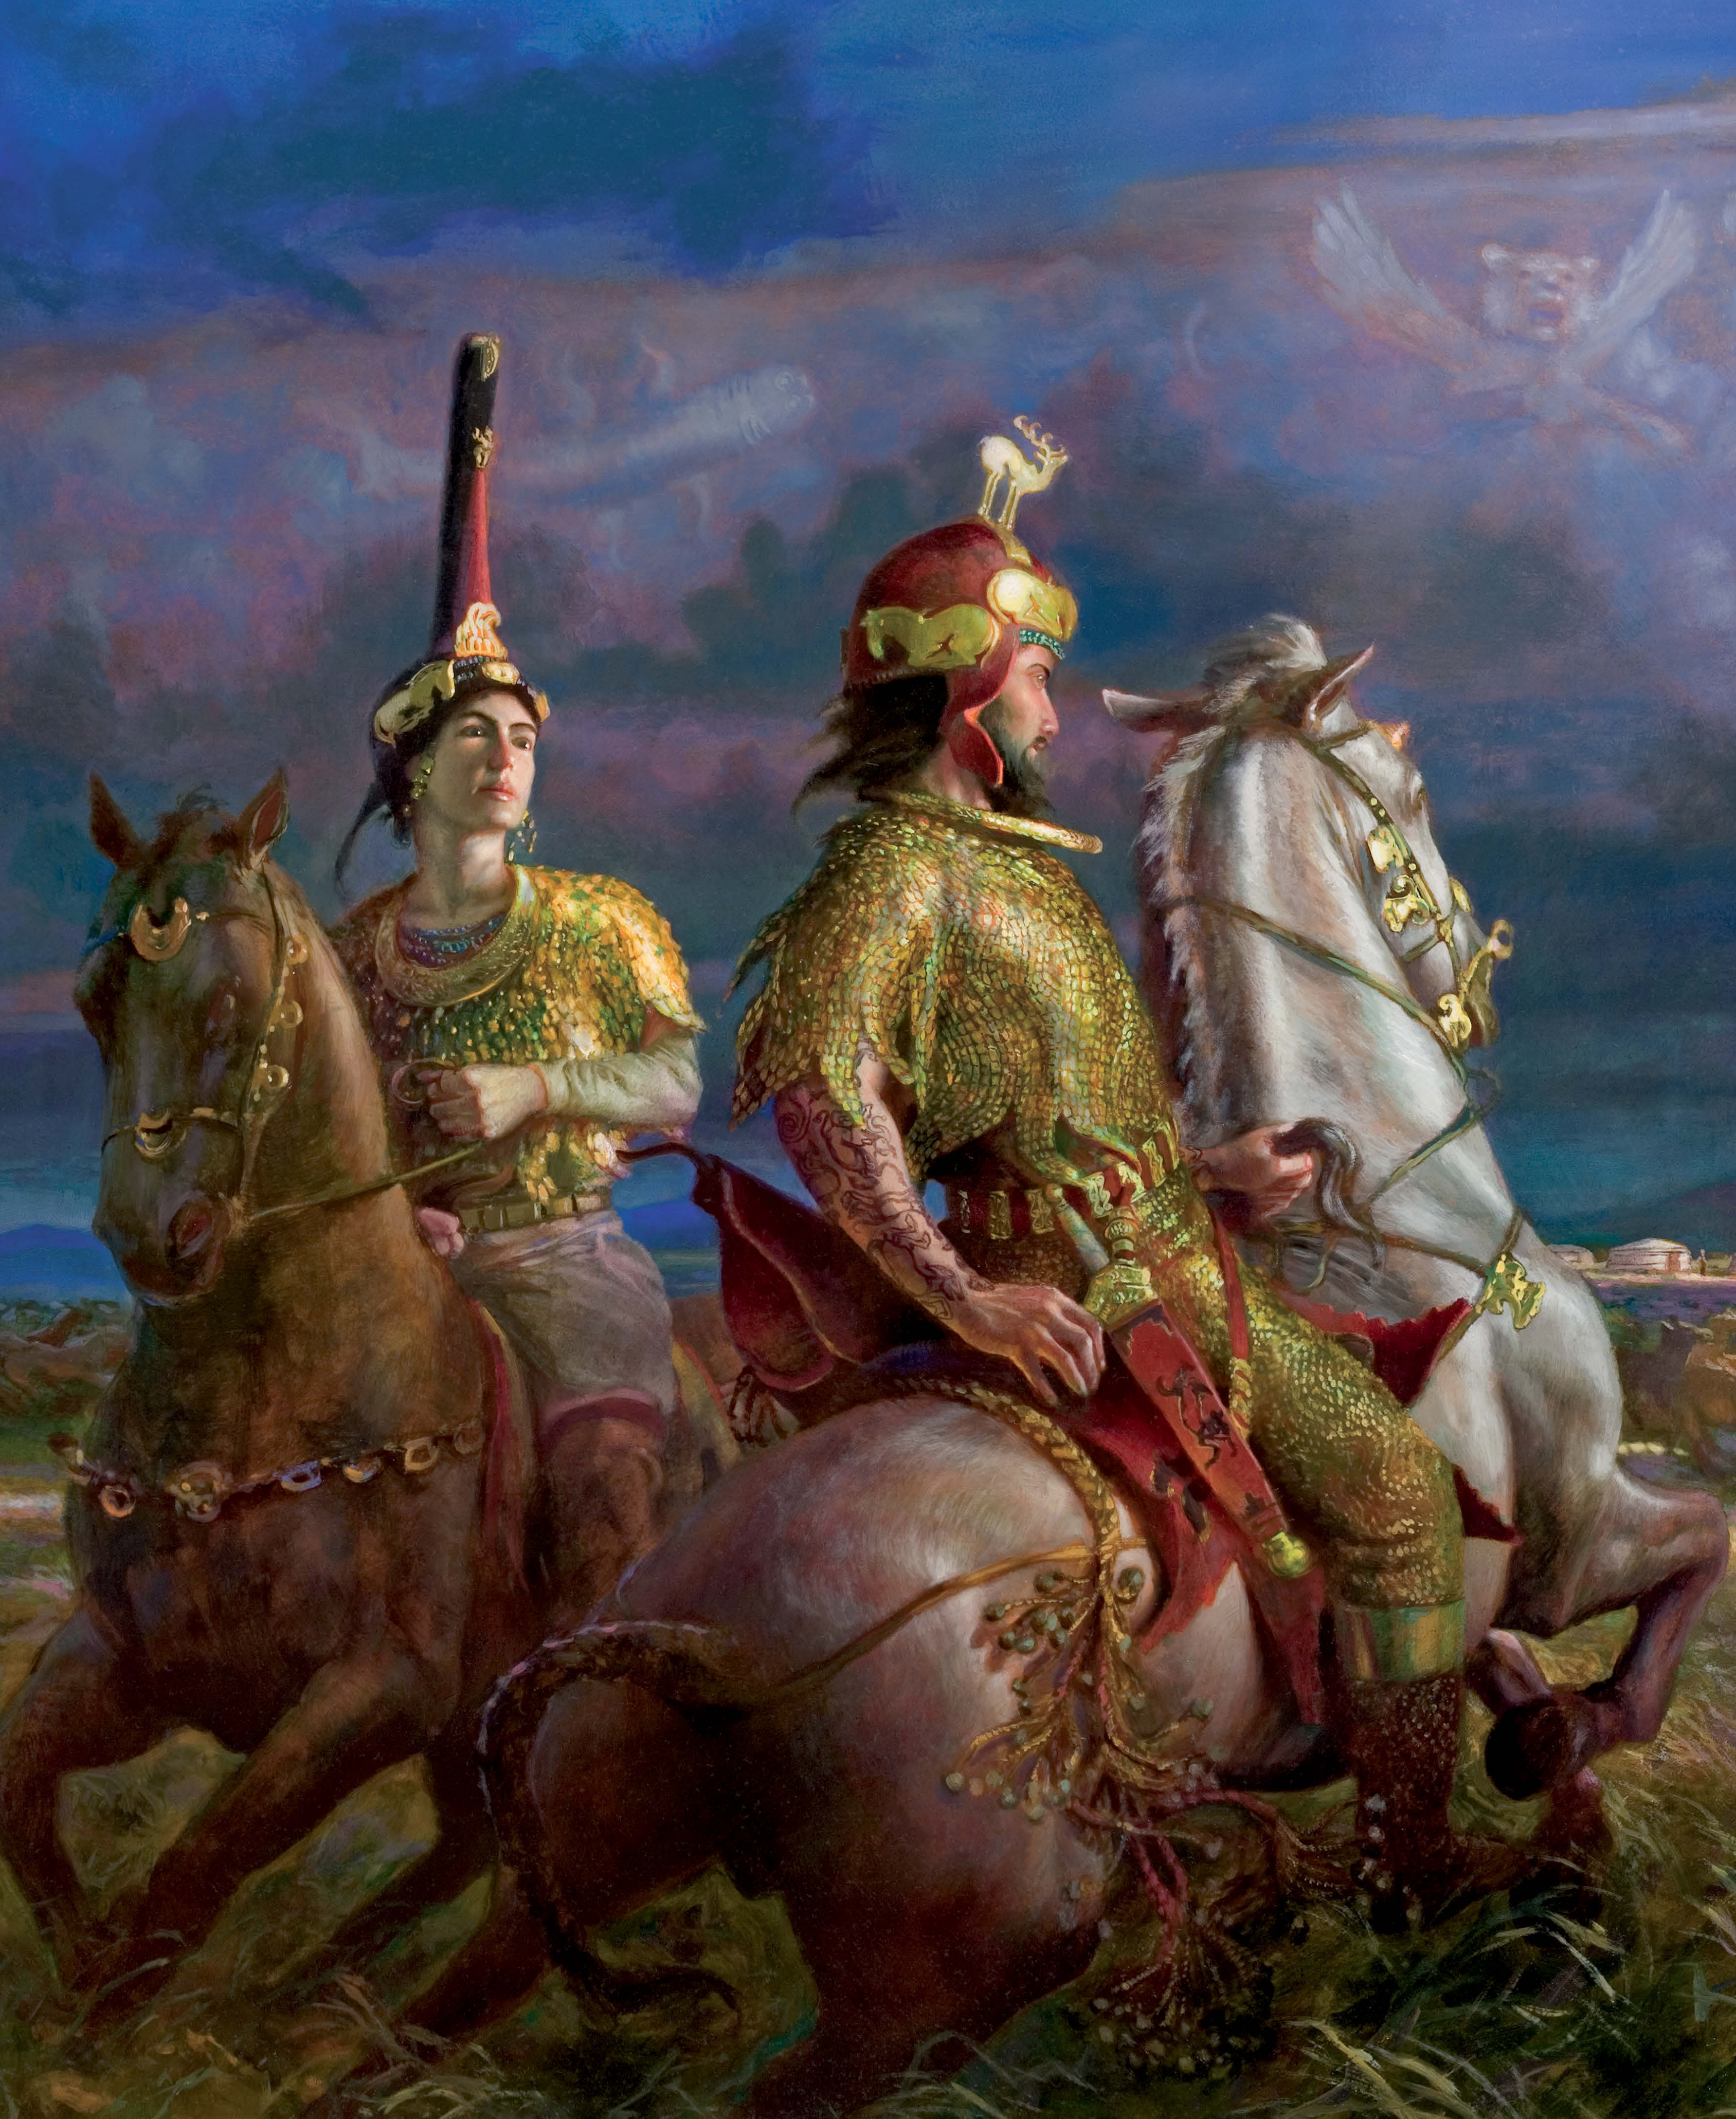
discovered a total of 41 human skeletons, including the royal couple, a retinue of 16 violently killed men and women, as well as 23 later burials, with the most recent dating from the Mongol period. To these were added a grave laid shortly after the main burial with the skeletons of 14 sacrificed horses in harness, a ritual complex that archaeologists call a 'symbolic horse grave', as well as a few hoards of ornaments for horses.

As at Arzhan 1, the main tomb consists of two block structures made of larch and placed one inside the other, with the interior chamber having originally been covered with coloured felt. Here the archaeologists discovered the skeleton of a 50–55-year-old man, who had died of prostate cancer, and a woman, 20 years younger, as well as 9,300 objects, 5,700 of which were made of gold. The man wore a 1.8 kg gold torque with animals depicted all around it; a leather or felt cap with five disc-shaped animal ornaments; a red jacket decorated with more than 2,500 small panther figurines cast in gold; trousers adorned with thousands of tiny gold beads; and boots with gold cuffs. An iron dagger with gold encrustations and two knives with golden knobs, an iron battle pick with gold encrustations, a riding crop decorated with gold and a gorytos, whose long side was made of a thick sheet of gold with a fish scale pattern, hung from two belts decorated with gold ornaments. The remains of a composite bow and arrows with three-winged iron arrowheads were found in the gorytos, which protected the delicate weapon from the weather.

The straight, double-edged iron dagger represents one of the earliest forms of the *akinakes*, common among the Scythians, Saka, Medes and Persians. The akinakes was a hybrid of a dagger and a short sword with a straight, double-edged blade 30 to 35 cm in length. It was a thrusting weapon and, because of its light weight, an ideal secondary weapon for both fallen riders in close combat and spear bearers. The akinakes was often made from two metals and consisted of an iron blade and a bronze or gold-encrusted hilt,

---

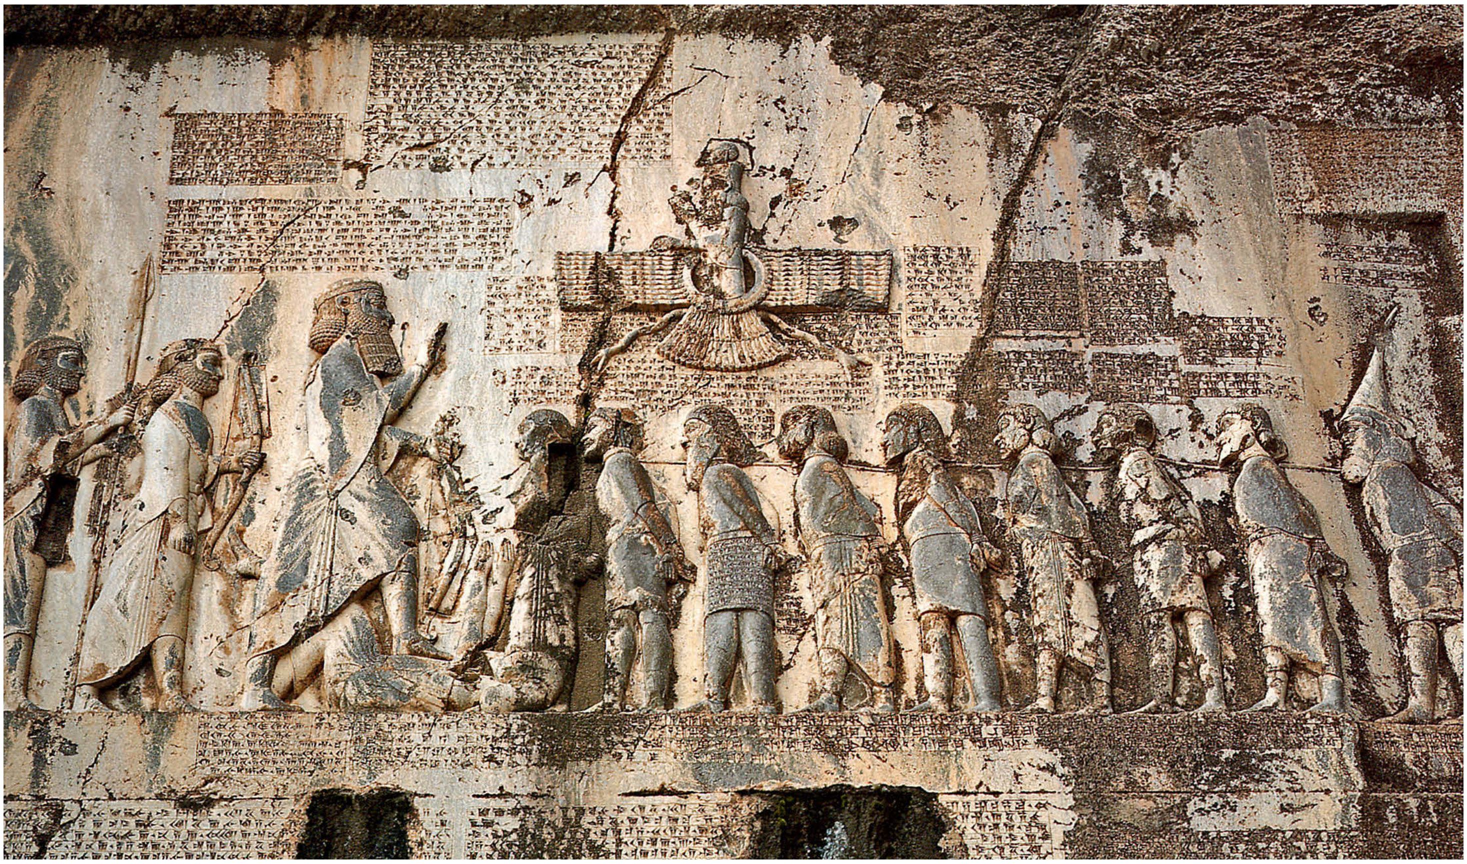
▶ Illustration after archaeological objects of the princely couple buried at Arzhan 2, Tuva, southern Russia.



which had a butterfly-like form or ended in two symmetrically arranged animal protomes. Among nobles the akinakes was carried in an elaborately decorated sheath made up of a wooden scabbard with a golden casing, which among the Saka and Sarmatians was sometimes adorned with colourful semiprecious gems. The sheath was fastened to a belt to the front or right side of a warrior. Whether the origin of the akinakes is to be found in the northern Caucasus or, as the author believes, among the daggers of the Karasuk Culture, remains uncertain.[75]

The woman was just as sumptuously clothed as the man. She wore a gold pectoral decorated in the animal style with gold and silver incrustations; a red cloak, on which were sewn 2,500 panther figurines made from sheets of gold; a knee-length dress; and boots decorated with miniature gold beads. She had an iron dagger with a gilded hilt; a miniature kettle decorated in the animal style; a gold comb; and a wooden ladle with a gold handle in the shape of a hoof. Her headdress was a tall, pointed cap, adorned with gold figures of two horses, a panther and the head of a bird of prey, as well as two long gold needles. This tall headdress shows similarities to those of Ak-Alacha[76] and Olon Kurin Gol[77] from the subsequent Pazyryk Culture (fifth–third centuries BC) and that of the 'Golden Warrior' of Issyk[78] in southern Kazakhstan. Similarly tall but undecorated conical headpieces were discovered in Subexi near Turfan, Xinjiang (fifth–third centuries BC);[79] they were also found on significantly older petroglyphs of the Okunev Culture.[80] Tall hats were also common among the Scythians who lived farther to the west, as can be seen in the Achaemenid inscription of Bisotun (also Behistun) from *ca.* 516 BC. In it Darius I (r. 522–486 BC) proclaims, among other things, the quelling of a revolt of the *Saka tigraxauda*, the 'pointed-cap Saka', and boasts of his victory over Skunkha, chief of the neighbouring Dahae. Beside the inscription a relief shows the captured Skunkha, wearing a tall, pointed hat.[81] The gold objects found in the kurgan were locally produced in Tuva, as the necessary tools were easy to transport; the high quality suggests a longer development of the Scytho–Tuvan gold-working art.

The 14 sacrificed horses were male animals belonging to ten different haplotypes or genetic variants. This large variability indicates that, as in the sacrifices at Arzhan 1, the sacrificed horses came from different herds. Surprisingly, additional analyses of the horses from both kurgans showed a considerable genetic distance



On the rock relief of Bisotun, carved around 516 BC, the king of kings Darius I (r. 522–486 BC) proclaims his victory over the nine rebellious kings, who appear before him with their hands bound behind their backs and chained together by the neck. The last king in the line, with the tall, pointed cap, to the right in the picture, is Skunkha, king of the Sakan Dahae.

between them and the Przewalski's horse, and thus that it was not part of the development of the Scythian horses. Likewise striking was the discovery of a small pile of human finger bones; a similar find of six fingers from a minimum of three or four individuals had previously been seen only in the great kurgan of Čertomlyk (fourth century BC) on the lower reaches of the Dnieper.[82] This evidence of presumable self-mutilation recalls Herodotus's description of mourning rituals at the death of a king: 'The Royal Scythians cut a piece from their ears, shave their hair, make circular incisions on their arms, gash their foreheads and noses, and thrust arrows through their left hands.'[83] Such self-mutilation at the death of the ruler was also common among Huns and Central Asian Turks.[84]

Like Arzhan 1, Arzhan 2 represented no mere tomb, but rather a sophisticated ritual complex with a planned layout. If one draws a line through the kurgan from the north-west to the south-east, it becomes apparent that all the burials of women lie to the west of this line and all burials of men and horses, as well as all four hoards of horse ornaments, lie to the east. This division into a female half, oriented toward the setting sun, and a male half, oriented toward the rising sun, is also found in the main tomb. The line runs through the grave, and the woman lies to the west, the chief to the east. To this day in their yurts Mongolian nomads follow a strict arrangement of rooms according to sex, although reversed. The entrance points to the south and the left, western side belongs to the men; the right, eastern side, to the women and young children. As mentioned above, four parallel circular and concentric rows of small stone rings border the outer edge of the kurgan, totalling 336, 352 or 368 stone settings, which served as sites for burnt offerings.[85] The cultural proximity to the great kurgans of Tagisken South (eighth–early fifth centuries BC) and Ujgarak (seventh–early fifth centuries BC) east of the Aral Sea is revealed not only in the analogous fire rituals but also in the practically identical horse-gear, which can also be found in part in the Central Kazakh Tasmola Culture. Thus Hermann Parzinger speaks of a 'Eurasian-Central Asian interaction zone'.[86]

Carbon-14 measurements and dendrological analyses date the main grave to the last quarter of the seventh century BC, so Arzhan 2 belonged to the **Aldy Bel' Culture** of Tuva (700–500 BC), which corresponded to the middle Podgornovo phase of the Tagar Culture. Arzhan 2 is roughly contemporaneous with the western Scythian kurgans in the Kuban region such as Kelermes. The royal couple and their sacrificed attendants were without exception Europids of the southern Eurasian type, who also had some Mongolid heritage. A century later Europid tribes advanced again from the south-west into Tuva, initiating the **Sagly Bazy cultural phase** (500–200 BC) and ending the use of the royal necropolis of Ujuk Valley. In summary it can be concluded that the kurgans of Arzhan 1 and Arzhan 2 illustrate the establishment of a new aristocracy of nomadic horsemen, in which the accumulation of wealth provided the basis from which to use rich gifts to help one's own clients appease foreign tribes and clans. The rider elite consolidated its power through the redistribution of levied tribute to loyal tribal chiefs. In a nomadic society no feudal rule could develop on the basis of the possession of real property, so the elite had to accumulate material possessions in the form of herds and precious metals. Thus burials provided the backdrop for demonstrating the wealth of a ruling family, entertaining followers at a funeral meal and, through the memorial cult, ensuring the legitimacy of the successor.

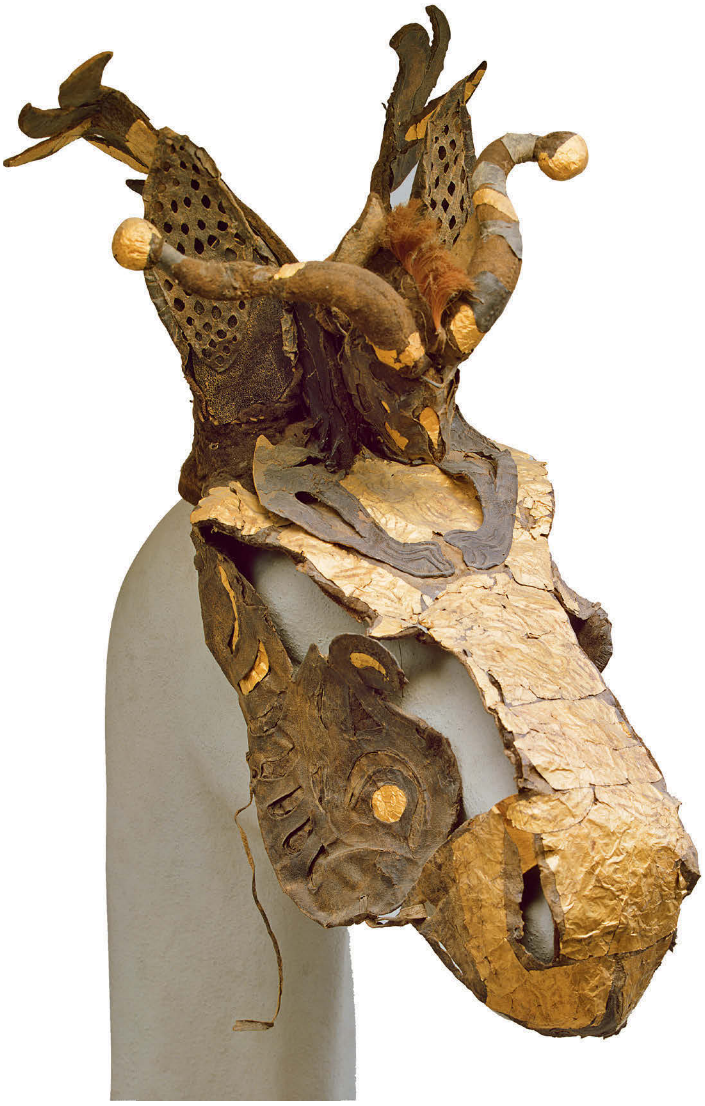
1.4 The ice kurgans of the Altai

In the very cold valleys of the Altai, between 1,600 and 2,500 m above sea level, the particular climatic conditions result in the natural conservation of mummified corpses with their tattoos, clothing and organic grave goods. When water flowed into the burial chamber after interment and froze to ice, it formed a compact lens of ice, which surrounded all the organic material and protected it from decay. The stone mound placed over the grave, through which the warmth of the sun barely penetrated, prevented the thawing of the ice lens until the moment the grave was opened. The current warming of the climate threatens the ice kurgans acutely, however. In 1865 Radlov was the first to explore ice kurgans, using brute force, near Berel in northern Kazakhstan. 'The earth was frozen solid. I gathered dry tinder, stacked it on the floor of the grave and lit it, then removed the upper, thawed layer of soil.'[87] The first, sensational discoveries were made by Michail Grjaznov in 1929 and Sergei Rudenko in 1947–49 at Pazyryk in the Russian Altai. The dating of the **Pazyryk Culture** proposed by Grjaznov and Rudenko to between the fifth and the early third centuries BC is still considered valid today. However, the most recent carbon-14 measurements, combined with dendrological analyses called 'wiggle matching', pinpoint the time frame of the five most important kurgans of Pazyryk more precisely. The earliest burial of kurgan 2 dates from 300 (+25/-28) BC; the most recent from kurgan 5 with the two famous carpets from 241 (+/-5) BC.[88]

As in Arzhan 1 and 2, the burial chambers of the largest kurgans of Pazyryk consisted of two log cabins made of larch, one inside the other, and the deceased rested in timber coffins.[89] This feature of a double wooden burial chamber decorated inside with felt or silk fabrics was later also applied at elite tombs of the Xiongnu (early first century AD) and of the Tashtyk Culture (50–500 AD).[90] The Europid or Europid–Mongolid corpses of Pazyryk were, in contrast to the mummies of the Tarim Basin, artificially mummified. The brain, viscera and muscles were removed from the deceased and the cavities filled with grass and shredded twigs, after which the openings were sewn shut with horsehair. Mercury was also used for embalming. The skull of a warrior who had been killed and scalped in battle was first covered with another piece of human skin. This discovery confirms Herodotus's accounts on two further points, since he reports that the Scythians removed the scalps from conquered enemies, tanned them and tied them to the reins of their horses as trophies.[91] Regarding the mummification of kings he stated, 'the corpse [...] has been prepared in the following way: the belly is slit open, cleaned out, and filled with various aromatic substances, crushed galingale, parsley-seed, and anise; it is then sewn up again and the whole body coated over with wax.'[92] The bodies of the dead men buried in the Pazyrk kurgans 2 and 5 were decorated with tattoos in the animal style of deer, ibexes, winged predatory animals and panthers; in some animals the haunches are turned 180 degrees relative to the head. A fish hanging downward adorned the right lower leg of the dead warrior in barrow 2.[93] In this regard the Siberian Scythians differentiated themselves from their Eastern European relatives, since the latter were not tattooed.

The men wore leather caps with earflaps, which were decorated with deer figures covered in gold foil; the women wore felt caps as tall as 90 cm (!) with built-in wooden rods, which were similar to the contemporaneous woollen headdresses of Subexi near Turfan. Another connection to the burials of Xinjiang is presented by two women's skirts, consisting of several colourful pieces of wool sewn together horizontally. At the time wrap-around skirts predominated in the Pazyryk Culture and stitched skirts, found in several necropolises of Xinjiang such as Satma Mazar and Shanpula, were exceptions. The nomadic riders of Pazyryk were thus in contact with the stockbreeders of the Tarim Basin. Other indications of trade relations to the south were a shirt made of Indian cotton and the handle of a mirror made of Indian ox horn. Bronze mirrors were given to both women and men, since they warded off evil spirits and also served as the seat of the soul. A few of these mirrors display Chinese decoration and were produced in China. They were often intentionally broken during burials, so that the soul would follow the dead person, or to prevent it from staying at the grave, close to the world of the living.[94]



Leather and felt mask covered with gold leaf with attached horns for a sacrificed horse, kurgan 1 of Pazyryk, Altai, southern Russia, around 300 BC. The State Hermitage Museum, St. Petersburg.

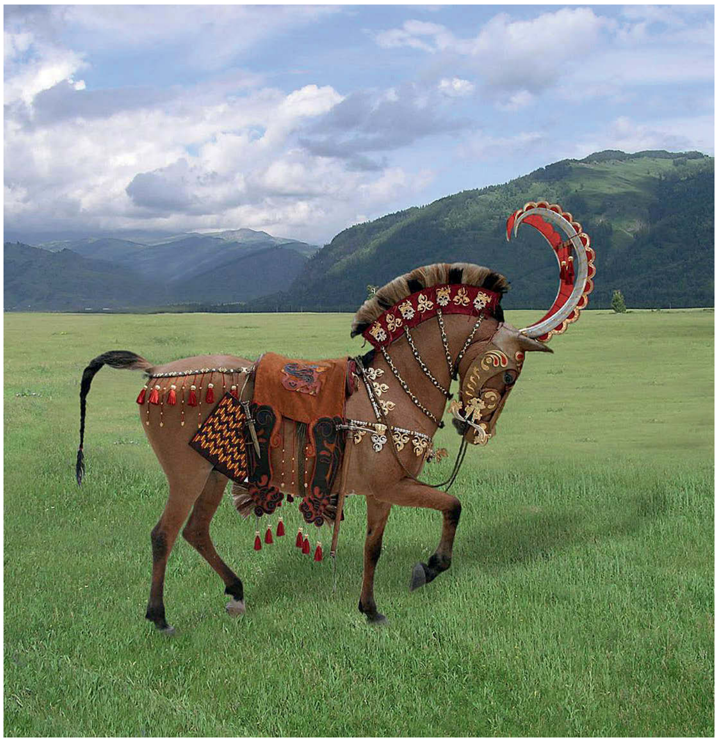


Illustration based on the excavation of a horse prepared for sacrifice. The State Hermitage Museum, St. Petersburg.

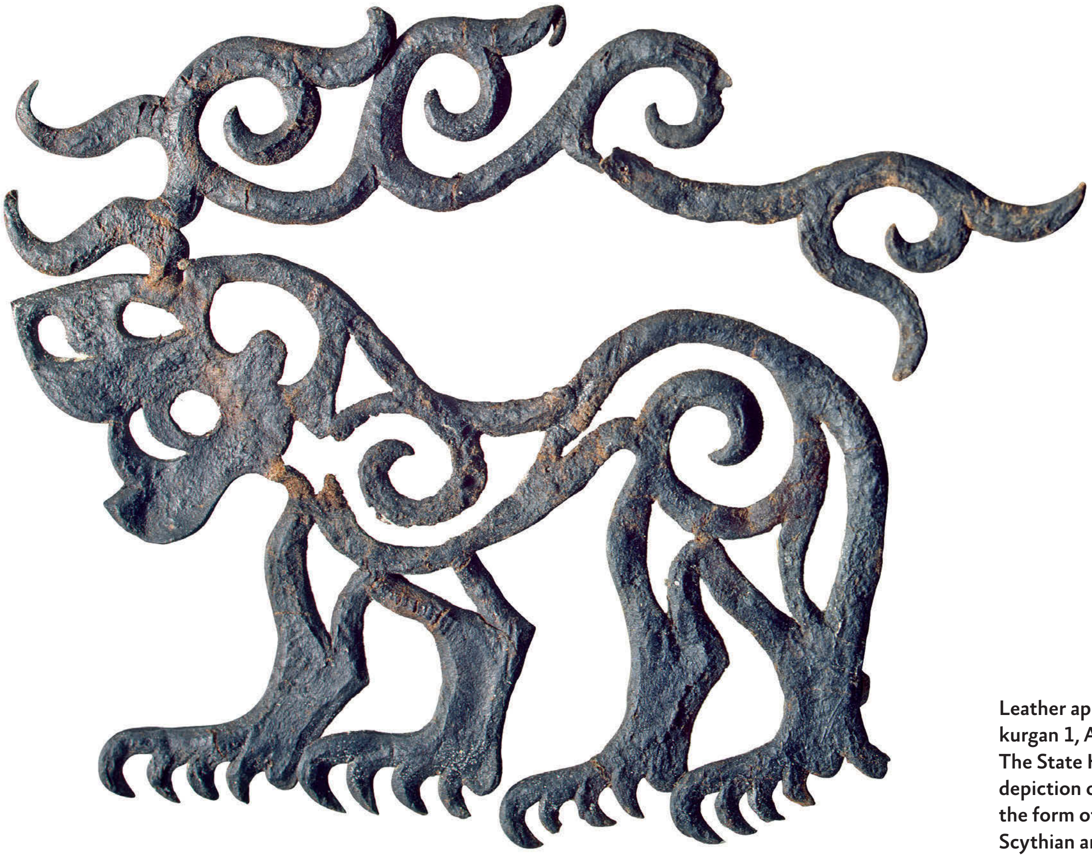
Unique to the Pazyryk Culture are the elaborate masks, made of leather, felt, cloth and wood and covered with gold leaf, which covered the heads of a few sacrificed horses. These masks had deer antlers or ibex horns, which were often gilded with gold leaf. In a few cases a tiny wooden figure of a bird of prey or a griffin sat between the ears of the mask. On other masks a griffin fought with a tiger, or a griffin with the head of a devoured deer in its sharp beak wore leather deer antlers, whose tips ended in heads of birds. In a magical sense the horses that pulled the funeral cart also had the attributes of other animals, which played an important role in the theriomorphic – relating to the animal world – worldview of the Scythians.

Belief in the mutability of animals or the transferability of their characteristic qualities is also expressed in works of art, whether in bronze depictions of hybrid animals or the small wooden horse figurines covered in gold foil that decorated the felt caps of warriors and had gilded deer antlers or ibex horns. Such deer-horses and ibex-horses were found in the Pazyryk Culture graves of Pazyryk itself, of Tuekta[95] and Ak-Alacha[96] (Russian Altai), Olon-Kurin-Gol[97]

(Mongolian Altai) and Berel[98] (northern Kazakhstan). In Tuekta archaeologists even discovered a depiction of a tiger with deer antlers.[99] As already indicated at the petroglyphs of Tamgaly and the deer stones, the horse accompanying the deceased into the afterlife possessed the regenerative power of the deer, the ability of the ibex to advance to heaven and the conquering strength of the griffin. In the holistic thought of the Scythians these animal qualities were transferred to human beings through tattoos.[100] The most sacred animals of the Scythians of the Pazyryk Culture, such as the eagle that ruled the skies, the powerful leopard, the sure-footed ibex and the deer with its antlers that grew again each year, were all native to the Altai.

The horse harnesses in Pazyryk were adorned with gilded wooden figurines and protomes of griffins, ibexes, wolves and birds of prey, which held in their mouths or beaks the head of a deer or an ibex. To these were added leopards, horned predatory cats and bearded men's heads with ears positioned high.[101] The last images strongly recall the Egyptian patron deity Bes, who enjoyed great popularity in amulets in the Persian Achaemenid Empire (550–330 BC). In the contemporaneous necropolis of Berel, south of Pazyryk, statuettes of winged or horned griffins and sphinxes were also discovered; the latter indicate an Egyptian influence mediated by Iran. The griffins, ubiquitous in the art of the Pazyryk Culture, not only recall Herodotus's gold-protecting griffins, which may be identified with the Altai Scythians, but their figures awaken associations with the contemporaneous griffin protomes of the Achaemenid capitals of Persepolis, who for their part had forerunners in the Babylonian and Neo-Assyrian portrayals of griffins. The griffin motif was also prominent in Scythian jewellery, as in the griffin-shaped ends of torques (smooth and twisted neckrings) and rhytons (drinking horns), whose mouths took the form of animal heads.[102]

Related to the choker are the bracelets that ended in griffin protomes, the most spectacular example of which is the pair of massive golden bracelets from the Oxus treasure of the fifth/fourth centuries BC.[103] As can be seen in the relief of the tribute-bringers on the stairway of the Apadana audience hall of Persepolis, built by Xerxes (r. 486–465 BC), such bracelets served as tribute gifts for the king of kings. The relief shows not only Scythians but also Syrians, Medes, Sogdians or Lydians presenting bracelets as tribute.[104] Griffins were also prominent in the decoration of gold diadems,[105] pectorals,[106] scabbards[107] and brooches.[108] This mythical

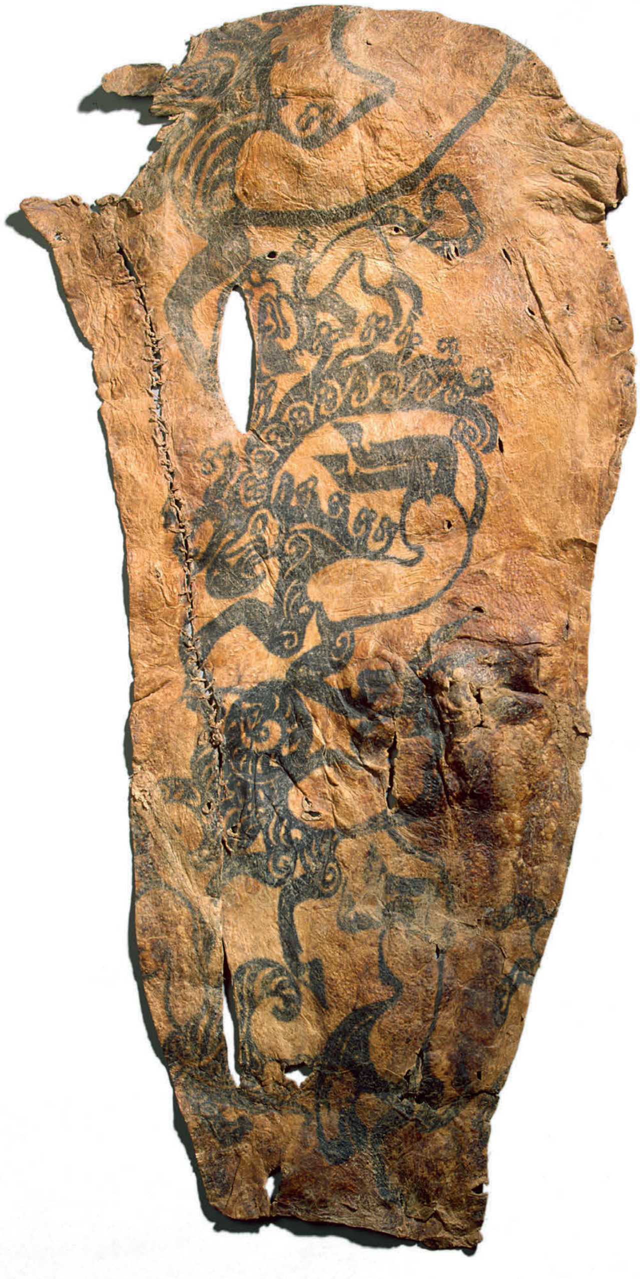


Leather appliqué of a tiger with deer antlers, Tuekta, kurgan 1, Altai, southern Russia, fifth century BC. The State Hermitage Museum, St. Petersburg. The depiction of the tiger's shoulders and haunches in the form of a spiral belongs to the vocabulary of the Scythian animal style.

creature made up of a winged lion's body and the head of a bird of prey united the strongest and most dangerous animals of the earth and sky, so the griffin presumably symbolised rule over heaven and earth. At the same time it could have served as guardian not only of gold but also of the sun. Both the Persian capitals and the chokers and bracelets had an apotropaic function.[109]

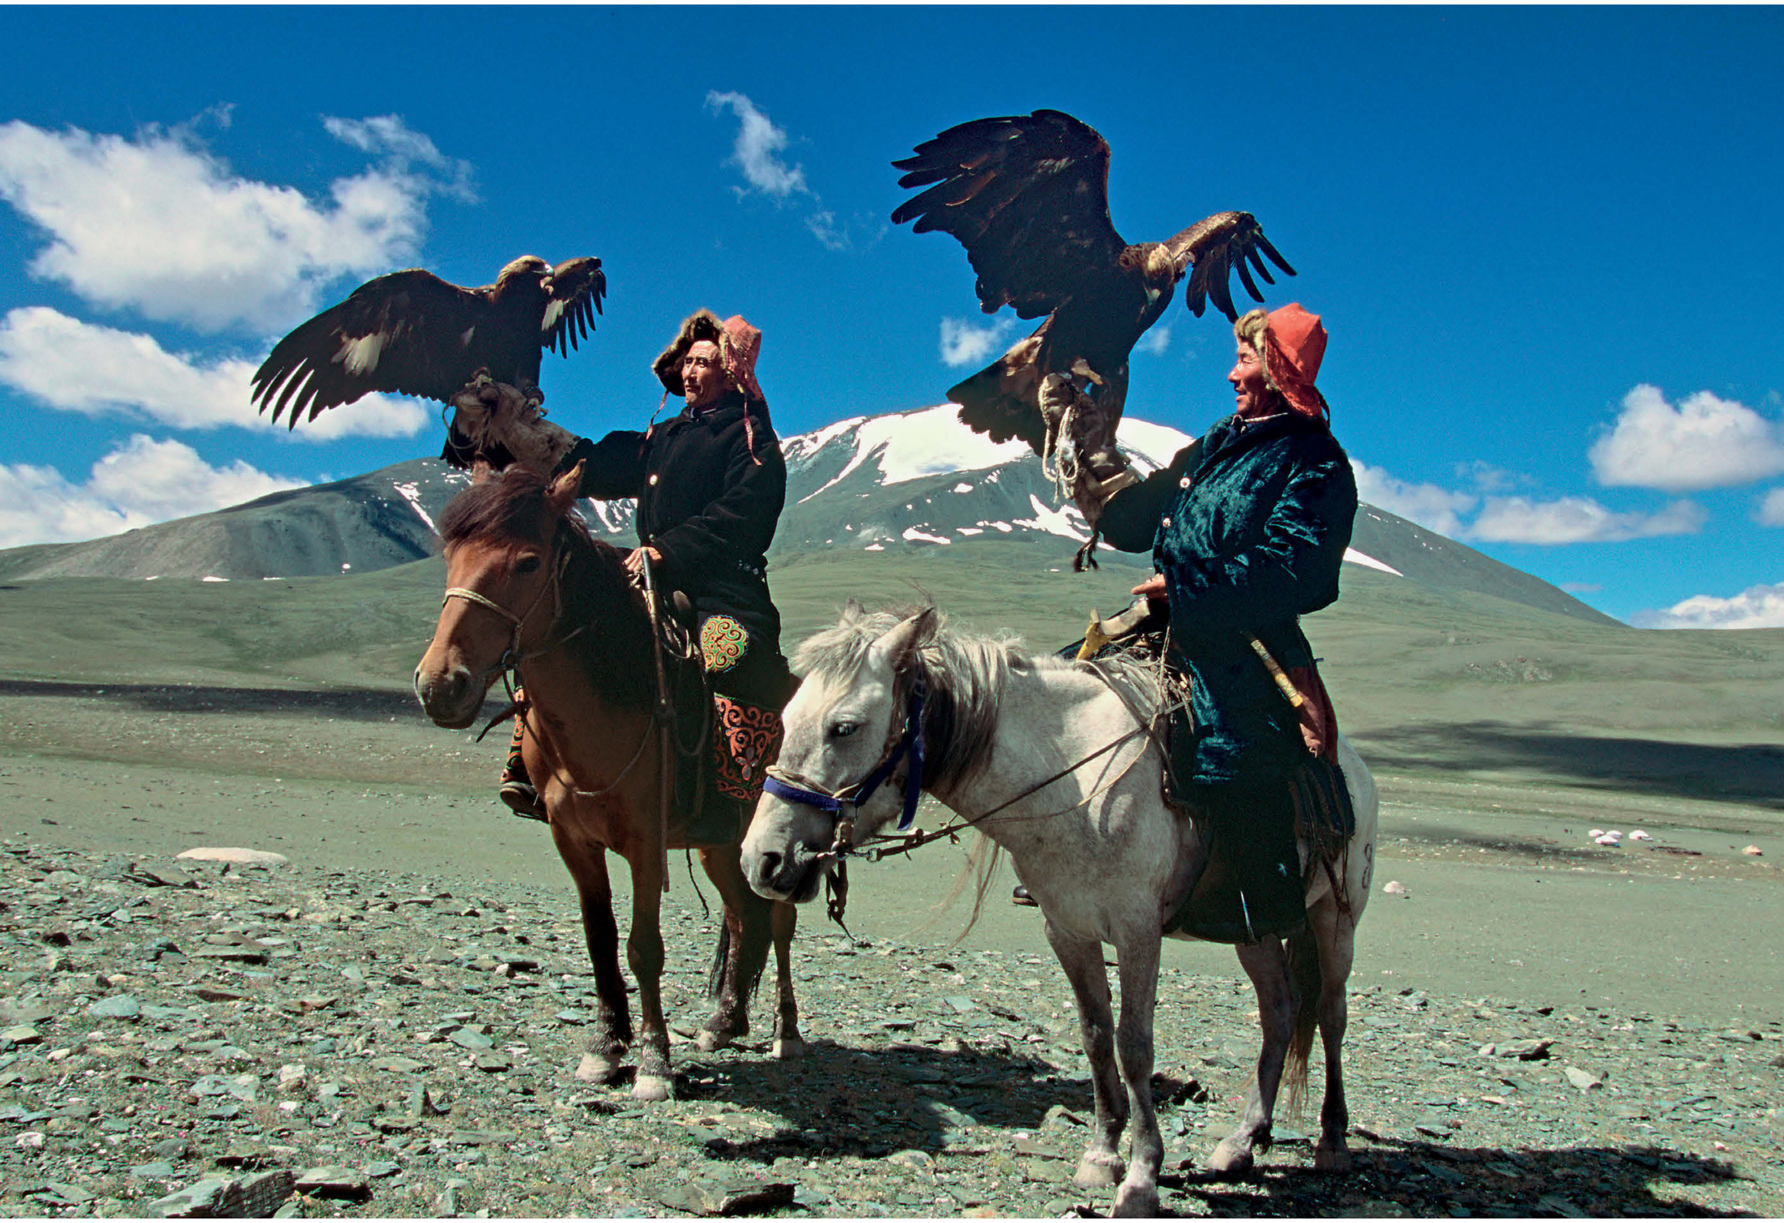
In kurgans 1 through 4 of Pazyryk there were simple carts for the dead with disc wheels, but kurgan 5 had an extraordinarily well-preserved wooden wagon with four spoked wheels. Since Rudenko also found Chinese silk in the same grave, he posed the question of whether this tall, two-axle ceremonial wagon could be a traditional dowry of a Chinese princess, of the type seen during the time of the Chinese Han Dynasties (202 BC–220 AD) when Chinese ruling families were related by marriage with the Xiongnu.[110] A baldachin decorated with colourful felt figures of swans and supported by thin wooden rods stood over the simpler carts. The grave also held modern-looking wooden tables. Their four wooden legs, carved in the shape of standing predatory beasts, could easily be removed and then reattached to the tabletop when required.[111]

Rudenko also came upon another confirmation of Herodotus's descriptions; he found copper kettles and stone vessels with charred hempseed (*Cannabis sativa*) and seeds from sweet clover (*Melilotus*), another intoxicant.[112] Next to them lay leather pouches filled with hempseed and wooden frames made up of six or seven wooden rods bound together that could be set up very quickly. Decorated felt or leather coverings were placed over the 120-cm-tall frames. Herodotus reported that after burials the Scythians take 'a framework of three sticks, meeting at the top, [on which] they stretch pieces of woollen cloth, taking care to get the joins as perfect as they can, and inside this little tent they put a dish with red-hot stones in it.' Then 'they take some hemp seed, creep into the tent, and throw the seed on to the hot stones. At once it begins to smoke, giving off a vapour unsurpassed by any vapour-bath one could find in Greece. The Scythians enjoy it so much that they howl with pleasure.'[113] Rudenko had undoubtedly found the equipment used to create intoxicating smoke, as described by Herodotus. Use of cannabis among the eastern Scythians was presumably not limited to burial rituals, as can be inferred from another proclamation of the Persian king of kings Darius. The inscription of Naqsh-e Rostam, found close to Persepolis, mentions the *Saka haumavarga* – 'the haoma (intoxicant drink)-worshiping Saka', which scholars have tentatively located in the Fergana valley or the Pamirs.[114]



Tattoed skin from the arm of the man buried in kurgan 2 of Pazyryk, Altai, southern Russia, around 300 BC. The tattoos show mythological animals. The warrior was tattooed on both arms and shoulders as well as on the lower right leg and looked like a living work of art. The State Hermitage Museum, St. Petersburg.

Pazyryk was also known for its distinctive saddles with their decoratively carved wooden frames, over which fabrics were stretched. In the case of the kurgan of Bashadar in the Russian Altai[115] a powerful eagle adorned the frame. The saddleclothes used to cover the frames were often richly ornamented, perhaps with felt appliqués of attacking griffins and galloping elks, or blankets decorated with Chinese silk embroidery depicting pheasants or phoenixes. On another pelmet, made of Iranian fabric, women are portrayed praying before a fire altar. Two unique and exceptionally well-preserved carpets were found in kurgan 5. The first

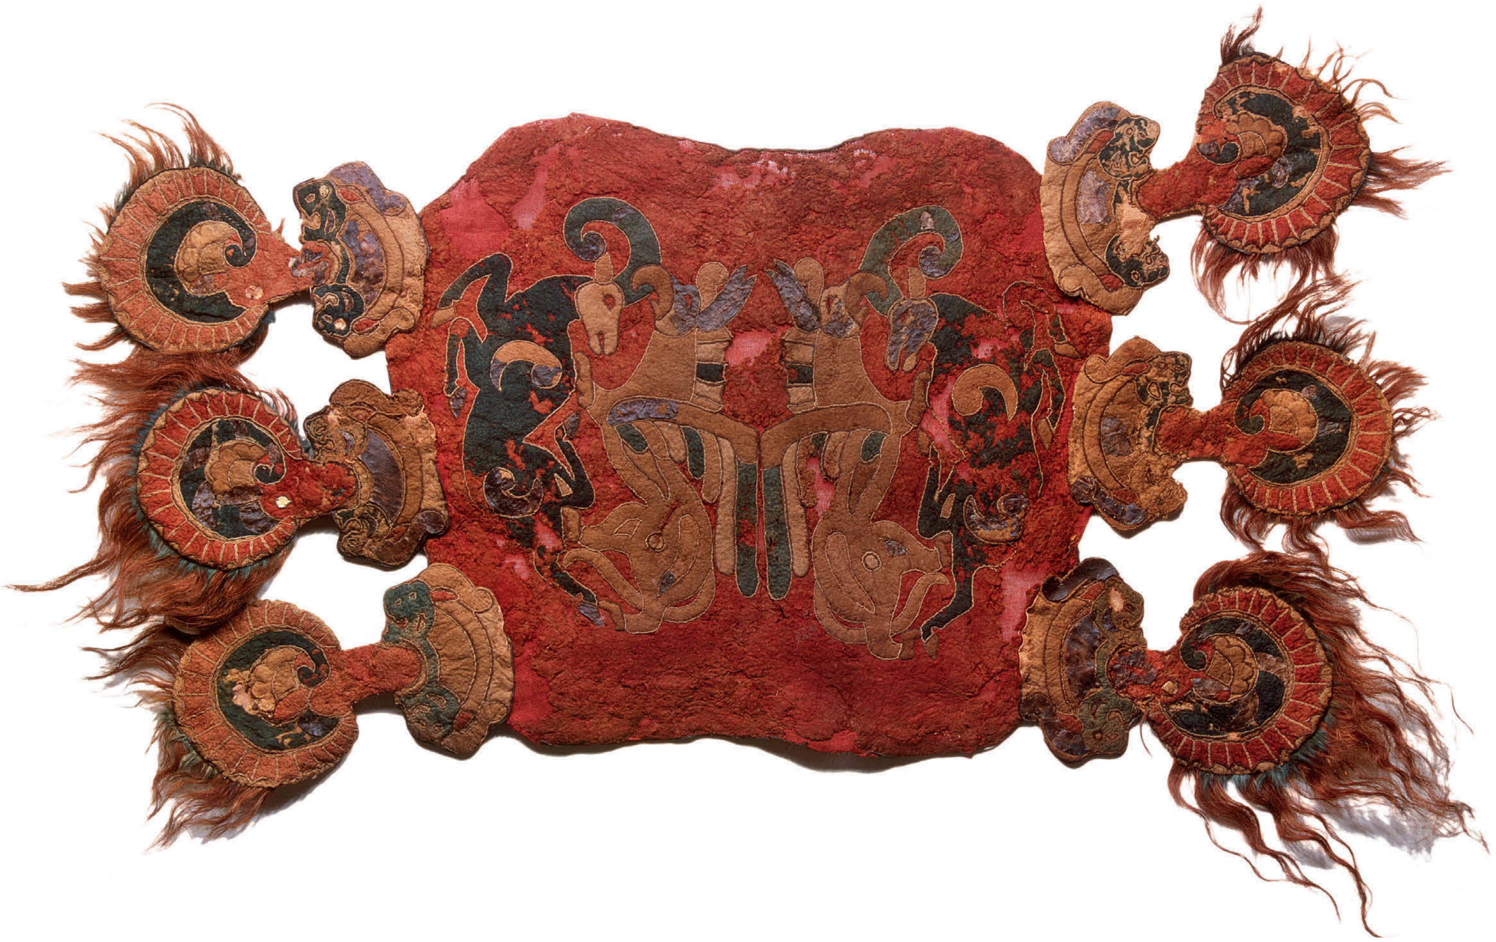


Two Kazakh eagle hunters at the foot of Tsengel Khairkhan, which rises 3,943 m above sea level, Ölgyi Aimag, western Mongolia. Golden eagles used for hunting are traditionally released into the wild between ages 15 and 18 and can live to be 30 years old.

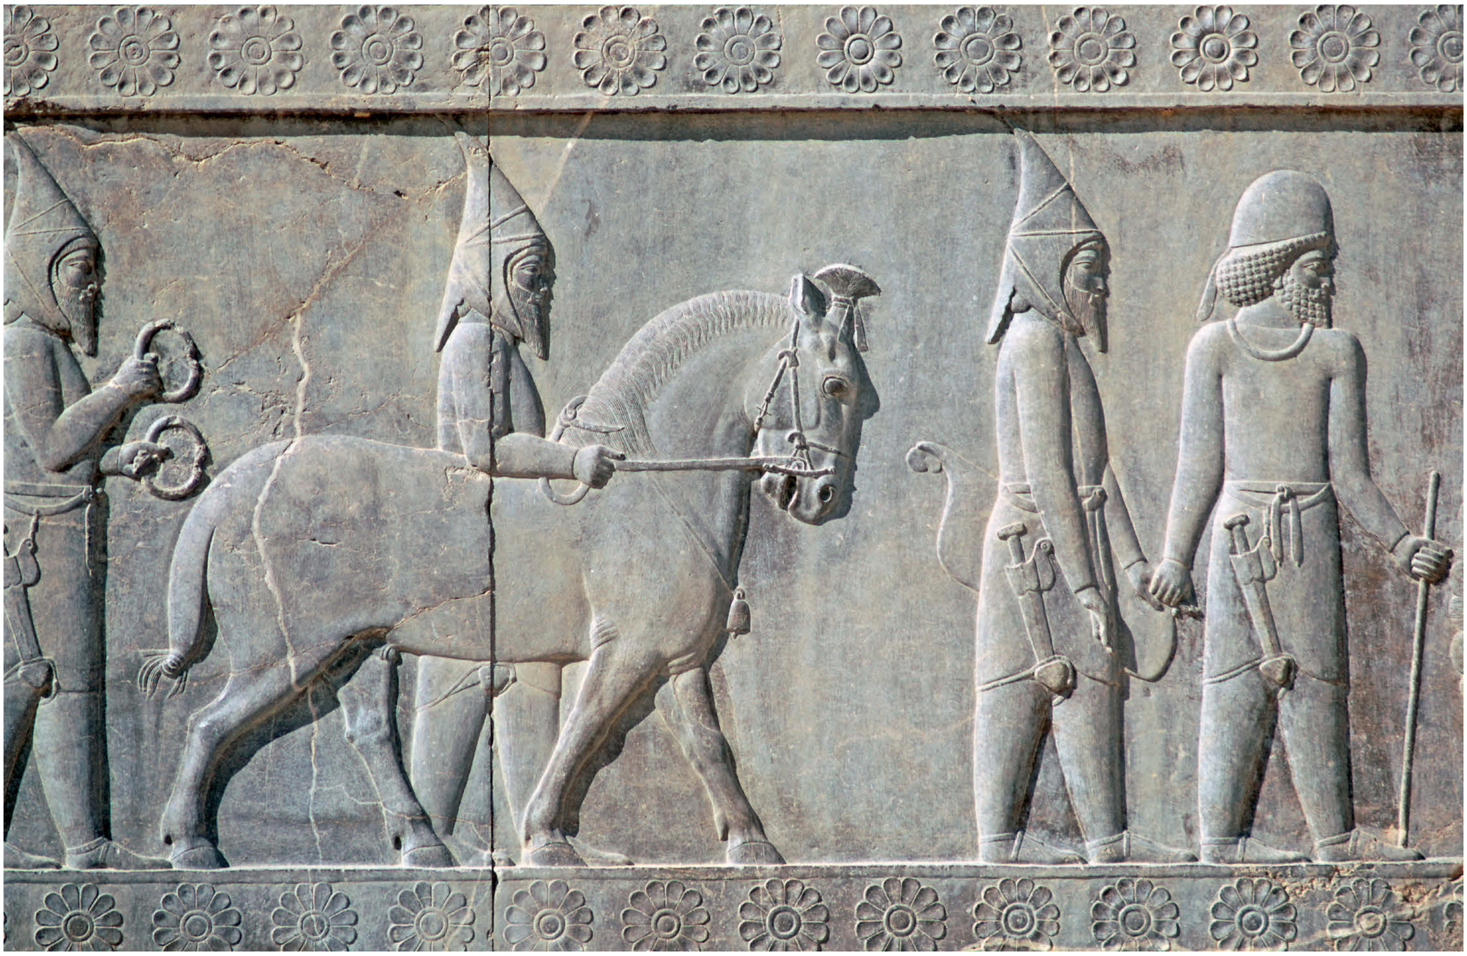
was a densely knotted wool carpet, 183 x 200 cm in size, with silk embroidery, one of the oldest examples of its kind in the world.[116] The borders depict griffins, pacing fallow deer and riders, in a procession recalling the parade of tribute-bringers in Persepolis. Presumably the carpet was made in an eastern Persian satrapy (a regional governing unit), using crimson pigments from the steppe.

The second carpet or wall-hanging, 29.3 m^2 in size, was made of felt with sewn-on appliqués. One motif shows a winged hybrid animal with a human upper body, a bearded head and deer antlers, as well as a winged lion's lower body and a long tail. The creature, which resembles Achaemenid monsters, does battle with a phoenix, which also has antlers.[117] The second, dominant motif, often repeated, shows a rider with a billowing cape and a gorytos, high on a horse, who rides proudly but respectfully toward a presumably female person sitting on a throne. She wears on her bald head a headpiece reminiscent of a Persian crown and, analogous to an enthroned Persian king who holds in his hand a lotus bud, an Egyptian symbol, she holds out a large plant to the rider.[118]

The symbolic content of this striking scene is unclear. Does the rider represent a chief approaching the highest deity of the western Scythians, Tabiti, goddess of the hearth and domestic life, who holds in her hand the tree of life and validates the ruler in his role? Is the goddess receiving a deceased person?[119] Or does the scene show the ritual marriage of the chief with Tabiti, who, according to Herodotus,[120] was venerated as 'queen of the Scythians'? Or perhaps the rider has come before the ancient Iranian judge Mithra to receive the drink of immortality, *haoma*?[121] Many golden decorative clothing or strap plaques have been found in the western Scythian territory depicting a man drinking from a rhyton and standing in front of a seated woman who is looking into a mirror. This scene may be interpreted as a symbolic transfer of power by Tabiti to the new ruler.[122] In this sense the picture on the felt wall-hanging of Pazyryk may symbolise the investiture of a deceased chief in the afterlife. However, in the world of the Pontic Scythians, influenced by Hellenism, the seated woman could also represent the goddess of destiny Tyche, who hands the chief a cornucopia or, as in the carpet,



Two griffins attack two ibexes on a saddle blanket made of felt, horsehair and leather, Pazyryk, kurgan 1, Altai, southern Russia, around 300 BC. The State Hermitage Museum, St. Petersburg.



A Median ceremonial attendant with a ball-shaped felt hat leads the delegation of the Saka, which brings as tribute a stallion and heavy armlets, to the Achaemenid king of kings. Both the Median leader and the Saka carry akinakes short swords on their right sides, and the Saka leader carries a gorytos on his left. The tall, pointed cap of the Saka recalls the cap of the defeated ruler of the Dahae, Skunkha, on the Bisotun relief, so the delegation may be identified as Dahae or as the neighbouring Saka tigraxauda, the 'pointed-cap Saka'. Tribute procession on the Apadana steps to the hypostyle hall of Persepolis, first half of the fifth century BC.

a tree of life. The archetypal motif is also found on considerably older silver seals from Gonur Tepe in southern Turkmenistan,[123] among the Iron Age Thracians,[124] and also on anthropomorphic stone stelae of the Viking age from the eighth/ninth centuries.[125]

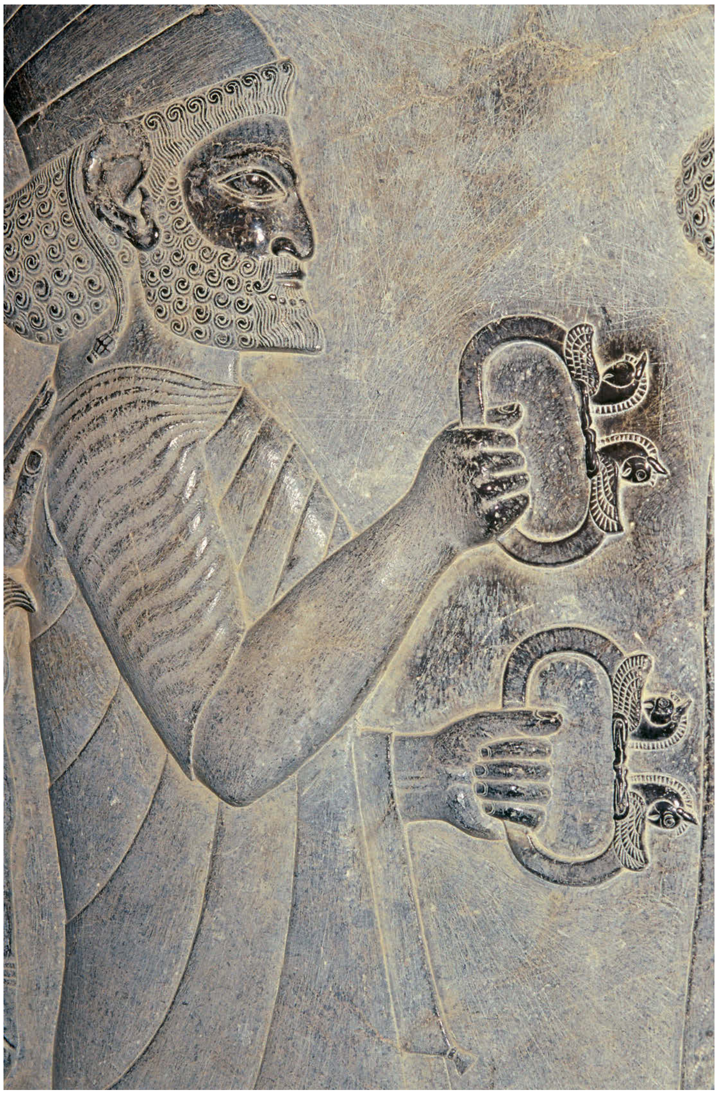
Compared with the Tuvan phase of Arzhan 1 and Aldy Bel', the animal style developed dramatically around the mid-first millennium BC as a consequence of trade contact with China and especially with Iran. In terms of content, new mythical creatures appeared, as well as fight scenes between a victorious carnivore and a defeated herbivore. Such scenes were adopted by the Xiongnu and the Saka of the southern Tarim Basin towards the end of the first millennium BC, as can be seen in the embroidery on the felt carpets of Noin Ula[126] in northern Mongolia and the wool tapestry bands of Shanpula[127] in southern Xinjiang.

Formal innovations also appeared in Pazyryk. Muscles and body parts that were to be emphasised were highlighted by special marks like commas and periods, whether through the use of colourful felt or leather appliqués or the implementation of a cloisonné gold working technique, in which first blue and green and later also red gemstones were incorporated into gold objects. The earliest gold inlaid objects had appeared in the seventh century BC, however, as discoveries from kurgan 5 of Čilikty show. Here green semiprecious gems accentuate the eyes, ears, mouths, beaks and hoofs of small gold animal statues. They are evidence that the toreutic technique of coloured inlays developed not in the Achaemenid Empire but rather among the Scythians of the Kazakh Altai.[128] Polychrome gold working developed several centuries later, however, and was perfected shortly before the start of the first millennium AD by the Saka of Bactria and the Sarmatians of the Black Sea region. As Ellis Minns determined in 1913 and Rostovtzeff in 1922, first the Sarmatians and then migrating tribal bands such as the Goths, Lombards, Vandals, Franks and Merovingians took the Sarmatian art of polychrome gold working to all of Western Europe as far as the British Isles.[129] Not only were products and raw materials transported on the Iron Age trade routes of the steppes but representatives of cultures with specific worldviews and corresponding practices travelled along them – an early and impressive example of transcontinental globalisation.[130]

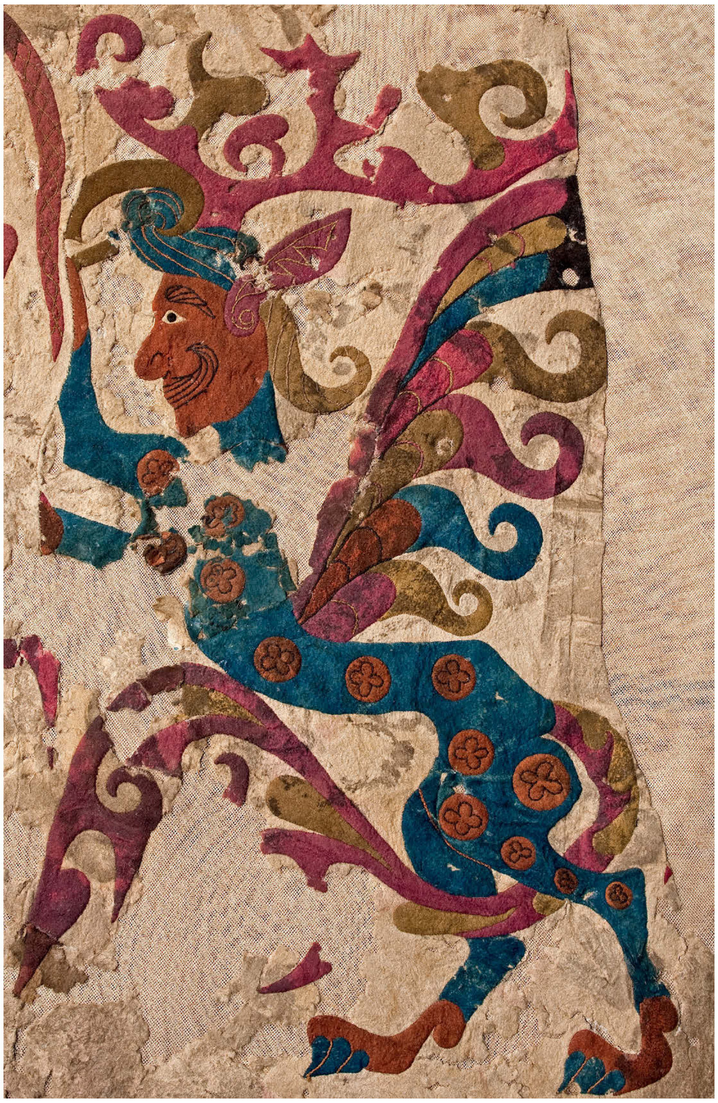
Around 200 km south of Pazyryk in 1990–1995 the Russian archaeologists Natalia Polos'mak and Vjačeslav Molodin discovered on the high plateau of Ukok, which has an elevation of up to 2,500 m, the graveyards of Ak-Alacha, Verch-Kaldžin and Bertek. At Bertek, petroglyphs from the early Bronze Age[131] show that the site served for a long time as a winter grazing area. Because of strong winds, the Ukok plateau stays free of snow in the winter, when lower valleys lie under a thick layer of snow. The winter grazing lands, to which the nomads returned annually, also served as gravesites for the deceased elite. Especially spectacular discoveries were made in the ice kurgans of Ak-Alacha, which lie in the Russian Altai right on the border with Kazakhstan and China.[132] The graves belong to the Pazyryk Culture, which here superseded the Majemir Culture (900–500 BC). In kurgan 1 of Ak-Alacha 3 an adult woman lay in a wooden casket with large, carved depictions of deer and next to her lay six sacrificed horses in harness. Wooden figurines of deer and ibexes covered with gold leaf adorned the headdress of the deceased. The discovery that the woman was tattooed on both arms with images of animals was unique. Carbon-14 wiggle matching measurements gave a date of around 274 BC for the death of the tattooed woman.[133]

Still more sensational were the discoveries in kurgan 1 of Ak-Alacha 1. In a side chamber of the grave, built from larch wood in a block structure, lay nine ornamented horses, three small wooden shields and three richly decorated felt pelmets. The horses' saddlecloths were each hung with two long predatory fishes called *nalim* cut from felt. These fish were in turn decorated with appliqués of griffins and layered eagle heads. They recall the fish-shaped gold sheets, also attached to saddles, of Arzhan 2 and the mysterious fish-shaped gold plaque found at Vettersfelde, Germany.[134] On the upper half of this fish, scenes of animals fighting are depicted in high relief; on the lower half, a hybrid creature with the body of a fish and the bearded head of a man leads six fishes. A bird of prey flies above the fish's fins, which end in rams' heads. According to two origin myths, the ancestress of the Scythians emerged from an aquatic environment, and such fishes may have served as an apotropaic amulet.

The main chamber of kurgan 1 contained a double burial. In the larger wooden casket lay an armed Europid man wearing a felt cap with earflaps and decorated with small wooden animal figurines. The shape of the cap is very similar to the pointed caps of the Sakan tribute delegation on the Apadana relief of Persepolis. The smaller wooden casket held the remains of a young Europid woman who wore not a skirt but rather trousers made of red woollen cloth. As grave goods she had not only jewellery, a ritual miniature mirror and cowry shells from China or India but also, like the man, a complete set of weapons, consisting of an iron battle axe, an iron akinakes, a quiver, a bow and arrows. Remarkably, these were not ritual weapons unsuitable for combat but actual battle weapons. Like the man, the woman wore a tall felt cap, which ended at the peak in a wooden bird's head covered with gold foil. The sides were



The delegation of the Syrians (or Lydians) also brings armlets with small animal heads, here winged griffins, as tribute gifts for the Achaemenid king of kings. Such gold armbands were rarely worn but rather were traditional honorary gifts of subjected peoples in the Achaemenid Empire. Tribute procession on the Apadana steps to the hypostyle hall of Persepolis, first half of the fifth century BC.



A hybrid creature consisting of a winged carnivore, deer and human being, standing on its hind legs, attacks a phoenix of the same size (not shown). Felt wall hanging, Pazyryk, kurgan 5, Altai, southern Russia, *ca.* 241 BC. The State Hermitage Museum, St. Petersburg.

decorated with two gold-covered horse figurines, a deer statuette and three stylised birds cut from gold foil. Clothing and weapons were identical for both the deceased; the young woman was a warrior who died young. In the neighbouring kurgan 2 lay an eight-year-old boy, who was buried like an adult with a horse and a ritual battle axe. Finally, in kurgan 3 of Verch-Kaldžin 2 a young, tattooed warrior was buried, with clothing and armaments identical to those of the double burial of Ak-Alacha 1.

The double burial of Ak-Alacha, dated to the fourth/third centuries BC,[135] was sensational because it was the first time a female buried with battle weapons had been discovered in north-eastern Central Asia, although finds of weapons in female burials of the Pontic Sythians and Sarmatians from the same time were not unusual.[136] This woman's grave also recalls Herodotus's accounts of Sarmatian women 'taking part in war and wearing the same sort of clothes as men. [...] They have a marriage law which forbids a girl to marry until she has killed an enemy in battle.'[137] But this isolated discovery does not necessarily prove that among the eastern Scythians young women took part in war, as with the Sauromatians and Sarmatians. Presumably this was a unique case, in which the young woman had to take over the tasks of the older man, who was incapable of fighting since he suffered from chronic polyarthritis.

In 2006 explorations east of Ak-Alacha in the high plain of Olon Kurin Gol, at an altitude of 2,500 m in the Mongolian Altai, brought to light first a cenotaph, then a plundered grave and finally the undisturbed kurgan 1 of Olon Kurin Gol from the early third century BC.[138] In front of the kurgan stood a row of nine stone steles, oriented towards the south. In the wooden chamber lay a tattooed, fully clothed warrior, who wore wool trousers and a coat

One of the four hay-stuffed felt figures of a swan that decorated the high-wheeled, collapsible wooden wagon in kurgan 5 of Pazyryk. Altai, southern Russia, around 241 BC. The State Hermitage Museum, St. Petersburg.

made of marmot pelt and sheepskin. His tall felt cap ended, like those of Ak-Alacha, in a wooden bird's head. On the peak of the cap stood a gilded wooden horse figurine with ibex horns. A second horse figurine, this one with deer antlers, was found on the front above the forehead, and the sides were decorated with very realistic, somewhat larger horse figurines. Also particularly interesting was the completely preserved, 120-cm-long asymmetrical composite bow, whose different parts were covered with animal skin. Its length and shape anticipated the Hunnic bow.

In summary it may be concluded that the eastern Scythians in Tuva and the Altai responded to the changing climate by developing a new form of economy, ideally suited to the new conditions. At the same time a hierarchically structured and militarised society arose. The elite members of this society accumulated wealth and created independent forms of art, thanks to long-distance trade with China, the Tarim Basin and especially the Medes and Persians of Iran. North-eastern Central Asia soon became too confining for the nomadic horsemen and individual tribal bands struck out for the south and west.

1.5 Stockbreeding cultures of north-eastern Kazakhstan and the western Siberian forest steppe

The cultural phase of Arzhan 1 extended at least 750 km to the south, where in eastern Kazakhstan in the ninth–seventh centuries BC the early Iron Age cultural phase of the **Zebakino-Čilikta phase** flourished. After this followed the **Čilikta phase** (seventh–fifth centuries BC), which corresponds to the Aldy Bel' Phase of Arzhan 2. Simultaneous with the Pazyryk Culture developed the **Bukon phase** (fifth–third centuries BC).[139] In kurgan 5 of Čilikty (seventh century BC) articles of gold jewellery with colourful inlays of

artificial gemstones made of glass-like coloured paste came to light. The kurgan also held figurines of boars on tiptoe, cut from thin gold sheets. Also striking is the pyramidal shape of a few kurgans with four steeply sloping sides, reminiscent of the kurgan of Barsučij Log.[140]

About 1,300 km north-west of Čilikty, near the Ishim River, lies the necropolis of **Bajkara**, dominated by the enormous kurgan 1.[141] The kurgan contained no royal tomb, however, but was rather a Scythian-era cenotaph with a shrine over it from the fifth/fourth centuries BC, which had been built in four stages. In a first stage a dromos (entrance corridor) was made from the eastern edge of the planned circular kurgan, leading to a never-used central burial chamber. Stairs led then to the exterior, where, in the western part of the plot, twelve wooden posts of unknown purpose stood. In a second stage the dromos and tomb were filled in, the posts removed, and the site covered with several layers of birch bark and encircled by a stone wall. Then the actual kurgan was constructed out of sod, thick layers of clay and finally a stone shell. The kurgan still contained a central chamber, to which three low corridors led. In the fourth stage the corridors were intentionally brought to collapse, and on the western part of the mound, where the side was steepest, a stone platform was built, on which was constructed a small pyramid, visible from afar, made of a reddish mixture of clay and sand, which recalls the kurgan of Barsučij Log. The entrance to the pyramid and thus to the purported shrine ran over the gently sloping eastern side of the kurgan.[142]

The leading archaeologist in the excavation of Bajkara, Anatoli Nagler, associated the kurgan with Herodotus's account of the Scythian cult of their god of war, whom he called Ares: 'In every district, at the seat of government, Ares has his temple [set up in the form of a mound]. On top, the heap is levelled off [to] a square, like a platform, accessible on one side but rising sheer on the other three. [...] On the top of it is planted an ancient iron sword which serves for the image of Ares. Annual sacrifices of horses and cattle are made to this sword [... also] prisoners of war, [...] one man is chosen out of every hundred.'[143] The kurgans of Bajkara and Barsučij Log, as well as other Scythian kurgans with flattened domes may well have been used as shrines dedicated to the god of war. This is illustrated by the seven Scythian–Maeotian kurgans of Uljap (fifth–fourth centuries BC) and two from Ul (sixth–fifth centuries BC) in the region of Kuban in the Russian northern Caucasus. Here human skeletons as well as piles of animal and human bones recall corresponding ritual sacrifices. In the centre of the dome of kurgan 5 of Uljap Alexander Leskov discovered a quadrangular platform with an ancient sword – clear evidence that 'this shrine was associated with the cult of the war god Ares, whose symbol was the sword'.[144] Similar shrines may be traced back in Kuban as far as the early Scythian period of Kelermes (seventh century BC). Over half a millennium after the construction of the shrines of Uljap the Sarmatian Alans, relatives of the Scythians, venerated a sword as the symbol of their god of war, according to the Roman officer and historian Ammianus Marcellinus (*ca.* 330–395 AD), who noted that 'a bare sword is stuck in the ground according to barbarian custom, and [the Alans] worship this believing it to be the god of war and guardian of the territory they inhabit'.[145]

The sword-worship of the Scythians and the Alans is also echoed in the Ossetian version of the Nart saga. This originally presented the code of honour of the warrior nobles of the Iranian-speaking Ossetians, who lived in the Caucasus and who were descended from the Sarmatian Alans.[146] In the saga the chief of the legendary warrior people of the Narts, the demigod hero Bartraz, whose life is existentially linked with a sword, is venerated. As a young warrior he pulled his sword out of a tree root and as an aged, mortally wounded warrior he can die only after a comrade throws his sword into the sea, where it is immediately taken up by a water deity. Parallels to the saga of King Arthur and his sword Excalibur ought not to be overlooked. Perhaps the 5,500 Sarmatian cavalrymen from the tribe of the Iazyges, whom Emperor Marcus Aurelius sent to the Roman province of Britannia after 175 AD to guard Hadrian's Wall, carried this mythological heritage to Great Britain.[147]

In the western Siberian forest steppe between the lower Tobol and the Irtysh the **Sargat Culture**, strongly influenced by the Scythians and Sarmatians, spread from the fifth century BC to the fourth century AD, following the late phases of **Irmen** (1450–800 BC) and **Baitovo** (850–500 BC). A notable witness to the late Bronze Age Irmen Culture was the fortified settlement of Čiča on the eastern edge of the Irmen cultural territory between Omsk and Novosibirsk. The settlement boasted a systematic arrangement of rows of over 100 houses with streets lying between them, which required overall planning.[148]

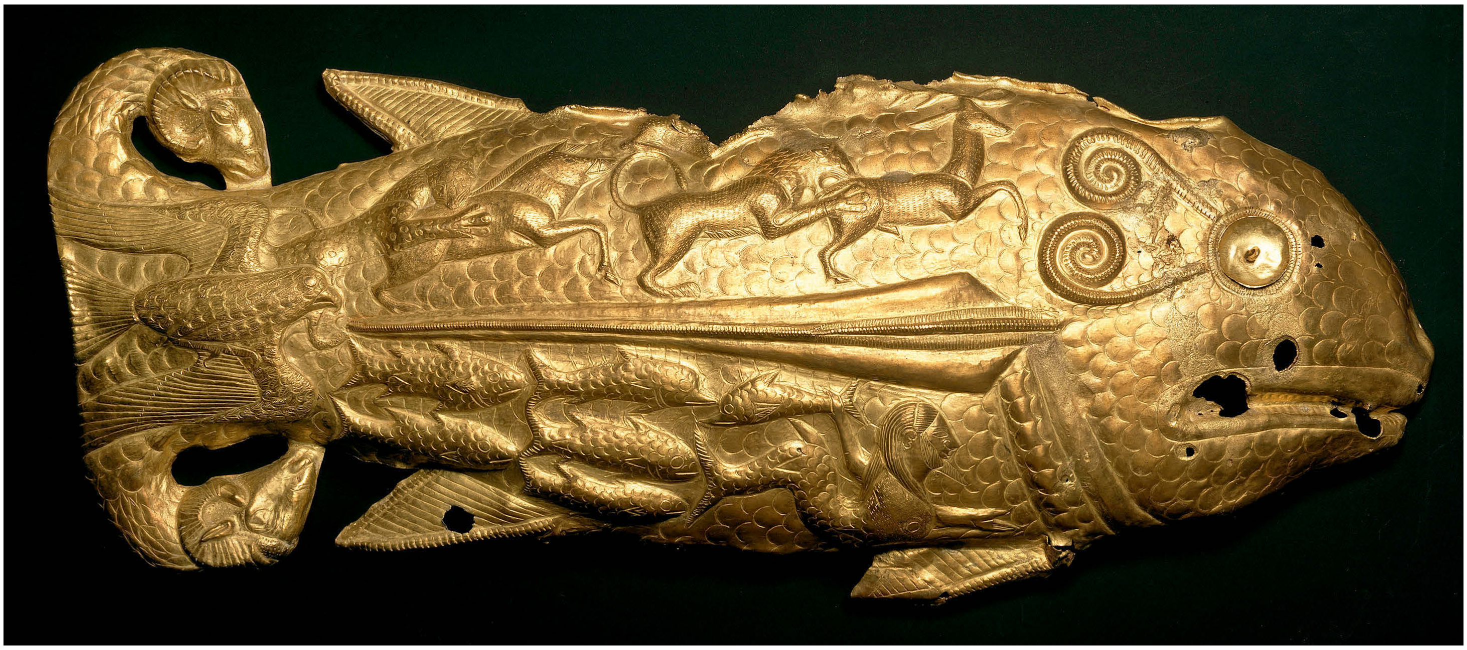
Gold belt buckle with a scene of animal combat: a winged and horned leopard attacks a horse, with the croup of each animal turned 180 degrees, so the hind legs of the defeated horse point upwards and those of the cat are turned away from the head. Siberian collection of Tsar Peter I (unknown provenance), fifth–fourth centuries BC. The State Hermitage Museum, St. Petersburg.

Scythian and Saka tribes had advanced in the direction of the Urals from the eighth century BC and around 500 BC there suddenly appeared, in addition to the small earthen tumuli of the forest steppe inhabitants, enormous kurgans.[149] The Sargat Culture had a mixed population, made up of a settled majority of native forest steppe people, who spoke a Finno-Ugric language, and a nomadic, Iranian-speaking upper class of heavily armed horsemen of Sakan heritage. Beginning in the sixth century BC two factors increased the migration of Saka nomadic horsemen from north-eastern Central Asia to southern Siberia. The first was a renewed drying of the climate, which led to a withering of grazing lands, and the second was pressure arising from the Achaemenid expansion to the north-east.[150]

Most representatives of the Sargat Culture were settled stockbreeders, who also practised hunting and fishing. They lived in mostly unfortified settlements on the banks of rivers and lakes, but also had ringforts. However, the grave goods from the kurgans suggest a heavily armoured horse-riding elite that wore iron scale armour and helmets with neck guards, and carried long iron swords and lances. The bow was no longer the short Scythian recurve bow but rather the superior so-called asymmetrical Hunnic composite bow, 120 cm or longer, which was also used by the Sarmatians.[151] The appearance of such armoured riders, called *kataphraktoi* by the Greeks, confirms the dominant position of the Sarmatians here. Many discoveries of polychrome gold jewellery from western and eastern Central Asia, Chinese mirrors, coins and silk fabrics, Roman coins and artefacts with Aramaic and Choresmian inscriptions attest to active long-distance trade, whose security was protected by the ringforts.[152]

On the western edge of the Sargat Culture the Iron Age culture of **Ananyino** (700–250 BC) flourished in the forest steppes between the Kama and Volga rivers. As a result of increasing pressure from the Sarmatian nomadic horsemen, who had successfully infiltrated and overthrown the neighbouring territory of the Sargat Culture, a high level of militarisation marked the society of Ananyino. This took the form of extensive production of weapons and numerous fortresses and defensive settlements, and led to the term the 'Age of Fortresses'.[153] The stockbreeders, hunters and fishermen adopted certain elements of the Irano–Sarmatian culture, as indicated by by both the burials – the dead were either stripped of their soft tissue or cremated – and the grave



Fish-shaped gold fitting from Vettersfelde, discovered in 1882 by chance in Lusatia 100 km south-east of Berlin. This fitting, likely used to decorate a shield, was part of a hoard deposited *ca.* 500 BC for unknown reasons. Portrayed on the sheet are animal scenes from air, land and water; presumably it had an apotropaic function. Workshops in the Hellenised north-western Pontic region may be assumed as the place of origin. Antiquities Collection, State Museum of Berlin.

goods made of animal bone and decorated in the Scytho–Siberian style. However, depictions of animals of the forest steppe such as bears, elk, wolves and boars replaced the usual steppe animals such as horses, deer and birds of prey.[154]

1.6 Achaemenid invasions in the territory of the Saka: The beginning of a 2,500-year-long conflict between nomadic horse-riding peoples and states of settled societies

While Herodotus maintained that 'the Persians call all Scythians Saka', Pliny the Elder (23–79 AD) stated more precisely that the Persians called only those Scythians who bordered their empire Saka.[155] For ancient historians all Saka belonged to the Scythians but not all Scythians were Saka. Both ethonyms are collective terms for the Iron Age, Iranian-speaking nomadic horsemen of the steppes of Eurasia. In modern scholarship the term Scythian refers to the Pontic group west of the Urals; the term Massagetae, to the nomadic horsemen around the Aral Sea; and the Saka, the remaining groups in eastern Central Asia.[156] Both the etymology and the localisation of individual Saka peoples are debated.

The words 'Scythians' and 'Scoloti' and the name of the first ruler 'Scolaxaïs' may have different roots from the word 'Saka'. The former words probably trace back to the northern Iranian term *skuða*, which means 'archer'.[157] The ethonym 'Saka' and the corresponding Chinese name 'Sai', in contrast, derive either from *skuða* or from the Iranian root *sag*, which means 'deer' in Ossetian, which could indicate that the deer was the totem of the Saka.[158]

Identifying the individual peoples of the Saka, as they are listed in six Achaemenid stone inscriptions, is difficult, as is the correlation with the ethonyms of Herodotus and with his tax register of Persian satrapies.[159] The most informative are the grave inscriptions of Darius I of Naqsh-i Rustam, which were made at the latest in 486 BC, and the so-called Daiva inscription of Xerxes I (r. 486–465 BC) from Persepolis. Both lists of the peoples belonging to the Persians name the *Saka haumavarga* (haoma-worshipping Saka), the *Saka tigraxauda* (pointed cap Saka) and the *Saka tayaiy paradraya* (Saka on the other side of the sea). The Daiva inscription also listed the *Daha*, the Dahae, whereby four Saka peoples were named (see table opposite).

The Achaemenid Empire, which at its height stretched from Egypt and Anatolia in the west as far as Central Asia and Pakistan in the east, arose from the alliance of the Indo–Iranian, originally Central Asian peoples of the Medes and the Persians. Around 672 BC the Medes, who lived in western Iran, managed with the help of bands of Cimmerian warriors to overthrow Assyrian rule. In 655 BC they also conquered the Persian tribes, but they came under the domination of the Scythians from *ca.* 644 BC till 616 BC (or 652 to 624 BC). As Herodotus reported, King Cyaxares II (r. *ca.* 624–584 BC) drove out the Scythians after he had their

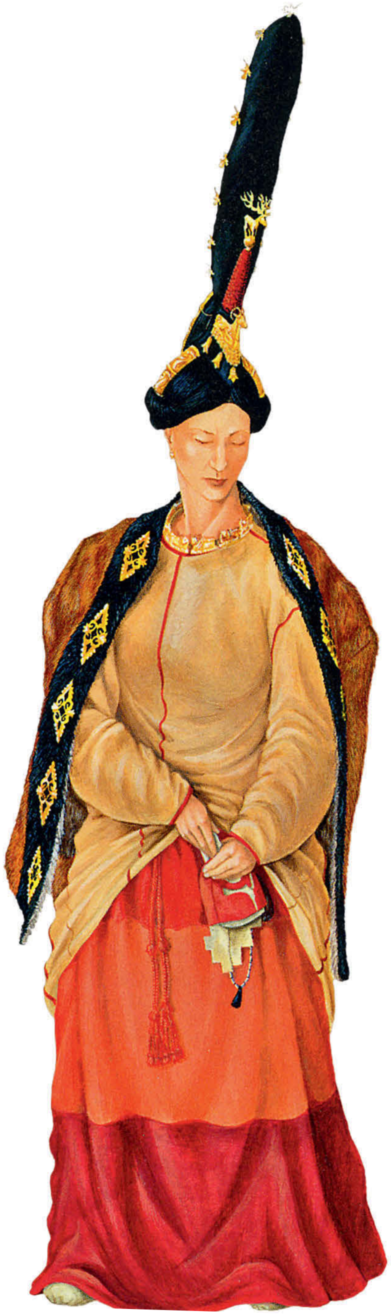


Illustration based on the excavation of the woman with a tall headdress buried in kurgan 1 of Ak-Alacha 3, Russian Altai.

military elite murdered at a banquet,[160] and in 612 BC, with his Babylonian allies and Scythian mercenaries he stormed the Assyrian capital, Nineveh. Afterwards the Medes undertook the first campaigns toward the east against Parthia and Hyrcania, both south-east of the Caspian Sea. In 553 BC, however, the Persian vassal prince Cyrus II (ruled as Achaemenid ruler 550–530/29 BC),[161] who had married a daughter of the Mede king Astygates, rebelled against his father-in-law, defeating him decisively three years later. With the uniting of the Persians and the Medes, Cyrus founded the empire of the Achaemenids.[162] In light of the lack of Achaemenid chronicles the only sources of information on the Achaemenid regime in Central Asia, besides archaeological finds, are the few royal proclamations and the Greek historians, above all Herodotus. However, even Herodotus tended to mention the Persians only when their history involved Greeks or Scythians.

After Cyrus II had conquered Elam, Lydia and its king Croesus, as well as the Ionian cities, he divided his army: 'While Harpagus was turning upside-down the western part of Asia, Cyrus was engaged with the north and east, bringing into subjection every nation without exception.'[163] The details of Cyrus's campaign to consolidate and expand Persian power in eastern Central Asia are unknown. The chronological reference points are the fall of the Lydian capital of Sardis and the Ionian cities in 547–546 BC, as well as the conquest of Babylon in 539 BC by Cyrus himself, so the first Central Asian campaign took place *ca.* 545–540 BC. The most important geographical evidence is provided by the Bisotun inscription, since it lists the 23 lands and peoples that Ahura Mazda bequeathed to Darius I as the legitimate heir of his predecessors Cyrus II and Cambyses I (r. 530/29–522 BC). It remains unclear, however, which regions Cyrus had already defeated and which Darius I conquered later. If one follows the inscription, Cyrus incorporated the following regions from the east into the empire: *Parthava* (Parthia and Hyrcania), *Margush* (Margiana), *Uvarazmish*

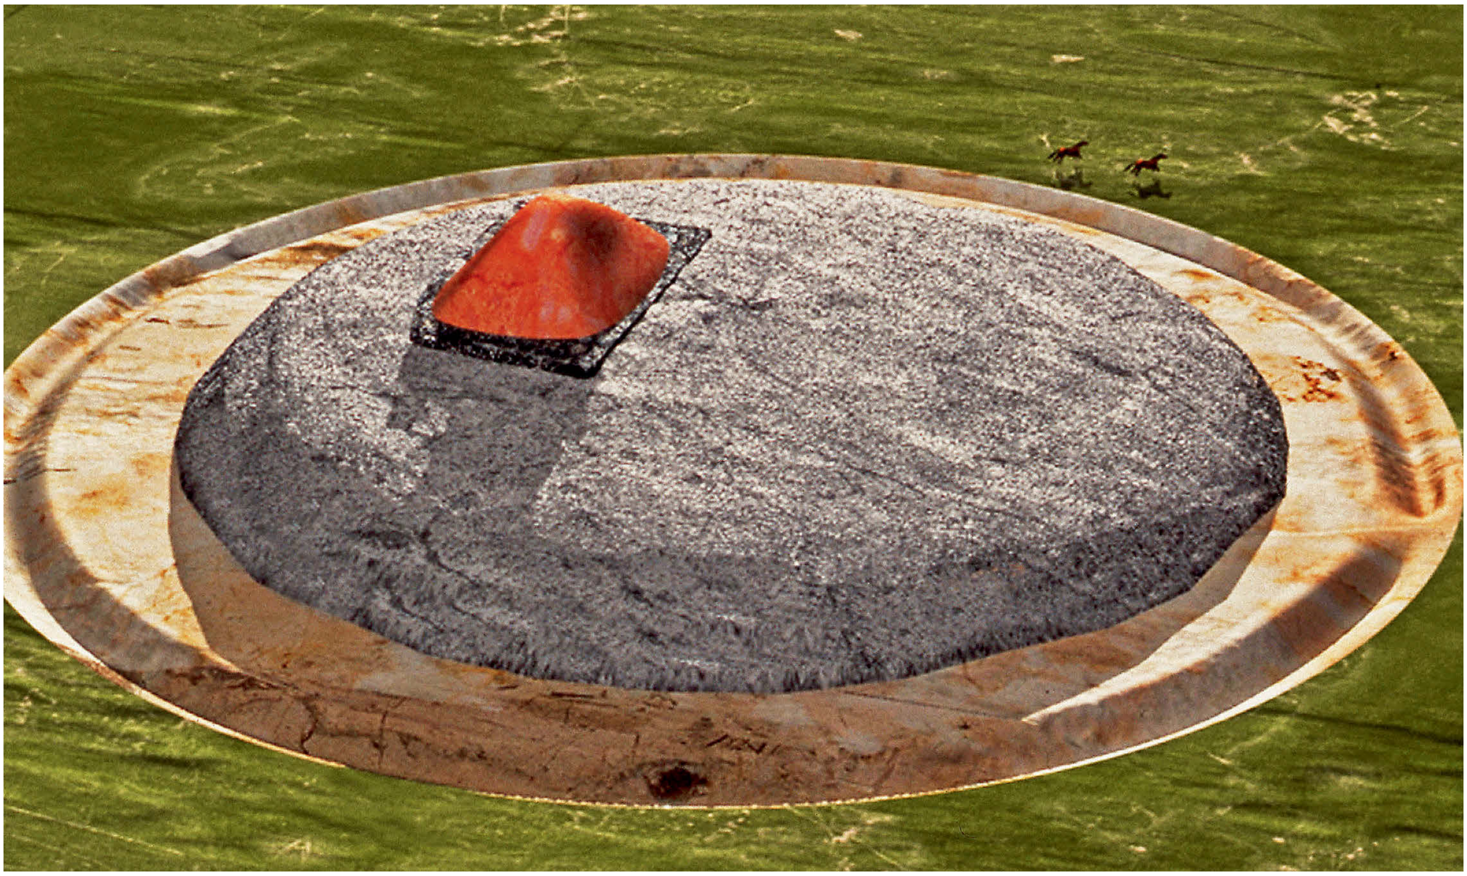
Identification of the Saka peoples mentioned in the Achaemenid inscriptions[164]

	TERRITORY	NOTES
Saka tayaiy paradraya	Pontic region (southern Ukraine)	Identical to Herodotus's Scythians
Saka tigraxauda	East of the Caspian Sea as far as Semirechie (western to south-eastern Kazakhstan including Choresmia)	Herodotus's Massagetae belonged to the *Saka tigraxauda*
Saka haumavarga	Fergana, Alai, Pamirs (Tajikistan, eastern Uzbekistan)	Identical to Herodotus's Amyrgians
Dahae	Syr Darya delta (east of the Aral Sea)	A sub-tribe of the Dahae, the Parni, conquered Parthia *ca.* 239/38 BC and later Iran

(Choresmia), *Saka* (Saka), *Suguda* (Sogdia) and *Baxtrish* (Bactria), where he built a chain of fortresses to defend the border. One of these fortresses was Kyrshkata (Cyropolis) near the modern city of Istaravshan in north-western Tajikistan, which Alexander the Great captured in 329 BC.[165] Whether there existed in Bactria a pre-Achaemenid empire that was connected to a king called Vistaspa, the purported patron of Zarathustra, is debatable. The archaeologists A. Askarov and V. Masson have argued in favour of a pre-Achaemenid Empire; however G. Gnoli, M. Dandamayev and the majority of scholars remain sceptical.[166] The inscription of Bisotun also listed the following south-eastern regions: *Haraiva* (Latin Aria, the province of Herat in western Afghanistan), *Zraka* (Sistan in south-eastern Iran and south-western Afghanistan), *Harauvatish* (Arachosia in the province of Kandahar in southern Afghanistan), *Gadara* (Gandhara in south-eastern Afghanistan and northern Pakistan) and *Tathagush* (Sattagydia, Punjab in central and eastern Pakistan?).[167]

After the conquest of Babylon Cyrus decided to secure the north-eastern border by means of a second Central Asian campaign against the Massagetae, who belonged to the Scythians. Herodotus reported this campaign in detail.[168] As mentioned above, the Massagetae had an armoured cavalry, worshipped the sun and sacrificed horses to it. At that time their king had died and his wife Tomyris served as regent for her son Spargapises. In 530 or 529 BC. Cyrus, with the help of a pontoon bridge, crossed a river called Araxes by Herodotus – presumably the Uzboy – and, on the advice of Croesus, set a trap for the Massagetae. He retreated with his army and left behind abundant baggage, guarded by only a few soldiers. When a third of the Massagetaean army plundered the baggage and became drunk from the wine contained there, Cyrus returned and killed many of his enemies or took them prisoner, among these Tomyris's son. After this Tomyris gave Cyrus an ultimatum: 'Give me back my son and get out of my country with your forces intact, and be content with your triumph over a third part of the Massagetae. If you refuse, I swear by the sun our master to give you more blood than you can drink, for all your gluttony.'[169] But Cyrus had no thought of return and Spargapises took his own life out of shame. In the subsequent battle Cyrus fell and Tomyris made good on her terrible oath by placing his severed head in a wineskin filled with human blood.

Even if details of Herodotus's accounts are mythological, the fact remains that the founder of the Achaemenid Empire, Cyrus, fell in battle with a Scytho–Sakan people. The two Central Asian



Computer reconstruction of the final building phase of cenotaph 1 of Bajkara, northern Kazakhstan, fifth/fourth centuries BC.

As described by Herodotus (IV, 62), the Scythians worshipped their war god in the form of an iron sword, which they placed on an artificially built mound. Shown here as representatives are the three monumental swords of the Vikings at Hafrsfjord, Stavanger, Norway.

campaigns of Cyrus marked the start of a more than millennium-long conflict between nomadic and settled societies of Indo–Iranian peoples who were related to one another. This struggle is reflected in the Avesta and celebrated in the *Shahname* of Firdausi (940–1020 AD). There it is reported that the ancestor of the Iranian peoples, King Fereydun, bequeathed the Arian Empire to his three sons as follows: to the eldest, Salm, intent on security, he gave Asia Minor; to the middle, reckless son, Tur, Central Asian Turan; and to the youngest, the noble Iraj, the homeland of Iran. The two older brothers were so envious that they murdered their younger brother. One of Fereydun's grandsons avenged Iraj and confirmed the dominion of Iran but the rivalry between the settled urban civilisation of Iran and the nomadic Turanians, those 'with the swift horses', continued for centuries. In the end the *Shahname* epic is about a fratricidal war between two related peoples, one of whom lived sedentarily and the other nomadically.[170]

Cyrus II was followed by Cambyses I, who conquered Egypt. He died in 522 BC during the return to Ektabana, today's Hamadan, where a revolution was in progress. In the subsequent chaos a distant relative of Cyrus and Cambyses, named Darius, prevailed and put down one revolt after another. On the Bisotun inscription Darius I (r. 522–486 BC) proclaimed his victory over the usurper Gautama and the nine rebellious 'kings of lies', among them Frada from Margiana and Skunkha, chief of the Saka tigraxauda. While the loyal satrap (civil governor) of Bactria defeated the insurgent Frada at the end of 522 BC, Darius personally led the campaign against the rebellious Saka in 519 BC: 'I marched with my army to the land of Saka [...] who wore pointed caps. [...] I smote part of the Saka exceedingly, and the other part was captured. [...] Their leader, by the name of Skunkha, was taken prisoner and led to me. Then I appointed another leader and the land became mine.'[171]

But as Alexander the Macedonian must also have experienced later, the Saka horsemen did not allow themselves to be easily subdued; again and again they made raids into the Achaemenid Empire. Thus Darius decided in 513/12 BC to attack the Saka from the west and close in on them. As Herodotus reported, the king failed spectacularly in the face of Scythian stalling tactics and a strategy of 'scorched earth.' The Pontic Scythians under King Idanthyrsos denied the attackers an open battle and retreated far into the territory of disloyal tribes. They 'retired in the direction of those nations who had refused to join the alliance, with the idea of involving them in the war against their will, if they would not fight on their own initiative. [...] The wagons which served as houses for the women and children, and all the cattle [...] were ordered to move northward at once, in advance of their future line of retreat.'[172]

Darius crossed the Bosporus at Byzantion and went on to conquer Thrace. He then advanced across the Danube and encountered the land of the Scythians, now empty. The Scythians had filled in their wells, burned their food stores and trampled down their pastures; their army retreated in lockstep with the advancing Persians, at a day's remove. Like the Russians who, more than two millennia later, led Napoleon into empty lands, the Scythians knew how to make optimal use of the barren steppe. They lured the Persians to the Don (Greek Tanaïs) and then turned northwards into the forest steppe of the neighbouring Budini. There stood here the large, fortified city of Gelonos, built entirely of wood, whose inhabitants were a Greek–Budini mix who spoke a Scythian–Greek

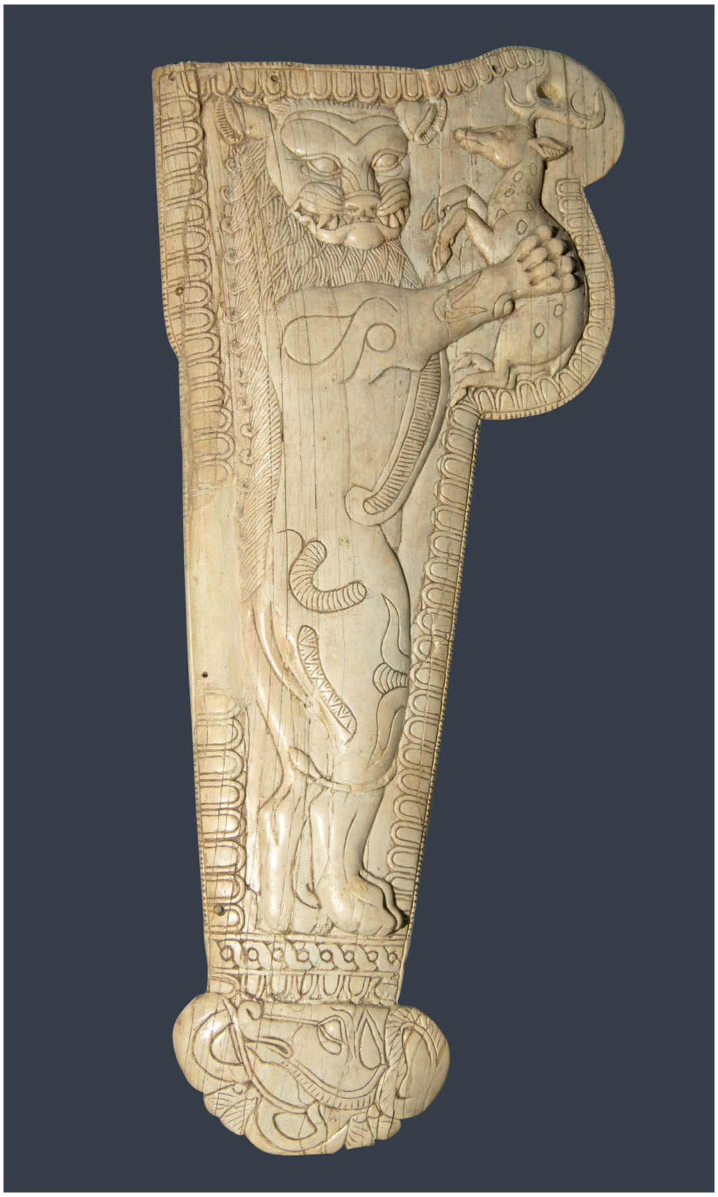
View from the ancient citadel of Cyropolis at the modern city of Istaravshan, north-western Tajikistan. The citadel was founded by the Achaemenid king Cyrus II between 545 and 540 BC; it was destroyed in 329 BC by Alexander the Great and in 1220 by Genghis Khan's troops. Excavations of the citadel confirm an early Achaemenid cultural layer.

language. When the Persians reached 'the wooden fortified town of Gelonos, abandoned and empty of defenders, [they] burnt it'.[173] Gelonos is identified today with the one-time fortified city of Bel'sk on the Vorskla, a tributary of the Dnieper, whose extensive 33-km system of walls surrounded an area of 4,000 ha and linked together three fortresses. Archaeological investigations have revealed that the site, founded in the mid-seventh century BC, was completely burned down at the end of the sixth century BC – that is, at the time of the Persian invasion. Gelonos was one of the most powerful of over 100 ringforts that stood on the waterways and roads of the forest steppe. They served Greek and Scythian traders, as well as local farmers, as places to conduct business and store goods.[174]

Darius was unable to subjugate the aggressive Scythians. On the contrary, they mocked him several times and adopted a guerrilla campaign in which they 'attacked [the Persians] whenever they found them foraging'.[175] Only with great effort were Darius and his exhausted army able to withdraw from the Scythians' lands. They escaped thanks only to a strategic error by the Scythians, who had failed to destroy the Persian pontoon bridge across the Danube.

In 518 BC Darius undertook a series of far-reaching reforms. He divided the empire into 20 satrapies, on which he imposed rigid taxes.[176] Each satrapy had a two-part leadership: a satrap with far-ranging civil functions and a military commander under the direct authority of the king. All central power remained in the hands of the king, however, so the Persian government cannot be compared to medieval feudalism. The most important administrative units of Central Asia were the twelfth satrapy of Bactria and Margiana, the fifteenth satrapy with the Saka and the Caspians, and the huge sixteenth satrapy with Parthia, Choresmia, Sogdia and Aria. For the first time Central Asia was anchored in a political structure that was also active in the direction of Europe.

In order to strengthen the unity of the enormous, multi-ethnic empire, Darius implemented use of the Aramaic language and script as the official language of government, which made Aramaic the lingua franca throughout the empire. Aramaic was not only the first script of Central Asia but also, after Latin, the second most productive script in the world, with 250 derivative systems of writing.[177] Over the course of the subsequent centuries the Aramaic alphabet served the development of writing for widely varied languages of Central Asia. Among these were the Parthian, Choresmian, Sogdian and Bactrian scripts; the last of which was first written with the help of Greek, and then the Manichaean, Nestorian, Uyghur, Mongolian and Manchurian scripts. The Old Turkish rune writing was also derived from the Aramaic alphabet. In addition, Indic languages and Indic-influenced dialects of south-eastern Central Asia, such as Gandhari of the Bamyan type, were put in writing by means of derivatives from Aramaic, out of which developed important scripts such as Brahmi and Kharoshthi.



Ivory fitting on a dagger sheath, on which a lion standing upright holds a small deer in its paws, Oxus Temple Takht-i Sangin, southern Tajikistan, sixth–fifth centuries BC. National Museum of Antiquities of Tajikistan, Dushanbe.

Darius then constructed a network of roads and founded a state postal service that had its own relay stations and was protected by watchtowers in strategic locations. He introduced a unified coinage with standardised coins in gold and silver, which brought coins to Central Asia for the first time. In the Central Asian satrapies, however, silver bars predominated. To encourage trade in his empire, Darius not only built caravan routes but also ordered the seafarer Skylax to open a sea lane that called at the ports along the southern border of the empire. Skylax sailed the Indus and reached the Indian Ocean, whereupon he followed the Iranian coast and then sailed around the Arabian Peninsula until he came to the Red Sea.[178] In order to foster commerce, Darius provided funds for the construction of an irrigation system and the building or expansion of important cities such as Cyropolis, Maracanda (Samarkand) and the neighbouring Kök Tepe, Merv (the site of Erk Kala), Bactra (Balkh, also called Zariaspa),[179] Herat, Kabura (Kabul), Taxila, etc. Finally, Darius created a standing army, which consisted primarily of Persian, Median, Sogdian and Bactrian units. In the event of war the additional bands of horsemen from Bactria, Sogdia and the Saka formed fearsome units and the composite bow of the Central Asian nomadic riders became one of the most important weapons of the entire army.

Darius's greatness lay not only in his military successes – apart from the failed campaign against the Pontic Scythians – but also in his creation of a governmental structure that encompassed the most varied peoples and economies and established both widespread internal peace and relative prosperity for almost two centuries. In comparison, the empire of Alexander, which largely corresponded to the conquered Achaemenid Empire, collapsed a few years after his death and led to the bloody war of the Diadochi. The Achaemenids also set new standards in the area of art. In their monumental architecture they adopted influences from Mesopotamia, Egypt and Greece, and in relief sculpture they perfected Elamite and Assyrian forerunners. Since in Central Asia there were rapidly decaying clay rather than stone buildings, corresponding examples, aside from exceptions such as the Oxus temple Takht-i Sangin, are difficult to retrace. In the area of sculpture, toreutics and painting, by contrast, Achaemenid influences marked the art of Bactria and Sogdia, which reached its zenith in the early Buddhist cave paintings of the northern Tarim Basin and the pre-Islamic murals of Sogdia from the sixth to eighth centuries AD. The Achaemenid Empire enabled easier East–West contact. It also anchored south-eastern Central Asia into the Iranian cultural realm and later the Iranian–Muslim cultural realm. This remained the case until the invasion of the region by tsarist Russia in the second half of the nineteenth century.

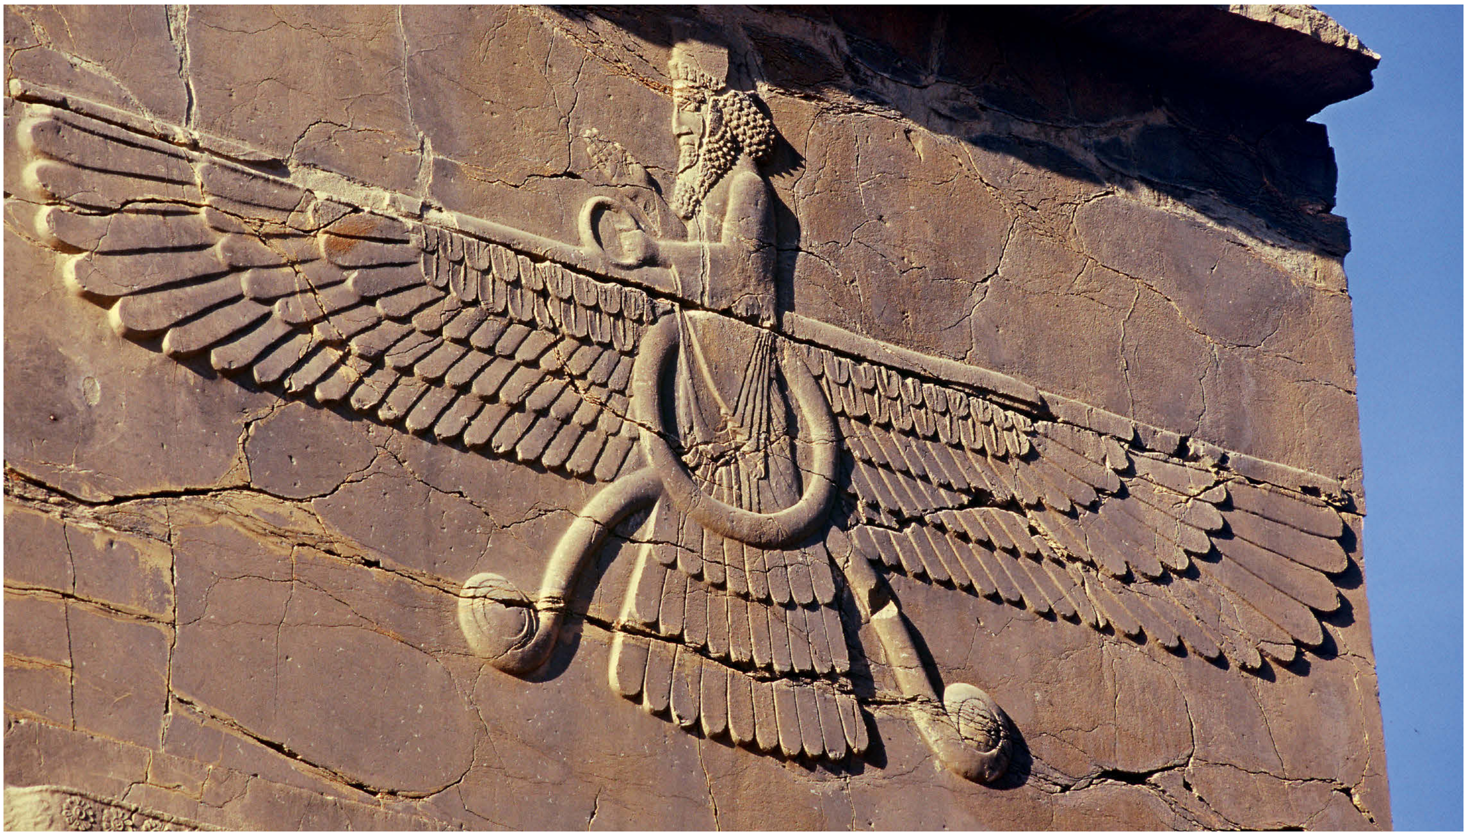
Zoroastrianism and its symbol, Faravahar

In the Bisotun inscription Darius used for the first time the symbol of Zoroastrianism and its spirit, called Faravahar. We know almost nothing about the personal beliefs of Darius; presumably he chose faith in the one true god Ahura Mazda for political reasons, in order to give the multi-ethnic empire a unifying state religion. In this way Darius pursued a tolerant religious policy, since as long as people recognised Ahura Mazda as the highest imperial god, they were free to privately worship their own gods. Darius borrowed a symbol from Neo-Assyrian iconography, which had been influenced by Egypt – namely, the image of a man standing in a winged ring, which in the Neo-Assyrian context symbolised the god of the sun and justice Shamash.[180]

In the Faravahar the human figure represents the connection to the Spirit and the three layers of feathers on each wing, the three ethical principles of 'correct thought', 'correct speech' and 'correct action'. By contrast, the lower part of the Faravahar symbolises the 'incorrect thought', 'incorrect speech' and 'incorrect action' that lead to destruction. The loop that falls forward from the ring stands for the good to which we should orient ourselves, and the loop behind the ring represents the evil on which we should turn our backs. The circle in the centre of the Faravahar symbolises the eternity of the Spirit. Finally, the hand gesturing upwards shows the path to true knowledge, while the ring in the other hand refers to loyalty to Zoroastrian principles.[181]

Zarathustra was a priest of an ancient Aryan religion, but it is not known when he lived and where he came from. Presumably he lived at some time between the twelfth and eighth centuries BC and came from south-eastern Central Asia, more precisely Bactria, where, according to tradition, he is said to have preached and died in Balkh.[182] He was a reformer who elevated Ahura Mazda, the 'wise lord', to the only god, and understood all other, functional deities, to whom were assigned particular phenomena such as rain, wind, sun or war, as abstract aspects of Zarathustra's omnipotence and declared the erstwhile gods, the 'daevas', as false gods. Tribal deities and angels also became superfluous. The principle of light and goodness, Ahura Mazda, symbolised by all-purifying fire, was, however, opposed by the opposite principle of darkness and evil, Ahriman. Ahura Mazda's omnipotence is only temporally limited by Ahriman, but he needs the help of humanity to regain it. Zoroastrian dualism is not absolute but rather of a temporal and ethical nature.

In order to defeat Ahriman, Ahura Mazda created the universe as the battlefield for a titanic 'war of the gods'. Thus the human



Faravahar symbol, eastern door of the tripylon (central building) of Persepolis, fifth century BC.

being, who has free will, must decide within the context of the cosmic struggle whether to support good or evil. The human being, as a microcosmic image of the macrocosmic universe, is both stage and actor in the battle of good against evil. As an aid to orientation, the human being is served by the three fundamental principles of 'correct thought', 'correct speech' and 'correct action'. Zarathustra's teaching demands from believers ethical conduct, coupled with a conscious sense of responsibility, but neither hollow rituals nor animal sacrifices. Zarathustra argued vehemently against senseless animal sacrifice, especially the sacrifice of cattle in honour of Mithra. It would be better to use the cattle to plough the fields than to slaughter them in a wild fury. Thus he represented a religious doctrine that contradicted the traditional beliefs and burial rituals of the Indo–Iranian nomadic horsemen in northern Central Asia such as the Scythians, Saka and Massagetae.

Insofar as all human beings, regardless of their status or birth, could participate in the cosmic struggle of good against evil and thus were fundamentally equal before Ahura Mazda, Zarathustra's teaching was revolutionary and diametrically opposed to the caste system emerging under the Aryans of India. In addition, Zoroastrian anthropology, like its cosmology, is fundamentally optimistic, as it teaches the perfection of creation and the triumph of the good at the end of the eschatological process. But because the living are considered pure and the dead impure, the natural elements of earth, water and fire must not be contaminated by corpses. For this reason all soft tissue and flesh had to be removed by natural means by predatory animals or birds before the bones were placed in an ossuary, a custom that had appeared in Sogdia and Bactria even before Zarathustra. Zoroaster's radical ideas regarding the sole reign of Ahura Mazda did not prevail, however, and Artaxerxes (r. 404–358 BC) officially reintroduced the cult of the god of justice Mithra and the goddess of water, love and war, Anahita.[183] The cult of the intoxicant drink *haoma*, banned by Zarathustra, also soon returned to cultic practice, as did animal sacrifices in honour of Mithra, although to a limited extent.

This heterogeneous character of Zoroastrianism was also reflected in the Avesta, its collection of sacred scripture. The oldest extant fragment of the Avesta contains the prayer *Ashem Vohu* in the Sogdian language from the ninth/tenth centuries AD. It was acquired by the British archaeologist Sir Aurel Stein in 1907 in Dunhuang in north-western China.[184] The oldest complete manuscript comes from the thirteenth century AD, so it is not surprising that the existing Avesta consists of texts from different epochs. The earliest collection of the Avesta, as it had been transmitted orally, may have been commissioned by the Parthian ruler Vologases IV (r. 147–191 AD),[185] and others followed under the Sassanids (224–651 AD). The 17 *gathas* (songs), which are part of the 72-chapter *Yasna* (worship), may have come from Zarathustra himself. The *Yasna* represents only one of the five books of the Avesta, however, which makes it clear how small the part of the text ascribed to Zarathustra actually is. The *Visparad*, which forms a kind of appendix to the Yasna, consists of a collection of 24 prayers. The *Vendidad* (also *Videvdad*), the 'law against the demons', is very heterogeneous and contains both a late creation saga and the archaic myth of Yima, the first ruler of the golden age. In the *Yashts* (songs of praise) 21 gods, nature deities and archangels, banished by Zarathustra from his teachings, reappear, with Mithra prominent among them. The Yashts are associated with the Indian Rig Veda and include much pre-Zoroastrian content. In them it becomes clear how strongly the Zoroastrian doctrine was merged with ancient Iranian ideas. The *Khordeh* (small) *Avesta,* finally, consists of excerpts from the Avesta for the daily use of the laity.[186]

The heterogeneous character of the sacred scripture of Zoroastrianism is unsurprising in view of its long history: no less than 3,000 years passed between the first oral tradition of the Indo–Iranians of the second millennium BC and the oldest extant written text.

1.7 Nomadic and settled cultures between the 'Land of Seven Rivers' and Choresmia

In the 'Land of Seven Rivers' in south-eastern Kazakhstan, called *Semirechie* in Russian and *Zhetysu* in Kazakh, the Saka continued to pursue their nomadic lifestyle, even though the Persian advances as far as the Syr Darya and in Choresmia led to the establishment of urban forms of culture in those places. The grass steppes of the Land of Seven Rivers, named for seven rivers that flow out of the mountains of the Dzungarian Alatau and the north-western Tian Shan, were a preferred territory for the Iron Age nomadic horsemen of the Saka, who left behind thousands of kurgans. One of the most important kurgan necropolises lies on the northern bank of the Ili River about 130 km north-east of Almaty. The cemetery of Besschatyr, which means 'five tents', consists of 31 kurgans, up to 17 m in height, of which 21 are made of stone and the remainder of earth and crushed rock. In individual kurgans an aboveground blockhouse-like wooden chamber was built over the tomb, yet it remained covered by the stone barrow.[187] The largest kurgan, 106 m in diameter, was surrounded by 94 stone megaliths arranged in a spiral. Remains of fire and calcined bones found near the stones indicate animal sacrifices and fire rituals. Unfortunately, the graves, dated to the fifth–third centuries BC, have been plundered.[188]

The necropolis of Issyk, 50 km east of Almaty, which numbers 67 kurgans, comes from the same cultural phase of **Issyk-Besschatyr** (fifth–third centuries BC). A side chamber of one of the large kurgans contained the undisturbed burial of a young, 17- or 18-year-old

On the Bisotun inscription, carved around 516 BC, Darius I announces his victory not only over the Saka rebel Skunkha but also over the rebellious ruler of Margiana named Frada, after which he expanded the important city of Margush (Merv). Here, a fortified gate of Merv in the south-western corner of Gyaur Kala displays three different construction layers: at left Seleucid (3rd century BC), in the centre Parthian (*ca.* 2nd/1st century BC) and on top Sassanian (3rd–4th centuries AD).

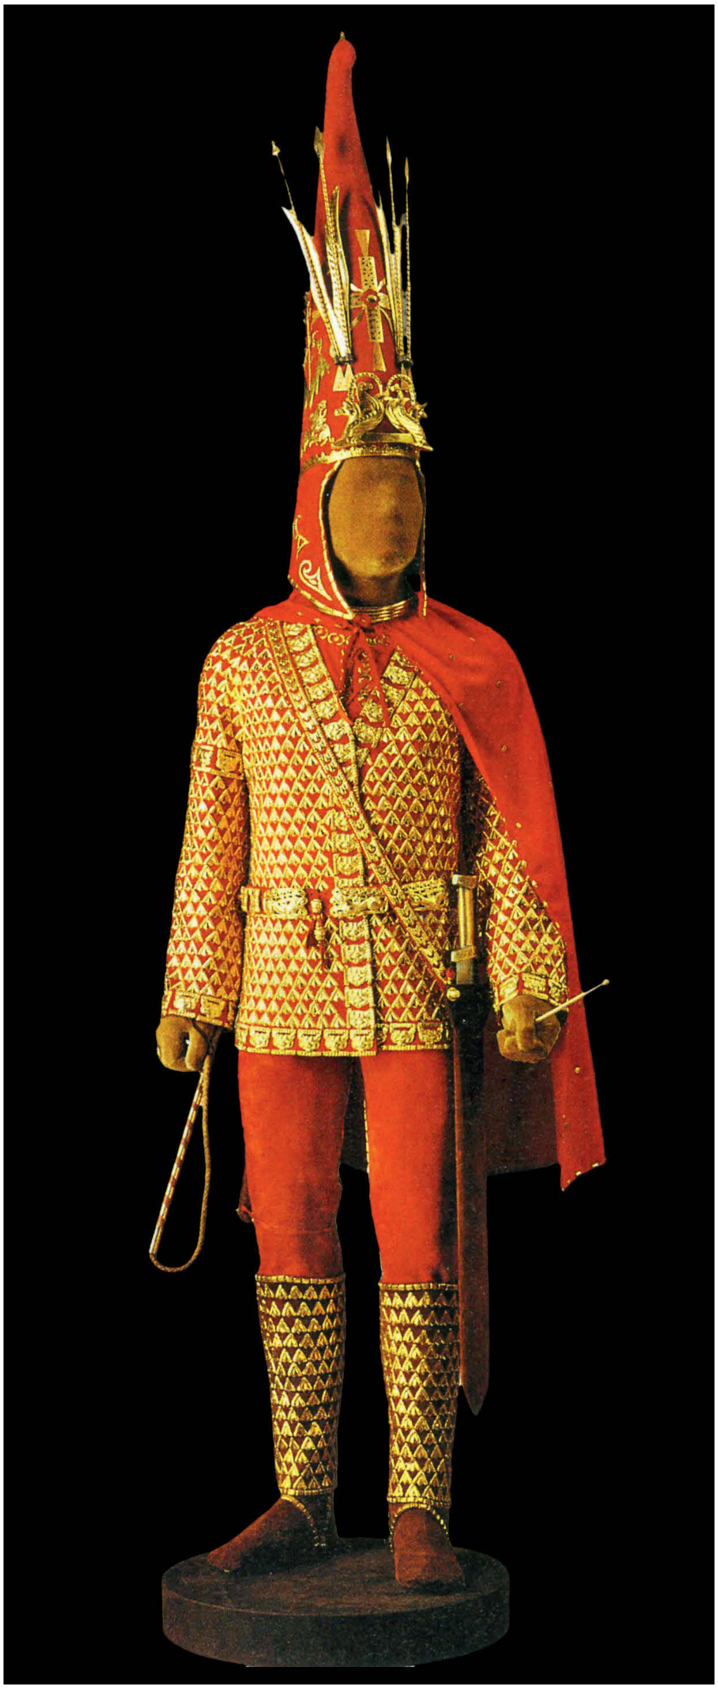
Saka chief in full parade armour from the fifth century BC. This 'Golden Man of Issyk', discovered in 1969, wore a red jacket and red boots, which were decorated with thousands of small gold discs, as well as an iron sword and dagger in sheaths covered in gold leaf. On one of the two finger rings was engraved a male face with a ray-like headdress. Most notable was the pointed headpiece, about 60 cm tall. At the top stood a golden figurine of an ibex, and beneath it were gilded statuettes of horned or winged horses, birds sitting in trees, snow leopards on a background of craggy mountain peaks, ibexes and 30-cm-long gold-covered arrows. The arrangement of trees with the birds in mountain valleys and the predatory cats against jagged peaks lend the composition a realistic, three-dimensional appearance.[189] The young chief wore on his head the most important elements of the mythical universe of the Saka. Just as unique was the discovery of a silver dish with a rune-like inscription in two lines. The oldest known Saka inscription, this has not been deciphered to this day; the symbols show a certain similarity to the Old Turkish inscriptions of Mongolia and southern Siberia, derived from Aramaic but much later. Some 30 inscriptions with comparable symbols have been identified to date.[190] The Saka also built a great necropolis north of Besschatyr in the valley of the Koksu near the Bronze Age petroglyphs of Eshki Olmes.[191] In contrast to the Bronze Age cist graves placed close beside one another, the large kurgans here stood far removed from one another, as though they wanted to take possession of the landscape.[192]

At the necropolises of **Tagisken South** and **Ujgarak**, north-west of Semirechie, a pronounced fire cult characterised the burial rites and shaped the culture.[193] These necropolises were abandoned in the middle of the first millennium BC, when an arm of the Syr Darya river, and with it the settlements and encampments that lay along it, shifted to the west. Here the **Čirikrabat Culture** (500–200 BC) developed.[194] After this shift of the river's course no more Saka memorials appeared in the broad delta of the Syr Darya. Presumably one group of the Saka migrated to another region and another adapted to the Persian-influenced culture of Čirikrabat, as the region around the mouth of the Syr Darya belonged to the fifteenth Achaemenid satrapy. Among the most striking witnesses to the sudden Persian influence are widely placed irrigation systems and fortified smaller urban centres such as Čirikrabat. They display the typical Central Asian city plan, consisting of a strong surrounding wall guarded by towers, the residential quarters called in the Middle Ages *shahristan* and the fortified citadel called *Kala* with its monumental buildings.[195]

A similar development can be seen in Iron Age Choresmia, where a settled population of farmers and traders lived alongside semi-nomadic stockbreeders. Their only remaining traces are the kurgans of the **Kujusaj Culture** (seventh–second centuries BC), an Iranian-speaking culture related to the early Saka.[196] Parallel to this nomadic culture the urban **Old Choresmian Culture** flourished from the seventh/sixth century BC to the first century AD. The archaeologist Sergei Tolstov (1907–1976) explored here from 1938 to 1964. The pioneer Tolstov was, with Sir Aurel Stein (1862–1943), one of the first archaeologists to use aerial reconnaissance to systematically investigate unfamiliar territory. In this manner he discovered dozens of unknown cities and fortresses in Choresmia.[197] The Old Choresmian culture had Achaemenid influences and belonged to the sixteenth satrapy. However, the local political authorities were able as early as 400 BC to liberate themselves from the Achaemenid Empire and found an independent state. Thus in the winter of 329/28 BC the Choresmian king Pharasmanes provided troops and logistical support to Alexander the Great in anticipation of a campaign against his northern enemies, the Massagetae and the Scythians on the Black Sea.[198] Although Alexander concluded the alliance, the campaign did not come to pass.

Presumably there were three decisive reasons why Alexander did not pursue the terms of the alliance: first, he had to secure his south-eastern flank in Bactria and, second, he dreamed of an advance – in Cyrus's footsteps, so to speak – into the Indus Valley. Third, he must have taken seriously the warnings of two delegations of Pontic Scythians in autumn of 329 BC and spring of 328 BC.[199] In 331 BC the Pontic Scythians had completely destroyed the attacking Macedonian army of Alexander's governor, General Zopyrion, at Olbia and had killed him. Zopyrion's failed offensive had presumably been part of a strategic plan that foresaw first the overthrow of the Pontic Scythians and then a union with Alexander's troops in northern Bactria.[200] According to reports

One of the 31 Sakan kurgans of Besschatyr, south-eastern Kazakhstan, fifth–third centuries BC.



Model according to archaeological data of the 'golden man of Issyk', from the fifth century BC. Southern Kazakhstan. Margulan Archaeological Institute of Kazakhstan, Almaty.

by the Roman historian Quintus Curtius Rufus (first century AD) the second Scythian delegation presented Alexander with an outright threat: 'You proudly claim that you have come in pursuit of bandits, but to all the people you have visited *you* are the bandit. [...] We guard both Asia and Europe. We border on Bactria [where Alexander had troubles quelling Bactrian and Sogdian revolts] except that the Tanaïs [here: the Syr Darya] separates us. We inhabit territory beyond the Tanaïs and all the way to [the Macedonian province of] Thrace and they say Macedonia stands next to Thrace. We are neighbours to both your empires. Consider whether you want us to be your enemies or your friends.' Alluding to the routs of Cyrus II and Darius I, the Scythian added boldly, 'Just cross the Tanaïs and you will discover the extent of Scythian territory – but you will never catch the Scythians. [...] When you think we are far away, you will see us inside your camp. We pursue and retreat at equal speed.'[201] The Scythian threat was twofold: if Alexander were to attack, the Scythians would lure him into the emptiness of their steppes and at the same time mount a campaign against his homeland Macedonia. Alexander abandoned the idea of advancing to the north and contented himself with a victorious skirmish against the Saka north-east of Khujand.

The ancient Choresmian culture had been preceded by the **Amirabad Culture** (*ca.* 1400–750 BC). The settlements of the time consisted of both small, sunken 'single-family houses' of a standard size and longhouses 70 m in length. These were divided into small residential units, each with its own hearth. The tradition of the longhouses was further developed in the Old Choresmian Culture into 'settlements within ramparts' as they were placed together in rectangular or circular complexes. These settlements were surrounded by strong walls made of clay bricks and fortified with towers, and in the interior of these walls narrow, vaulted and corridor-like rooms were concealed. The city of Kjuzeligyr, built in the early Old Choresmian **Kjuzeligyr phase** (seventh/sixth–fourth centuries BC) and located 80 km south-west of today's city of Nukuz, had within its defensive walls three parallel residential corridors, and the neighbouring city of Kalaligyr, 7,000 x 1,000 m in extent, had two.[202] Thousands of people lived in such settlements and the unbuilt sections of the cities offered shelter for herds of cattle in the event of war. In the first half of the fourth century BC a building boom began in Choresmia and many fortified cities arose for protection against the raids of nomadic horsemen in the north. Among these were Ajaz Kala and Gyaur Kala north of the Amu Darya, Gyaur Kala near Mizdajkan, Janbas Kala, the large and the small Qirq Qiz Kala, Qurgashin Kala and Zamakhsha.[203] Vadim Masson very aptly described Old Choresmia as 'a small island of urban culture in an endless sea of nomadic tribes'.[204] At the start of the **Kangju phase** (fourth century BC–first century AD) there appeared within the cities fortified citadels with separate palaces for the rulers and fire shrines, such as Toprak Kala. Towards the end of the Kangju phase and in the subsequent Kushan phase (second–third centuries AD) the social unity of the settlements collapsed, as rulers and nobles remained in the well-fortified cities, while merchants and farmers lived in separated fortified villages, such as Kyzyl Kala.[205]

A unique structure of Old Choresmia was the circular, or, more precisely, 18-sided site of Koi Krylgan Kala (fourth century BC–fourth century AD), which had two concentric ring walls, respectively 87 and 44 m in diameter. The outer defensive wall, 7 m thick and reinforced by nine towers, contained nine connected rooms. The inner wall protected the two-storey central structure, originally about 10 m tall and vaulted with clay. The complex served first as a royal gravesite where rituals associated with an ancestor and sun cult, and perhaps also an astral cult, were performed. Near the complex archaeologists discovered numerous ossuaries filled with charred bones. As mentioned above, this circular gravesite recalls both older gravesites of the Central Asian steppe, such as Anchil Chon or Arzhan 1, and the mythical city of Var.[206] Perhaps the cylindrical central structure represents a forerunner of the future Zoroastrian 'towers of silence', *dakhma*. In any case, Choresmia in the Kjuzeligyr phase was familiar with the burial of mortal remains in ossuaries after the corpse was burned or had decayed. A few ceramic ossuaries from Koi Krylgan Kala took the form of a life-size seated man, with the individually crafted heads presumably reproducing the facial features of the deceased.[207] Another ossuary had the shape of a camel, possibly a symbol of the Iranian god of victory Verethraghna.[208] Around the first century BC radially laid out houses filled the space between the two walls and the gravesite became a fortified settlement, surrounded by an intensively cultivated agricultural zone.[209]

1.8 Mountain, steppe and desert stockbreeders between the Pamirs and Altyn Tagh

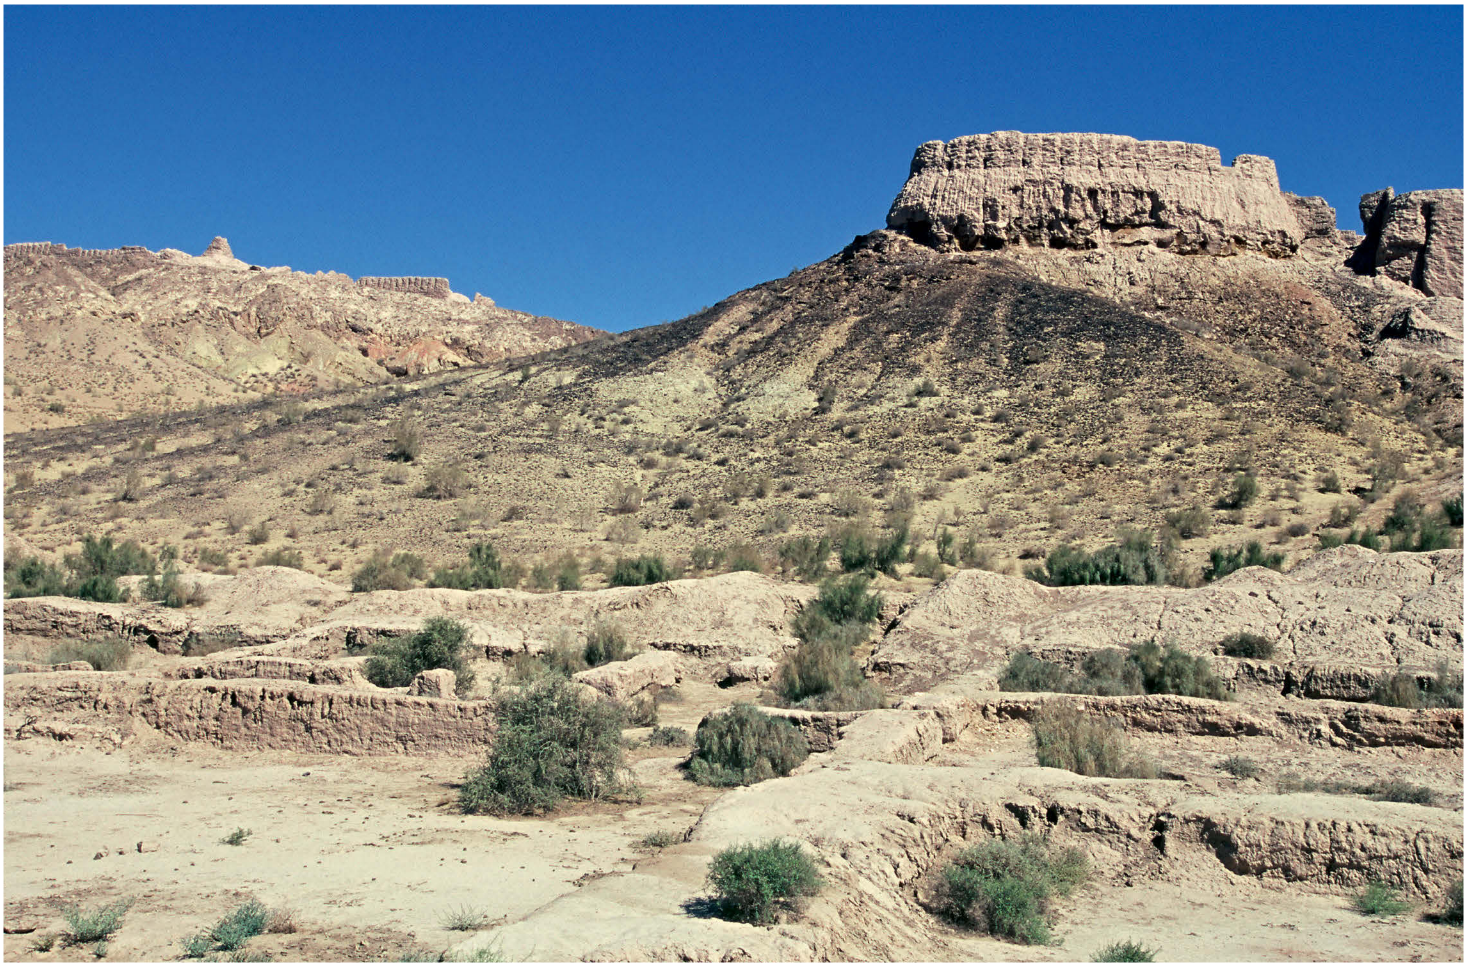
1.8.1 Fergana and the Pamirs

The Fergana valley in south-eastern Uzbekistan and south-western Kyrgyzstan, as well as the eastern Pamir Mountains in eastern Tajikistan, were home to the Saka haumavarga from about the seventh century BC. Although these people are listed in Achaemenid inscriptions as belonging to the Empire, this is highly unlikely. In Fergana the Saka abandoned the oases and city-like settlements of the settled populace and moved into the higher elevations as nomads. They maintained their cult of the dead and their burial rituals, as can be seen in the kurgans.[210] The Saka also settled the valleys and high plateaus of the Pamirs on Fergana's southern border. They left behind hundreds of kurgans at an elevation of up to 4,000 m, such as those in the valleys of Alichur, Aksu, Jalang and Shurali and on the southern banks of Karakul Lake, 4,040 m above sea level. In the last three of these places, the Saka created spectacular geoglyphs beside and between their kurgans.

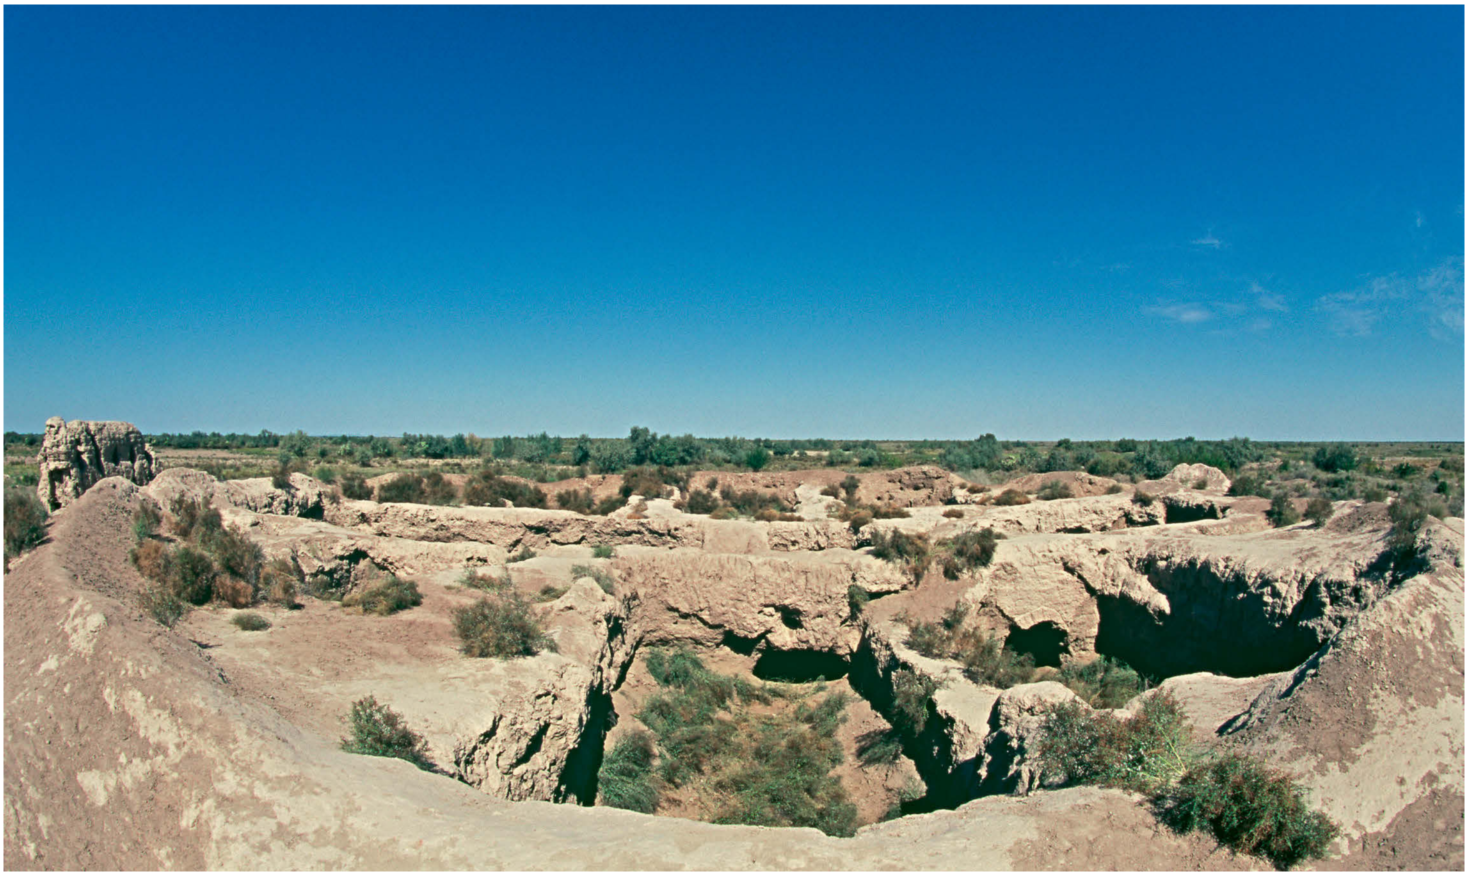
The geoglyphs of the Pamirs are geometric figures on the surface of the earth, which consist of light and dark stones placed over a large area and against a contrasting background. The graveyard of Kara Art on the bank of Karakul Lake, not far from the Chinese border, has 25 kurgans and 19 geoglyphs from the seventh to the second centuries BC, and that of Shurali, seven kurgans and 26 geoglyphs. At both sites nearly all the geoglyphs are oriented toward the south-east; two geoglyphs mark the summer and winter solstices and another the spring and fall equinoxes.[211] Like the kurgans of southern Siberia, the necropolises in the Pamirs were both gravesites and cultic places.

Saka tribes also lived in the eastern foothills of the Pamirs, in what is now the Chinese mountain region of Tashkurgan, as can be seen in the necropolises of the **Xiangbaobao Culture** in Xiangbabei, Xiangbaobao and Mingtiegai from the sixth to the fourth centuries BC.[212] Of the 40 graves of Xiangbabei, 21 were burials of corpses and 19 were cremations.[213] Probably even at that time groups of Saka were advancing farther east into the southern Tarim Basin, where the Sakan oasis culture of Khotan developed later in the second century BC. At that time large groups of Saka fled the attacking Yuezhi to the southern Tarim Basin.[214]

The Saka haumavarga continued the territorial advance begun by their forerunners and, together with tribes of the Saka tigraxauda, attacked Bactria and Margiana around 293–292 BC. They overran garrisons of the Seleucids and plundered several cities, such as Merv, which went up in flames. After that King Seleucus (r. 305–281 BC) sent General Demodamas from Milet to the north-eastern satrapies, who drove out the Saka and advanced to the Jaxartes River (Syr Darya). In view of the threat posed by the restive Saka, Seleukos appointed his son Antiochus, the future Antiochus I (r. 281–261 BC), as viceroy of the eastern satrapies, with the strategically important regions of Margiana and Bactria coming under his rule. Antiochus lived for a time in Bactria, presumably in Bactra, and led the reconstruction of the cities from there. Among these cities were Alexandria Eschate (Khujand), which he renamed Antiochia-in-Scythia, Maracanda (Samarkand) and Merv, which from then on was called Antiochia-in-Margiana. The older, Achaemenid settlement was turned into a citadel and the city now covered an area of 4 km^2.[215] In order to protect the agricultural zones around Merv from plundering nomads, Antiochus surrounded them with a 278-km-long defensive wall.[216] In the mid-third century BC Merv fell to the Greco–Bactrian Kingdom, and, a century later, to the Parthians.[217]



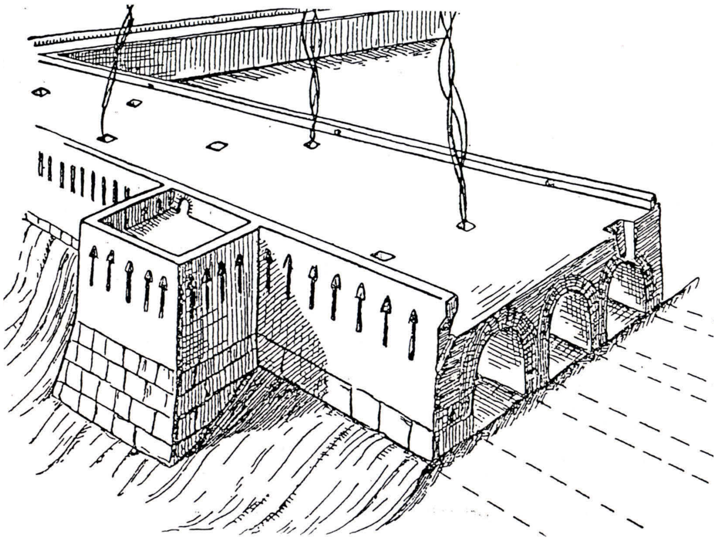
The Choresmian fortress and settlement complex of Ayaz Kala in central Uzbekistan traces back to the late Kjuzeligyr Phase of the Old Choresmian Culture (seventh/sixth–fourth centuries BC). Shown here: in the foreground, ruins of a palace from the fourth century AD; to the rear left, the fortified city of Ayaz Kala I, founded in the fourth century BC; and to the right, the ruler's residence Ayaz Kala II (sixth–eighth centuries AD).



The two-storey Old Choresmian graveyard and later fortified settlement of Koi Krylgan Kala, south-western Uzbekistan, fourth century BC–fourth century AD.

1.8.2 The Chinese Altai and regions north of the Tian Shan Mountains

The area between the mountains of the Altai and the Dzungarian Desert in northern Xinjiang, with its lush pastures, offered ideal living conditions for stockbreeding nomads. Stone engravings on the southern edge of the Altai Mountains attest to their presence from the Bronze Age on. Three types of gravesites from pre-Christian times may be found: large khirigsuurs with deer stones of the second type (900–700 BC), decorated with boars, horses and deer on tiptoe, as well as tomahawks, beside them; simple pit graves, all belonging to the **Dalongku Culture** (*ca*. 800–200 BC). Quite different are the mysterious graves of the **Ke'ermuqi** cultural group (*ca*. second half of the second millennium BC).[218] These consist of one or more cist graves, which are surrounded by a stone enclosure made of upright stone slabs. These enclosures are usually rectangular but occasionally circular. Next to the majority of these graves or grave groups stand anthropomorphic stone steles of heights from 60 to over 150 cm. The steles are almost rectangular or oval in cross-section and from the shoulders the neck moves seamlessly into the broad head. The slightly sculpted, schematically portrayed



Sketch of the defensive walls with three parallel corridors of the Old Choresmian city of Kjuzeligyr, western Uzbekistan. According to Sergei Tolstov *Drevniy Choresm*, 1948, p. 81.

Mt. Shurali Mozkol, standing 5,119 m above sea level, Gorno-Badakhshan, north-eastern Tajikistan.

face is often surrounded by a torus; sometimes the statue wears a neckring and sometimes sculpted triangular patterns mark the cheeks, as at the complex of Kayina'er about 40 km west of the district town Altay.[219]

The burials and especially the stone steles have been assigned widely varying dates, from the late Afanasievo Culture (second half of the third millennium BC) to the Old Turkish period (fifth–eighth centuries AD).[220] Individual characteristics of the steles rule out a dating to the Old Turkish epoch, since they lack the typical Turkish weapons of that time, the pointed moustache and, in particular, the vessel held in the hand of the warrior portrayed. An analysis of the grave goods shows that in several complexes the graves come from different cultures, ranging from the Okunev to the time of the Saka. We date the Ke'ermuqi cultural group provisionally to the late second millennium BC, hence to the late Bronze Age. Finally, the very slender, 26-cm-tall stone figure from grave 21 is notable, since it is very similar to the almost equally slender stone statues of Kan'ergou in the district of Hutubi.[221] Perhaps the creators of the nearby petroglyphs of Quergou belonged to a cultural circle related to Ke'ermuqi.

The kurgans of the **Tiemulike Culture** (sixth–third centuries BC), which lie on the upper valley of the Ili and its tributaries the Künäs He and the Terek He, recall the Saka nomadic horsemen. After the Saka other nomadic peoples such as the Indo–European Wusun and Yuezhi, the Xiongnu, Xianbei, Rouran and Ashina, which made up the leading clans of the Gök Turks ('blue Turks'), used the lush grazing lands. The Ili was rich not only in pastures that could be used almost year-round but also in sources of ore, such as the copper mines of Nileke near the Nulasai Mountains, where ore was smelted right on site.[222] In the early 1980s a 21-kg ball-shaped copper cauldron with three feet was found on the southern bank of the Künäs He in the district of Xinyuan. This

cauldron resembled the kettles of the Land of Seven Rivers. The three-footed cauldron of the Saka should however be distinguished from the cauldron of the Scythians, the so-called Hunnic cauldrons, which stood on a conical foot. The cauldrons not only had a cultic function but also served in daily life as vessels for cooking meat. For the nomads the cooking pot and shared mealtimes were a unifying activity within the extended family or clan. The square bronze table, by contrast, served purely cultic purposes involving burnt offerings. Two bronze neckrings with two winged griffin figurines on the front reveal the close connection to the Russian Altai.[223] The most spectacular discovery from Xinyuan, however, is a bronze statue of a kneeling warrior, wearing a short skirt, who originally held in his hands a sword, lance or banner. His face has Europid features and he wears a helmet with a point bent forward, a so-called 'Phrygian cap', common among the Scythians. This statue, from the fourth–third centuries BC, could portray a Saka tigraxauda, a 'pointed cap Saka', although with his bare upper body and short skirt, the warrior looks more like a Greek than a Saka. Perhaps the artist had been inspired by a Bactrian statue.[224]

In the second half of the first millennium BC the cultural territory of the Saka extended over Semirechie, Kyrgyzstan, the Pamirs and the Chinese watershed of the Ili as far east as the north-eastern foothills of the Tian Shan and perhaps even the Turfan Depression. Archaeological finds indicate that at the time the boundary between Iranian-speaking Saka and Tocharian-speaking Tocharians ran along a line extending from Niya on the southern edge of the Tarim Basin to the Turfan Depression, where the two ethnicities converged. About 100 km south of Urumqi and west of Turfan lies the necropolis of Alwighul (Chin. Alagou) with two types of Iron Age graves. Burials referred to as Alagou I are pebble graves, so called because the walls of the shaft-like graves are covered with pebbles. The grave goods in these multiple-person graves from the sixth/fifth–third centuries BC display a connection to the necropolis of Jiaohe Gou near Turfan, as well as to the

◀ Anthropomorphic stone steles at the grave complex of Kayina'er in the Chinese Altai, Xinjiang, north-western China. The complex belongs to the Ke'ermuqi cultural group from the second half of the second millennium BC.

Three Tajik women in traditional garb in front of the fortress of Tashkurgan, last restored in 1895, Xinjiang, north-western China. In the second half of the first millennium BC Saka lived here, controlling the trade route to the Indus Valley and migrating from here into the eastern Tarim Basin.

cemeteries of Subexi and Yanghai in the south-eastern part of the Turfan Depression. Together these formed the settled **Aidinghou Culture**, which obviously had contacts with the culture of Pazyryk. The slightly later wooden chamber graves of Alagou II (fourth–second centuries BC) were covered with piles of stones, and the skulls of the dead, buried singly or in pairs, were covered with red ochre. The gold jewellery and a bronze table on a square base with a standing pair of winged lions, buried with them, as well as the gold jewellery of Jiaohe Gou, indicate affiliation with the cultural circle of the Saka and the early Wusun of the Künäs valley and Semirechie.[225] Several Europids were buried in the shaft and catacomb graves of Subexi (fifth–third centuries BC); these people presumably belonged to the Tocharians. Among the discoveries was a well-preserved, 121-cm asymmetrical recurve bow, an intact wooden saddle with harness and three women's wool caps, about 50 cm tall, with broad brims and tapered points, which recall the still taller headdresses of Pazyryk.[226]

1.8.3 Oasis cultures south of the Tian Shan Mountains

North of the city of Korla lies the **Charwighul Group** (*ca.* 1000–400 BC) which consists of five necropolises and over 2,000 graves, where stockbreeding, largely sedentary Europids were buried.[227] Horse bits and cheek pieces found in the graves, as well as jewellery decorated in animal style with depictions of coiled animals, show that representatives of this culture were riders who had contact with the Scythian world of southern Siberia. Related to Charwighul is the group of **Qunbake** (800–250 BC) west of Korla. Wooden beams and grass mats were laid over the burial chambers, and these were ritually set on fire before the construction of round or oval kurgans. In isolated cases a wooden house-like construction stood above the grave, similar to the burials of Besschatyr in the Land of Seven Rivers and of Satma Mazar on the lower reaches of the Keriya River. Among the grave goods of the deceased were also the heads of sacrificed horses, camels, sheep, goats and dogs.[228]

At the beginning of the Iron Age the extensive cultural complex of **Zaghunluq-Jumbulakum/Satma Mazar** (tenth–third centuries BC) arose in the southern half of the Tarim Basin. On the southern edge of the Taklamakan Desert near Qiemo lay the necropolis of Zaghunluq, numbering over 1,000 shaft graves, which had its heyday from the tenth to the sixth centuries BC.[229] Unfortunately, even before the start of excavations it had been 90 percent plundered. In one of the undisturbed graves a man and three women were buried. The 2,800-year-old Europid man lay on his back with bent knees, dressed in a burgundy wool robe, shirt and trousers, colourful striped knee socks and knee-high leather boots. He had light brown hair and his face had been painted after death with yellow and red ochre. The painting covered the forehead, temples and upper halves of the cheeks down to the beard like a half-mask; it took the form of rays on each side, like a sun. Two of the female mummies were poorly preserved; the third had spiral-like sun symbols on her cheeks and nose like the man. In an adjacent grave lay an infant wrapped in a crimson woollen cloth, who wore an indigo-coloured blue felt cap and whose eyes were covered with two bluish stones. Of note among the grave goods of this man were a leather saddle, a horse skull, a front hoof and a horsehide.

That he was a rider is also suggested by his trousers – an invention of Central Asian horse-riding peoples – which featured a gusset in the waistband, making it easier to straddle a horse.[230] Representatives of the culture of Zaghunluq were in contact with the steppe peoples of today's Mongolia, eastern Kazakhstan and the Altai, as can be seen in a variety of wooden vessels in which animal figures in the Scytho–Siberian animal style are engraved. Comparable objects in the Tarim Basin are known from Yanghai east of Turfan, Jumbulakum and Satma Mazar in the ancient delta of the Keriya River.[231] Four mummies also lay in another grave. The main person was an older woman, whose left hand was tattooed. She wore short boots made of bearskin and was wrapped in a blue blanket. The excavators interpreted the other corpses, a baby, a

one-year-old boy and a 20-year-old woman with amputated legs and arms, as human sacrifices.[232] Whether the earlier burials of Zaghunluq were those of proto-Tocharians is an open question.

Three hundred and fifty kilometres north-west of Zaghunluq stand the ruins of the city of Jumbulakum (Chin. Yuan Sha) on an ancient delta of the Keriya River. About 4,000 years ago, the Keriya Darya, which originated in the Kun Lun Mountains, flowed northward across the Taklamakan Desert, 670 km as the crow flies, until it reached the Tarim River. It formed a broadly branching, meandering delta about 200 km south of the Tarim. The Bronze Age settlement of Sebier and the necropolis of Ayala Mazar lay on such arms of the river.[233] Towards the end of the second millennium BC climatic changes caused a drop in the river's volume, which led to the disappearance of the Bronze Age settlements. Life shifted to the south, and the 7-ha fortified city of Jumubulakum arose around the sixth century BC about 73 km south-west of Sebier. The name of the settlement, first discovered in 1994, means 'round sand' and refers to the layout, in the shape of an irregular hexagon. The city wall, 995 m long, 4 m high and 5 m thick at the base, had entrance gates on the south and east sides. On the exterior the wall was made up of crude clay bricks, 66 x 40 x 11 cm in size, which corresponded to standard Achaemenid bricks and indicates an influence from the Persian satrapies. On the interior of the wall, by contrast, local construction methods were used, since the wall consists of several layers of irregular clay bricks, which were reinforced horizontally by tamarisk branches and vertically by poplar posts. The many traces of burning on the walls bear witness to troubled times.[234]

The settled inhabitants had a mixed economy. They raised sheep, goats, dogs, cattle and camels and, thanks to artificial irrigation, cultivated millet, barley and wheat. They mastered ironworking, produced both crude ceramic and wooden vessels and engaged in trade with central China, as can be seen in the copper cowry shells which served as a medium of exchange there. They also undertook trade with India, from where they obtained carnelian jewellery and dyes, and with Persian satrapies, which supplied glass beads, as well as with the steppe cultures of the north. In the six small cemeteries that surrounded the city a total of 43 dead rested in timber graves or in narrow buried cist-shaped wooden structures. The style of burial and the grave goods display parallels to both Zaghunluq and the Scythian-era sites of the Altai. Among the grave goods were textiles, copper decorations on pointed caps, and round copper adornments, in the form of coiled animals, used on horse gear.[235] The grave MC, close to the city, in which two men lay head-to-toe, their heads shot through

with several arrows fired at close range, remains mysterious. Was it a blood sacrifice or an execution? Jumbulakum was abandoned around the third or second century BC because of a water shortage.

Anthropological studies of the naturally mummified corpses reveal that they belonged to a dolichocephalous Europid population. Since the dead of Jumbulakum are assigned culturally to the community of the early Saka and Scythians of the Altai, it may be assumed that they were more or less distant relatives of the Saka. These migrants gave up their earlier, nomadic lifestyle in favour of settled stockbreeding and farming, which they adopted from their presumably proto-Tocharian forerunners. In the last quarter of the first millennium BC additional Saka immigrants practised a settled hybrid culture in the oasis of Khotan, as can be seen in the discoveries at the necropolis of Shanpula.[236]

In autumn 2009, 12 km north-east of Jumbulakum, the author discovered the cemetery of Satma Mazar, which offered further evidence of the cultural connection of the Iron Age population of the Keriya Darya to the steppe world of the Saka. While the northern half of the graveyard, which numbered at least 21 burials, had been plundered, the southern half remained undisturbed. Its layout is trapezoidal with two 630-cm long sides and breadths of 460 cm and 320 cm. Walls up to 2 m in height and made of still-standing poplar posts, which were covered on the exterior with a meshwork of tamarisk branches and rough clay plaster, surrounded the southern section.[237] A 110-cm-high and 120-cm-wide entrance stood there, with a gate made of parallel, V-shaped tamarisk meshwork. The structure, unique for this region and reminiscent of the above-ground wooden chambers of Besschatyr in Semirechie, earned it the Uyghur name *Satma Mazar*, meaning 'house grave'.

Here three corpses lay under a mat made of a meshwork of parallel, diagonally arranged, thin tamarisk branches. There were two juvenile females, whose dolichocephalous skulls showed no signs of violence, and a man, over 190 cm tall, lying on his back. Near the heads of the two women lay grey ceramic jugs with wave-shaped, red-white striped decoration and broad, protruding, beak-shaped spouts, resembling the ceramics of Charwighul,[238] as well as nine flat wooden vessels. The man was laid in a dark red wool blanket, fragments of which still surround his leg bones.

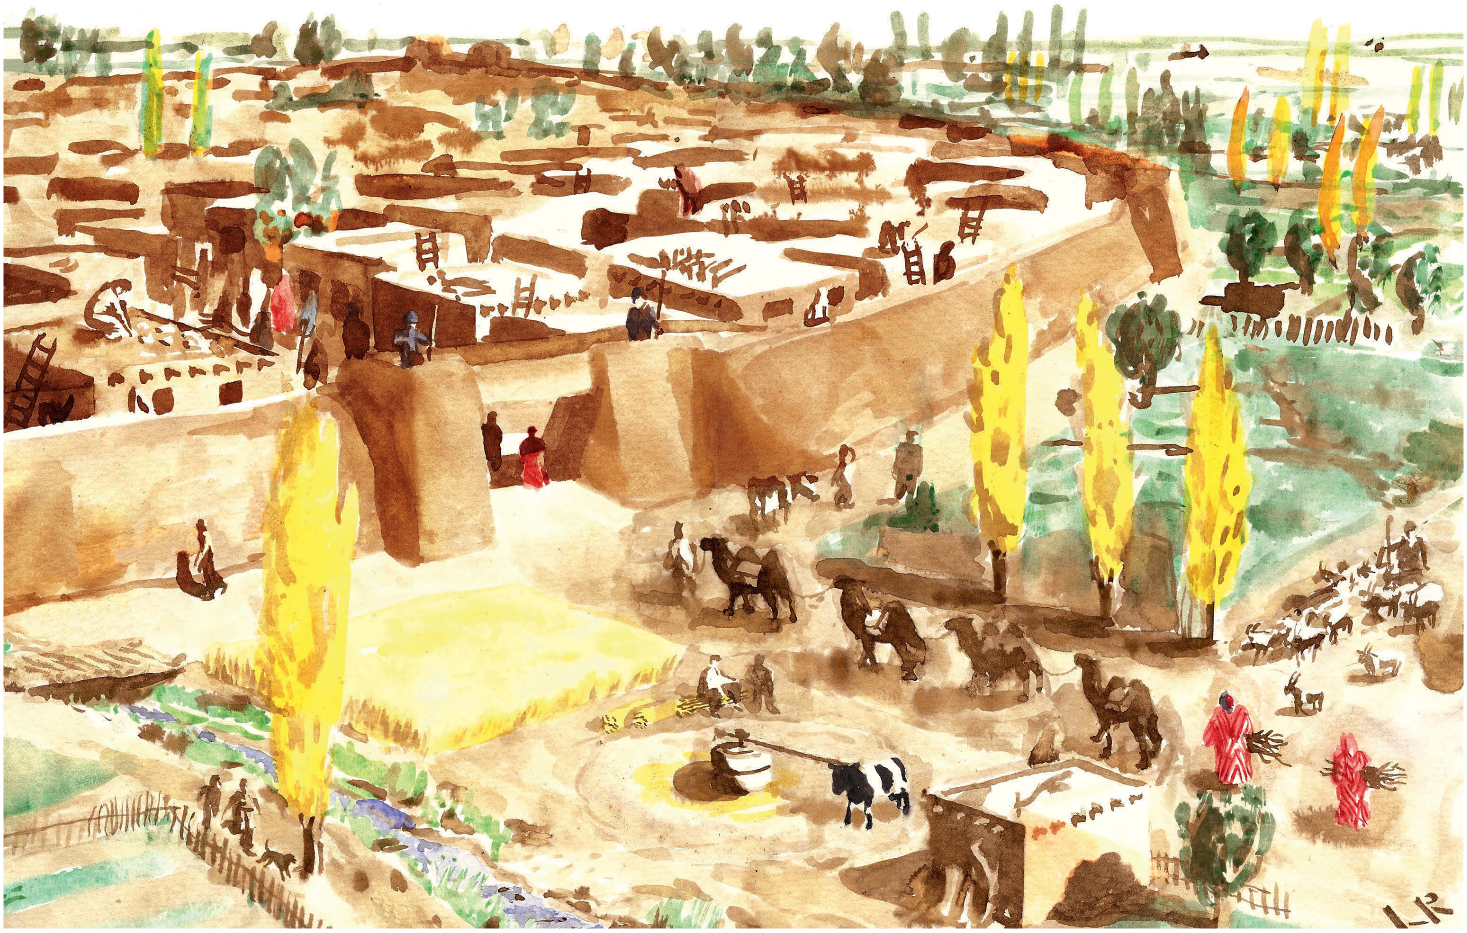

Illustration based on archaeological excavations of the Iron Age city of Jumbulakum (Yuan Sha) on the former middle section of the River Keriya, central Taklamakan Desert, Xinjiang, north-western China.

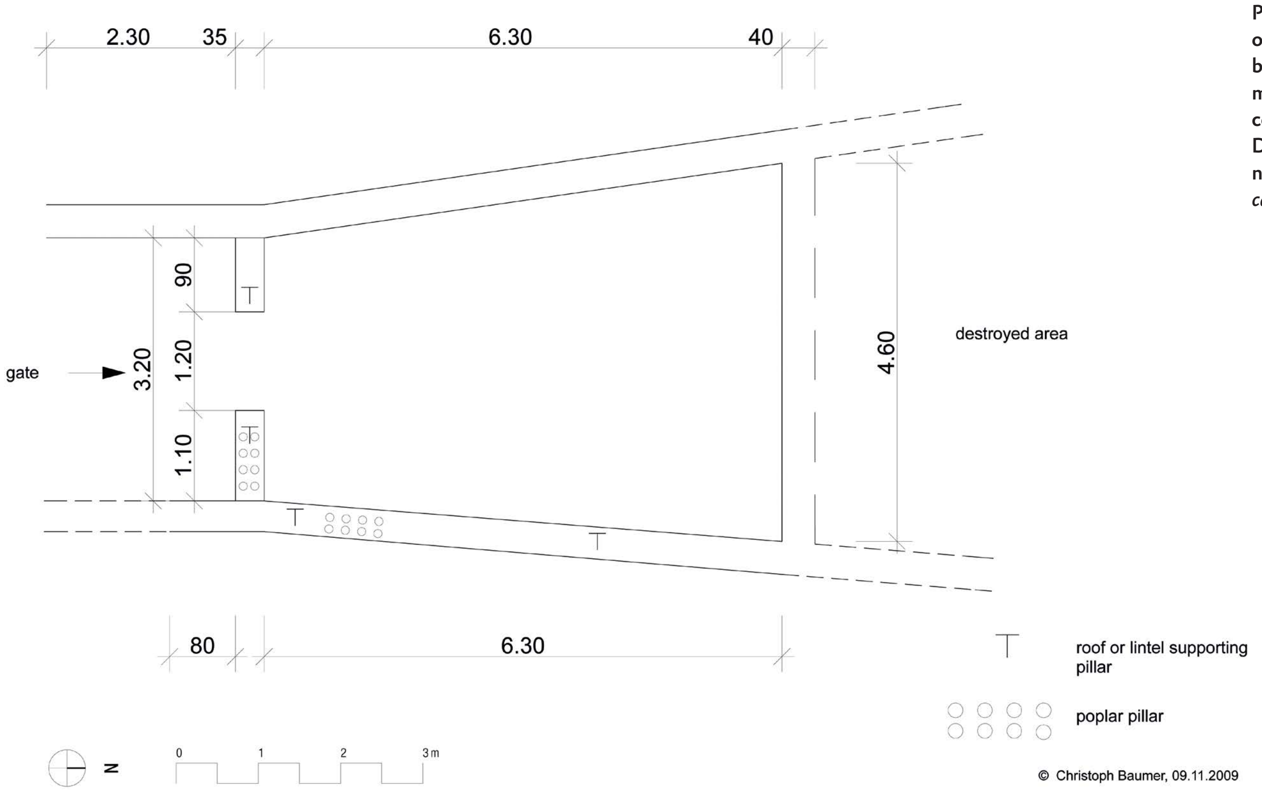
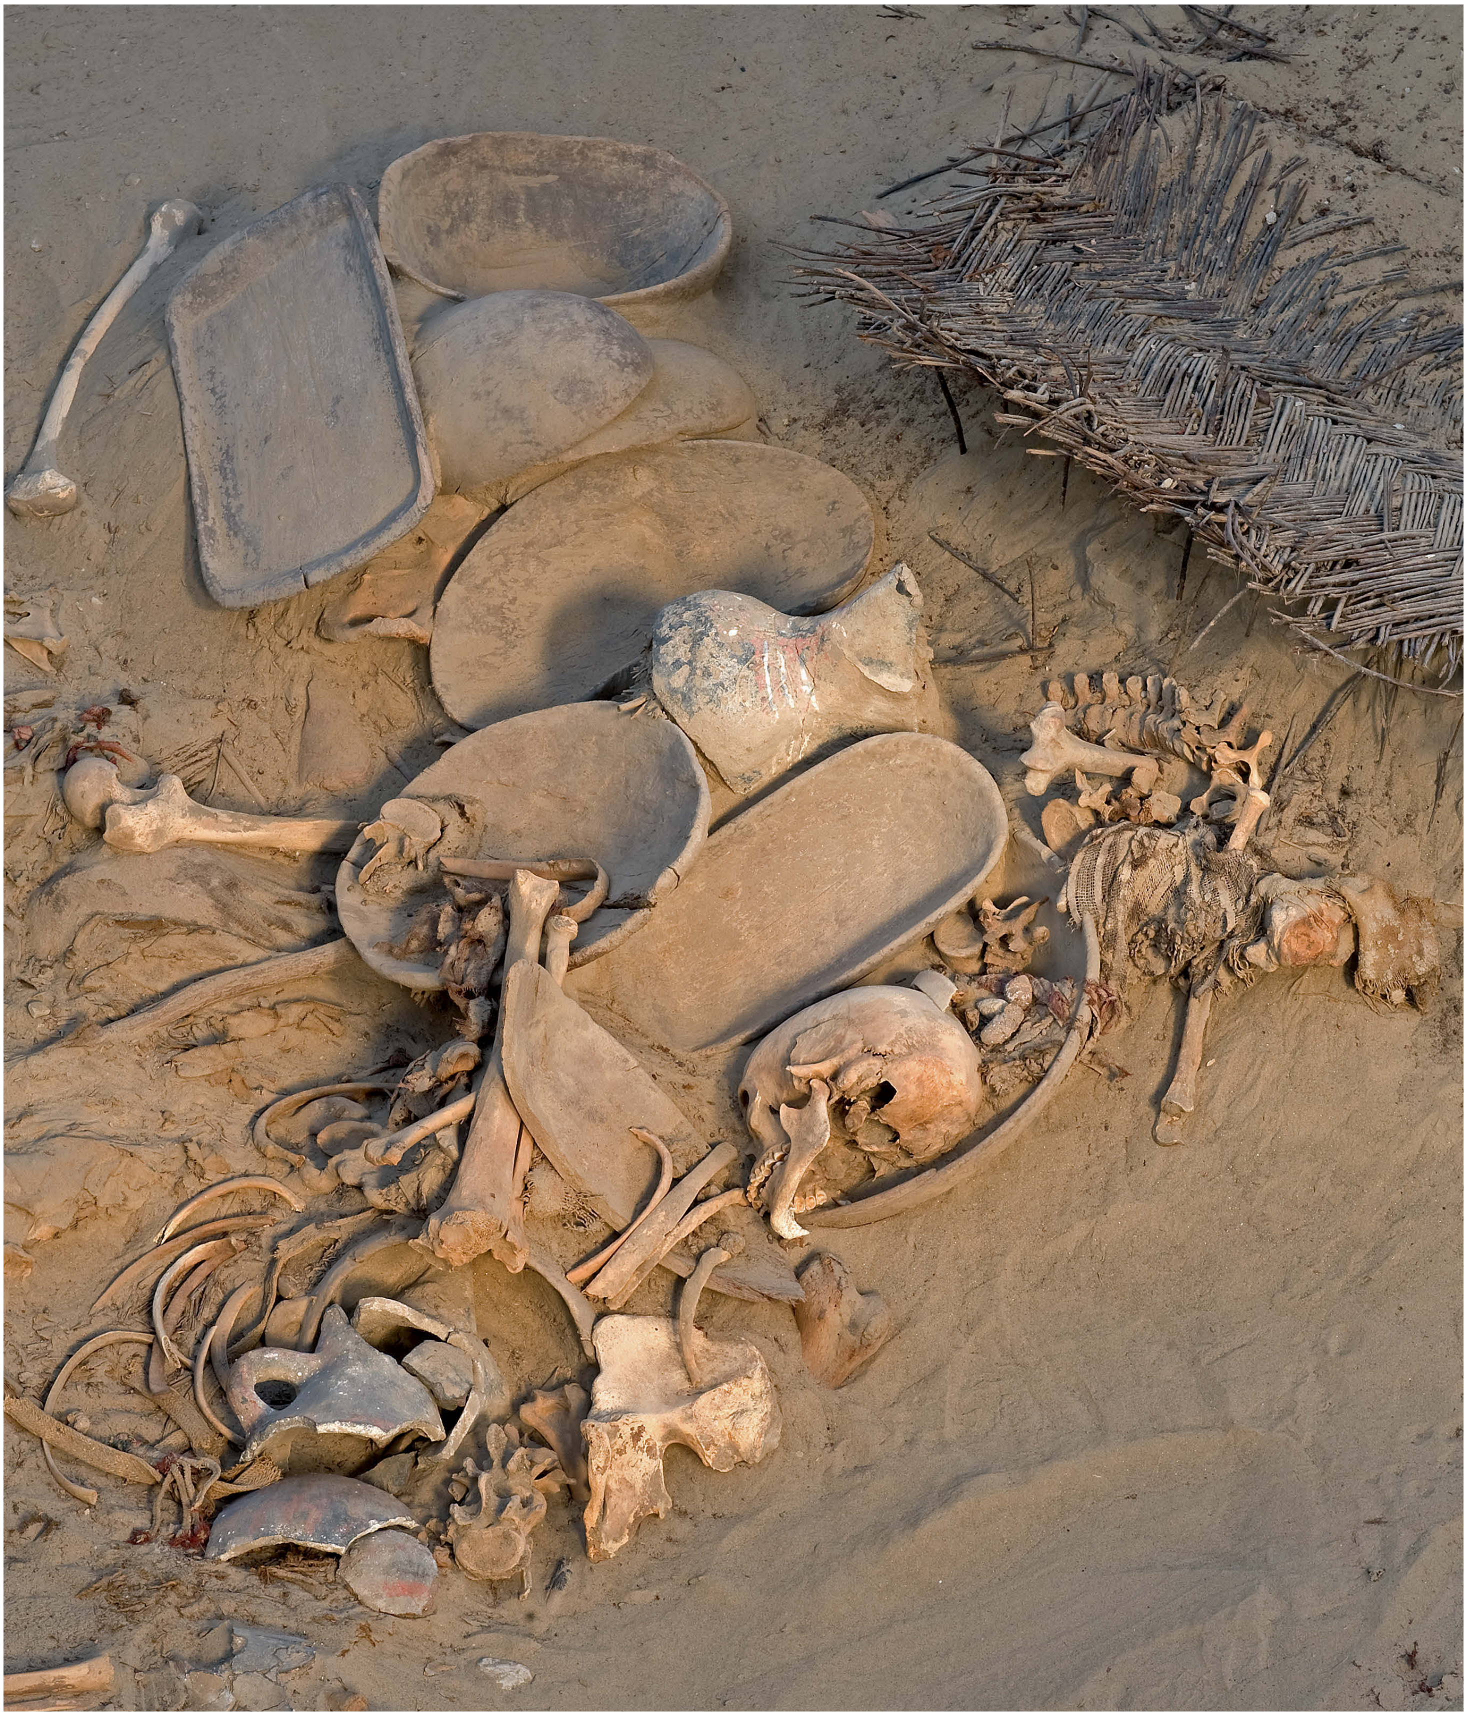
The women were wrapped in brown wool blankets with a striped pattern, which were presumably woven on a flat loom. The lower legs of one woman were covered with a fine, carmine red wool cloth, presumably a skirt. Analysis of an identical piece from Jumbulakum revealed the use of the animal dye of cochineal coccid (Porphyrophora),[239] so it may have been an import. Beside it lay fragments of a long, tricoloured wool weft faced twill tapestry, presumably part of a decorative band on a skirt. The pattern, which resembles a stylised animal, is made up of two rows of alternating colours arranged so that one is blue-red and the opposing row is blue-yellow. Similar pieces of tapestry of the same age were found at kurgan 2 of Pazyryk[240] and slightly later bands from the last quarter of the first millennium BC were discovered in the necropolis of Shanpula.[241] Next to these fragments lay an 18-cm-long strip made up of a variety of animal fibres. One end of the strip is wrapped in blue and red thread, and at the other end the strip is split into five cords trimmed with red and blue tassels. Similar pieces have been found not only in Jumbulakum but also in Ak-Alacha in the Russian Altai.[242]

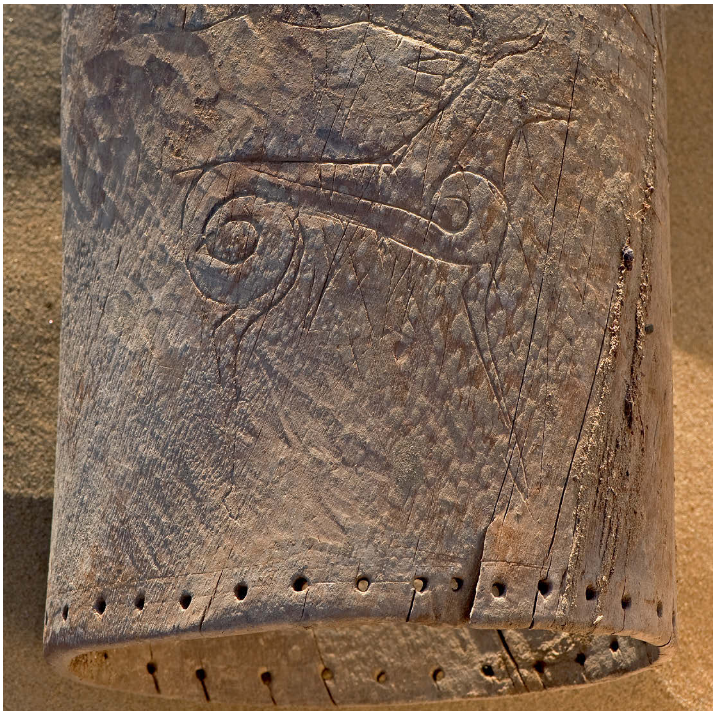
Further evidence of contact with nomadic steppe cultures north of the Tian Shan Mountains is provided by a fragment of a bronze buckle in the form of a small horse head, 3 x 3 cm, and a wooden barrel 50 cm high and 20 cm wide. A deer on tiptoe is engraved on two opposite sides of the barrel. In both animals a volute design forms the transition from the body to the forelegs and back legs. In the Iron Age culture of the steppe, such volute designs on animal figures belonged to the syntax of the animal style, and the tiptoe gait had been common in eastern Scythian art since Arzhan 1.[243] Depictions of animals carved into wooden vessels are also known in Xinjiang from Jumbulakum,[244] Zaghunluq[245] and Yanghai[246] east of Turfan. This dynamic representation of cervids in petroglyphs with volute designs and the tiptoe gait of Scythian steppe art spread even further south, to the Changtang (byang thang) high-altitude steppe plateau in north-western Tibet, especially to the Ruthog county, to neighbouring Ladakh and to the Upper Indus Valley in northern Pakistan.[247] The pieces of plaited hairpieces placed near the corpses at Satma Mazar call to mind similar habits among the Saka of the Altai,[248] a ritual symbolising the mourning for the deceased later also adopted by the Xiongnu.[249] In this context of Scythian steppe cultures the discovery of three 6- to 12-cm-long phallic symbols made of wood and stone was surprising and recalls the fertility cult of the Ayala Mazar-Xiaohe Culture, more than a millennium older. An AMS ^{14}C measurement of human hair sampled from the southern section of the cemetery confirmed a calibrated date between 390 BC and 200 BC at a 95.4% probability.[250]



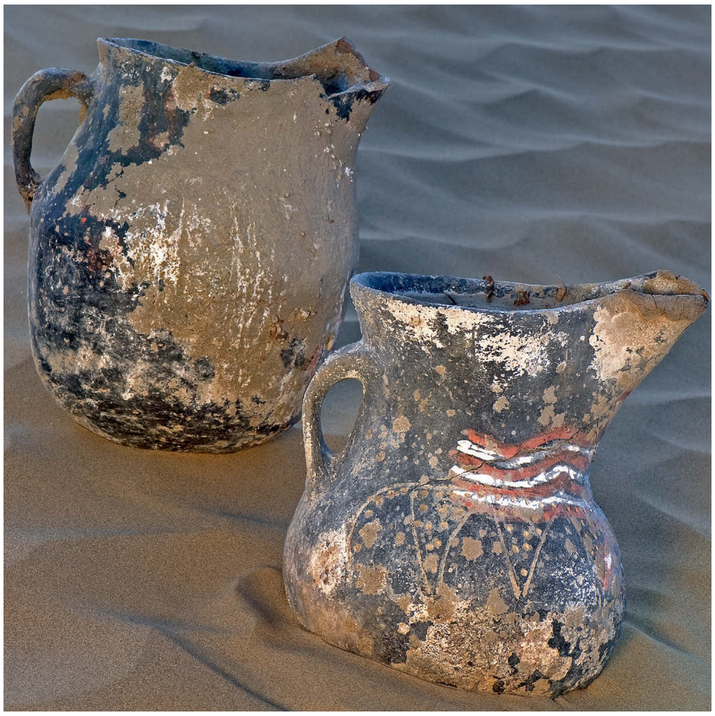
Plan of the necropolis of Satma Mazar, whose boundaries were marked by poplar posts, central Taklamakan Desert, Xinjiang, north-western China, *ca.* 390–200 BC.



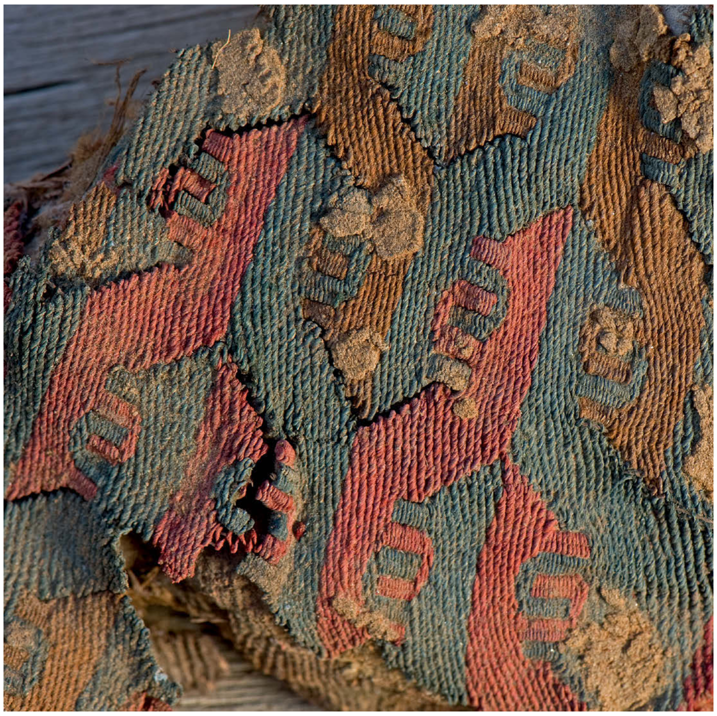
Southern half of Satma Mazar during the excavation; to the upper right, a protective mat made of tamarisk wickerwork divided the lower burial area from the upper; in the centre, flat wooden vessels and a grey ceramic vessel painted with red and white stripes, central Taklamakan Desert, Xinjiang, north-western China, *ca.* 390–200 BC.



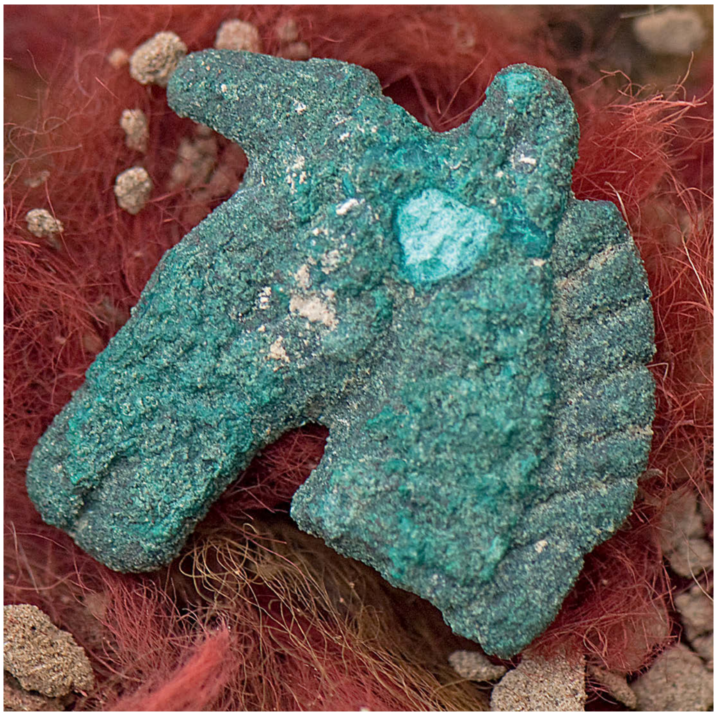
The just under 50-cm-tall wooden tub had a leather or wooden bottom, which was sewn onto the base of the vessel. The deer on tiptoe and the spiral-shaped depiction of thighs and shoulders carved into both sides are formal elements of the Scytho-Siberian animal style. Cemetery of Satma Mazar, central Taklamakan Desert, Xinjiang, north-western China, *ca.* 390–200 BC.



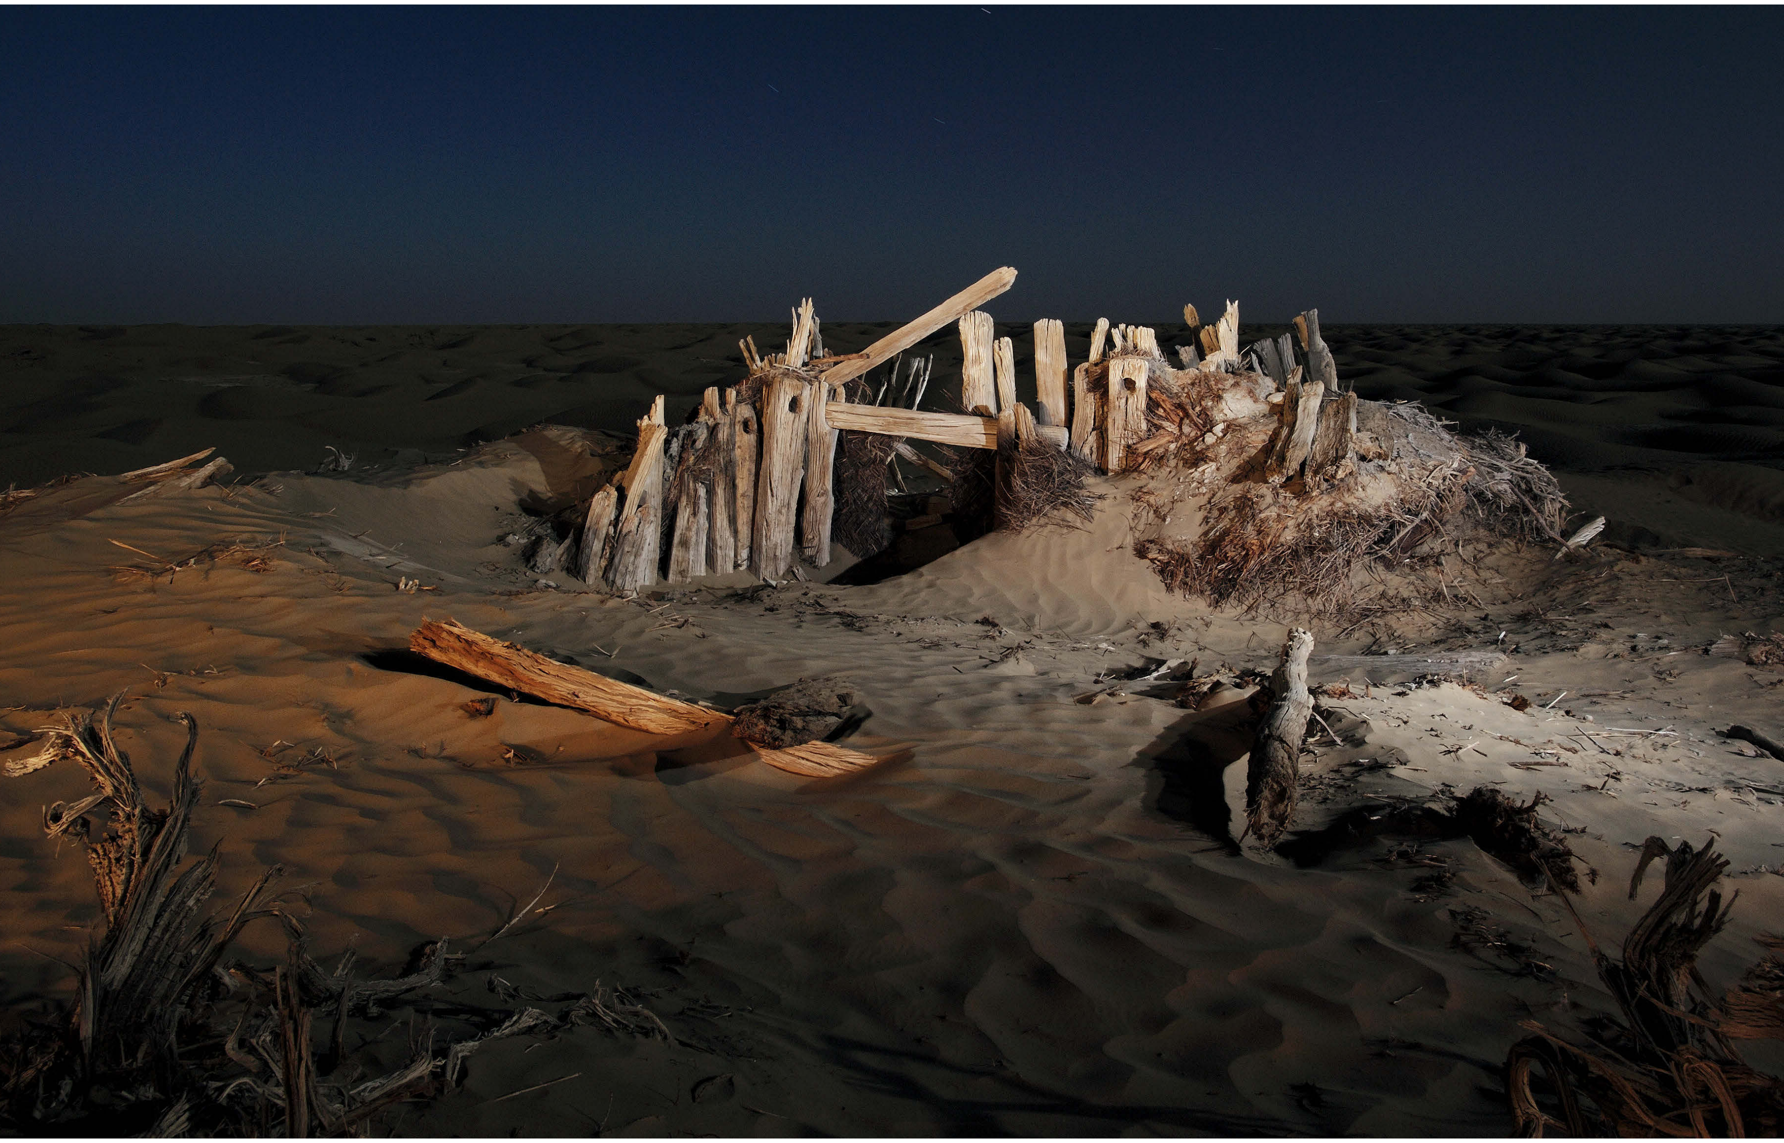
Grey jugs with beak-shaped spout. The jugs are decorated with incised triangles dotted inside with tiny points, and painted at the neck with wave-shaped red and white stripes. Cemetery of Satma Mazar, central Taklamakan Desert, Xinjiang, north-western China, *ca.* 390–200 BC. Similar jugs were found at Jumbulakum and in the northern section of the Charwighul graveyard north of Korla and dating from the Iron Age.



Tricoloured wool weft faced twill tapestry, whose pattern suggests stylised animals; presumably it was part of a decorative band on a skirt. Cemetery of Satma Mazar, central Taklamakan Desert, Xinjiang, north-western China, *ca.* 390–200 BC.



Fragment of a bronze belt buckle in the Scytho-Siberian animal style. House 4 at Gäze near Satma Mazar, central Taklamakan Desert, Xinjiang, north-western China, *ca.* fifth–third centuries BC.



Southern entrance to the Iron Age cemetery of Satma Mazar, central Taklamakan Desert Xinjiang, north-western China, *ca.* 390–200 BC. The wooden structure over the grave is very similar to corresponding grave structures of the Saka at Besschatyr in south-eastern Kazakhstan and suggests cultural connections.

Satma Mazar was used parallel to the heyday of Jumbulakum, perhaps not by inhabitants of that city but by the sprawling village of Gäze, 13 km farther north. This agricultural settlement extended over 13 km along both banks of an approximately 300-m-wide winding riverbed, and most of its 11 identified residential complexes included stables. Stone mills, piles of ceramics and bronze and iron objects lying between the individual complexes indicate that the region was once more densely populated than the ruins suggest.

Another reference to early eastern Scythian culture is found 300 km south of Jumbulakum at a height of 2,850 m above sea level in the northern Kun Lun Mountains. The necropolis of Liushui, discovered in 2002, lies at the confluence of the Keriya and Liushui rivers and contains 52 graves with multiple burials. It was used from the late tenth to the early eighth centuries BC, contemporaneously with the earliest burials of Zaghunluq. A mound of river stones was plac ed over 13 of the grave chambers; the rest of them had stone circles arranged on the ground. Unusual features on the femurs of a few of the skeletons and healed fractures attest to intensive riding. Both the grave types and the discovery of bronze horse-gear, knives and two-winged arrowheads with sockets show connections to the Kamennyi Log Culture on the Yenisei and early Scythian cultural forms. It remains surprising that the earliest burials in the Kun Lun Mountains belonged to a presumably semi-nomadic rider community that had close contact with distant steppe cultures.[251]

2. Nomadic riding peoples on the north-western periphery of Central Asia

> At the sound of horsemen and archers every town takes to flight. [...] 'People of Israel,' declares the LORD, 'I am bringing a distant nation against you – an ancient and enduring nation, a people whose language you do not know, whose speech you do not understand. Their quivers are like an open grave. [...] Look, an army is coming from the land of the north. [...] They are armed with bow and spear; they are cruel and show no mercy. They sound like the roaring sea as they ride on their horses.'
>
> **Prophet Jeremiah** about the attacking, most likely Scythian warrior horsemen[252]

Thanks to Assyrian and Greek sources we are relatively well informed about the early nomadic horsemen of Eastern Europe, even if the various timelines cannot always be reconciled. The history of the pre-Christian cultures of Iranian-speaking riding peoples may be divided into three periods:

I. **Cimmerians and early Scythians:** Toward the end of the eighth century BC the Cimmerians from the north arrived in the Near East. Presumably a drying of the climate of the northern Pontic region, which began in the eleventh/tenth centuries BC, forced the Cimmerians to leave their homeland there, cross the Caucasus and descend upon the Near East.[253] Three or four decades later bands of Scythian riders invaded the Near East, while the Cimmerians advanced into Anatolia. The economic foundation of the nomadic horsemen active in the Near East consisted of war, raids and the imposition of tribute. The 'means of production', or rather of destruction, of the nomadic warrior were his horse and weapons.

II. **Pontic Scythians:** In the first half of the sixth century BC the Scythians of the Near East returned to other Scythian groups in the region of Kuban and began soon thereafter to occupy the northern Pontic steppe. At the same time new waves of Scythian nomadic horsemen advanced from the east into what is now Ukraine. Here they subjected the farming population of the forest steppes and controlled trade with the Bosporan Kingdom and Greece.

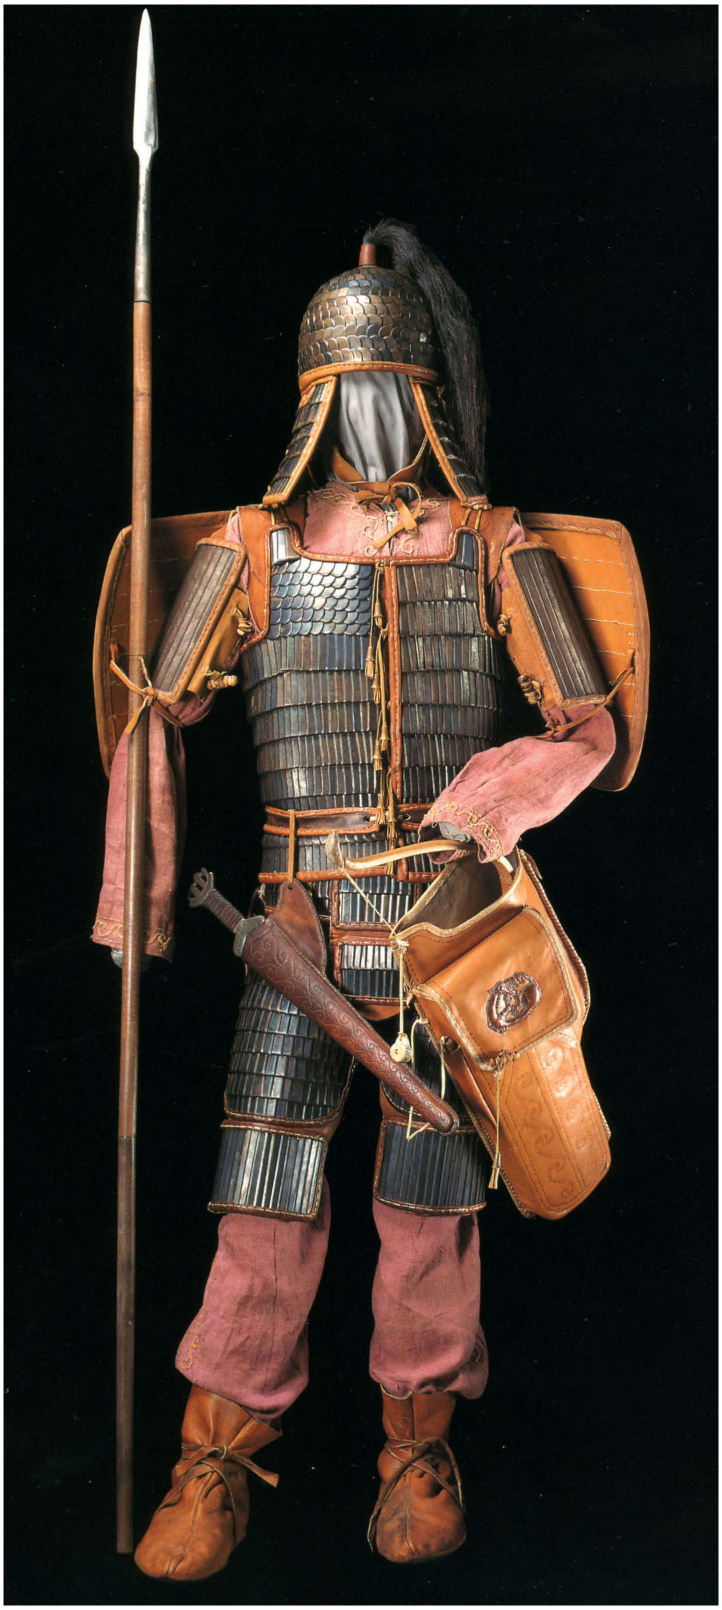
III. **Sarmatians**: While the Sauromatians, presumably ancestors of the Sarmatians, supported the Scythians in the war against the Persian king of kings Darius, towards the beginning of the third century BC Sarmatian tribes began to pressure the Scythians on their eastern border. The advance to the west brought the Sarmatian tribes into a centuries-long conflict with the Bosporan Kingdom and with Rome, during the course of which individual tribes of Sarmatians reached England and North Africa. In this way peoples and cultures originating in Central Asia extended as far as the Atlantic.

2.1 Cimmerians and early Scythians

Akkadian sources from the Neo-Assyrian Empire (911–612 BC) about the archaeologically elusive Cimmerians and early Scythians are especially valuable since they were produced during the time of Assyria's conflicts with the Cimmerians, in contrast to the Greek sources, which were composed at a later time. Additionally, the Akkadian texts were current espionage reports, administrative documents and questions for soothsayers, all of which concerned concrete military problems. The Assyrian texts also consistently distinguish the Cimmerians from the Scythians, although the lifestyle and material culture of the two Iranian-speaking peoples were very similar. The Cimmerians' name in Akkadian was *Gimmirai*, while the Scythians called themselves *Ašguzâi, Iškuzâi*.[254]

The background for the emergence of the Cimmerian people was the climatic fluctuation in the northern Pontic region between the Dnieper and the Volga towards the end of the second millennium BC and the extensive land utilisation of the Srubnaya Culture. The rapidly decreasing productivity of the pastures and fields led to both an out-migration of the population and a transition to nomadic herding. At the same time, the successor culture to Srubnaya, the culture of **Belozerka** (1200–950 BC), came to an end and with it disappeared most of the settlements on the Black Sea steppes. Ukrainian archaeologists propose that around the tenth–ninth centuries BC pre-Scythian, Iranian-speaking nomadic horsemen advanced from Kazakhstan and Siberia into the Pontic steppes, which sped the development of an economy based on nomadic stockbreeding, in which horses played a prominent role. The bimetallic battle pick, common among the Cimmerians, which had its origin in the early Tagar Culture of the Minusinsk Basin, provides one piece of evidence for a hypothetical migration from the east.[255]

The Cimmerians appear in the Assyrian texts for the first time in the year 714 BC, when the Assyrian crown prince Sanherib informed his father, Sargon II (r. 721–705 BC), that the king of Urartu, Rusa I (r. 735–*ca.* 714 BC), whose army was based on war chariots, had attacked the land of the Gimmirai and suffered a devastating defeat. The Cimmerian base Gamir lay in the southern Caucasus, which means that these first nomadic horsemen on the south-western edge of Central Asia must have left their northern Pontic homeland, at least in part, by the last quarter of the eighth century BC at the latest. Since Sargon attacked and destroyed the arch-enemy of Urartu in the same year, coordinated action between the Cimmerians and Assyrians is probable.[256] If there was an alliance against Urartu, it was short-lived, because Sargon fell in a battle 'in the land of the Cimmerians'.[257] After Sargon's death the Cimmerians disappeared from Assyrian texts for a quarter-century and emerged again only around 679 BC, simultaneously with the Scythians, who appear for the first time. According to the 'Annals of Asarhaddon' and the stele of Tell Ahmar, Asarhaddon (r. 680–669 BC) defeated Cimmerians led by King Teušpa in eastern Anatolia in 679/78 BC. A few graves on the upper Euphrates with stone bases and horse sacrifices may be connected to Cimmerian nomads who were active in the area.[258]



Equipment of a Scythian warrior of the fifth–fourth centuries BC, reproduced according to archaeological finds. For defence, the warrior wore, over a linen garment, a scale helmet with cheek and neck guards, armour for breast and thigh, and a rectangular lamellar shield. His offensive weapons were his lance, a bow and an iron sword. This equipment weighed a total of 23 kg. Reconstruction by O.I. Minzhulin.

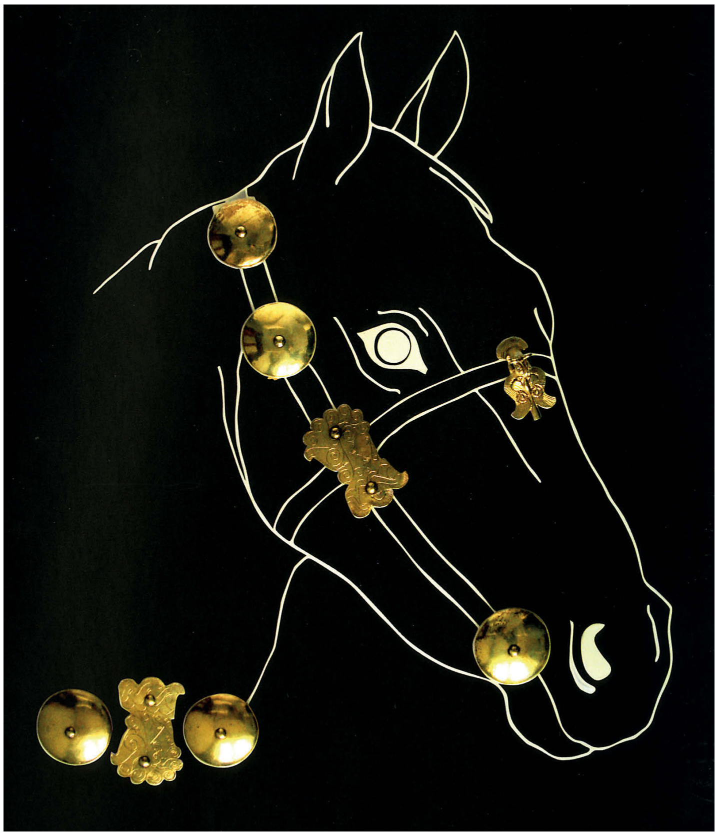
The Cimmerian defeat in no way dampened their desire to attack, however, as the Greek historian Strabo reported that in 676–675 BC the Cimmerians assailed the kingdom of Phrygia in central and western Anatolia, their erstwhile ally against Assyria. When the Phrygian capital of Gordion stood on the brink of collapse, King Midas II is said to have chosen suicide by drinking bull's blood.[259] After their victory the Cimmerians extended their military campaigns farther west and attacked the kingdom of Lydia. Here the sources differ: Herodotus speaks of a single Cimmerian raid against Lydia and its capital, Sardes, at the end of the reign of the Lydian king Ardys II (d. *ca.* 629 BC) around the years 633–629 BC. Strabo, however, mentions two Cimmerian campaigns against Sardes, the first of which took place shortly before 660 BC.[260] Since Strabo's accounts accord more closely with Assyrian reports, these two sources are favoured in this case. Assyrian texts report that the Lydian king Gûgu (Gyges) submitted to the Assyrian king Assurbanipal (r. 669–631/627 BC) around 660 BC and asked him for military aid against the Cimmerians who were destroying his land. Thanks to Assyrian help Gyges was able to expel the Cimmerians and sent two captured Cimmerian leaders to Assyria. In revenge the Cimmerians plundered and occupied the regions of Amurru in Syria and Palestine, which belonged to Assyria.

When Pharaoh Psammetichus I (r. 664–610 BC) threw off the Assyrian yoke after 658 BC, however, Gyges changed fronts and supported the rebellious pharaoh with troops against Assurbanipal.

The pharaoh was able to defend the regained sovereignty of Egypt; Gyges paid for his treachery with death. The Cimmerians attacked Sardes under their king Lygdamis in 652 BC at the latest, conquered the city and killed Gyges. A text of Assurbanipal states: 'When he [Gûgu] sent his troops to support Tušamilki [Psammetichus], who had thrown off the yoke of my rule, I implored Assur and Ishtar, "May his corpse be thrown down before my enemy." [...] And so it came to pass. His corpse was thrown before his enemy and his remains were dragged away. The Gimmirai, which he had subjugated through my name [help], rose up and subdued this whole land. After him his son [Ardys II] assumed the throne.'[261] After this victory the Cimmerian king Lygdamis [Dugdammê], whom the Assyrians called 'spawn of hell',[262] undertook an unsuccessful attack on Ephesus on the Ionian coast, where he had the temple of Artemis set on fire. Then he turned to Cilicia in south-eastern Anatolia, where he was twice subjugated by Assyrian troops and met his death. His son and successor Šandakšatru continued the war without success and from this point on the Cimmerians disappear from Assyrian texts. The Cimmerians who remained in Asia Minor were finally destroyed by the Lydian king Alyattes (r. 619/05–560 BC) with the help of Scythian mercenaries.[263]

One of the few archaeological traces of the Cimmerians may be found in the city of Sardes, where a massive layer of burnt remains may date to the time of King Gyges's death.[264] But no Cimmerian settlements have been found in the Near East, the Caucasus or the northern Pontic region, and it appears that the Cimmerians usually buried their dead rulers and warriors in older kurgans from the Bronze Age. Among the kurgans dating from the pre-Scythian period were those of Vysokaja Mogila (graves 2 and 5: 1000–800 BC) and Steblev 15 (late eighth century BC), dated using ^{14}C analysis.[265] The grave gifts of weapons and horse-gear found in the northern Caucasus and the Ukraine were decorated with geometric patterns of spirals, coving, rhombi, squares and crosses, but not with animal-style motifs. The Cimmerian burial culture continued the practice of erecting rudimentarily anthropomorphic stone steles that were decorated with belts of armour and weapons, but again these show no elements of animal style.[266]

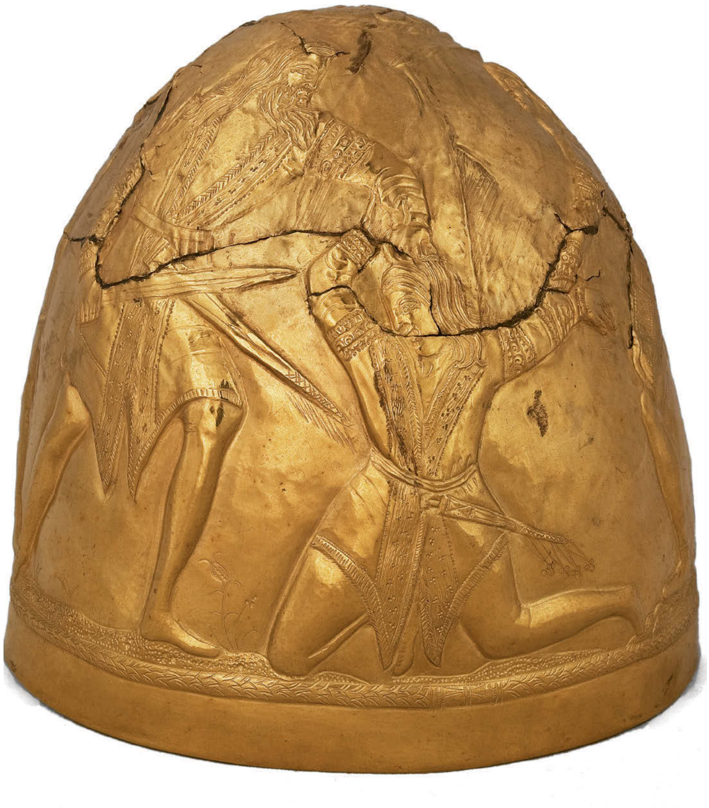
Towards the end of the eighth century BC Europid and Iranian-speaking proto-Scythians from eastern Central Asia crossed the Urals and the Volga and advanced into the northern Caucasus, where they subjugated the remaining Cimmerians and the native Maeotae.[267] A few groups of these nomadic horsemen settled in the Kuban and the northern Caucasus, which they chose as their heartland and the base for their campaigns in the Near East. Other groups of Scythian warriors crossed the Caucasus, referred to by the Greek poet Aeschylus as the 'Scythian road',[268] and, on the trail of the Cimmerians, advanced toward the northern border of Assyria. At first the Scythians, called the Iškuzâi, under the leadership of their king Išpakaia formed an alliance with the Mannaeans. The Mannaeans lived east of Lake Urmia, bordering Assyria, which was also at war with the Cimmerians. The leader of the Assyrians, Asarhaddon, succeeded not only in defeating the Iškuzâi of King Išpakaia but also in establishing an alliance with his successor, Bartatua. It is known from a question Asarhaddon asked an oracle that he considered giving the Scythian king an Assyrian princess as a wife. Whether the Scytho–Assyrian alliance by marriage occurred is unknown, but from then on the Scythians pursued a pro-Assyrian policy and in 673 BC supported Asarhaddon in a war against the Medes. Presumably after this a few Scythians bearing rich spoils of war returned to the Caucasus. Evidence for this is seen in the gold objects made in the Assyrian–Median style from the first royal kurgans of Kelermes (660–640 BC).[269]



Adornment of a horse bridle, Oghuz Kurgan, southern Ukraine, last quarter of the fourth century BC.

This first appearance of the Scythians in the Near East around 679 BC; that is, 35 years after the first Cimmerian attack of 714 BC, does not match up with Herodotus's account of events at the time. He says that the Cimmerians fled their northern Pontic homeland without a fight in advance of the invading Scythians, and that the Cimmerian elite committed mass suicide.[270]

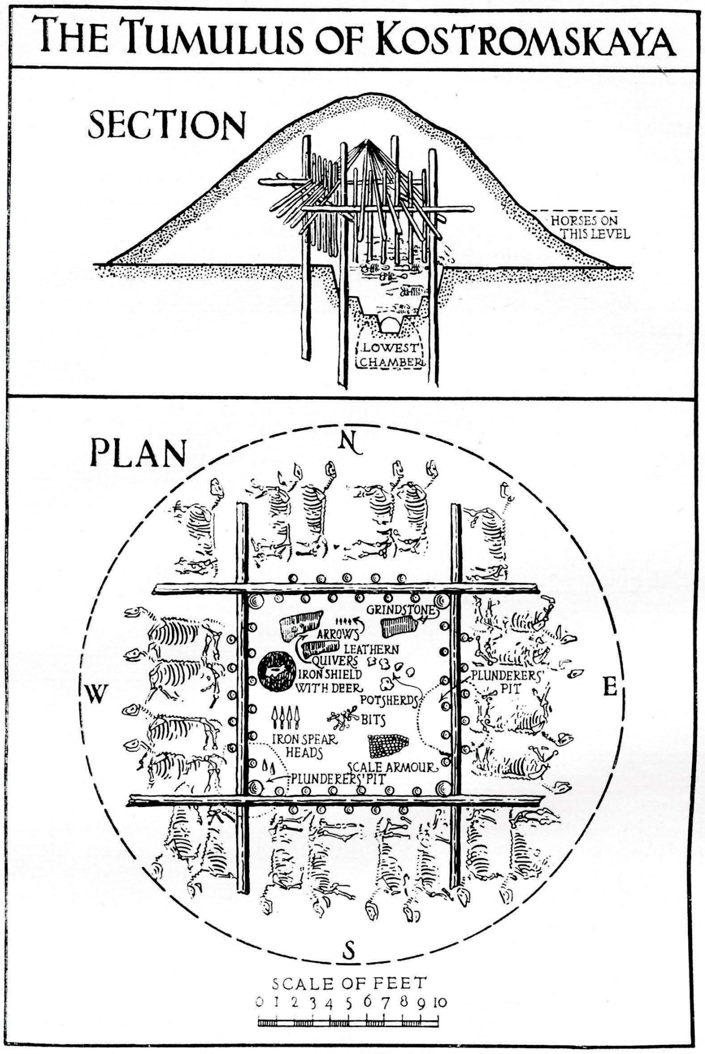
If we believe another account by Herodotus, the Scythian–Assyrian alliance came into effect again at the time of Assurbanipal.[271] Around 644 BC the Medes, who had become independent from Assyria, advanced deep into the Assyrian Empire and besieged its capital, Nineveh. The Median king 'fought a successful battle against the Assyrians, but while he was besieging the town he was attacked by a large Scythian army under the command of King Madyas, son of Protothyes [Bartatua].' Perhaps Madyas was in fact a nephew of Assurbanipal and rushed to aid his embattled uncle, or he took advantage of the invasion to extend his rule over a large part of the Near East. Herodotus continues: 'The Medes were defeated and lost their power in Asia, which was taken over in its entirety by the Scythians. The Scythians next turned their attention to Egypt, but were met in Palestine by Psammetichus, the Egyptian king, who by earnest entreaties supported by bribery managed to prevent their further advance.'[272]



A battle of four young Scythians against two older warriors is portrayed on the 'gold helmet' of Perederijewa Mogila. In the picture, an older warrior has seized the hair of a younger fighter, who has fallen to his knees, in order to finish him off with his sword. Perederijewa Mogila, kurgan 2, Donetsk region, eastern Ukraine, fourth century BC. Ukrainian Museum of Historical Treasures, Kiev.

According to Herodotus Madyas's victory in 644 BC heralded a 28-year rule by the Scythian nomadic riders in the Near East.[273] During their three decades of dominance the Scythian warrior horsemen didn't create a structured empire. Instead, they profited from the collapse of the first Median kingdom, which they subjected to a kind of tribute-granting vassal state, and from their alliance with the still militarily strong Assyrians. The contact with the Assyrians fostered further development of the Scythian military. For one, they adopted the scale armour, which consisted of a leather underlay covered with rows of small iron discs, which provided a fish scale-like outer layer that was both strong and flexible. This innovation was necessary because the introduction of new arrowheads with greater penetrating power required warriors to be better protected. While the Assyrians limited use of the metal discs to armour for the upper body, the Scythians began to fit out weapon belts, thigh coverings, leg pieces and shields using this technology. In a few cases they also protected their horses with breast armour. Somewhat later the scale helmet with protection for the cheeks and neck replaced the heavy, cast bronze helmet. The rectangular, oval or half-moon-shaped lamellar shield, which likewise developed later, was attached to the back and both underarms of the rider. In this way the hands remained free and, by turning his arm and shoulder, the rider could change the position of the shield.

The Scythians also divided their army, following the example of the Medes and Assyrians, into specialised weapon types. While poor Scythians and auxiliaries made up the infantry, the cavalry represented the key formation of the army. This was divided into a light cavalry outfitted with bows, which showered the enemy with a heavy barrage of arrows at the start of a battle, but avoided close combat. After the enemy lines were in disarray, the heavy cavalry followed, consisting of professional warriors. First they assailed the enemy once more with arrows – a practiced archer could shoot up to 12 arrows a minute, and his quiver held 200 to 300 arrows. Then they attacked their opponents with thrown spears and finally engaged in close combat with lances. As soon as the order of the enemy was broken and they began to flee, the light cavalry pursued them in flight. The Scythian cavalry was no wild mob; it maintained its cohesion, so that it could also separate itself from the enemy during a battle, regroup and attack a second enemy unit from another direction. The Scythians began to create the complex system of differently armed, highly mobile and yet very disciplined cavalry units, which first the Avars and then the Mongols would perfect two millennia later. This disciplined behaviour required intensive and ongoing training. The maxim of the Roman historian Flavius Josephus that



Elevation and plan of the kurgan of Kostromskaya, Kuban region, southern Russia, *ca.* 600 BC. The elevation illustrates the tent-like wooden structure erected over the grave; the plan shows the 22 sacrificed horses, laid out symmetrically. According to: M. Rostovtzeff, *Iranians and Greeks in South Russia*, 1922, p. 46.

the drills of Roman soldiers were bloodless battles and their battles were bloody drills also applies to the Scythian cavalry.[274]

Around the year 616 (or 624) BC the Median king Cyaxares II (r. 624–584 BC) succeeded in shaking off the Scythian yoke. According to Herodotus he did this by getting the Scythian elite drunk at a banquet and then murdering them.[275] In this way the Scythian army was deprived of leadership and Assyria lost its allies. Soon thereafter Cyaxares made a pact with Babylonia and attacked Assyria with the help of Scythian mercenaries. The fall of Nineveh in 612 BC dealt the Assyrian Empire a deathblow.[276] Although the Scythian army presumably split into several groups after the murder of its leaders, they continued to cause unrest in the Near East and, according to Herodotus, provoked a war between Media and Lydia. Cyaxares is said to have insulted a group of Scythians, to whom he had entrusted the military education of his sons, when they returned from a hunt without any prey. In revenge the Scythians 'decided to kill one of their young pupils, chop him up, dress the pieces in the ordinary way like meat [and] serve them to Cyaxares as a dish of game. [...] Cyaxares and the guests at his table ate some of the meat'.[277] The Scythians fled to the Lydian king Alyattes (r. 619/05–560 BC), who refused to surrender his guests. The five-year-long Median-Lydian war ended on 28 May 585 BC at the eastern Anatolian river Halys, when a solar eclipse interrupted the battle, whereupon the opponents made peace and deemed the Halys their shared border.

The majority of the Scythians who had remained in the Near East returned to their homeland in the northern Caucasus after 585 BC. In this way the first wave of nomadic horsemen from Central Asia, who had attacked the settled cultures on their south-western edge and spread to them Central Asian forms of culture and economy, came to an end. The Scythian adventure in the Near East finally foundered on the inability of the nomadic horsemen to create their own stable, state-like structure that could also withstand blows to personnel, such as the massacre of their military leaders by Cyaxares, as well as on the lack of political unity among the tribes. In addition, the Scythians encountered in the Medes a militarily equal opponent, with a tradition of nomadic riders and a strong cavalry armed with bows. Like other nomadic horsemen, the Median riders wore close-fitting clothing and carried half-moon-shaped shields, and they preferred to fight with bows and lances. Presumably the Scythians were vastly outnumbered by their Near Eastern enemies.

In the following centuries battle-tested nomadic riding peoples surged on the heels of the Scythians into the settled cultures of western Central Asia. These peoples included the Sarmatians, Alans, Huns, Magyars, Seljuks and other Turkic peoples, as well as the Mongols, who also attacked China. Only the convergence of several factors in Western Europe in the fifteenth century brought an end to the Central Asian expansion and slowly turned the tide. These factors were material inventions such as gunpowder, the development of centrally governed states, economic interests and the search for resources like spices and precious metals. Most important, however, was a new intellectual attitude in the west marked by curiosity and a thirst for scientific knowledge increasingly freed from religious dogma. At the same time, the Central Asian states largely failed to modernise accordingly. This technological and political stagnation culminated in the nineteenth century in the extensive conquest of Central Asia by tsarist Russia.

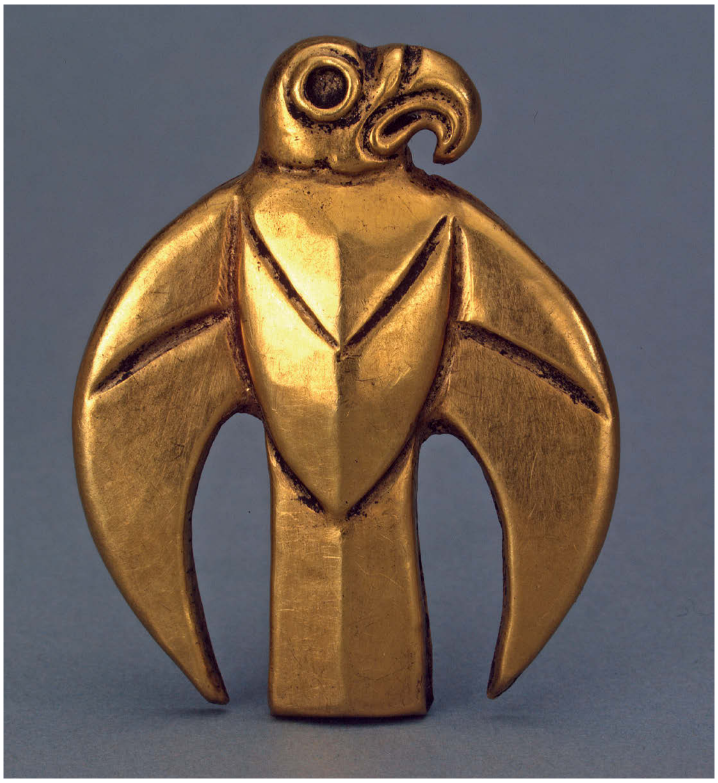
2.2 Scythians in the Kuban region

The Scythian veterans returning from the Near East encountered unexpected resistance. Herodotus's florid report says that the returning Scythians 'found trouble waiting for them hardly less serious than their struggle with the Medes. This was in the shape of a large hostile army, which opposed their entrance; for the Scythian women, wearied with their husbands' protracted absence, had intermarried with the slaves', and their sons now set themselves against the returning soldiers.[278] After a few engagements the veterans resorted to deceit and, armed only with riding crops, ripped into the young warriors, at which point they noticed 'that they are slaves'. The trick worked and the young fighters surrendered. This story was popular among Scythians, as can be seen in the so-called 'golden helmet' of Perederieva Mogila in the Ukrainian Donetsk region. This helmet depicts an older, bearded warrior grabbing the hair of a younger, beardless warrior in order to run him through with his sword. The tradition indicates that the Scythians were not a homogeneous people but rather made up a heterogeneous federation of nomads. Presumably Herodotus's tribe of Royal Scythians, who ruled over the other Scythian tribes, descended from the victorious Near East veterans.

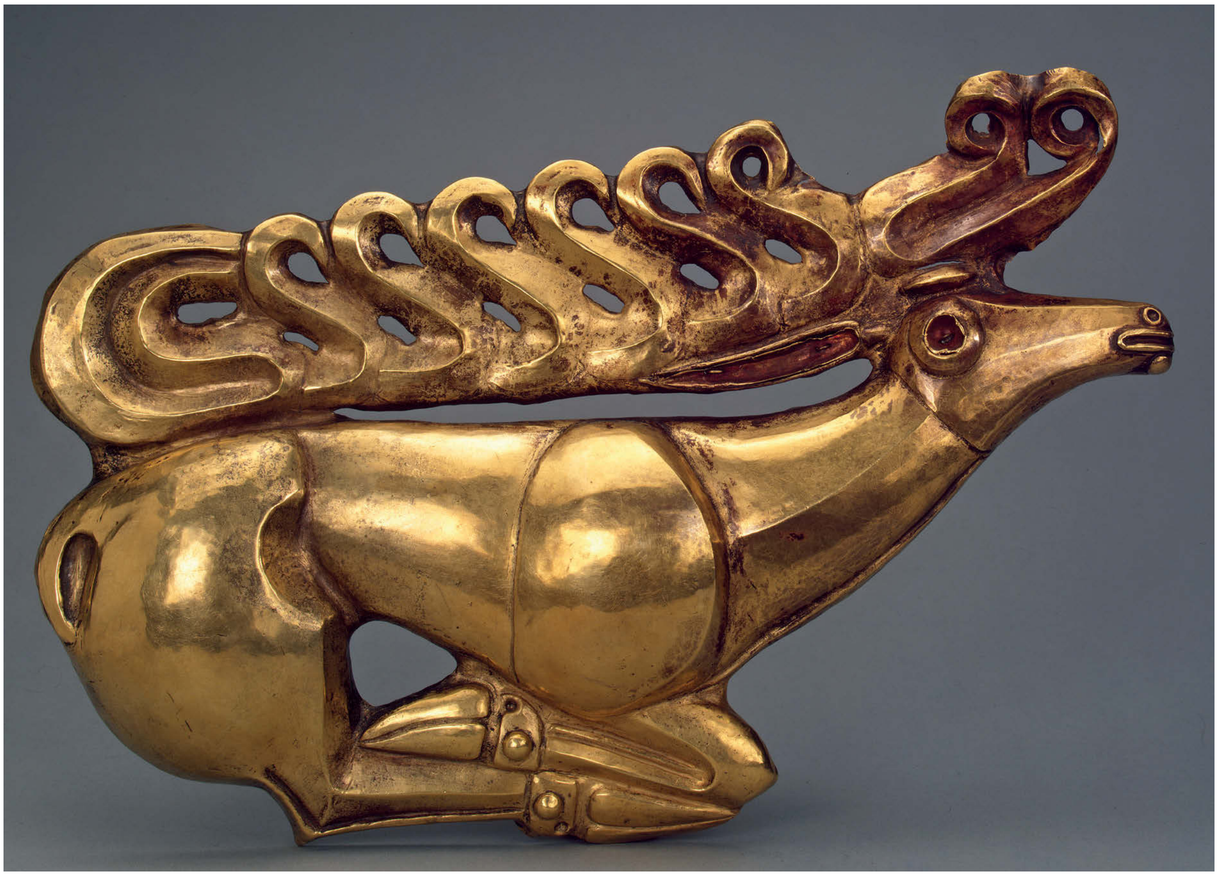
The Scythians left behind few material traces in the Near East, apart from the many finds of Scythian arrowheads and pieces of horse harnesses. The famous golden hoard of Ziwiyeh from the region of the Mannaeans, which displays Assyrian, Urartian and Scythian influences and which has been associated with the grave of a Scythian military commander, is unfortunately mute and scientifically worthless. The objects, purchased by museums from the antiquities market, come from illicit or commercial excavations, so that neither their provenance nor their relationship as a group are documented; furthermore, the authenticity of several objects is doubtful.[279]

The two most significant early Scythian necropolises in Kuban, Kostromskaya and Kelermes do, however, show obvious influences from the Near East. At Kostromskaya the Scythians removed the topmost part of the dome of a Bronze Age kurgan and put in the now flat platform a wooden pit, which was covered by a tent-like timber structure. As at the kurgans of Barsučij Log, Tagisken South and Ujgarak in eastern Central Asia, the wooden tent was ritually set on fire before the earthen mound above the tomb was built. In the kurgan archaeologists discovered the skeletons of 22 sacrificed horses outside the tomb and, within the tomb, 13 human skeletons, intentionally broken weapons and ceramic vessels, and a 700 g gold emblem of a deer, which once adorned a gorytos or a shield.[280] The deer, which has huge antlers covering its back, appears to flee from a predator, such as a large cat. This calls to mind the equally large golden panther found in kurgan 1 of the neighbouring Kelermes necropolis, which seems to be catching a scent with its flared nostrils. Ten small, coiled panthers form the paws and the tail of the cat. The third representative of the animal triad of the Scythians of Tuva and the Altai, the bird of prey, was found in the likewise early Scythian kurgan of Melgunov–Litoi west of the Dnieper in the form of golden discs of a bird with symmetrically spread wings. With deer, big cat and bird of prey, the three most prominent animals of the art of the Central Asia steppe appeared in north-eastern Europe in complete form as early as the seventh century BC. This underscores the close contact between the Tuvinian homeland of the animal style and the northern Pontic and northern Caucasian regions.

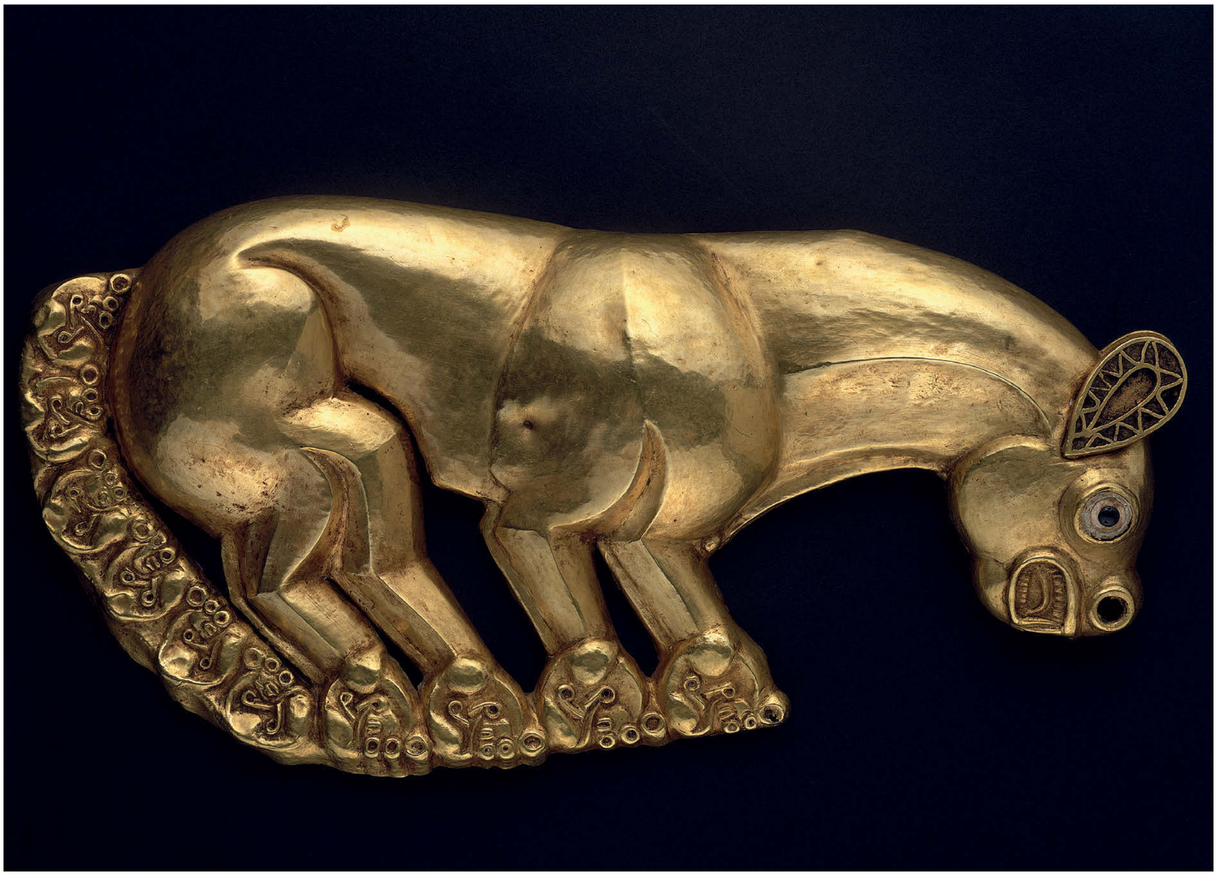
At the necropolis of Kelermes two different grave types met, reflecting the community of two peoples with their own customs. Members of the upper class of the native, agrarian populace of the Maeotae were buried in flat graves; the neighbouring kurgans held the remains of representatives of the ruling Scythian military elite.[281] The most important princely kurgans of Kelermes, and with them their contents, date from the second and third quarters of the seventh century BC, and thus are somewhat older than Arzhan 2 in Tuva.[282] Many of these objects display Near Eastern characteristics. Among them are the aforementioned bimetallic mirror



Gold clothing plaque of a bird of prey. Melgunov-Litoi Kurgan, central Ukraine, second half of the seventh century BC. The State Hermitage Museum, St. Petersburg.



Gold plaque of a recumbent deer. This 31.7-cm-long plaque originally adorned a gorytos or a shield. Kurgan of Kostromskaya, Kuban region, southern Russia, *ca.* 600 BC. The State Hermitage Museum, St. Petersburg.



Gold plaque of a panther whose paws and tail are formed from coiled panther kittens. The 32.6-cm-long plaque presumably decorated a shield. Kurgan 1 of Kelermes, Kuban region, southern Russia, *ca.* 675–625 BC. The State Hermitage Museum, St. Petersburg.

from kurgan 4, whose eight triangular electrum segments show both Ionian–Lydian and Assyrian influences.[283] And then the gold diadem with a griffin's head from kurgan 3; this headdress, common among pre-Scythian warriors, was not adopted by male Scythians but was used later by Sarmatian women.

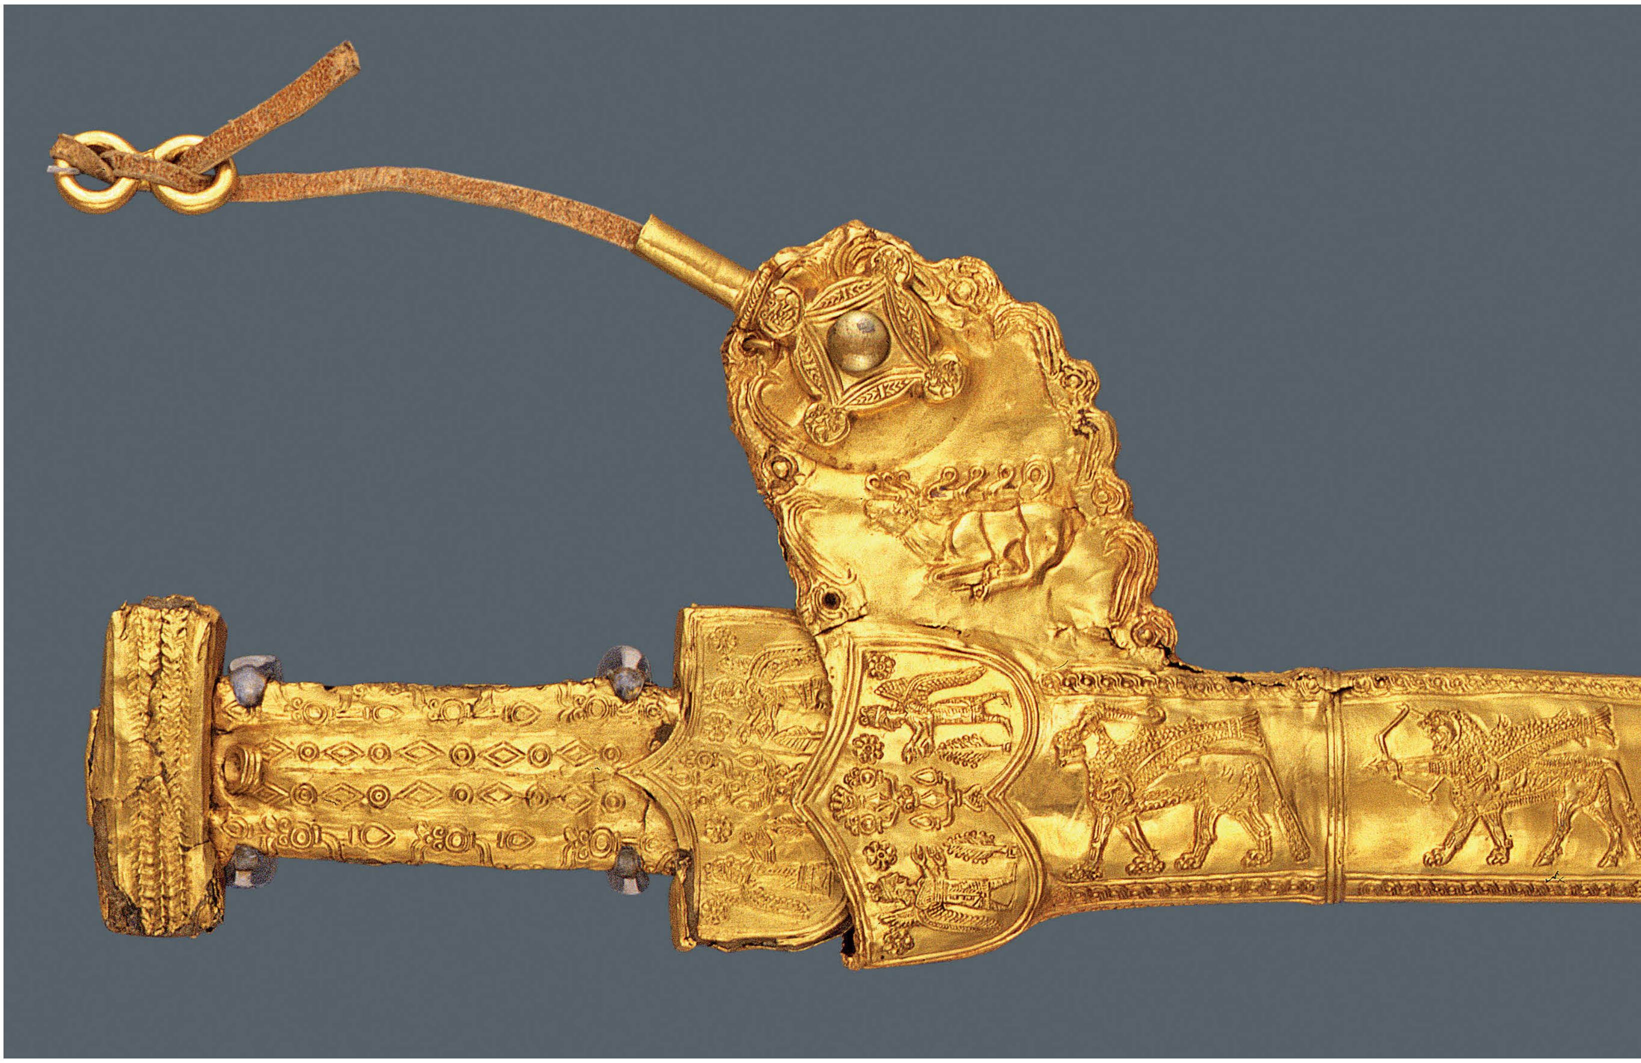
Other influences from the Near East strongly shaped Scythian art. They are found on the sumptuous gold ceremonial weapons of chiefs and army commanders who had fought in the Near East and were buried in the Kuban. Among them was a gold-covered battle axe from kurgan 1 of Kelermes with a portrayal of two ibexes, standing on their hind legs on either side of a tree of life. One splendid akinakes, also from kurgan 1, has a gold sheath showing winged deities standing before the tree of life – both Assyrian motifs. Additional decorations on this sword sheath also come from the Assyrian–Urartian visual world: they are bow-wielding, four-legged hybrid creatures with lion or raptor heads and pacing predators with the heads of goats or ibexes. All these creatures are being bitten on their front legs by fish. In these fantastical hybrids all three realms of life – air, earth and water – are united in a single being; their idea was most likely the inspiration for the depictions of hybrid creatures among the northern Pontic Scythians and Saka.

With the adoption of Near Eastern elements in Scythian toreutics, there began the second of the five periods of Scythian art:

I. **Archaic period** (ninth–eighth centuries BC): It encompasses the beginnings of the Scytho–Siberian animal style, as it manifested itself in perfected form at Arzhan 1 and developed out of petroglyphs and deer stones of the Minusinsk Basin and western Mongolia.
II. **Kuban period** (seventh–first half of the sixth century BC): The portrayal of the 'holy' animal triad of bird of prey, deer and predatory cat was enriched by elements from Assyria and Urartu, and novel hybrid creatures emerged, such as winged bulls and lions as well as S-shaped wings bent upward. Other Near Eastern motifs, such as the tree of life flanked by two winged deities, were not adopted into the repertoire of Scythian art.
III. **Classical period** (second half of the sixth century–fifth century BC): The Near Eastern elements were developed into a mature, self-contained syntax, which concentrated on the portrayal of the ur-Scythian animals: the bird of prey, the predatory cat and the deer, as well as corresponding hybrids like griffins; other animals, such as wolves and boars, receded into the background. While scenes of animals fighting and coiled animals were popular, depictions of human beings were almost nonexistent and Greek borrowings such as the owl remained rare. The stronger adherence to original Scythian themes resulted from the new waves of Iranian-speaking nomads from eastern Central Asia.
IV. **Greco–Scythian period** (fourth–third centuries BC): Beginning around 400 BC Scytho–Greek artistic contacts developed into a symbiosis. In this regard it is hardly relevant whether Greek goldsmiths living in the Bosporan Kingdom crafted ceremonial objects for their Scythian customers or Scythian artisans living in the steppe created the objects after an apprenticeship with Greek masters. Now human beings, such as Scythian and Greek warriors, Amazons, Greek heroes like Achilles, and Scythian deities appeared beside the animals in toreutics. In a few cases warriors were shown not in battle but rather in scenes from everyday life. At the same time the animal style experienced a softening as the animals were portrayed more naturalistically and domestic animals like cattle and sheep were also depicted.
V. **Late Scythian Crimean period** (second century BC–third century AD): In their last historical phase the Scythians sought refuge from the Sarmatians and Alans on the Crimean peninsula. During this time traditional Scythian mythological content as well as animals largely disappeared from their art.

As Ludmilla Galanina emphasises, Kelermes had a very large number of horse burials: there were 24 horses in kurgan 1, 21 in kurgan 3 and 16 in kurgan 2. The number of horses present is comparable only with the 22 horses at Kostromskaya.[284] These ritual horse sacrifices are not only consistent with the horse burials of Arzhan but they also recall Herodotus's description of a dreadful ritual. One year after the burial of a king, 50 young men were strangled and, as macabre sentries, placed on 50 killed, stuffed and harnessed horses, which were impaled on lances set at an angle in the ground.[285] The 50 horse skeletons found at kurgan 1 at Ul'skji Aul (fourth century BC) on a platform over the central grave correspond to Herodotus's account and show that this ritual continued to be practised after Herodotus.[286] The collections of human and horse bones found at regularly spaced intervals and the at least 50 horse harnesses in the mound at the foot of the royal kurgan of Čertomlyk confirm the pervasiveness of this ritual.[287]

In light of the size and wealth of ceremonial objects in these early Scythian royal kurgans the question arises of whether the royal necropolis of Gerrhos referred to by Herodotus should be sought in the Kuban instead of, as Herodotus states, at the rapids of the Dnieper.[288] Although large royal kurgans with rich gold grave goods lie within a 100-km radius of the rapids, they date to either around or after 400 BC; that is, after Herodotus's death in 424 BC.



Akinakes with gold hilt and gold-plated sheath from kurgan 1 of Kelermes, Kuban region, southern Russia, *ca*. 675–625 BC. The figures, from the Assyrian–Urartian imaginative world, represent two winged deities in front of a tree of life as well as four-legged hybrid creatures, some shooting with bows, which are being bitten by flying fish. The recumbent deer depicted in the upper indentation looks typically early Scythian. The State Hermitage Museum, St. Petersburg.

The huge kurgans along the Dnieper tributary of the Sula, however, come from the seventh–sixth centuries BC and may also be identified with the Scythian 'valley of the kings'.[289]

In the seventh and sixth centuries BC the Kuban represented the military and cultural heart of the European Scythians. As a consequence of the violent seizure of the northern Caucasian homeland by the veterans from the Near East, however, an extended conflict presumably smouldered. This led in the second half of the sixth century BC to an emigration of the Scythian warrior elite and a majority of the tribes to the west, to the lower and middle reaches of the Dnieper. This migration and takeover of the land in the northern Pontic steppe must have occurred before Darius's invasion of 513/12 BC, since King Idanthyrsos's centre of power was found there. Two factors encouraged the geographic shift of the Scythian centre of power and economy: for one, the climate in the northern Black Sea region became wetter,[290] giving rise to rich pastureland, and, for another, the trade of the northern Pontic farming societies with the emerging Bosporan Kingdom and with Greece – Athens was at the time dependent on the Ukraine for imports of grain[291] – could be conveniently controlled from there. The heyday of the western Scythians ran parallel to this optimal climate and the zenith of the Greek–Ionian economy, before it fell victim to the advancing Sarmatians. The Royal Scythians had rich grazing lands for their herds and subjugated the farmers of the forest steppes, from whom they extracted tribute. They also dominated the trade with the Greek and Bosporan cities. In the Kuban, however, Scythian influence receded, even as large kurgans, such as that of Uljap, were being built according to Scythian custom.

2.3 The Pontic Scythians

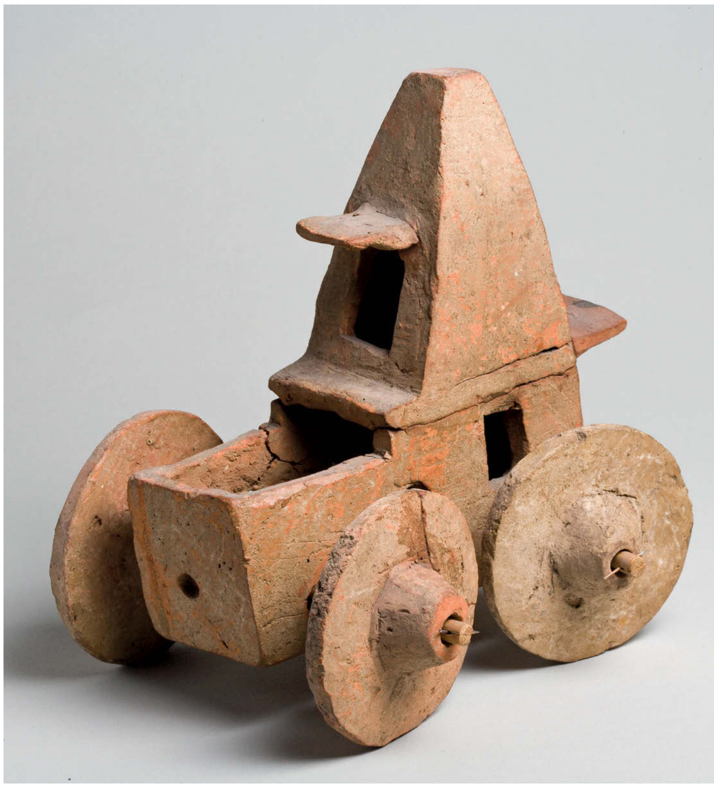
Two of the legends of the origins of the Scythians transmitted by Herodotus place their homeland in a region near the Dnieper. According to one, the foremother of all Scythians is the daughter of the river god Borysthenes (Dnieper), and according to the other, Hercules fathered the three ancestors of the Scythian tribes with the snake woman in Hylaia, a forested area on the eastern bank of the Dnieper. Two of the six Scythian peoples mentioned by Herodotus lived here, the 'Royal Scythians', who ruled over all of Scythia and whose forefathers lived in Kuban and had probably fought in the Near East, and the stockbreeding 'Nomadic Scythians'.[292] Both groups were most likely Iranian-speaking. The explosive increase in large kurgans north of the Black Sea beginning at the end of the sixth century BC attests to this migration. The Royal Scythians did not establish a fixed governing structure, however; Scythia remained an unstable federation of tribes under the leadership of the royal tribe. That Scythian mounted warriors had advanced into the forest steppes west of the Dnieper long before the end of the sixth century BC is suggested by the 11-m-high Perepiat'ycha kurgan south of Kiev, from the end of the seventh century BC. A chief was buried in the since-plundered kurgan with a 14-member entourage and horses, strongly recalling the contemporaneous kurgan of Arzhan 2 in Tuva.[293]

From the end of the sixth to the end of the fourth century BC, Scythia extended from the Danube to the Don and from the northern Black Sea coast and the Kuban to about as far as Kiev. The sedentary 'Farmer Scythians' settled west of the Nomadic Scythians, and, to the west of the former, the Callipidae and Alazones, two Hellenised Scythian tribes, and the corn growing 'Ploughing Scythians', who provided grain to the trading settlements of the

Bosporan Kingdom.[294] Presumably these four ‘Scythian tribes’ were barely related to the Iranian-speaking Scythians and ought to be considered instead proto-Slavs who adopted particular ‘Scythian’ customs under the influence of the Royal Scythians.[295] The Sauromatians, relatives of the Scythians, lived east of the Don, and the Maeotae lived in the Kuban.

When the Kuban Scythians reached the northern Pontic region, they encountered prosperous Greek–Ionic trading settlements and colonies, such as the cities of Borystenes and Olbia, founded in the delta of the Bug River in 645/44 and 633 respectively, the two most important ports for the export of wheat to Athens.[296] The subjugation of the farmers made it possible for the Scythians to base their economy less on war and raids and much more on trade. They exported wheat, cattle, leather, animal hides, wax, honey and prisoners of war, and imported gold objects, ceramics and wine. In a few cases Scythians also served as mercenaries, notably in Athens as mounted police.[297]

In order to secure both their rule and their trade routes, the Scythians built over 100 fortified settlements and fortresses, many of them along navigable rivers. Among the largest of the walled settlements were Bol’šhoe Chodosovskoe gorodišče near Kiev (2,000 ha), Karatul’skoe gorodišče (6,000 ha) and Bel’sk gorodišče (4,000 ha).[298] The last is probably identical to Herodotus’s Gelonos, which Darius I burned down. The Scytho–Greek city stood on a northern tributary of the Dnieper and was more than 400 km distant from Olbia as the crow flies. It served as a reloading point for both Scythians and Greek merchants and its 33-km-long and up to 10-m-high walls not only connected three fortresses but also protected many workshops and cultic sites.[299] Still more important was the city of Kamenskoje gorodišče, fortified with strong walls, which lay immediately south of the rapids of the Dnieper which blocked ship traffic at the time. The port was a first-class unloading point for Scythian trade with Olbia and Borystenes and had several weapon-makers, who worked with top-quality iron ore from the nearby mines. On an elevated spot stood an especially well-fortified stronghold, which may have served as the seat of a Scythian chieftain or even king. In any case, the heyday of Kamenskoje gorodišče coincided with the rule of the Scythian king Atheas (r. *ca*. 390–339 BC), when the population also increased significantly. Necropolises lay near Kamenskoje gorodišče on both sides of the Dnieper, containing the royal kurgans of Solocha and Čertomlyk. These sites underscore the importance of this trading city, which was also a significant crossroads.[300] These strong walled sites were not built by local people to protect themselves from belligerent nomadic horsemen. Quite the opposite: they served the Scythian elite as the cornerstone of the consolidation of their power and the channelling of the profitable flow of trade.



Clay model of a two-axle wagon with a yurt-like dwelling erected on top. Kerch, Crimea, Ukraine, first–second centuries AD. The State Hermitage Museum, St. Petersburg.

Another key region for trade between Scythia, the Greek–Ionian trading settlements on the northern Black Sea coast and north-eastern Central Asia was the Sea of Azov, in particular the broadly branching delta of the Don. As early as the third quarter of the seventh century BC Greek merchants founded the port of Taganrog west of the mouth of the Don, which was replaced a century later by the inland port of Elizavetovka in the delta of the Don, used by both Scythians and Greeks. The originally Scythian settlement soon served as a Greek emporium and was also a centre for Greek artisans. The nearby kurgan complex of Piat’ Brat’ev (‘Five Brothers’) underscores the importance of Elizavetovka for the Scythians. At the time of the Bosporan king Eumelos I (r. 310/09–305/04 BC) Elizavetovka was built up into a strongly fortified city. This did not, however, not prevent its destruction around 270 BC by the Sarmatians advancing from the east.[301]

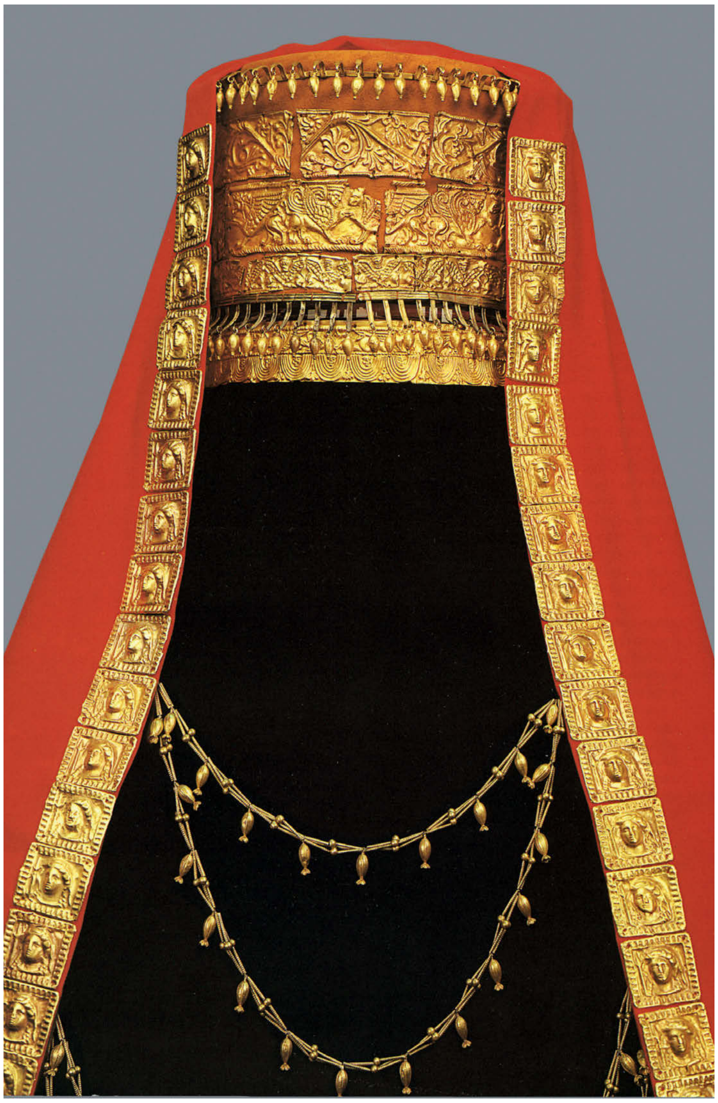
A few years before the burning of Elizavetovka the Bosporan king Pairisades II (r. 280–275 BC) founded the city of Tanaïs north-west of it. The Sarmatian Bosporan king Sauromates I (r. 93/4–123/4 AD) had the city rebuilt in magnificent style after its destruction in 8 AD. Then Tanaïs grew into an important crossroads, where

Bosporan and Roman sailors encountered traders from the Iranian-speaking Aorsi, a Sarmatian group. Strabo reported that the camel caravans of the Aorsi were in trade contact with eastern Central Asia, the Kushans in northern India, Mesopotamia, Armenia and Media.[302] One of the most important transcontinental trade routes of the time ran through the southern Russian steppe, not least because Rome's arch-enemy Iran either levied high taxes on trade between East Asia with Rome or aspired to cut it off.

2.3.1 The Scythian pantheon

Apart from epigrams and inscriptions on coins the Scythians left behind no written sources, so we must rely on Herodotus to reconstruct their religious beliefs.[303] He lists the following eight deities:

- **Tabiti** (Greek Hestia). Herodotus presents the deity of the hearth Tabiti as the highest deity, whom King Idanthyrsos called 'Queen of the Scythians'. Presumably Tabiti symbolised not so much the domestic hearth as the sacred element of fire, which also played a prominent role in the burial rituals of the Scythians.
- **Papaios** (Zeus) and **Api** (Gaïa). After Tabiti followed the primordial parents of all life, the sky god Papaios and the earth and water goddess Api. Papaios and Api were also the primal ancestors of the Scolotoi, since Targitaos was Papaios's son, and the daughter of the river god Borysthenes is to be understood as an aspect of Api.[304] Related to her is the snake woman, who had a human upper body and snake-like legs and was impregnated by Hercules. In some depictions the snake-like legs become plant motifs, turning her into a tendril-limbed semi-human female related to the tree of life. Plants and snakes have a few similarities, as they both live under as well as above the ground and both renew themselves annually, so they symbolise cyclical polarities of death and rebirth. The motif of the snake- and tendril-limbed woman presumably had its origin among the early northern Pontic Scythians and spread quickly both among the Celts and in the Greco–Roman Mediterranean region.[305]
- **Goitosyros** (Apollo). Goitosyros was presumably associated with Mithra; he served as sun god and divine archer, soothsayer and guardian of the herds.
- **Argimpasa** (Aphrodite). Like Goitosyros, Argimpasa had Oriental features and is comparable to both the fertility and war goddess Ishtar and the 'mistress of animals', as she is depicted on the mirror of Kelermes. It is conceivable that the Scythians became familiar with this goddess during their Near Eastern campaigns, even if the idea of a mistress of animals was already known in eastern Central Asia.[306]

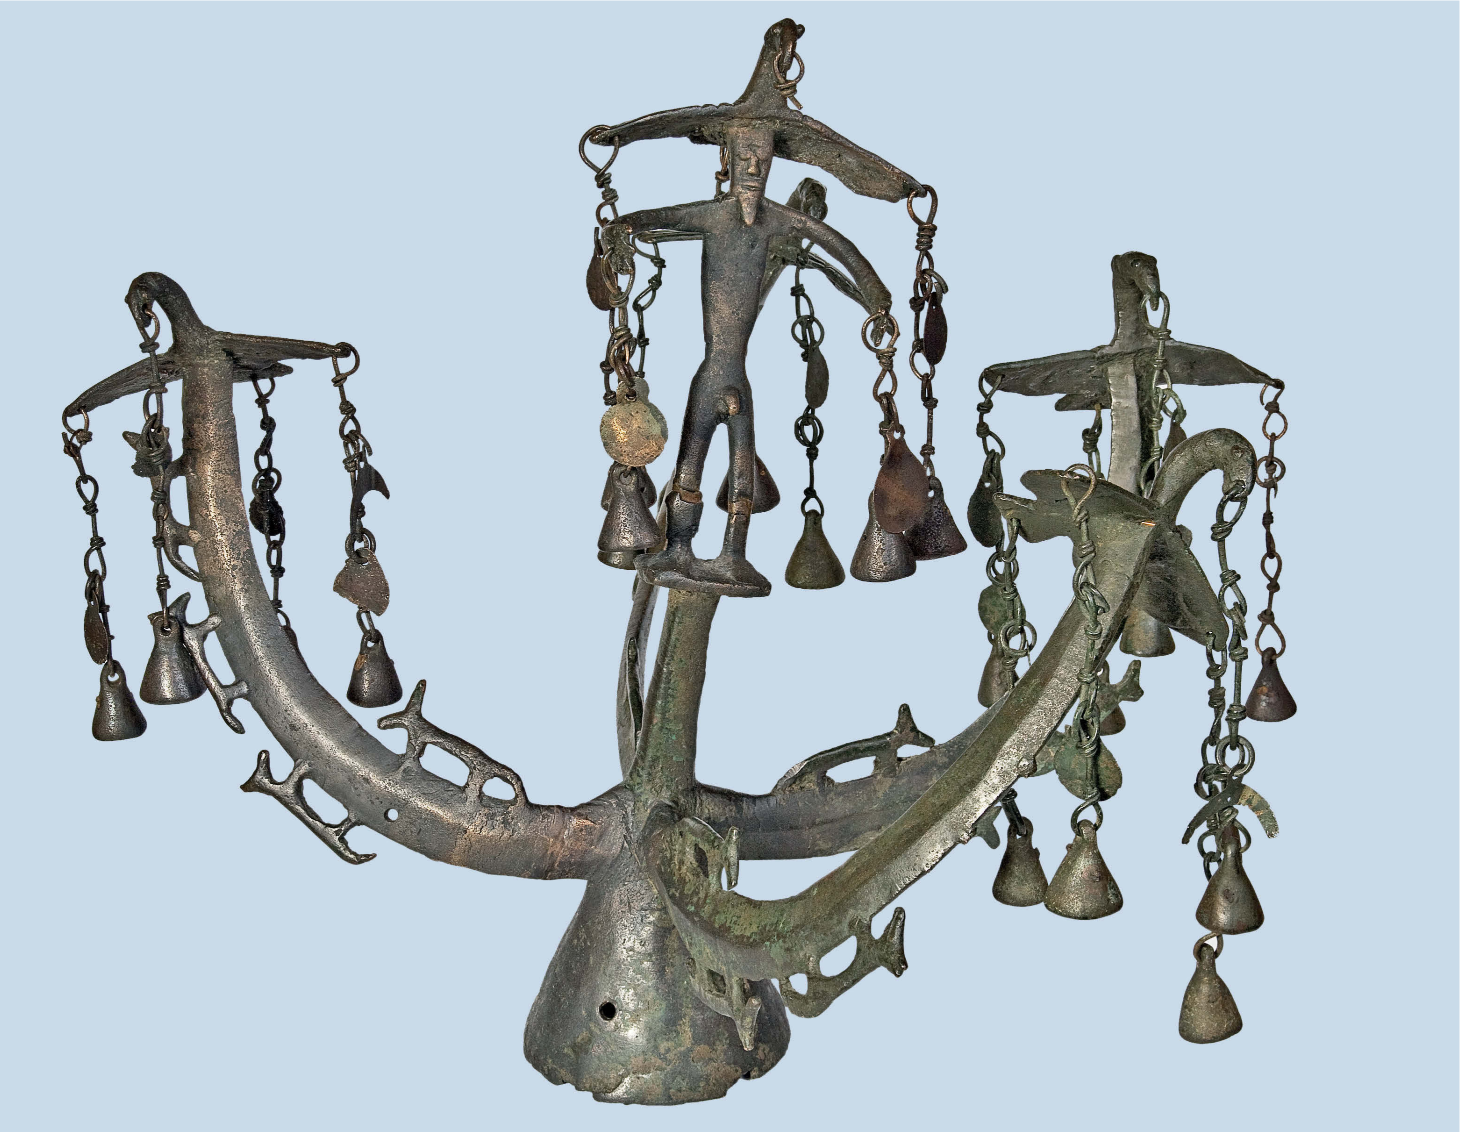


Woman's headdress from kurgan 8 of Piat' Brat'ev, Don River delta, southern Russia, second half of the fourth century BC. On the tiny clothing discs the female face may represent for Greeks Demeter or her daughter Persephone, for Scythians Tabiti or Api. Regional museum of Rostov.

- **Thagimasadas** (Poseidon). Only the Royal Scythians worshipped this god, presumably as the personification of the life-giving rivers of Scythia and as the guardian of horses.
- **Hercules.** This god, whose Scythian name is not given by Herodotus, also served the Scythians as primordial ancestor, since he had fathered with the snake woman who lived in the forest steppes Scythes, the mythical ancestor of the Scythian kings, and two other tribal forefathers named by Herodotus as Agathyrsos and Gelonos.[307]
- **Ares.** The Scythians must have had a special devotion to the war god, to whom Herodotus devoted more space than all other Scythian deities combined. He was the only god with a shrine

dedicated to him alone in every district, in which an upright iron sword symbolised his presence. He was also the only god who had people as well as animals killed in his honour – every hundredth prisoner of war was sacrificed to Ares. Archaeological discoveries in kurgan 5 of Uljap and in Bajkara have confirmed Herodotus's account.[308] While Herodotus clearly identifies Ares as the god of war, the role of Hercules, apart from his function as ancestor, is unclear. For an explanation Lebedynsky draws on the Indo–Iranian pantheon, in which male, militaristic contents are assigned to two gods: Verethraghna, or Indra, was a god of thunder and embodied victory in war, so Ares would be comparable to him. Vayu, by contrast, symbolised immense strength, which Hercules could represent.[309]

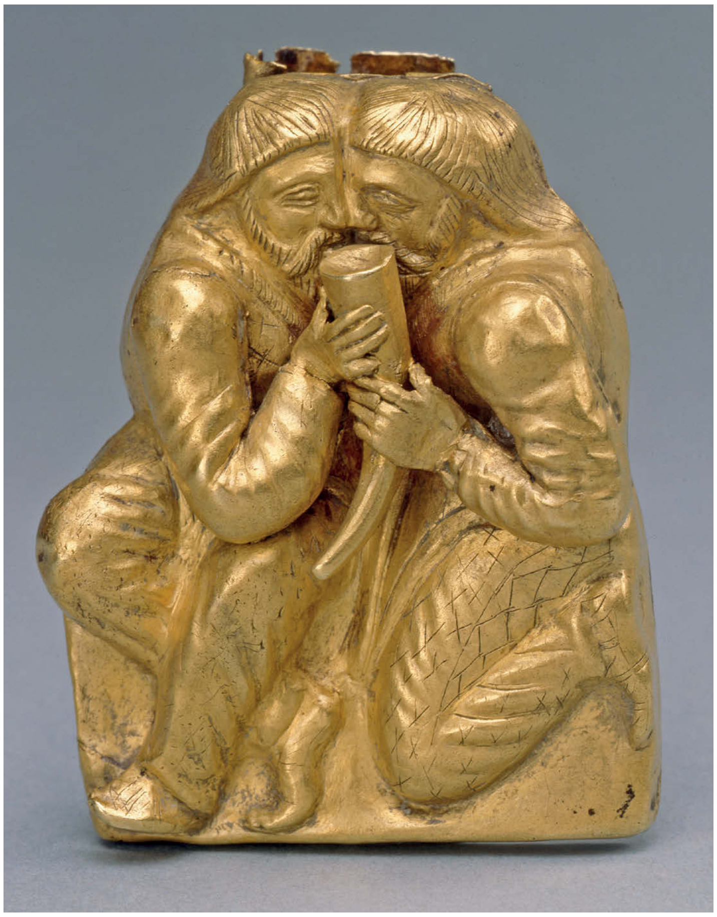
Although the Scythians had no permanent temples with images of their gods and goddesses, they portrayed their deities in toreutics on gold sewn-on discs and vessels. Perhaps occasional depictions of animals symbolised deities in a coded way, so that we can no longer recognise them. Despite considerable speculations to the contrary, there is no evidence of shamanism or nature religion among the Scythians. Neither the Scythians of Tuva or the Saka nor the Scythians of Eastern Europe seem to have been familiar with the role of a shaman, who would move into invisible worlds and spheres inhabited by spirits to resolve a conflict between humans and powerful spirits or to ensure a successful hunt. The Scythians were equally unfamiliar with an organised clergy intermediating between humans and gods, as rituals and sacrifices were performed



Bronze pole top with the highest god of the Scythians, Papaios, crowned by a bird of prey, in the centre and four more raptors on the ends of the branches arranged in the shape of a cross. Chance discovery at Lysaja gora, Dnepropetrovsk, central Ukraine, fifth–fourth centuries BC. National Museum of the History of the Ukraine, Kiev.

by the leaders of the time.[310] As a 'religious' profession the Scythians had only soothsayers, who, if one believes Herodotus, led dangerous lives. If they were incorrect in their attempt to diagnose an ill king, both they and their sons were executed.[311]

The Scythians also seem to have been remorseless when it comes to enforcing religious conformity. Herodotus told of two prominent Scythians of royal blood who suffered the death penalty on account of dissenting beliefs. One was the legendary philosopher Anacharsis, who ostensibly lived in Athens in the second half of the sixth century and was numbered among the 'Seven Sages' there. When he was seen rendering homage to Cybele on his return to Scythia, his brother, King Saulius, killed him with an arrow shot.[312] The second Scythian chief who died as a consequence of worshipping Greek gods was the mid-fifth-century BC king Scylas. He repudiated his royal duties in three ways, as he sacrificed to Greek gods, participated in the Dionysian mysteries and preferred a settled life in the city to a nomadic one on the steppe. The military court deposed him and appointed his half-brother Octamasadas as his successor, after which the latter executed Scylas.[313] Perhaps the Scythian warrior elite feared that the comforts of urban life might weaken their king and make him unfit for military command. By taking up such a lifestyle, Scylas forfeited his authority.

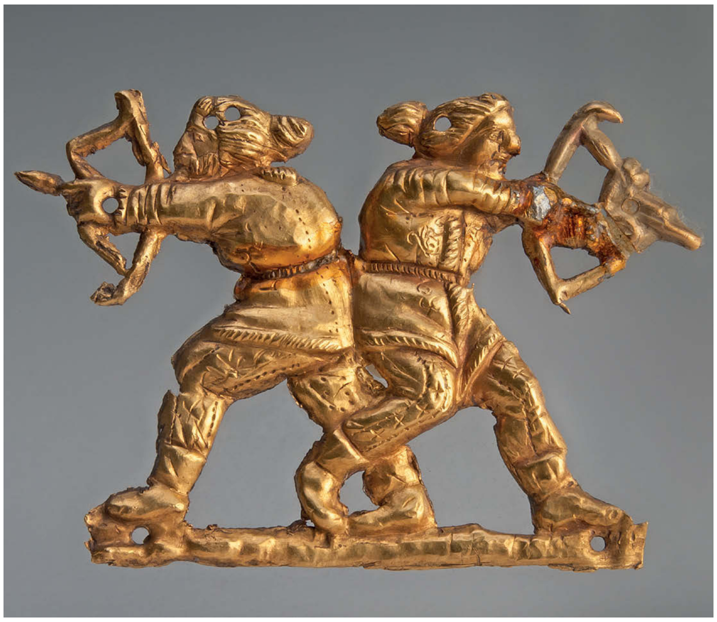


As described by Herodotus (IV, 70), the Scythians swore blood brotherhood with the shared drinking of a mixture of their own blood and wine. Gold plaque from Kul Oba Kurgan, Crimea, Ukraine, *ca.* 350 BC. The State Hermitage Museum, St. Petersburg.

2.3.2 War and burial customs

It is not surprising that a people as militaristic as the Scythians had special war rituals. In order to strengthen cohesion, pairs of warriors would swear blood brotherhood. They mixed their blood with wine in a cup, dipped their weapons in it and drank it in the presence of witnesses.[314] On the battlefield young warriors also drank the blood of the first enemy killed, in order to incorporate his strength. Since a warrior's share of the spoils was determined by the number of heads of decapitated enemies, they collected these and brought them to their king or chieftain. The collecting of heads on the battlefield brought not only spoils but also honour, since the district rulers gathered all the warriors annually and each warrior who had killed at least one enemy was honoured with a cup of wine. The unsuccessful, however, 'have to sit by themselves in disgrace'.[315] The Scythians further 'made use' of fallen enemies by making drinking vessels out of their skulls and clothing out of their tanned scalps or tying the scalps on the reins of their horses.

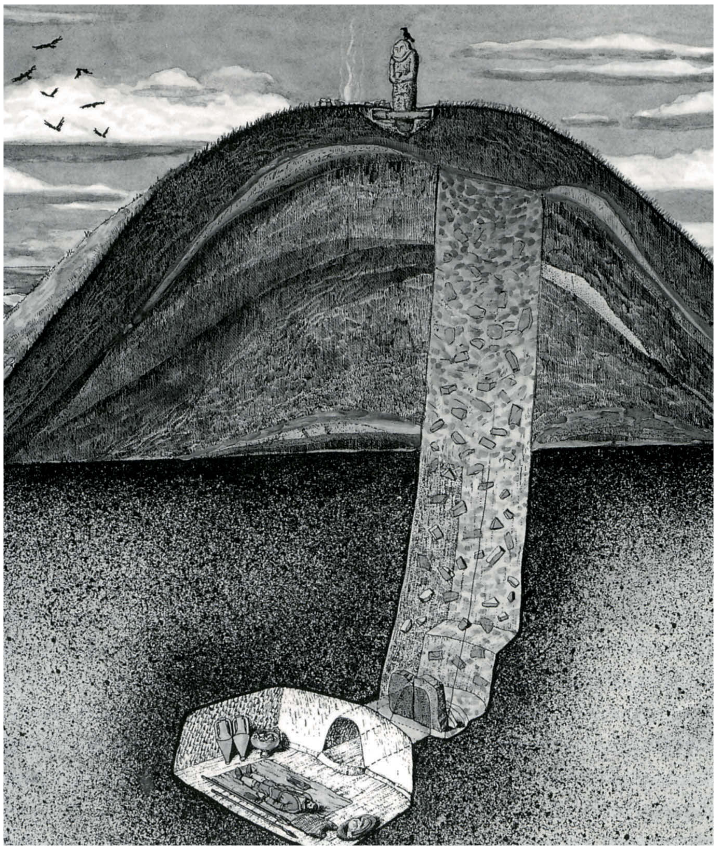
As reported by Herodotus and largely confirmed by archaeology, the burial of kings followed a precisely defined, multi-step ritual which lasted more than a year.[316] This ensured that the



Two Scythians fight back to back, presumably a symbol for a blood brotherhood. Gold clothing plaque from Kul Oba Kurgan, Crimea, Ukraine, *ca.* 350 BC. The State Hermitage Museum, St. Petersburg.

king's attendants were able to bid farewell to their ruler and that he was ensured a secure transition into the afterlife. At the same time the ritual legitimised the chosen successor. First the deceased was mummified, placed on a wagon and led in solemn procession through the districts of his realm for 40 days. During these 40 days his soul remained by his corpse and his attendants hosted banquets, mourned him and mutilated their heads and hands as signs of grief. On the fortieth day the funeral procession returned to the royal necropolis, after which the corpse was laid in the prepared grave, together with selected companions. These strangled people were 'a concubine, his butler, his cook, his groom, his steward and his chamberlain' [messenger], as well as horses and cattle.[317] To complete the royal household, gold and bronze vessels, weapons and wine amphorae were also placed with the dead. The kurgan was then erected over the grave. The dead were not cremated but rather buried as corpses, with the tent-like wooden structure over the grave sometimes set on fire before the final burial.

Members of the warrior elite enjoyed similar burials, although on a more modest scale and usually without human sacrifice. With regard to grave goods, horses were included in normal burials of deceased chieftains and mounted warriors, and wagons in the case of aristocratic women. It appears that in the Scythian imagination 'warriors rode horses into the afterlife, and women rode there on a wagon'.[318] This gender-specific distinction occurred practically independently of the function of the buried women, since in the more than one hundred excavated graves of female warriors in Scythia weapons are in fact only found in a single case, from the seventh/sixth century BC, where there was a horse buried as well.[319]



Sketch of a kurgan with an anthropomorphic stone statue standing on its top, near the village of Pervomaievka, eastern Ukraine. Sketch after Kornjienko.

While the early northern Pontic graves were quite simple, beginning in the sixth century BC the so-called catacomb graves represented complex arrangements, which differed from the much earlier catacomb graves of the Bronze Age. In the Scythian kurgans a steep shaft ran 10 to 15 m into the ground, from which corridors up to 30 m long led to various grave chambers containing the bodies of the 'grave inhabitant', his attendants and sacrificed horses. Although the subterranean chamber system of the catacomb graves was complex many kurgans were plundered as early as the Scythian and subsequent Sarmatian periods. Sometimes the tunnels collapsed on the grave robbers and archaeologists found their skeletons two millennia later.[320] Among the grave chambers, the enormous Oguz royal kurgan (second half of the fourth century BC), originally 21 m high, in the northern Pontic region, is an exception, since there was no wooden structure over the grave but rather the floor, walls and a corbelled vault consisted of worked limestone plates layered over one another. Such stone chambers are otherwise known only from the Bosporan Kingdom, where they developed under Greek influence.[321]

The kurgan was topped by an anthropomorphic stone statue of an armed and armoured Scythian warrior. More than 100 such stone warriors, produced between the seventh and fourth centuries BC, have been found. They carry a long sword on the right side and an akinakes on the front. On the left thigh hangs a gorytos with a bow and arrows.[322] The stone men, in some cases more than 2 m tall, were often interpreted as ancestors, yet the hand putting a drinking horn to the mouth strongly recalls the scene on the felt hanging of Pazyryk and the gold discs on which a standing or mounted warrior receives a rython from a seated deity, so the figure more likely symbolises the acceptance of the deceased into the pantheon of heroes. The custom of placing a Scythian stone warrior on the dome of the kurgan was later continued by the Crimean Scythians, the Sarmatians and the Old Turks. The Turkic Polovtsy, by contrast, who dominated the northern Pontic steppes from the eleventh to the thirteenth centuries AD, erected both male and female stone statues.

After a year the soul of the deceased had reached the afterlife and the final sacrificial ritual took place. Fifty young men were

Olbia and the Bosporan Kingdom

The Bosporan Kingdom and the port city of Olbia were neighbours and the most important trading partners of the Scythians. While the city-state of Olbia, founded by the Ionian city of Miletus and located at the mouth of the Bug, emphasised its Greek identity and tried to keep its autonomy, around 480 BC several Greek cities that lay on both sides of the Strait of Kerch in the east of the Crimean peninsula and in the west on the opposite peninsula of Taman, began to unite to form a centrally governed defence alliance, from which the Bosporan Kingdom emerged. Presumably the withdrawal of the Scythians from the Kuban facilitated the establishment of Ionian cities in the second half of the sixth century BC on the bordering Taman peninsula. The Strait of Kerch, which at the time was called the Cimmerian Bosporus, was strategically important, since it controlled the trade routes to the north through the Sea of Azov. As Herodotus reported, in the winter Scythian bands from south-eastern Crimea sometimes advanced over the frozen Strait of Kerch against the Sindi in south-western Kuban.[323]

The cities on the Strait of Kerch that had been founded by Ionian Greeks in the sixth century BC at the latest came under pressure from the Scythians after their victory over Darius in 513/12 BC. The strengthened nomadic horsemen, who benefited from the influx of new immigrants from Central Asia, undertook raids not only against the likewise expansive Thracian empire of the Odrysians but also against the Greek colonies. Scythian tribes had already gained a foothold in the north-eastern Crimea as early as the seventh and sixth centuries BC, however, as can be seen in the corresponding burials.[324] While the Scythians spread into the steppes of the Crimea, in the foothills farther south and in the mountains lived native herdsmen, the Tauri. These people were feared by the Greeks because, as Herodotus relates, ‘It is the custom of the Tauri to sacrifice to the Maiden Goddess all shipwrecked sailors and such Greeks as they happen to capture upon their coast.’[325]

Around 480 BC three new alliances were formed. The Greek cities of the Cimmerian Bosporus formed a symmachy, a defensive alliance, analogous to the Delian League, from which the Bosporan Kingdom developed. The Scythian king Ariapeithes (r. *ca.* 490–460 BC) then made peace with the Odrysian king Teres, who gave him one of his daughters as a wife.[326] The marriage produced the future Scythian king Octamasadas. For its part, shortly after 480 BC Olbia placed itself under the protection of the Royal Scythians. This protected

The prytaneion of *Pantikapaion* in the lower Acropolis. The ancient seat of the city's government was abandoned and destroyed in the late fifth century BC. when a new ruler took power and concentrated all executive powers in the royal palace on the upper acropolis (Vladimir Tolstikov, *Pantikapaion*, 2002, p. 52).

status continued into the time of King Scylas (r. 460–440 BC), since Olbia was the favoured place of residence for this Scythian king.

At the time of Herodotus's visit around 460 BC, three different lifestyles coexisted in the city-state of Olbia: the urban and maritime culture of a classical Greek polis, the agrarian culture of native tribes and a steppe culture of nomadic horsemen. A century later in 331 BC the Scythians destroyed the Macedonian army of Alexander's governor of Thrace, Zopyrion, when he besieged the city of Olbia. Shortly thereafter Olbia slipped from the dominion of the flagging Scythians, whereupon their hinterland was battered by successive raids. In its distress Olbia turned in the third quarter of the second century BC to the king of Lesser Scythia, Skiluros, who ruled over the western part of the Crimean peninsula. Olbia became a vassal of Skiluros, as can be seen in the coins he had minted in Olbia. After a short period of prosperity under Mithridates VI of Pontus (r. 116/13–63 BC), Olbia was plundered by the king of the Getae, Burebista, around 55 BC and a century later came under the rule of the Sarmatians. In the third century AD first the Sarmatians (232–35 AD) and finally the Goths (269–70) destroyed the port city for good.[327] Notable in Olbia's history is the fact that Scythians, who were a superior power for a long time, never attacked and destroyed

Olbia but rather left it as a Greek island inside their empire. The warrior horsemen understood that it was more rewarding to extract tribute from a wealthy city than to plunder and destroy it.

The Bosporan cities initially placed themselves under the leadership of the Milesian noble line of the Archaeanactidae. Four decades later the Scythians, the Thracians and the Bosporan Kingdom moved closer together when dynasties friendly to Thrace seized power among the Royal Scythians as well as in the Bosporan capital of Pantikapaion, the modern city of Kerch. In 438 BC the dynasty of the Spartocids, who were of Thracian descent, superseded the Archaeanactidae in Pantikapaion and among the Royal Scythians Octamasadas, who was related to the Thracian king Sitalces, supplanted as king the philhellenic Scylas around 440 BC. It was surely no coincidence that rulers friendly to Thrace came to power among the Scythians and in the Bosporan Kingdom practically simultaneously. The Scythian dynasty was from then on related by marriage to the Thracian dynasty, and the Istros River, the Danube, formed their common border.[328]

That the Scythians had good relations with the Bosporan Kingdom at least for a time can be seen in the dozens of kurgans on the edges of its capital Pantikapaion. These include the kurgans of Altyn Oba, whose name means 'golden hill', those at Kul Oba, the large group at Juz Oba, the Zarskij Kurgan and the Melek Chesmen Kurgan in the centre of modern Kerch, all of them dating from the fourth or early third century BC. Under the large earthen tumulus of Kul Oba kurgan lay the central grave with the burials of a man and a woman with rich gold grave goods, as well as a sacrificed stable boy and a horse. The woman rested in a wooden sarcophagus whose inner sides were decorated with paintings showing, among other things, a winged Nike driving a quadriga and a lioness attacking a bull.[329] As at the Oguz kurgan, a dromos led to the grave chamber which consisted of dressed stone blocks, held together by fasteners made of lead, over which stood a corbelled vault. While the structure shows some features of Thracian grave architecture, the grave goods correspond to a Hellenised Scythian style. The buried man was probably a Hellenised Scythian chief who was associated with the Bosporan court.[330]

Towards the end of the third century BC a change in the trading patterns of Greece toward Asia Minor and Egypt sent the Bosporan Kingdom into an economic crisis. At the same time the weakened Scythians surrendered their homeland between the Dnieper and the Don to the Sarmatians more or less without a fight and partly retreated to western Crimea. Why the Scythians collapsed militarily in the third century BC remains unclear. Perhaps the dominance

The kurgan of Kul Oba west of Pantikapaion dated *ca.* 350 BC. Soldiers had found the burial vault by chance in 1830 when searching for large stones for construction purposes. It was one of the first large Scythian barrows to be officially excavated in modern times, but was plundered during the excavations when the armed guards were bribed to leave the site during night. Some of the stolen pieces were later bought back by the Russian government on the local antiques market (Paul Du Brux, *Rackopi kurgana Kul-Oba*, 1830, p. 167).

▲ **Gold torque with coloured gold incrustations and two Scythian rider protomes. Kul Oba Kurgan, Crimea, Ukraine, *ca*. 350 BC. The State Hermitage Museum, St. Petersburg.**

of the Royal Scythians broke down after the death of King Agaros around 300 BC, but such a fall would not explain the lack of resistance to the Sarmatians by the remaining Scythian groups. Perhaps the centuries-long relationship with the Greek cities and their material seductions had made the warrior horsemen soft.

In Crimea, King Skiluros (r. *ca*. 135–114/13 BC) initiated aggressive raids against Tauric Chersonesos and the Bosporan cities while entering an alliance with the Sarmatian Roxolani. Chersonesos, located near modern Sevastopol in the south-west of the peninsula, was founded by Doric Greeks in the fifth century BC and was a booming trading centre till the encroachments by the Scythians of Neapolis Scythica. The eastern part of the Bosporan Kingdom was also under threat, as the Sarmatian Siraces had formed a military alliance with the Maeotae.[331] Chersonesos then sought an alliance with the Bosporan Kingdom and its last Spartocid king, Pairisades V (r. *ca*. 140–109 BC), requested finally help from the Pontic king Mithridates VI. Mithridates's general, Diophantos, defeated the king of Lesser Scythia, Palakos (r. 113–*ca*. 111/110), and his allies, the Sarmatian Roxolani, in several battles.[332] The Bosporan Scythian Saumakos (r. 108–107 BC) then killed Pairisades V and seized power in the Bosporan Kingdom, but Diophantos quickly ended his rule.[333] The Pontic protectorate did not return the Bosporan cities to prosperity, however; quite the opposite, as Mithridates's wars against Rome had given rise to crushing taxes. When Mithridates fled Crimea in the face of Pompey in 63 BC the Bosporan cities rose up, and with them Mithridates's son Pharnaces. Mithridates, besieged in Pantikapaion, was driven to suicide. The new king, Pharnaces II (r. 63–47 BC), believed he could take advantage of the Roman civil war between Pompey and Caesar and attack Asia Minor, but Caesar completely defeated him and his Sarmatian cavalry in 47 BC at Zela, a victory recalled in the famous words, 'Veni, vidi, vici'.[334]

Shortly after the start of the Christian era, King Aspurgos (r. 14–38 AD) founded the Sarmatian dynasty of Bosporan rulers, who remained in power until the mid-fourth century. With this, two erstwhile nomadic riding peoples divided power in Crimea: in the west, called 'Lesser Scythia', the Scythians ruled, and in the east, their arch-enemies, in the form of a Sarmatian dynasty. The stability of the Bosporan Kingdom depended on Rome's military support, however, so it resembled a Roman protectorate. When the newly strengthened Crimean Scythians besieged Chersonesos, Emperor Nero sent Roman troops in 63 AD, who fought off the Scythian attackers. Now Roman garrisons were stationed in Crimea and a Roman fleet patrolled the Black Sea. Thanks to Roman backing, the power struggle between the Bosporans and the Crimean Scythians was decided in favour of the former under their kings Sauromates I (r. 93/4–123/4), Cotys II (r. 123/4–132/33), Sauromates II (r. 173/4–210/1) and Rhescuporis III (r. 210/1–226/7). The end of the Bosporan cities coincided with the start of the 'barbarian migration', when Goths and Alans after 240 and Huns around 375, left the cities, with the exception of Chersonesos, in ruins.[335]

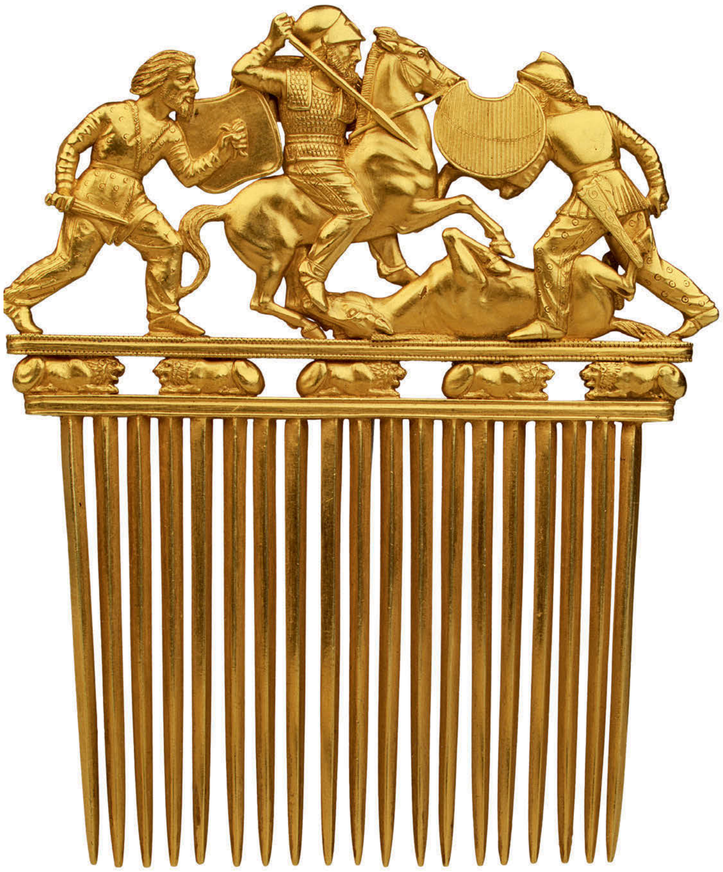
strangled and seated on 50 killed and stuffed horses, which were impaled on lances in a circle around the kurgan. They formed a gruesome vigil at the final resting place of the dead king. That the kurgan with all its grave goods represented a symbolic replica of the familiar world of the king can also be seen in the construction of the mound. Unlike Bronze Age mounds it was not made of the material dug out of the grave or earth from nearby but rather out of sod from special, black earth that was sometimes brought from a great distance. The earthen tumulus represented a heavenly pasture for the sacrificed horses and the cattle of the deceased, so that the king symbolically took his grazing lands into the afterlife with him.[336] A Scythian kurgan for kings and warriors represented a ritually planned cosmic world of the dead; the kurgan and the bodyguard protected the dead from the world of the living and, conversely, it from him.



The gold comb of Solocha, lower Dnieper region, southern Ukraine, *ca.* 390 BC. A scene of battle among three Scythian warriors is depicted. The rider is presumably the Scythian king Octamasadas; his opponent, fighting on foot after having been thrown, his philhellenic half-brother and predecessor Scylas; and the warrior following the rider on foot, Octamasadas's loyal half-brother Orikos. The State Hermitage Museum, St. Petersburg.

2.3.3 Chronology of the Scythian kings

Since the Scythians produced no chronicles, a reconstruction of their regime depends on foreign sources and interpretations of archaeological finds. Despite this limitation, three royal dynasties can be determined: the first was based in the Kuban at the time of the campaigns in the Near East; the second ruled over classical Scythia; and the third retreated to Crimea.[337]

I. **The dynasty in Kuban** (*ca.* 700–550 BC). The first Scythian king known by name was **Ishpaka** (Išpakaia), who was defeated by the Assyrian Asarhaddon shortly after 680 BC. Ishpaka's successor **Bartatua** changed sides and established a pro-Assyrian policy, which bore fruit in the Scytho–Assyrian victory over the Medes in 673 BC. Bartatua was succeeded by his son **Madyas**, who may have been a nephew of Assurbanipal on his mother's side. In any case, in 644 BC he defeated the Medes when they besieged the Assyrian capital of Nineveh. This victory gave the Scythians a free hand to demand tribute from various peoples of the Near East. Around 616 BC the Median king Cyaxares II had the Scythian leaders murdered. The veterans returning to their homeland had to establish their dominance in Kuban through armed warfare against the clans that had stayed behind.

II. **The dynasty between the Don and the Dnieper** (*ca.* 550–third century BC). The first Scythian king of the northern Pontic steppe mentioned by Herodotus was **Spargapeithes**, who was succeeded by his son **Lykos**, followed in turn by his own son **Gnuros**.[338] Regarding Gnuros's son and successor, King **Saulius**, Herodotus reported that he killed his brother, who was numbered among the 'seven sages' of Greece, when the latter paid homage to Greek gods after his return from Athens. All these kings ruled before 513/12 BC, when the Scythians were faced with the invasion of the Achaemenid king Darius I. The then Scythian king and commander of the Scythian tribes **Idanthyrsos** and his viceroys **Skopasis** and **Taxakis** succeeded in forcing the attackers into retreat by means of clever guerrilla tactics. A Scythian delegation tried in vain to form a military alliance with the king of Sparta, Cleomenes, against the Achaemenids.[339] When exactly King **Ariantas** ruled and whether he was a king or a viceroy is unknown. In any case, Herodotus refers to his census, for which he ordered that every Scythian had to personally deposit an arrowhead in a particular location.[340] **Ariapeithes** (r. *ca.* 490–460 BC), who concluded a peace treaty with the Thracian king Teres around 480 BC and took a daughter of Teres as his wife, ruled at the start of the fifth century BC. The marriage produced the future Scythian

The reconstructed mausoleum of the Scythian king Skiluros at Neapolis Scythica was originally built *ca.* 120 BC.

king Octamasadas. The Thracians and their culture developed as a blend of two different peoples and cultures, when in the mid-fourth century BC nomadic stockbreeders of Indo–European origin moved from the northern Pontic steppe into the agrarian region on the west coast of the Black Sea. Their descendants created a settled culture of aristocratic warrior horsemen and charioteers.[341]

Ariapeithes had at least two additional wives, the Scythian Opoia, who gave birth to Orikos, and a Greek from the Greek colony of Istria in the Danube delta, whose son was Scylas.[342] Ariapeithes's successor was **Scylas** (r. *ca.* 460–440 BC), who pursued a philhellenic policy and neglected his duties as king of a riding people. He was deposed and replaced by his half-brother **Octamasadas** (r. *ca.* 440–390 BC). When Scylas fled to the Thracian king Sitalces (r. 445–424 BC), whose brother had sought refuge with Octamasadas, the Scythian king marched to Thrace and met Sitalces at the Danube. There Sitalces had the following message delivered to Octamasadas: 'Give me back my brother, and I will do the same with Scylas; then neither of us need risk his army in an engagement.'[343] They exchanged the disliked brothers and Octamasadas promptly beheaded his half-brother. This rapprochement between Scythians and Thracians, as well as the coming to power of the Thracian Spartocids in the Bosporan Kingdom, led to a political stabilisation among these three regional powers and led to a period of economic prosperity.

The epic tragedy of Scylas also appeared in art, as can be seen in a gold comb from an intact side chamber of the kurgan of Solocha on the eastern bank of the Dnieper. The comb was discovered by the archaeologist Vesselovski in 1913.[344] It depicts three warriors fighting: one rider raises his lance against an enemy fighting on foot, whose mortally wounded horse lies on the ground. The warrior on foot wears a Thracian ridge helmet and holds an akinakes in his right hand and a half-moon-shaped shield in his left. The rider wears Scythian trousers, a breastplate and a Corinthian helmet; he is protected by a Scythian back shield. The rider is supported by an unarmoured second combatant on foot with an akinakes and shield. It is conceivable that the middle rider and the fighter following him on foot, who have both lost their bows, represent Octamasadas and Orikos, and the unseated rider the defeated Scylas.[345] In light of the fine grave goods in the side burial in the 19-m-high Solocha kurgan, it is undoubtedly a royal burial, as was the unfortunately plundered central grave chamber.[346] Today it is presumed that in the central chamber the loyal half-brother of Octamasadas, Orikos, who died around 410 BC, found his final resting place, and in the undisturbed side chamber lay Octamasadas, who died around 390 BC and next to whose head lay the golden comb.[347]

The presumed successor of Octamasadas was King **Atheas** (r. *ca*. 390–339 BC).[348] Atheas, whose capital may have been Kamenskoje gorodišče, oriented himself towards the south in a time of increasing pressure from the Sarmatians on the eastern flank of Scythia. It is unclear in this regard whether the Sarmatian threat moved him to expand Scythian holdings on the Danube or whether neglect of the eastern border first enabled the Sarmatian invasion. The king tried to provide modern structures for Scythia, as he minted coins bearing images of Hercules and Artemis on the obverse and himself on horseback on the reverse.[349] Atheas's advance to the south-west forced him into conflict with the powerful king of Macedonia, Philip II (r. 359–336 BC). Although the two kings invaded Thrace together in 346 BC, when Atheas later refused to appoint Philip as his successor as he had promised, Philip attacked the Scythian army stationed south of the Danube in 339 BC. The Macedonian won a surprising victory and the 90-year-old Atheas fell in the battle.[350] Atheas's unnamed successor ('**Anonymous I**') succeeded, however, in completely defeating the Macedonian army led by Zopyrion, Alexander's governor, before Olbia, after which he sent a first delegation to Alexander in Bactria. He died soon thereafter, in 328 BC, and may have had his final resting place in the Oguz kurgan.[351] His brother, another anonymous Scythian ruler ('**Anonymous II**'), apparently ruled only briefly, followed by '**Anonymous III**'[352] or King **Agaros** (d. *ca*. 300 BC). The latter suffered a serious defeat in 313 BC by the Macedonian warlord of Thrace, Lysimachus. Agaros then intervened in the fratricidal Bosporan war of 310/09 BC, when he provided Scythian troops to Satyros in the battle against the latter's younger brother Eumelos. Satyros won the battle but died from a wound.[353]

Stone relief found in 1830 at Neapolis Scythica with the presumed representation of the Scythian kings Skiluros (left) and Palakos (right). The original was lost in the 1890s, and only a gypsum copy remains.

III. **The late Scythian dynasty of Crimea** (*ca*. 170 BC–third century AD). The classical age of Scythia ended with Agaros. Beset in the east by the Sarmatians and in the west by the Thracians and the Galatians, Scythian territory shrank to the western part of Crimea and the Isthmus of Perekop in the north.[354] Those Scythians who were not absorbed by the Sarmatians retreated to Crimea, where they came into conflict with Chersonesos, which had expanded its territory into the north-west of the peninsula toward the end of the fourth century BC.[355] The Crimean Scythians represented a multicultural mixture and they had cities reinforced with strong walls, such as Neapolis Scythica, Chabeion and Palacium, practised farming and raised cattle. The Crimean Scythians no longer sought protection in the wide open steppes, like nomadic horsemen, but rather behind walls, as settled peoples. Their culture was shaped by a consistently increasing Hellenisation. Adaptation to new conditions could also be seen in royal burials. While horses and, in a few cases, servants were sacrificed as before, and stone stelae were put up, the mounding up of earth, which required much space, was now largely given up. The hybrid culture of Scythia Minor represented less the final stage of classic Scythian culture than an amalgamation of Scythian, Thracian and Greek elements.

The first known King of the Late Crimean Scythians was **Argotos**, son of Idanthemidos. He rose to power in the second quarter of the second century BC after having entered a matrimonial alliance with the Bosporan Kingdom by marrying Kamasarye, the widow of King Pairisades III (d. *ca*. 170 BC) and mother of Pairisades IV (r. *ca*. 170–150 BC). Argotos established his residence at Neapolis Scythica in south-western Crimea, close to the modern city of Simferopol. After Argotos, King **Skiluros** (r. *ca*. 135–114/13), who may have been of Sarmatian stock, initiated an aggressive policy. He obliged Olbia to pay tribute, conquered the western Crimean ports of Kerkinitis and Kalos Limen, attacked the hinterland of Chersonesos and forged

Inside the basilica reconstructed in the tenth/eleventh century AD at Tauric Chersonesos. When the city was under threat from the Scythian king Skiluros in 114 BC it sought military assistance from the Bosporan and Pontic Kingdoms.

Gold pectoral, 30.6 cm in diameter, from the kurgan of Tolstaya Mogila, lower Dnieper region, southern Ukraine, around 350 BC. The three sections between the four twisted bands show: in the outer space, scenes of animal combat; in the centre, vegetable ornament; and in the inner space scenes of daily life. Ukrainian Museum of Historical Treasures, Kiev.

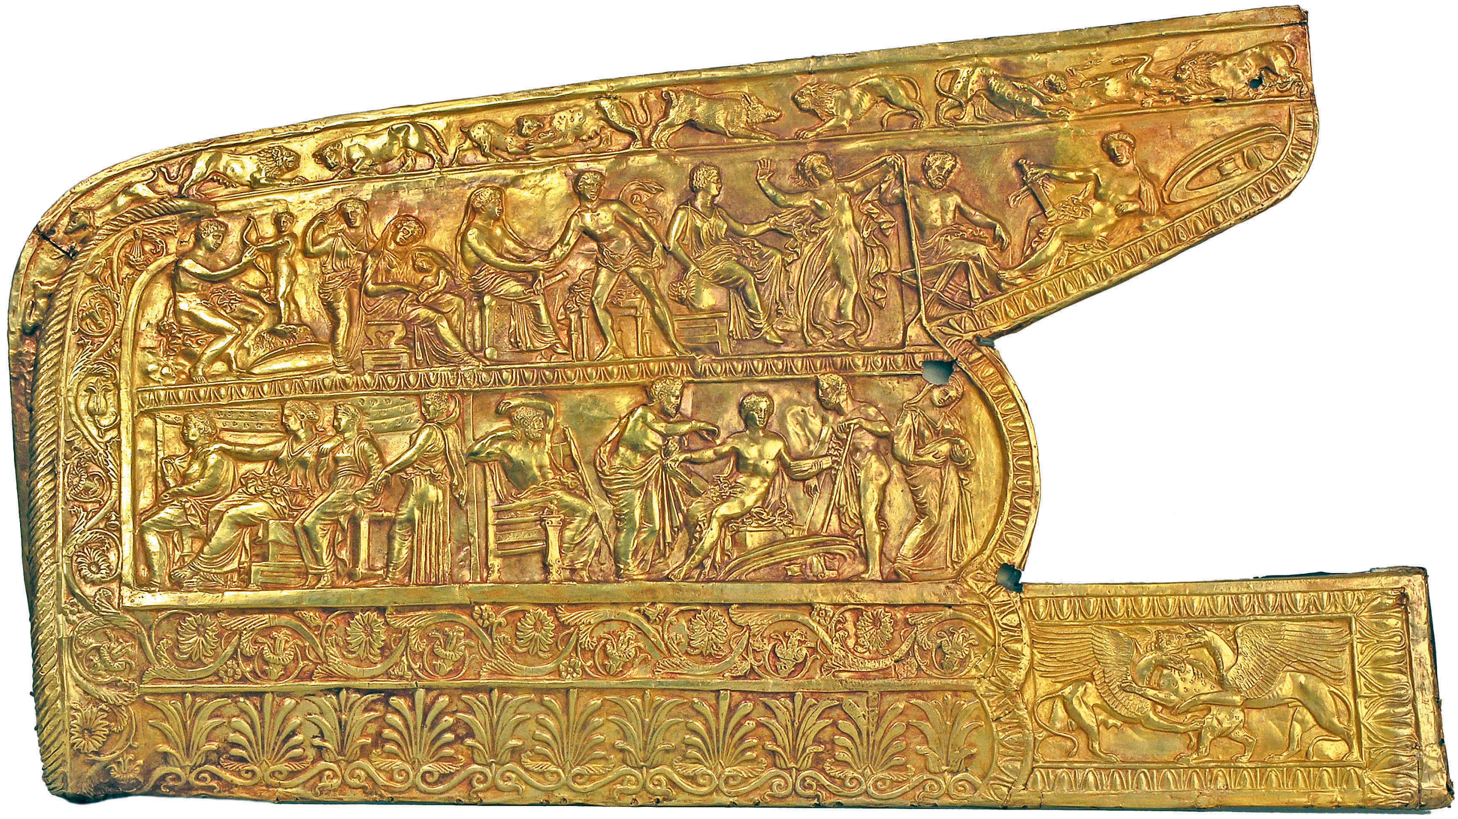
an alliance with the Sarmatian Roxolani against the Bosporan Kingdom. At the same time, Skiluros reconstructed Neapolis Scythica, which had been devastated by fire around 130 BC, probably in the wake of a Sarmatian attack. On the acropolis he built a heroon, a shrine in the shape of a Greek temple, in honour of his predecessor Argotos, a fortified palace and his own mausoleum which was later converted into a tower as part of the fortifications.[356] But both Chersonesos and the Bosporan Kingdom appealed to Mithridates VI of Pontus for help against Skiluros. Mithridates responded by sending an army under his general, Diophantos. Skiluros died before the onslaught in 114/13 and his son and successor **Palakos** (r. 113–111/110) was no match for the Pontic army. As Strabo reports,[357] he and his Roxolani allies suffered several crushing defeats by Diophantos who relieved Chersonesos, conquered Kerkinitis and Kalos Limen and utterly destroyed Neapolis Scythica.

By minting his own coins Skiluros had tried to give his unstable 'empire' more secure structures. It was also Skiluros who came up with the famous metaphor of an unbreakable sheaf of arrows or spears as a symbol of unity. As Plutarch reported, when Skiluros appointed Palakos as his designated successor, he called together his 80 sons or tribal leaders. He first asked them to break 80 arrows bundled together, a test they all failed. After this he effortlessly broke each arrow individually and told them that united, they would be invincible but individually they were easy to defeat.[358] Skiluros and possibly also Palakos were buried in the large mausoleum of Neapolis Scythica, where in 1946 72 other buried persons were found.[359] The final Scythian ruler known by name was **Saumakos**, who briefly took power in the Bosporan Kingdom in 108–107 BC, before Diophantos ousted him. After defeats against the Bosporan king Aspurgos (r. 10/11–37/8 AD), against the Roman legate Silvanus around 63 AD,[360] and against the Sarmatian kings of the Bosporan Kingdom, Lesser Scythia and the settled late Scythian culture vanished from history. It was previously believed that the Goths delivered Neapolis Scythica the final death blow in 255/56, but the archaeologist directing its excavation since 1999, Juri Zaytsev, attributes its final destruction to Alan groups in the year 218.[361]

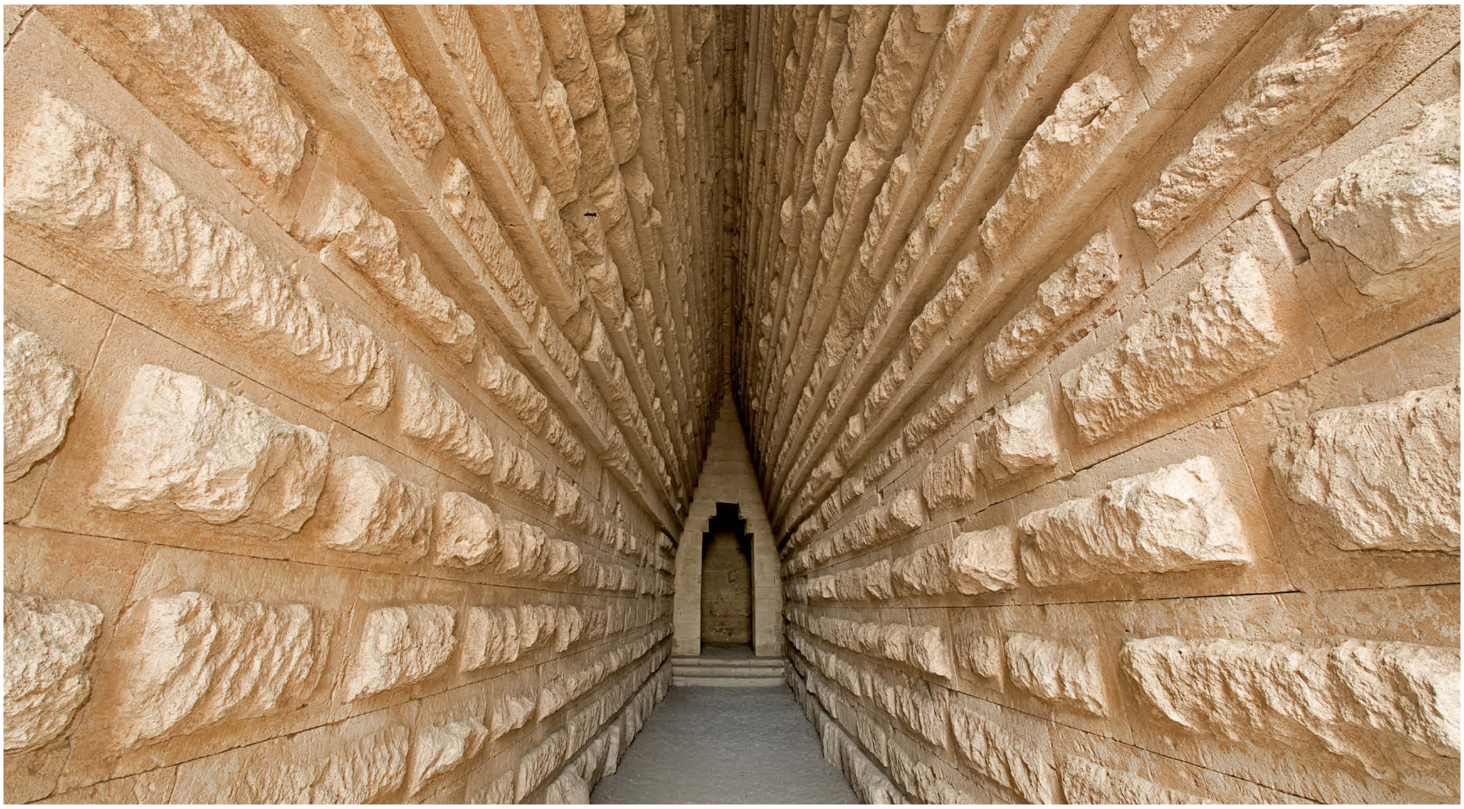
2.3.4 Greek influences on Scythian toreutics and grave architecture

The intensive contact between Scythians, later Sarmatians, and Greeks shaped the art of the nomadic horsemen, especially their goldsmithing. As a result a dazzling kaleidoscope of cultural artefacts developed in the region around the Bosporan Kingdom, which brought together Greek–Ionic, Thracian and Scytho–Sarmatian cultural elements. Under Greek influence Scythian depictions of animals became more naturalistic, not least through their representation in semi-profile; in this way they lost some of the earlier distinctiveness of the animal style with its ability to emphasise significant characteristics of the animal portrayed.

Additionally, the animal figures were supplemented with anthropomorphic motifs, which had been largely absent from the early Scytho–Siberian animal style. The Greco–Scythian depictions of humans showed a markedly authentic and detailed reproduction of facial features, which set them apart from the more idealised and elevated Greek portrayals. In terms of content, griffins and winged horses increasingly appeared in Greco–Scythian toreutics, as did newly domestic animals such as cows and dogs as part of scenes of daily life. An outstanding example of these innovations is the gold pectoral of Tolstaya Mogila. Between the four twisted coils of the pectoral are, in the outer space, scenes of animals fighting; in the middle, vegetable ornamental patterns; and in the inner space, peaceful scenes of daily life, such as milking cows and sheep and making clothes. Among the anthropomorphic images Scythian deities such as Tabiti, Papaios, Hercules or snake women predominate; to these are added elements from Greek mythology like gorgons, sphinxes, maenads, hippocamps and satyrs. Depictions of



Gold gorytos plate from the Melitopol Kurgan, southern Ukraine, second half of the fourth century BC. The gorytos plate is one of four plates made from the same wooden mould. The two centre friezes show episodes from the life of the Greek hero Achilles; they begin to the left in the upper frieze: The young Achilles is taught how to shoot with a bow; Achilles, dressed as a woman among the daughters of Lykomedes, is exposed by Odysseus as he grabs a sword at the sound of the trumpet; Deidameia, daughter of Lykomedes, in tears; Achilles and Lykomedes. Lower frieze: Deidameia's mother and sisters bid farewell to Achilles; Achilles with Odysseus, Diomedes and Agamemnon at Troy; Achilles's mother Thetis with the urn of her son, who fell at Troy. Ukrainian Museum of Historical Treasures, Kiev.



The 37 m long, 2.8 m wide and 7.14 m high dromos made from worked limestone plates leading to the central vault of Zarskij Kurgan near Kerch, eastern Crimea, first half of the fourth century BC.

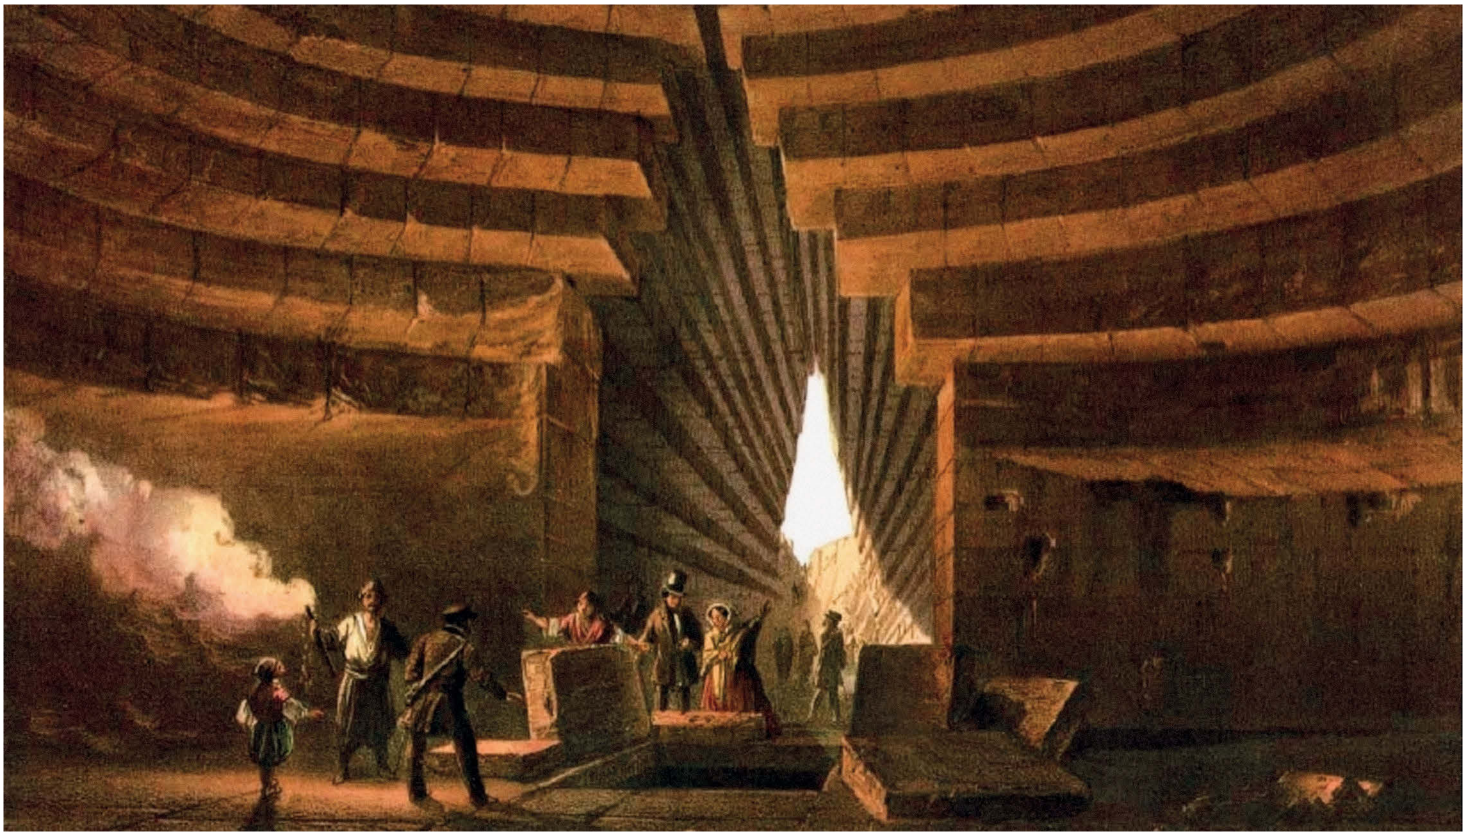


Illustration of the vault of the Zarskij Kurgan near Kerch looking outwards to the dromos; painted by Carlo Bossoli (1815–1884). Paul Du Brux, *Oeuvres* (2010) Vol. II, p. 289.

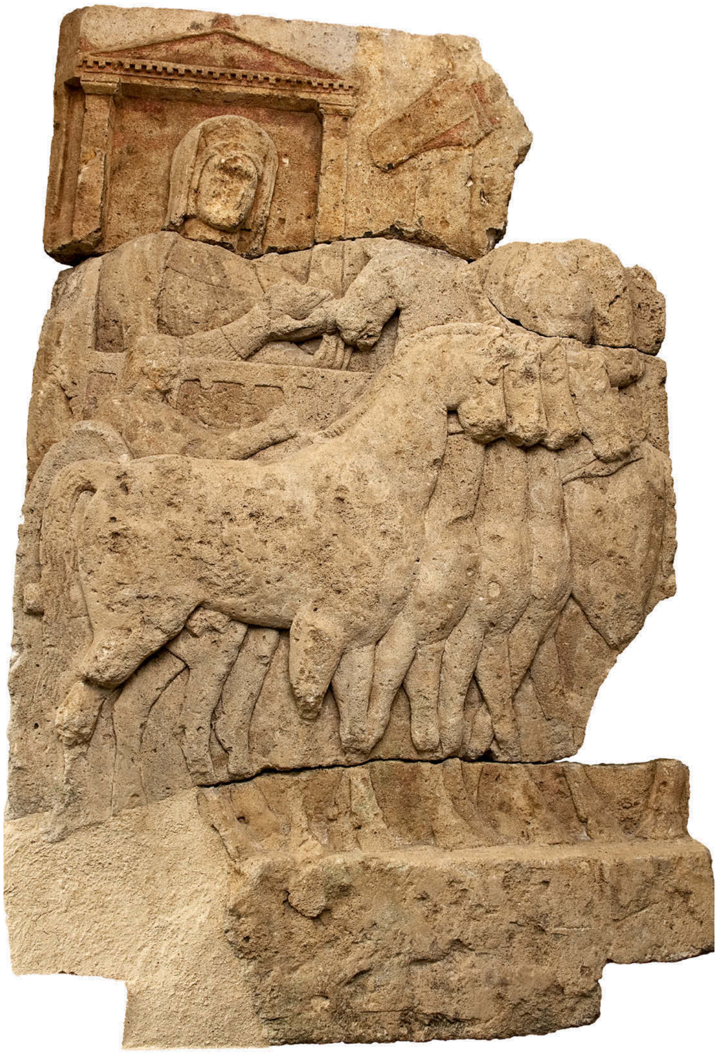
warriors were also very popular, whether in battle or in peaceful situations such as fraternising, conversing, tending to a wounded comrade or receiving dental treatment, as can be seen in the gold vase of Kul Oba.[362] The Scythians also occasionally adopted the common Greek depiction of naked or barely clothed warriors, as can be seen on the gold scabbard of Čertomlyk and the gold gorytos cover plates with scenes presumed to be from the life of Achilles, in particular his discovery by Odysseus on the island of Skyros.[363]

Both plates are striking not only because of the vitality of the depictions but also because of the fact they were made with identical moulds. The scabbard with a battle scene between Greeks and 'barbarians', perhaps Persians, was discovered in three versions, the gorytos cover plate in four, namely, in the royal kurgans of Ilintsy (south-west of Kiev), Čertomlyk (north-west of Kamenskoje gorodišče), Melitopol (south-west of Kamenskoje gorodišče) and in the eighth kurgan of Piat' Brat'ev ('Five Brothers,' near Rostow on the Don). These all date from 350–300 BC and were found far apart from one another. These four gorytoses were crafted in the same, presumably Greek, goldsmith shop, according to Scythian taste. A similar gorytos cover plate made of gold was found in the purported grave of Philip II of Macedonia near Vergina in northern Greece, and it is identical to the silver gorytos of Karagodeuashkh in the Kuban, preserved in fragmentary form.[364]

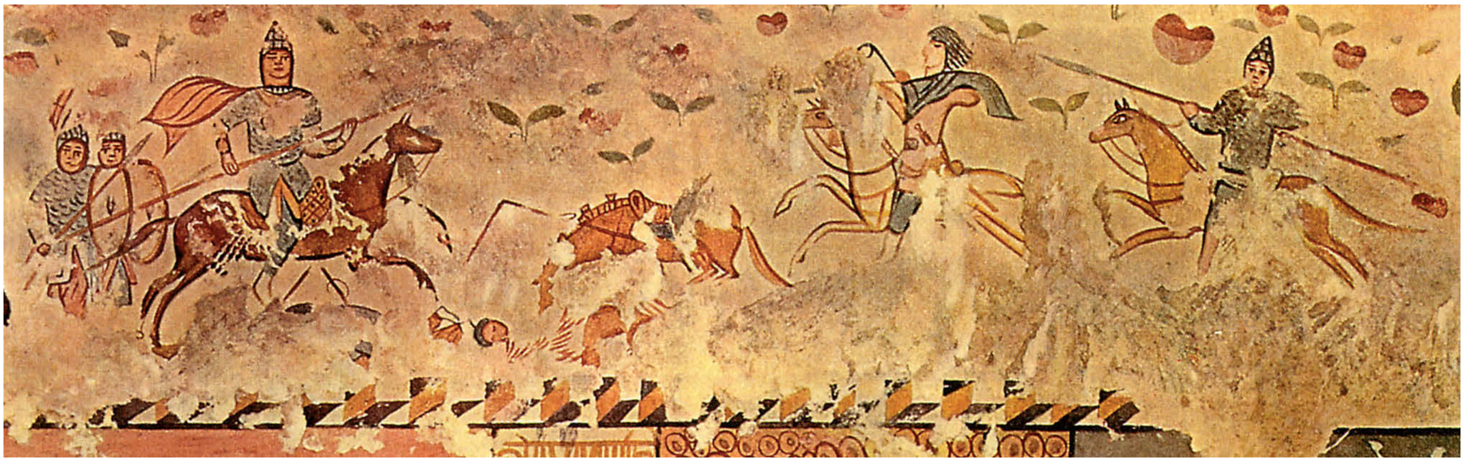
The question of why five different Scythian chiefs had virtually identical objects with a motif from Greek mythology placed in their graves remains unanswered. Were they diplomatic gifts of Bosporan kings or the ruler of Olbia to their powerful neighbours? Or did Scythian leaders identify with Achilles, whose final resting place was said to be on the island of Leuce near Olbia? As Arrian reported in his *Periplus Ponti Euxini*, a temple dedicated to Achilles stood on Leuce, so Olbia served as the last homeland of the greatest Greek hero.[365] In both cases the legend of the war hero Achilles was a shared link between Greeks and Scythians. Given that identical objects have been found in geographically distant but temporally comparable Scythian burials, the hypothesis of A. Shcheglov and V. Katz that the sheaths represent diplomatic gifts to various Scythian tribal chieftains seems plausible.[366]

Scythian grave architecture in Crimea also adopted Hellenistic influences, as had already been revealed in the Oguz kurgan on the Dnieper. At the kurgans from the fourth to third centuries BC within the chora of Pantikapaion a dromos made from smoothed limestone plates layered over one another led to a central crypt with a corbelled vault. Here the dead rested in a huge sarcophagus built of stone. Despite these innovations, the traditional grave goods of weapons and sacrificed horses were not abandoned and the earthen tumuli remained huge. The Zarskij Kurgan for example was 17 m high and had a diameter of 80 m. In a few graves of Neapolis Scythica the Scythians even adopted the Hellenistic and Thracian custom of decorating the walls with paintings. In the paintings, which have been poorly preserved if at all, hunting and sacrifice scenes predominate, as well as solemn depictions of mourners.[367]

A unique piece of Scytho–Greek cultural amalgamation was discovered in 1965 in the largest of the Kurgani Trëkh Bratev, the 'Three-Brothers-Kurgans', located west of Nymphaion which had been conquered by the Bosporan Kingdom in the late fifth century BC. In tomb 1 of kurgan 1 dating from *ca.* 300 BC a noble Scythian woman was buried, together with a sacrificed juvenile servant and a horse. Within the burial chamber made from limestone plates

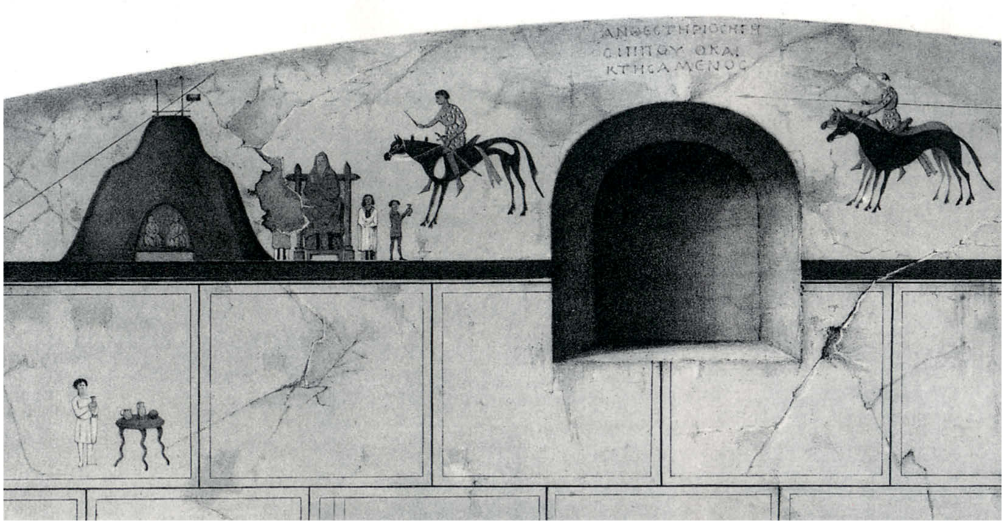


Stone stele from the 'Three-Brothers-Kurgan' in eastern Crimea, *ca.* 300 BC. The stele, 286 cm high, 165 cm wide and weighing 1.4 tons, was erected in honour of a noble Scythian woman and shows the presumed consecration of a dead warrior as hero by a female deity, possibly Demeter. Lapidarium, Kerch.



Sarmatian armoured rider with a long lance held with two hands, called a kontos, and two armoured warriors on foot (left) in combat against a likewise armoured and an unarmoured rider (right); in the centre a fallen attacker lies on the ground. Mural on the southern side of the grave chamber of the 'Kurgan of 1872', Kerch, Crimea, Ukraine, first century AD. Watercolour by M.V. Farmakovskij from 1909.

Mural on the eastern wall of the grave chamber of Anthesterios, Kerch, Crimea, Ukraine, first century AD. The murals, discovered on private property in 1877 and then sketched, were intentionally destroyed by the owner of the property and the vault of the grave chamber was deliberately brought to collapse. An armoured rider is portrayed approaching a tent with a long lance leaning against it. At the left a gorytos hangs from a tree branch. Two figures sit in the tent and a woman is enthroned beside it while two children bid the rider welcome. Further to the right a second armoured rider holds a lance and a spare horse. The scene may symbolise the return home of a fallen warrior. Tinted drawing by F.I. Groß from 1877. Archive of the Museum of Kerch.



she rested on a stone bed, a *klinai*. She wore a kalathos, the typical high headgear of Scytho–Sarmatian aristocratic women, and was adorned with rich golden jewellery. She was given offerings of meat and a Pantikapaian coin as obolos for Charon. To the east of the vault, on the lower slope of the tumulus about 2 m above the antique ground level, stood a stone altar and a huge limestone stele. The stele is 286 cm high (including the plug), 165 cm wide and weighs 1.4 tons.[368] It depicts a woman wearing a short kalathos and standing on a quadriga under a funeral *naiskos*, a Greek votive shrine ending in a triangular pediment with an eagle spreading its wings in the centre. Parts of the naiskos show remains of red and yellow painting. A groom leads the four horses drawing the quadriga. From the right side a mounted warrior approaches and the woman hands him a vessel, now lost. Behind the rider stands a column with goryt suspended from it. This is a symbol of the transition from this world to the nether world. The scene is reminiscent of similar representations on small gold plaques and, especially, on the famous felt carpet from Pazyryk. It may represent a chthonic deity such as Demeter welcoming a deceased chief into the afterlife and consecrating him as hero. One may surmise that the buried noblewoman was a priestess and that the wooden wagon that was usually part of an aristocratic female Scythian burial in the Pontic area, but absent here, was represented by the quadriga.

Conversely, cultural elements from the nomadic riders also entered Bosporan art, especially during the time of the Sarmatians. In several graves of Hellenistic design on both sides of the Cimmerian Bosporus from the era around the birth of Christ not only are there grave goods from the world of the Scythians such as sacrificed horses and dogs, harnesses, light wagons and weapons but murals painted in a late Hellenistic style showing, beside classical

Greek scenes such as the abduction of Persephone by Hades, many motifs from the worlds of the nomadic horsemen. Among these are duels of Sarmatian mounted warriors armed with long lances, combat between cavalry units, and mounted archers. They also depict the return of dead armoured riders to their tent, with a lance leaning against its top and a gorytos with a bow hanging from a nearby branch.[369]

Scythian cultural influences spread further to the west in the seventh to the fourth centuries BC, whether though contact in the region on the lower Danube inhabited by Thracians or through immigration into the Danube–Tisza region in what is now Hungary. Here the elements of the Scythian triad – horse harnesses, weapons and animal-style objects – are found in many kurgans of the elite of the warrior horsemen. In view of the nearby rich sources of gold, it may be presumed that local goldsmiths produced the gold objects following examples of steppe art. With the invasion of the Celts this distant offshoot of the steppe art of the nomadic riders disappeared.[370]

2.4 Sarmatians, Alans and Amazons

> The Sarmatians do not live in cities; they do not even have fixed residences. They are a warlike tribe, free, unconquered and so cruel and barbaric that even the women take part in war just as the men.
>
> **Pomponius Mela**, first century AD[371]

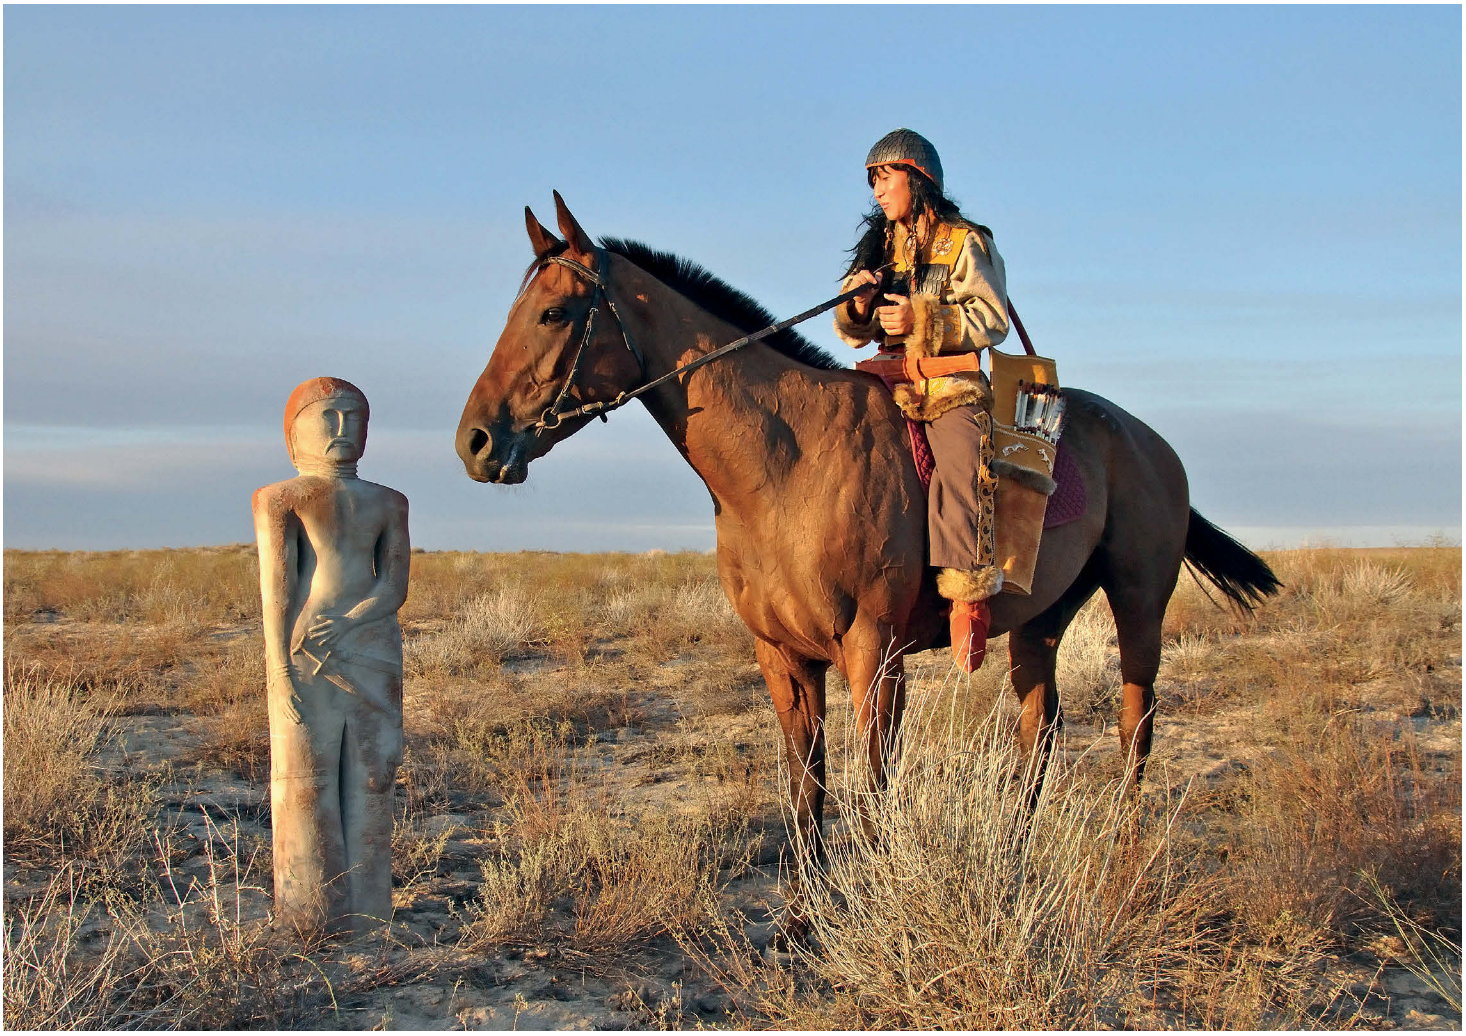
The presumable forerunners of the largely Indo-European Sarmatians, who were not a unified ethnic group or even a federation but rather a loose group of Iranian-speaking tribes, were the Sauromatians referred to by Herodotus, who lived east of the Don; that is, east of Scythia. At the time of the Persian invasion of Darius I they were allies of the Scythians and placed themselves under the command of the Scythian viceroy Skopasis.[372] In the seventh–fourth centuries BC the Sauromatians and early Saka who lived between the Don and the Ustyurt Plateau of western

Chalk formation called 'Tchink' at twilight, near Bozzhira on the Ustyurt Plateau, Mangyshlak Peninsula, western Kazakhstan.

Kazakhstan formed the hinge between the Siberian Scythians and Saka on one side and the northern Pontic Scythians on the other. The militaristic character of the Sauromatians and their relation to the Scythians can be seen in the origin myth recounted by Herodotus. According to this myth, Greeks in Asia Minor defeated Amazons at the Thermodon River, 50 km east of the modern city of Samsun, taking many of them prisoner and carrying them off in ships. The Amazons broke free, however, and threw the Greeks into the sea, after which they landed on the northern coast of the Sea of Azov. There they stole horses and plundered the area. When the Scythians noticed that the armed invaders were women, they sent young men to seduce them. They joined together and occupied the steppe east of the Don. The women maintained their warrior lifestyle, however, and their masculine garb, and the Sauromatians emerged from their union with the Scythians.[373]

2.4.1 Sauromatians and early Sarmatians between the Volga and the Ustyurt Plateau

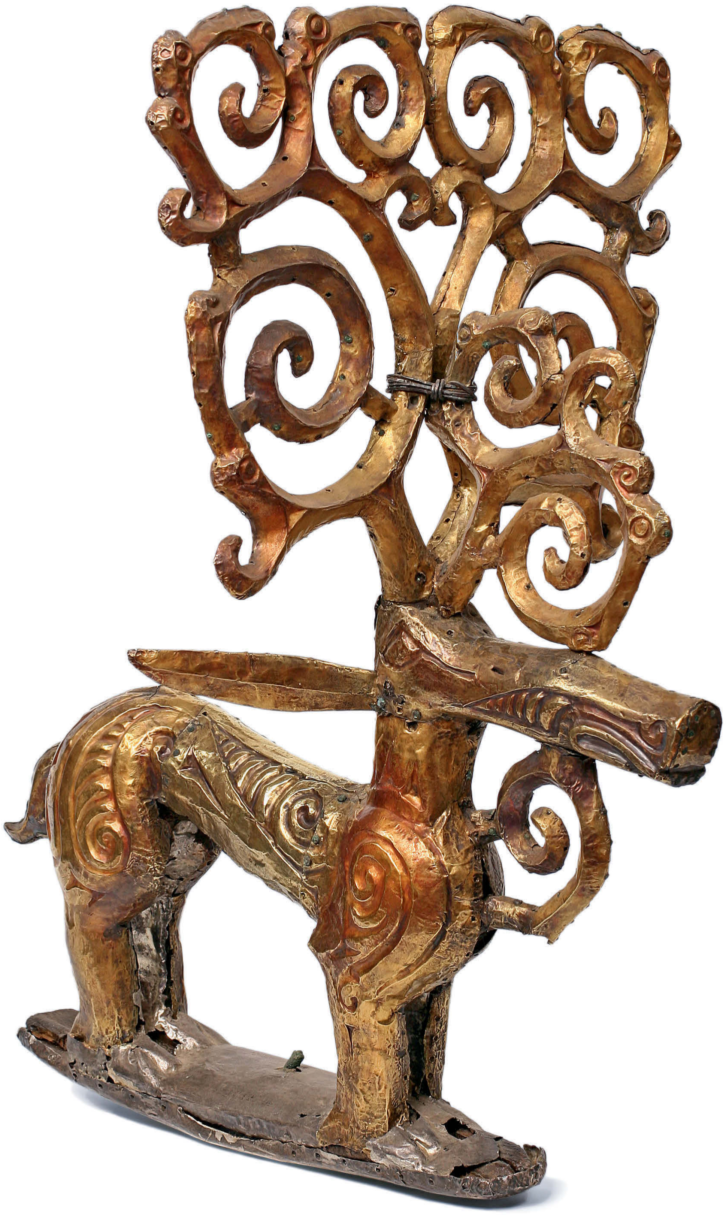
Like the Scythians, the Sauromatians and early Sarmatians had no written language, so we are dependent on Greek and Roman sources, as well as archaeological evidence. The group of early Sarmatians furthest to the east lived nomadically on the Mangyshlak Peninsula and the adjacent Ustyurt Plateau, where the landscape 2,500 years ago was less barren than today. At the time one of the trade routes that linked the Don and the Volga with Choresmia and Bactria ran through the corridor between the Caspian Sea and the Aral Sea. Presumably these early Sarmatians were related to Herodotus's Massagetae and the tribal federation of the Dahae. In the mid-third century BC the Parni, a member of the federation of the Dahae, moved south under the leadership of Arsaces and conquered Parthia, where they founded the dynasty of the Arsacids and later began the conquest of Iran.



Sarmatian stone statue with girded akinakes and a rider wearing a reproduction of Sarmatian equipment. Baite, Mangyshlak Peninsula, western Kazakhstan, fourth–third centuries BC.

The most visible traces of the early Sarmatians are over 100 large masculine stone statues. Some of these are life size, while others are up to 4 m tall. The stone figures stand in the steppe near a dozen circular stone shrines, either alone, paired or in groups of up to 32 statues. Presumably they represent honourable deceased people, who were venerated as ancestors and to whom sacrifices were brought. Two groups of statues may be distinguished. In the older type the figure is quite flat, the head is tilted slightly to the side and the bent arms frame the upper body; an akinakes hangs from the belt. The Kazakh archaeologists Samashev and Astafjev associate these stone warriors, which sometimes stood beside an altar of sacrifice within a kurgan-shaped stone shrine with a domed roof, as at Tubezik 2, with the Massagetae of the fifth–fourth centuries BC.[374] The stone men of the second type from the Sarmatian period, such as at Teren, Konaj, Kyzylujik and Baite, come from the fourth–third centuries BC and are strongly reminiscent of Scythian stone statues. They wear flat caps and have moustaches, and from their belts hang an akinakes in front, a double-edged, straight long sword on the right and a gorytos with a bow on the left.[375] A few of the stone statues are decorated with typical Sarmatian *tamgha*, the tribal sign or seal used by stockbreeders to brand cattle or lay claim to a pasture, spring or shrine.

The princely necropolis of Filippovka at the confluence of the Ilek and Ural rivers, about 150 km south-west of Orenburg, comes from the transition period between the Sauromatian and early Sarmatian cultural phases at the turn from the fifth to the fourth century BC.[376] Perhaps the representatives of the culture of Filippovka were also related to the mysterious Issedones of Herodotus.[377] The arrangements of the kurgans in the landscape was not coincidental; if one connects the 18 kurgans in the centre with a line, it forms the outline of a strung bow with an arrow aimed to the north. The largest kurgan 1 forms the notch at the end of the arrow and kurgan 17 its head.[378] The kurgans were family crypts, which were reopened as needed. Despite earlier grave robbing, archaeologists found spectacular gold objects in kurgan 1, including 26 deer-like hybrid creatures. The creatures, up to 52 cm tall, were made of sheets of gold covering a wooden core.[379] They consist of the body of a deer or a big cat and the head of a teeth-baring wolf and have large antlers with volute-like points that sometimes culminate in birds' heads. Spiral patterns form the transition from the body to the fore- and hind legs. In this way these fantastical, majestic hybrids unite the three most important animals of the Scythian Altai; namely, the deer, the predatory cat and the bird of prey, and they must have had a special symbolic significance. Even though these creatures recall similar hybrids from Pazyryk and Berel, they exude a uniqueness.



Deer-like hybrid animal with the body of a carnivore and a huge wolf's snout. Gold leaf applied over a wooden core. Filippovka, kurgan 1, eastern bank of the Ural River, central Russia, early fourth century BC. Archaeological Museum Ufa.

In burial 2 of kurgan 4 a fully armed warrior was found displaying the equipment of a heavily armed Early Sarmatian horseman. He wore iron scale armour and an iron helmet with nose and cheek protections. His offensive weapons consisted of a composite bow and a quiver filled with more than 200 arrows, an iron akinakes with a golden, butterfly-shaped crosspiece and a gilded handle decorated in the Animal Style featuring hunting and sacrifice scenes, an iron battleaxe and a 3.2 m long spear with a massive iron head.[380]

2.4.2 Sarmatians and Alans on the Black Sea and in the Roman Empire

The fourth century BC saw the final wave of migration of Iranian-speaking Indo–European tribes from the east to the west. The migration lasted half a millennium and carried a few of them as far as England and North Africa. The collective term 'Sarmatian' does not characterise a specific ethnicity but rather numerous tribes of nomadic horsemen who spoke the same language and had comparable lifestyles, weapons and handicrafts, which differentiated them from the Scythians. The triggers for this migration, which expanded the territory of the originally Central Asian nomadic riders as far as the Atlantic, were many. Among the 'push factors' were the Central Asian expedition of Alexander, the spread of the Xiongnu mounted warriors to the west, a drying of the climate of the northern Caspian region and perhaps demographic pressure. The most important 'pull factor' was the power vacuum among the Pontic Scythians following the death of King Agaros. This westward movement became discernable when Sarmatian tribes of the Prokhorovo Culture west of the Urals crossed the Don and infiltrated the regions of the Kuban and the northern Pontic steppe.[381] In the Kuban the Sarmatians coexisted with the native Maeotae; in the northern Pontic region they assimilated the majority of the Scythian tribes that did not flee to Crimea.

Over the course of the centuries scanty Greek, Bosporan and Roman sources recorded some two dozen names of Sarmatian tribes. A snapshot from the mid-second century BC reveals the following picture:[382] The Siraces occupied the Kuban from the fourth century BC until about 200 AD.[383] North of the Siraces, between the Don and the middle Ural, lived the Aorsi, who, according to Strabo, could mobilise more than 200,000 mounted warriors. Around the time of the birth of Christ they were partially assimilated by the Alans, who were related to them and were advancing out of the Syr Darya region. West of the Aorsi, between the Don and the Dnieper, lived the Roxolani, whose name means 'bright Aryans' or 'bright Alans', and north-west of them, on the right bank of the middle Dnieper, the Urgi. The Saii and the 'Royal Sarmatians', who may have had a level of sovereignty over all Sarmatian tribes west of the Dnieper, settled south of the Urgi.

The Iazyges lived south-west of the Royal Sarmatians, in the delta of the Bug, and thus on the border of Lesser Scythia. In the first century BC the Iazyges began advancing towards the south-west and reached the Hungarian plain between the Tisza and the Danube in the mid-first century AD.

The Kuban region was populated by a mixture of people consisting of Greek immigrants, Sarmatian Siraces and the various native tribes of Maeotae, who were mostly settled and practised farming. A few of the Maeotae tribes, such as the Ixomates, were notorious for their bellicosity.[384] The story told by the Greek rhetorician Polyainos (second century AD) about Queen Tirgatao

The grave, discovered in 1987, of a princess of the Sarmatian Aorsi killed by an arrow. Kobiakovo near Rostov, southern Russia, end of the first/beginning of the second century AD.

On each side three anthropomorphic figures with monkey heads wrestle playfully with a winged dragon, which could indicate a Chinese influence. Regional museum of Rostov.

exemplifies their abilities in battle. After the Bosporan king Satyros I (r. 393/92–389/88 BC) had enabled the deposed king of the Sindi, another tribe of the Maeotae, called Hekataios, to return to the throne, he gave him one of his daughters as a wife. Satyros then ordered Hekataios to kill his first wife, Tirgatao. Tirgatao fled to her tribe, the Ixomates, and roused them to war. The Ixomates laid waste to the land of the Sindi and sacked the Bosporan city of Georgippia. Only when Satyros and Hekataios paid an enormous tribute did Tirgatao agree to make peace.[385]

Siraces: The Siraces interfered with the politics of the Bosporan Kingdom several times, first in 310/09 in the above-mentioned fratricidal war between the legitimate crown prince Satyros and the rebel Eumelos. Although Eumelos, who had the support of the king of the Siraces, lost the battle against his older brother and his Scythian allies, Satyros died soon thereafter and Eumelos assumed the throne.[386] This war showed that the Bosporan Kingdom threatened to devolve into a pawn of Scythian and Sarmatian interests. The Siraces were the most Hellenised of the Sarmatian tribes; many of them were settled and carried out intensive trade with the Bosporan cities and, via the Armenians, with Mesopotamia and India. In the later wars the Siraces were often on the losing side, first in 47 BC at the battle of Zela, where their king Abeakos and his ally King Spadinos of the Aorsi fell to Caesar. Around the time of the birth of Christ the Siraces had to move southward hard pressed by the more numerous Aorsi, so they fought another intra-Bosporan war against their northern neighbours in 40 AD. In the brutal war they supported the Bosporan Mithridates VIII, who opposed Rome, against the alliance with Rome and the king of the Aorsi Eunones formed by the challenger Cotys I. In 45 AD the army of Rome and the Aorsi won an overwhelming victory and the Siraces quickly became insignificant.[387]

Aorsi: The victory of Rome and the Aorsi in 45 AD secured the supremacy of the Aorsi. They lived in the broad delta of the Don and the northern forest steppe, where in the early third century BC they had driven out the Scythians and destroyed their fortified settlements.[388] The Aorsi were the largest Sarmatian tribe and constituted their own federation. Archaeological discoveries suggest that the Iranian-speaking Aorsi advanced in more than one wave from the territory of the Massagetae, between the Caspian Sea and the lower reaches of the Syr Darya, to the Don and thus spread their Central Asian culture, which included Chinese elements in the decoration of weapons, to Northern Europe. During the early seizures of land the Aorsi often buried their deceased leaders in existing Scythian kurgans,[389] but beginning in the mid-first century AD they built their own earthen tumuli over individual graves. The dead were placed diagonally in square grave chambers, whose corners were oriented to the four cardinal directions, with their heads pointing south. The Sarmatians, like the Scythians, worshipped the sword. Despite their clearly militaristic character, however, the Sarmations rejected human sacrifices at burials, and largely abandoned animal sacrifices as well.[390]

Among the most famous of the kurgans of the later Aorsi are those of Datchi south of Azov, Kobiakovo near Rostow and Khokhlach north of Azov, all of which were erected from the end of the first to the start of the second centuries AD. Aristocratic women were buried in the latter two. In Kobiakovo the grave is that of a princess killed by an arrow, and a Chinese mirror was placed within it.[391] The grave in Khokhlach is that of a noblewoman who may have had a religious role.[392] These and other elaborate burials of women of the Aorsi underscore the high status of women in Sarmatian society.

As Rostovtzeff was the first to point out in the 1920s, the polychrome animal style of the Sarmatians, particularly that of the Aorsi and the Alans, should be distinguished from the classical animal style of the Scythians.[393] The polychrome gold work continued the technique, begun with the gold figurines of Čilikty and further developed with the appliqués of Pazyryk, of emphasising certain body parts such as eyes, ears, hooves, paws, shoulders and pelvic muscles with colourful inlays of garnet, carnelian, coral, turquoise and coloured glass. Added to these were hump-shaped depictions of animals as additional decorative elements, of which the dagger sheath from Datchi 1 is a fine example, as is the decoration of the knob of long cavalry swords with jade inlays. Other swords had a disc-shaped knob made of quartz or chalcedony. These innovative knob decorations were

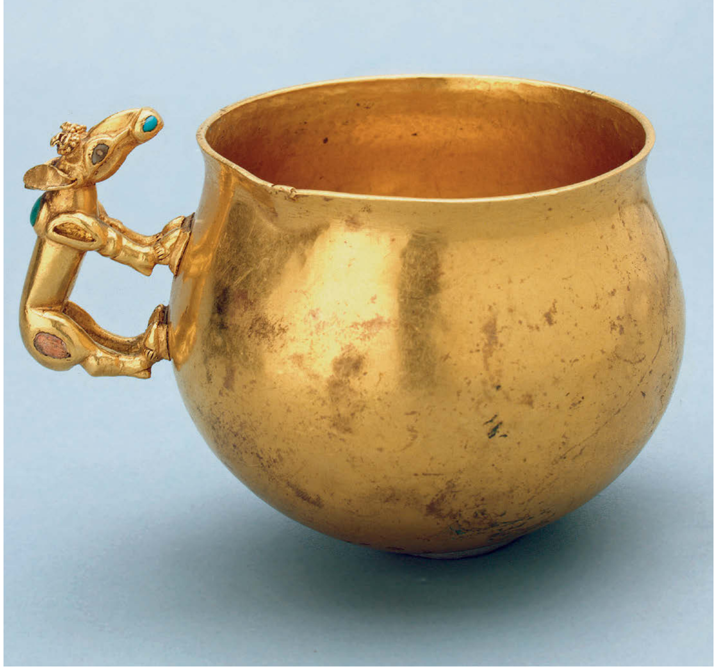
found more frequently among the Aorsi and Alans beginning in the second century AD and indicate influence from China.[394] The custom of intentionally deforming the skull by flattening the back and raising the forehead, seen at the same time among members of the upper class of the Aorsi, also had its origins in eastern Central Asia.[395]

Alans: The nomadic horsemen who immigrated in the first century AD were the Europid Alans. They assimilated the Aorsi settled on the Don and, drawn by new pastures and potential targets for pillaging, spread westwards together. The scenario is suggested not only by Ptolemy (*ca.* 100–175 AD), who wrote about Ἀλανορσοι, 'Alanorsoi', but also by Chinese sources. In the *Shiji* Sima Qian (*ca.* 145–*ca.* 87 BC) described the land of Yancai: 'Yancai lies some 2,000 li [832 km] north-west of Kangju [whose capital was near present Tashkent]. The people are nomads … and the country has over 100,000 archer warriors, and borders on a great shoreless lake.'[396] The delta of the Syr Darya River, which empties into the Aral Sea and where the homeland of the Massagetae lay, is exactly 830 km away from Tashkent. The chronicle called the *Hou Hanshu*, which records the events of the Eastern Han Dynasty (25–220 AD), adds: 'The kingdom of Yancai has changed its name to the kingdom of Alanliao.'[397] Thanks to the Chinese chronicles it is clear that the Alans, who were originally called 'Yancai' and in the first half of the first century AD changed their name to 'Aryan' or 'Alan', came from Central Asia; their modern descendants are the Caucasian Ossetians. The relative geographic proximity of Alanliao to China and a joint Sino–Alanian military campaign against the Xiongnu conducted in 36 BC[398] explains why the Alans were aware that members of the Chinese elite decorated the knobs of their swords with jade inlays.

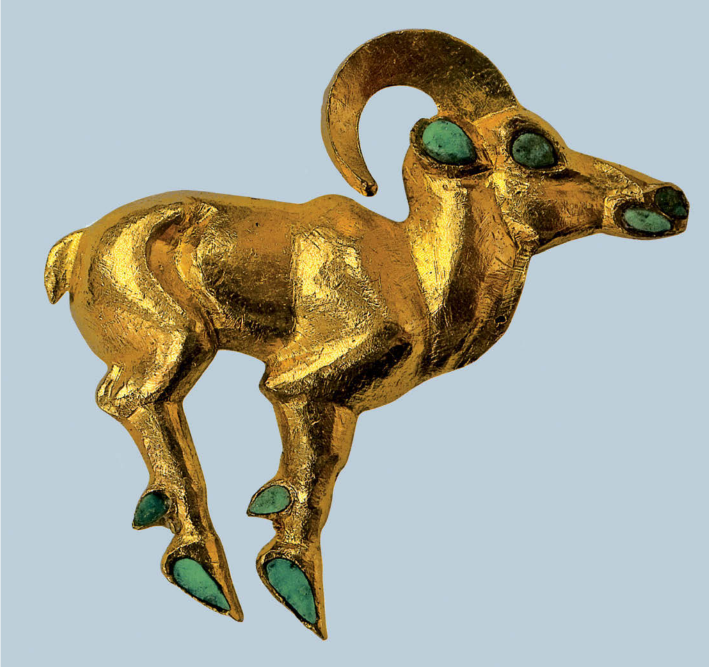
Early on, around 73 AD, the Alans laid waste to Media and Armenia. When they again plundered Armenia 60 years later and threatened Asia Minor, they were driven out in 135 AD by the historian and governor of Cappadocia Arrian. Arrian was helping Emperor Hadrian (r. 117–138) to expand the Roman army, which consisted almost exclusively of infantry, by adding units of heavy cavalry. The Alans must have been seen by the Romans as the most dangerous of mounted warriors, since Arrian wrote a work on strategy called *Acies contra Alanos*, the 'Order of Battle against the Alans'.[399] Thanks to their military power, the Alans controlled the trade routes of the steppes with the east. The Alans buried their dead in narrow grave chambers and laid them on benches with their heads oriented toward the north.[400]

Roxolani, Saii and Iazyges: The Roxolani, the 'bright Aryans', lived between the Don and the Dnieper, and west of them lived the Saii, the Royal Sarmatians and the Iazyges, who in the third and second centuries BC either assimilated the Scythians or drove them into Crimea. Like the eastern Sarmatian tribes they intervened with varying success in the fortunes of the Bosporan Kingdom. In 179 BC the king of the Saii, Gatalos, succeeded in demanding tribute from the city-state of Olbia, but the strengthened Scythians were soon able to return Olbia to their sphere of influence.[401] However, in 113–111/110 BC, the Siraces, the Roxolani and their Scythian ally Palakos suffered severe defeats from Diophantos. Under pressure first from the Aorsi and later from the Alans, the western Sarmatian tribes began at the end of the first century BC to cross the Danube and test the defences of the Roman Empire. The first invasions of the Iazyges took place in Macedonia in 18 BC, after which they drove the Dacians out of the Hungarian plain between the Danube and the Tisza and established themselves there as a Roman client state. With the Iazyges for the first time an originally Central Asian tribe settled in the Roman Empire; others soon followed. Rome hoped to be able to defend itself against other threatening barbarian invasions with the help of the Iazyges.

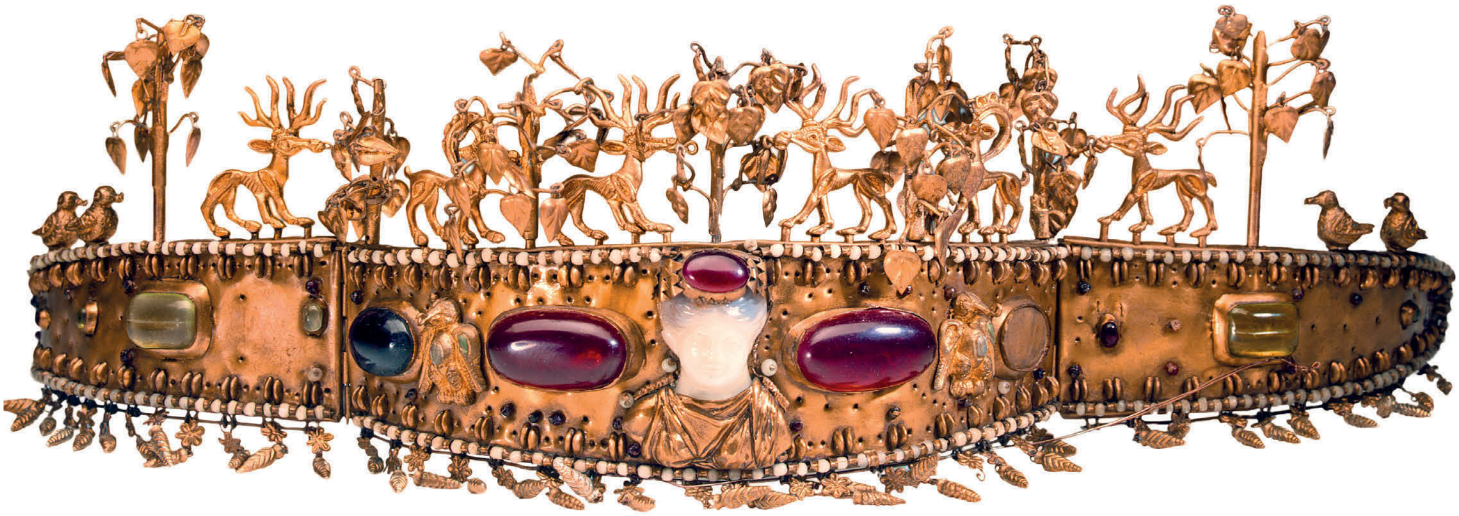
On the heels of the Iazyges followed the Roxolani, who were defeated by the Roman legate Silvanus in 60–63 AD, and 100,000 of whom settled north of the Danube. The Roxolani remained restless; in 69 they were defeated in Moesia south of the Danube, after which they supported the Dacians in the second Dacian war of 101–106. Iazygian units fought on both sides, with one group



Sarmatian gold vessel with a zoomorphic handle from the Khokhlach Kurgan of Novocherkassk, Rostov Oblast, southern Russia, end of the first/beginning of the second century AD. The elk turned toward the rim of the vessel had an apotropaic function and symbolically guarded the contents. The State Hermitage Museum, St. Petersburg.



Small gold figure with inlaid turquoise of a wild sheep from the kurgan of Čilikty, eastern Kazakhstan, seventh–sixth centuries BC. Central State Museum of the Republic of Kazakhstan, Almaty. The gold objects with incrustations of semiprecious stones show that the Sarmato-polychrome animal style developed in eastern Kazakhstan as early as the seventh–sixth centuries BC.



Complete copy after the original of the diadem, discovered in 1864, of Khokhlach Kurgan at Novocherkassk, Rostov Oblast, southern Russia, end of the first/ beginning of the second century AD. The diadem, made in the Sarmato-polychrome animal style for a noblewoman of the Aorsi, reveals an influence from the Alans, who had migrated from the delta of the Syr Darya. The diadem's band is decorated with garnets, turquoise, pearls and coloured glass; in the centre is an amethyst bust of a woman, while on the upper rim deer approach trees of life. The woman may have worn the diadem during religious rituals. The State Hermitage Museum, St. Petersburg.

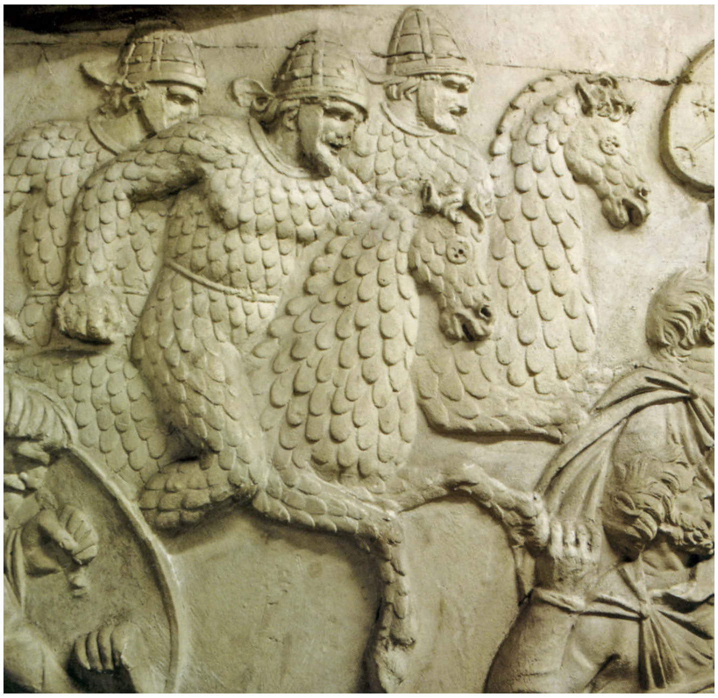
aiming to remove itself from the Roman sphere of influence and the other serving Rome as valued mercenaries. Emperor Trajan (r. 98–117) defeated both Sarmatian tribes, the Iazyges and the Roxolani, and celebrated his success on 'Trajan's column', erected in Rome in 113. In the first Marcomannic war (166–175) the Iazyges allied themselves with the Germanic Marcomanni, Quadi and Vandals against Rome. Emperor Marcus Aurelius (r. 161–180) dealt them a severe defeat on the frozen Danube in 174, after which the Iazyges surrendered and deposed their king, Bana. From then on Marcus Aurelius called himself *Sarmaticus* and the new king of the Iazyges, Zanticus, had to provide 8,000 troops, 5,500 of whom Marcus Aurelius posted to Britain.[402]

About 60 years later the Roman Senate conferred the title *Sarmaticus* on Emperor Maximus Thrax (r. 235–238) as well, after a triumph over the rebellious Iazyges. In the subsequent 150 years groups of Iazyges and Roxolani repeatedly attacked the Roman Empire with varying success; other groups settled throughout the empire, obtained Roman citizenship and served as heavy cavalrymen in Rome's armies. At the end of the fourth century they lost their cultural identity but remained active as mercenary units.

At the start of the third century AD a new power appeared in the northern Black Sea region, the eastern Germanic Goths, who first destroyed the cities of Olbia, Gorgippia and Tanaïs and in 271 occupied the province of Dacia, which had been evacuated by Emperor Aurelian (r. 270–275). Thus they formed a wedge in the territory of the Iranian-speaking tribes and separated the Sarmatians living in the Hungarian plain from the Aorsi and Alans who remained on the Don. 300,000 Sarmatians are said to have fled from the Danube region to the Roman Empire in around 334, settling in several Roman provinces.[403] Less than 40 years later another warlike riding people emerged from Central Asia, the Huns.[404] They were, for the first time, not an Indo–European people advancing from Central Asia to the west but rather an Altaic one. The tribal group of the Huns displayed a marked Mongolid heritage and were presumably led by the elite of a Turkic tribe. The Alans were the final Iranian-speaking Europids to migrate from east to west; the Huns were the first Altai-speaking Turko–Mongolids doing this. Even before 375 they defeated the Alans on the Don, who fled to the northern Caucasus. The Huns, purportedly led by King Balamber, incorporated the remaining Alans into their army and advanced farther westwards. In the years 375–76 they defeated first Ermanaric, king of the Ostrogothic Greuthungi, and then his successor, Vithimir. The defeated Greuthungi moved into the territory of the Visigothic Thervingi, who fled to the Roman Empire. Rome's consent for the fleeing Thervingi to cross the imperial border proved to be a catastrophic mistake. The Roman administration was overstrained by the integration of the armed Thervingi, so the latter soon revolted. In 378 the Thervingi and the allied Alans dealt Rome a crushing defeat at the battle of Adrianople, at which Emperor Valens (r. 364–378) and all the high-ranking officers fell.[405]

Under pressure from the Huns advancing into the Hungarian plain, the Alans living there fled, simultaneously with the Vandals, farther west and on 31 December 406, under the leadership of their king, Respendial, they crossed the frozen Rhine at Mainz. The

Alans then pillaged and laid waste to Gaul for three years, after which they split into two groups. One remained in Gaul and in 451 fought on the side of the Roman general Flavius Aetius and the Visigoths at the important Battle of the Catalaunian Fields near Troyes. Together they defeated the Hun king Attila, who had to halt his campaign. Still today the place names such as *Alainville* and *Alaincourt* recall the originally Central Asian Alans, so the written traces of the Alans extend from the almost 2,000-year-old Chinese chronicles to the contemporaneous place-name signs of France.[406] The other Alans moved on in 409 to Spain, where between 416 and 418 they were annihilated by the Visigoths allied with the Western Roman Empire. After the death of their king Attaces the surviving Alans placed themselves under the protection of the Vandal king Gunderic, who from then on called himself *rex Vandalorum et Alanorum*. Ten years later the united Vandals and Alans advanced to North Africa, where they expelled the Romans and founded the North African Vandal state with Carthage as its capital, which stood from 429 to 534.[407] The Alans, who had originally come from the delta of the Syr Darya east of the Aral Sea, were indeed 'well-travelled' and had over the course of some 20 generations covered more than 9,000 km. They left behind a cultural legacy in the form of military innovations and the art of goldsmithing.



Armoured horsemen wearing a 'spangenhelm' on the victory column of Emperor Trajan in Rome, dedicated in the year 113 AD. The very close-fitting armour of riders and horse, as well as the armour on the horse's legs, are an artistic exaggeration.

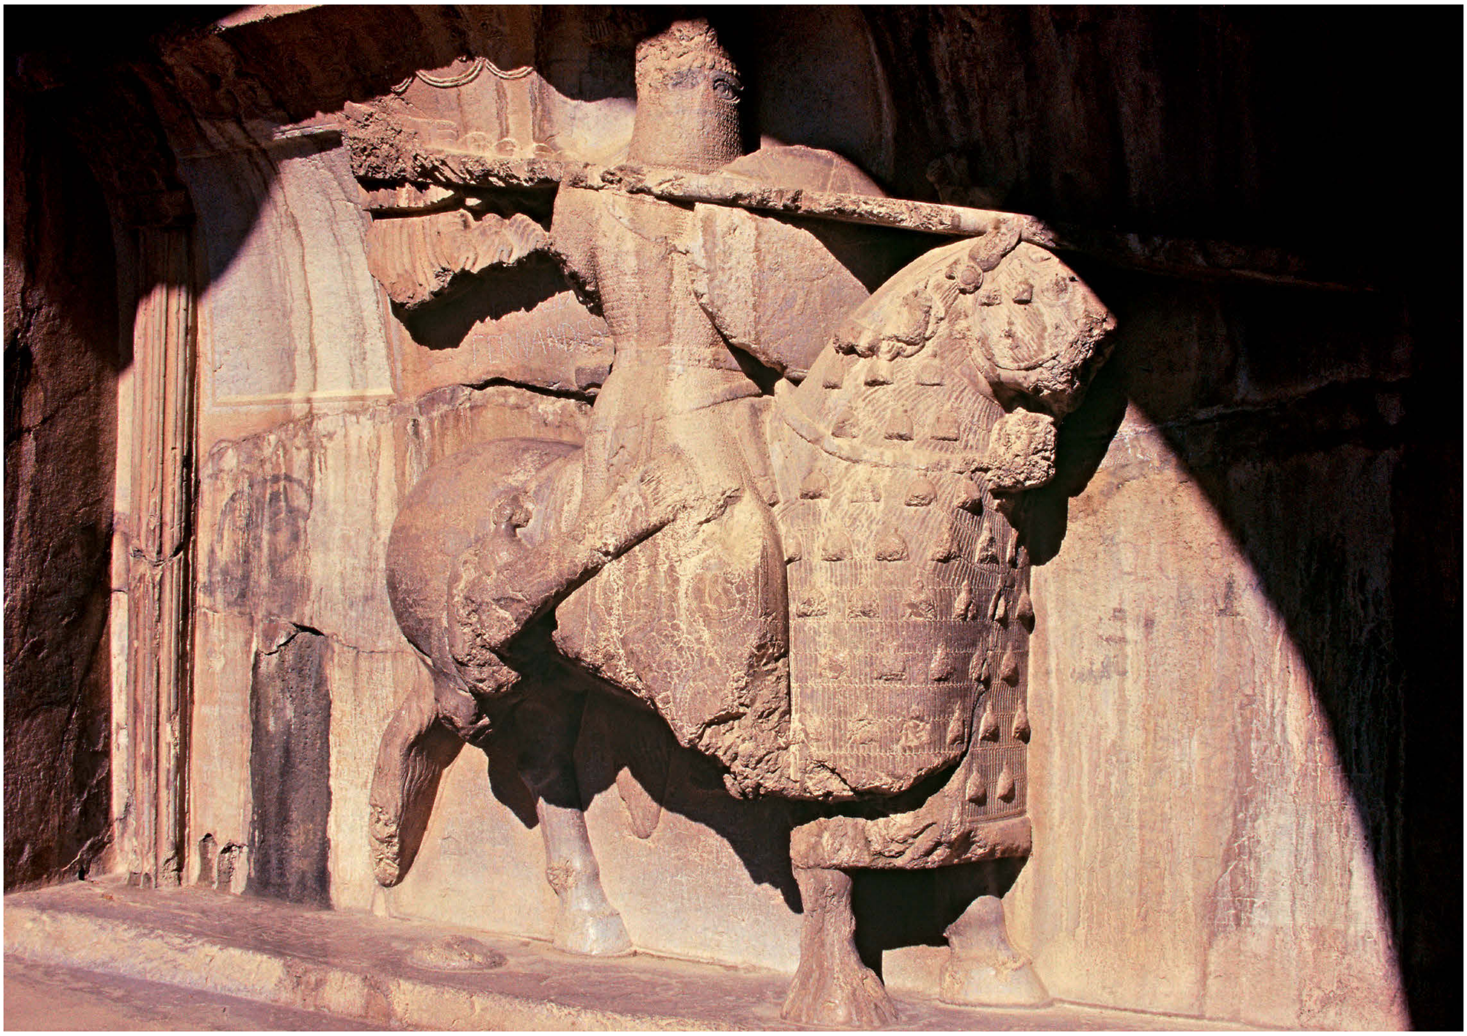
2.4.3 Military innovations

The military successes of the Sarmatians and the Alans were essentially grounded in their new offensive and defensive weaponry. Although the Scythians had already adopted the principle of scale armour from the Assyrians, it was the Sarmatian elite horsemen who extended this technology to create full-body armour. Members of the elite, who made up the heavy cavalry, protected their bodies with iron scale armour; those of the light cavalry, which consisted of common free warriors, used armour made of horn or hardened leather.[408] The Sarmatian riders protected not only themselves but also their horses with scale armour, which covered the horses' bodies and their heads. As Herodotus had already reported about the Massagetae, 'they give their horses bronze breastplates'.[409] The Greeks called them *Hippeis de kataphraktoi*, 'completely armoured horsemen'. Except for arrows shot at close range, iron scale armour protected against arrows shot from a short recurve bow.

This armour offered good protection but also had two significant disadvantages. First, it was enormously heavy, as a warrior's armour weighed up to 30 kg and that of a horse around 45 kg, which impeded the horse's mobility. For this reason armoured riders preferred larger horses than the small and very tough steppe horses.[410] Because of the great weight, horses threatened either to fall on slippery ground or to fall through the ice when crossing frozen bodies of water. As the Roman historian Tacitus (*ca.* 58–120) said on the occasion of a defeat of the Roxolani, the horses foundered on the thawing, swampy ground and the fallen riders could not get up again.[411] Secondly, heatstroke and dehydration threatened the armoured horses, especially in warmer latitudes, which is why the Romans called their fully armoured cavalry units *Clibanarii*, 'oven men'.[412]

Another innovation, the riveted plate helmet called the *Spangenhelm*, appeared among the Sarmatians around the time of the birth of Christ. It consisted of a thick metal band on which were affixed four to six metal strips, the *spangen*, between which were placed triangular metal plates. Metal cheek flaps and a neck-guard made from chain mail offered additional protection.[413] It remains unclear whether the Sarmatians were really the inventors of this type of helmet.

While the composite bow was the main weapon of the light cavalry, the heavy cavalry sported a cavalry sword, up to 130 cm in length, and a lance as long as 5 m, wielded with both hands, called the *kontos*. During a frontal attack the horsemen, riding close to one another, spurred their horses and held their lances level, with the tips far in front of the horses' heads and the ends of the shafts secured by loops to the horses' shanks. According to Plutarch (*ca.* 45–125), an attacking *Kontopharos* could impale two opponents, one behind the



Stone relief of a fully armoured Sassanian rider with helmet, shield and lance. The heavy cavalry of the *Kataphraktoi* were an important military branch not only among the Sarmatians and Romans beginning in the second century AD but also among the Iranian Sassanians (224–651 AD). The stone relief of Takht-i Bostan in the Iranian province of Kermanshah presumably portrays the king of kings Khosrau II (r. 590–628 AD).

other, with a single thrust of the lance. As the chief weapon of the heavy cavalry of the Sarmatians and the Alans was the lance, Arrian called them *Kontophoroi*, 'lance-bearers', rather than *Kataphraktoi*. The Greek light cavalry lance *xyston* or the heavy phalanx lance called the *sarissa* may have served as examples for the early Sarmatians.[414] The Sarmatian armoured horsemen abandoned the Scythian strategy of rapid attacks and retreats accompanied by hails of arrows, in favour of an attack carried out as quickly as possible in order to ensure the shortest possible exposure to enemy arrows. The Sarmatian cavalry units resembled a mounted phalanx. In this way they anticipated the military strategy of the medieval knights, as well as their fundamental weakness, in that a frontal attack could succeed only if the enemy remained in place and engaged them.

The mounted archers adopted three additional tools: the slingshot and the lasso, which Sarmatian female warriors and later the Huns also used, and the windsock, which showed the archers the direction of the wind. It consisted of a lance with a metallic dragon, snake or wolf head at its tip, from which hung a colourful windsock made of cloth. Like the Parthians and Sassanids, the Romans adopted the Sarmatian windsock as a battle standard; they called the bearer of this standard the *Draconarius*.[415] Although the Romans had been confronted with armoured enemy cavalry as early as 190 BC at the battle of Magnesia against the Seleucid king Antiochus III, it was more than two centuries before they formed their own cataphract units. While until Emperor Trajan the Romans had found Sarmatian mercenaries sufficient, Emperor Hadrian established cataphracts as an independent unit of the Roman army for the first time. Now the Roman army, which also adopted the Sarmatian long sword called the *spatha*, used the same weapon system as the menacing mounted warriors of the steppe

Roman marble sarcophagus with scenes of an Amazonomachy, origin unknown, around 200 AD, Harvard Art Museum, Boston.

The Amazons – myth and reality

The Sauromatians 'have a marriage law which forbids a girl to marry until she has killed an enemy in battle'.[416] With this description of young Sauromatian women, who were said to be maternally descended from the Amazons, Herodotus confirmed the myth that female warriors lived in foreign Scythia. The source of this legend goes back to around the end of the eighth century BC, the time of Homer's *Iliad*, in which the Amazons appears only as a footnote to the Trojan War. Only in the post-Homeric epic *Aithiopis* (*ca.* seventh century BC) do the Amazons become more clearly defined, in the form of their queen Penthesilea, a daughter of the god of war, Ares. She fights with her Amazon army on the side of the Trojans against the Greeks, but falls in a duel with Achilles. At that time their homeland was localised on the south-eastern coast of the Black Sea near the Thermodon River.[417] Greek exploration of the Black Sea soon deprived the myth of its basis, so the 'man-killing'[418] Amazons were relocated to the distant Sauromatians even before Herodotus, and the Scythian Amazon myth replaced the Greek one. In Greek art, especially vase-painting, the warrior women were no longer portrayed in Greek clothing but rather in Scythian garb. Now they wore long, patterned trousers, long-sleeved jackets and tall felt caps and were armed with battle axes and bows.[419]

To what extent can archaeology confirm the myth of the Amazons? Did women fighters live in the Pontic region and is there evidence for bands of female warriors, who even formed their own communities that lived independently of men? The oldest evidence of a female warrior comes from the Caucasus, where in 1927 at Semo-Awtchala, Georgia, archaeologists discovered the grave of a 30- to 40-year-old woman, who had been given grave goods of a bronze sword, iron spearheads and a horse's head to accompany her into the afterlife. The woman, who had died at the end of the second millennium BC, had a serious skull wound that could not have resulted from post-mortem trepanning, since the injury had healed before her death. This reveals that she was a genuine warrior and that the weapons had not been laid in her grave in a purely ceremonial context.[420] This female warrior remains an anomaly in the Caucasus, however, like the above-mentioned warrior woman of Ak-Alacha in the Altai.

Discoveries from the Scytho–Sarmatian territory are more revealing. Between the lower Volga and the Ural about 20% of all burials with weapons and horse-gear from the Sauromatian period were of women. In these graves, such as those in the cemetery of Pokrovka 2 in the southern Urals, light weapons like akinakes and arrowheads predominate. Since the female skeletons show clear battle wounds only in isolated cases, it often cannot be determined whether the deceased were hunters or warriors. A greater percentage of armed women, as measured by all female burials, are found in Scythia, where some 130 graves of women from the fifth and fourth centuries BC included weapons as grave goods. About one quarter of the excavated female burials of Scythia contained weapons. Frequent signs of injuries such as serious blows or stabs to the skull or arrowheads stuck in bones show that these dead, who belonged to the tribal elite, were women warriors and often died in battle.[421] The Alans, for their part, did not have female fighters; only in the seventh–eighth centuries AD did weapons begin to appear in the graves of Alan women in the forest steppes along the Don.[422]

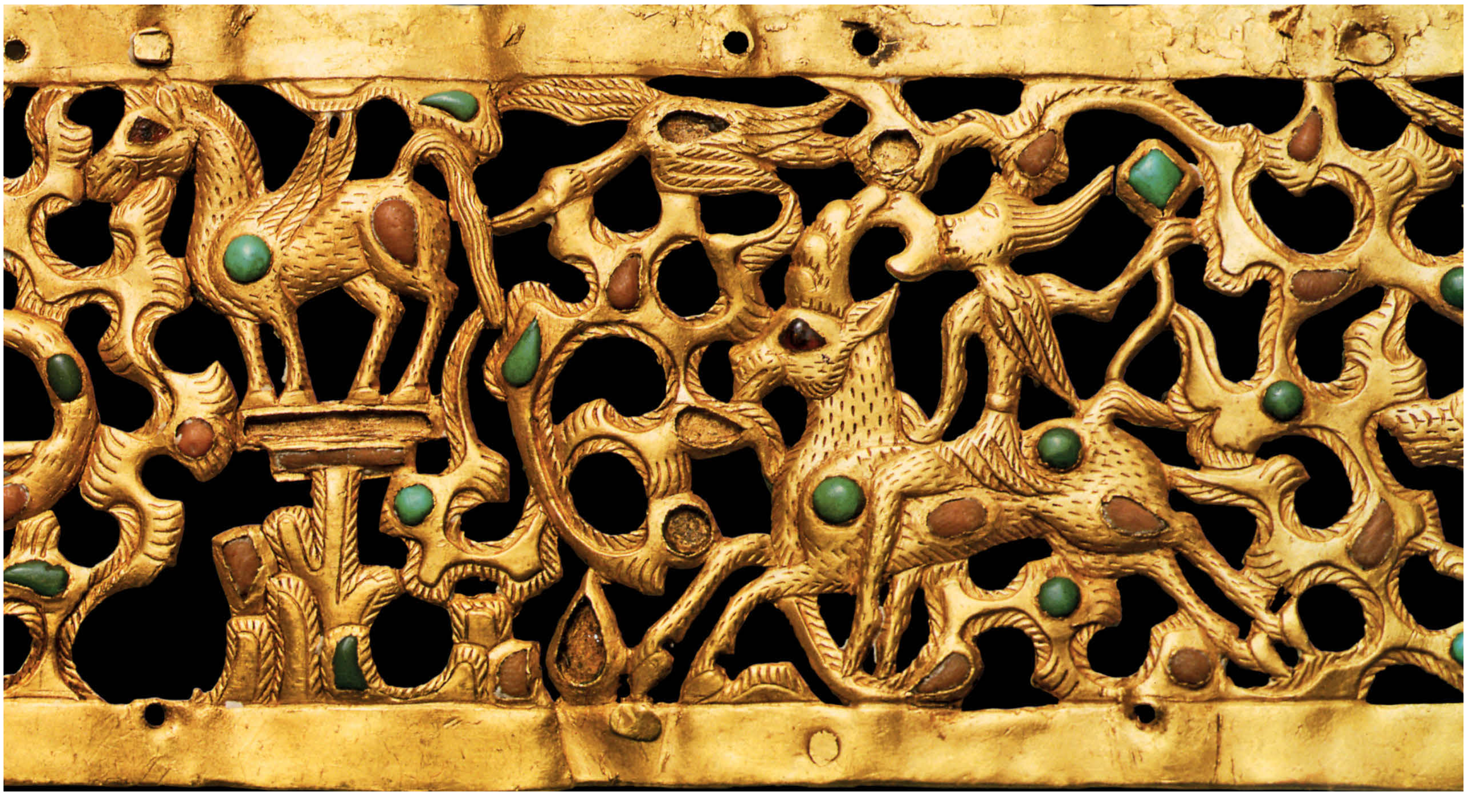
In contrast to the graves of Sauromatian female warriors and hunters, the burials of Scythian warrior women often contained, in addition to arrows and daggers, heavy weapons such as spears, lances and axes. Iron swords have been found in only three graves, however, as have iron scale belts. Two Scythian graves of female warriors are exceptions: in kurgan 5 of Zelenoje three young female warriors were buried, with the main person given a spear, a javelin, a helmet and scale armour with an iron lamellar shield. This is the only grave of a woman warrior with the complete equipment of heavy cavalry. In kurgan 35 of Bobrica from the seventh–sixth centuries BC, however, a sacrificed horse was placed in the grave of a female warrior.[423]

From these discoveries it may be concluded that although there were neither Amazon armies or Amazon communities in the northern Pontic region, there were indeed female warriors in the light cavalry, who participated in military engagements. The large percentage of female warriors who died young indirectly confirms Herodotus's assertion that Sauromatian women had to perform military service before marriage. But, in the absence of men, married women must also have taken up weapons to defend their herds and grazing lands. Two archaeological observations indicate that female warriors had no special status. Burials of women warriors did not include any splendid ceremonial weapons and no proper weapons were found in the elaborate single burials of women.[424] In Sarmatian and Scythian graves with an opulent female burial as the primary burial, weapons, much less opulent weapons, were hardly ever included as grave goods, but rather costly jewellery and symbols of prestige. Among the latter were the diadem with a tree of life from Khokhlach (first/second centuries AD) and, in particular, the iron ceremonial staff with four deer protomes from the grave of Pestchanyi (first century BC).[425] These women, who belonged to the nobility, may also have had a religious role. Additional evidence of a possible religious task for some aristocratic women is suggested by the portable stone tables whose three legs were decorated with mythical creatures. These tables, mostly found in Sauromatian female graves of the southern Urals, presumably served as altars of sacrifice.[426]

and the Parthians in the east. Although the infantry remained the strategic core of the Roman army, the heavy cavalry increased steadily in importance.[427]

The use of heavy armour was called into question as early as 100 AD, when a few Sarmatians and Alans began using the 120-cm-long, asymmetrical composite bow called the Hunnic bow with its bonded bone reinforcements, whose arrows, mounted with heavy iron arrowheads, could penetrate scale armour. Presumably it was this development that inspired some Sarmatians and Alans to trade the heavy scale armour for the lighter ring armour, the chain mail.[428] Ring armour offered less protection from arrows but was significantly lighter and allowed the rider sufficient mobility to use the powerful Hunnic bow. The clear superiority of the light-armoured Hunnic mounted warriors, who relied on their long composite bow and had mastered the tactic of attack, feigned retreat and renewed attack, over the lumbering Sarmatians could be seen in the ease with which they were able to drive the various Sarmatian tribes from the Don to the Rhine. In his famous military handbook *Strategikon*, the Byzantine emperor Maurice (r. 582–602) aptly described the battle style of the Avars, whom he compared to the Huns, as follows: 'They prefer battles fought at long range, ambushes, encircling their adversaries, simulated retreats and sudden returns, and wedge-shaped formations ... When they make their enemies take to flight, ... they are not content, as the Persians and the Romans, and other peoples, with pursuing them a reasonable distance and plundering their goods, but they do not let up at all until they have achieved the complete destruction of their enemies.'[429] The Huns fought in exactly the same way. Maurice warned further that Central Asian mounted warriors never give up in the face of a looming defeat: 'If the battle turns out well, do not be hasty in pursuing the enemy or behave carelessly. For this nation [the steppe nomads] does not, as others do, give up the struggle

Bronze phalera (decorative plaque on a horse bridle) with two fighting camels. Filippovka, kurgan 1, eastern bank of the Ural River, central Russia, early fourth century BC. Archaeological Museum of Ufa.



Part of the gold diadem of Kargaly near Almaty, southern Kazakhstan, second–first centuries BC. The diadem, placed in a woman's grave, represents a further development of Sarmato-polychrome goldworking by the Wusun; it does not illustrate a scene of animals fighting but rather a magical world of winged humans and animals, suggesting influences from China. Central State Museum of the Republic of Kazakhstan, Almaty.

when worsened in the first battle. But until their strength gives out, they try all sorts of ways to assail their enemies.'[430] The renaissance of heavily armoured cavalry came with the Avars who introduced to western Central Asia and Europe the iron stirrups which formed part of the standard equipment of Roman cavalry by the end of the sixth century.[431]

With the downfall of the Sarmatians, the epoch of Iranian-speaking Europids spreading elements of Central Asian culture into Europe came to an end. Their nomadic riding successors were Altaic-speaking Turko–Mongols, whose advance ended only in 1683 at the gates of Vienna. The obvious wealth of the Scythian and Sarmatian elites, which endured for centuries, was not based only on war and raiding but probably to a greater extent on trade, whether the exchange of goods with the Bosporan Kingdom, Olbia and Rome or the taxing of goods that passed through their territory in transit along the trade routes between east and west.

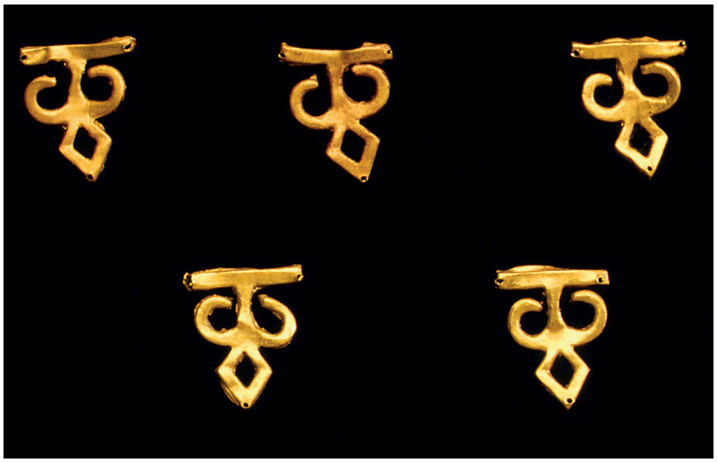
◀ Ceremonial dagger from Datchi, crafted in the Sarmato-Alan polychrome animal style, kurgan 1, Rostov Oblast, southern Russia, end of the first century AD. The knob and the sheath with the four indentations are made of gold and decorated with turquoise and carnelian. On the knob a Bactrian camel is portrayed, and beneath it a griffin lunges at a standing camel; on the sheath a griffin attacks a kneeling camel four times. The dagger, found in Datchi, displays great similarity to the dagger from grave 4 at Tillya Tepe, northern Afghanistan (40–70 AD) and is an import from the homeland of the Alans on the Syr Darya, Kazakhstan. Azov History, Archaeology and Palaeontology Museum.

2.4.4 The polychrome animal style

Like the Scytho–Siberian animal style, the Sarmatian polychrome animal style, with its coloured inlays, had its roots in Asia and appeared for the first time in the gold animal statuettes of Čilikty from the seventh century BC and, in rudimentary form, in the gold panther of Kelermes, which once had coloured stones in its ears and paws.[432] When enhancing metalwork with inlays of semiprecious stones and glass paste, artists at first found it sufficient to emphasise individual body parts on the head and extremities. In the Sarmatian period they started, as a first step, to draw attention to joints and muscles as well. In a true 'horror vacui', they began in a second step to cover the entire body with coloured glass or stone inlays and finally they added hump-shaped depictions of animals to flat dagger sheaths. Garnet, carnelian, coral, topaz, turquoise and coloured glass served as inlays. In contrast to Scythian toreutics the Sarmatians outside of the Bosporan Kingdom remained largely free of Greek influence, although the diadem of Khokhlach with the female bust made of amethyst represents a spectacular exception.

The Sarmatian polychrome animal style introduced to toreutics not only new techniques but also new contents. Among these were scenes of fierce animal combat, whose subjects were given a strong dynamism, and animals not previously known in the Scythian art of northern Europe such as camels and dragons. While in the southern Urals and in western Kazakhstan images of camels appeared in the animal style as early as the sixth century BC, in the northern Pontic region they emerged four centuries later. It was the Sarmatians who introduced the Bactrian camel into the northern Black Sea region. The numerous discoveries of camel bones, such as those found near the Sarmato–Bosporan trading city of Tanaïs, attest to their proliferation at that time.[433]

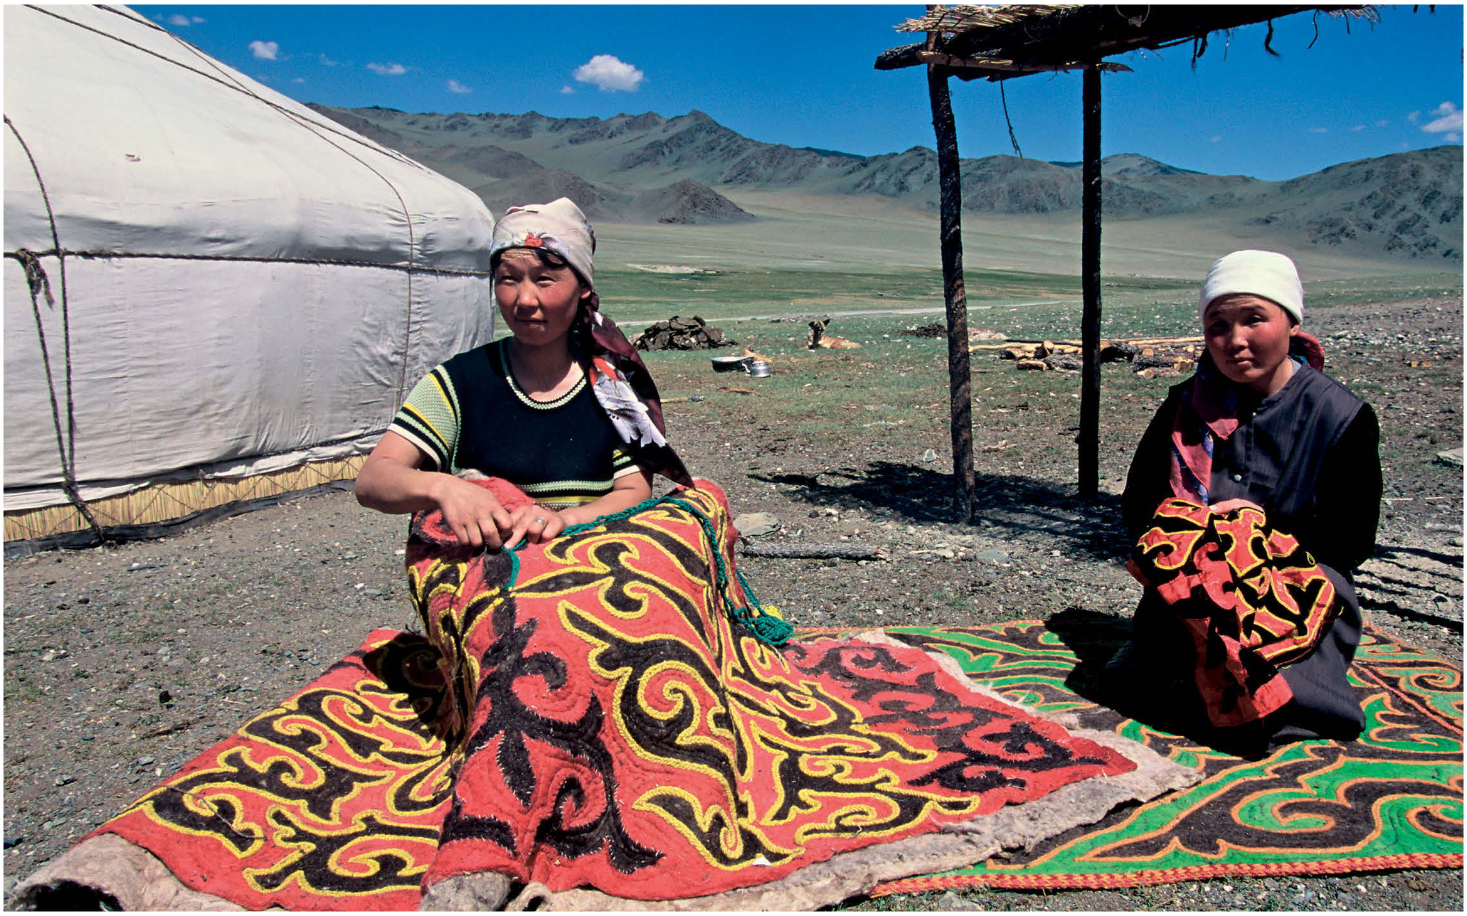
One of the most spectacular depictions of camels can be seen on the golden dagger of Datchi from the end of the first century AD, which was discovered in 1986 in kurgan 1 south of Azov. On the front of the rounded knob stands a battle-ready two-humped camel with an open mouth; on the hilt a griffin lunges at a standing camel and bites it between the humps. A plant motif decorates the reverse of the knob and hilt. On the sheath, in scenes repeated four times, a griffin attacks a buckled camel, which bites its attacker on the left wing. On the lower end of the sheath and in three other bulges, a griffin bites a cowering camel, while in the upper indentation to the left a griffin portrayed in profile watches in an attacking pose. All the animals are decorated with carnelians and turquoise.[434] Comparable in both form and content is one of the two golden daggers from grave 4 of Tillya Tepe in northern Afghanistan. In the small necropolis from the second to third quarter of the first century AD a chief of the Alans from Kangju was buried with at least five women.[435] The dagger, crafted in opulent Sarmato–Alanic polychrome style, likewise has a golden sheath with four side indentations. Although a standing bear rather than a camel adorns the knob and a procession of hybrid creatures, each stalking the one before it and biting it on the croup or hind leg, is portrayed on the sheath, an allegory of the cycle of life and death is depicted on both dagger sheaths. As Schiltz noted in her analysis of the dagger of Tillya Tepe, the animals on the knob symbolise life and those on the sheath remind us that without death renewal and life are not possible. On the reverse of both knobs, plant motifs suggesting a tree of life mediate between the antitheses of life and death.[436] The dagger of Tillya Tepe presumably came from an Alanic goldsmith on the Syr Darya and that of Datchi perhaps also from Alanliao (Kangju) or Kazakhstan.



Gold clothing plaques in the form of geometric bulls' heads, Khokhlach Kurgan of Novocherkassk, Rostov Oblast, southern Russia, end of the first/beginning of the second century AD. Such strongly schematised depictions of horned animals kept their original semantics. The State Hermitage Museum, St. Petersburg.

Features of the finds from Tillya Tepe also appear on the neck ring from the grave of the princess of Kobiakovo, not far from Datchi, from the first/second centuries AD. However, there are also signs of influence from Kazakhstan and even China. In the centre of the neck ring sits a bearded man with his sword on his knees. On both sides two-legged, ape-like beings wrestle or play with winged dragons.[437] Depictions of dragons are also found in Tillya Tepe on a dagger sheath from grave 4 and on a pair of golden pendants with images of a lord of the animals taming two dragons from grave 2.[438] Dragons are also seen on the diadem of Kargaly in southern Kazakhstan. This diadem, found not far from Almaty, dates from the second/first centuries BC, a time when the nomadic herders of the Wusun lived in the Ili valley. A few decades earlier the Yuezhi had expelled the Saka from the Ili valley, after which they in turn were displaced by the Wusun, their former neighbour in Gansu, north-western China, whom they had destroyed *ca.* 173 BC. The gold diadem, adorned with carnelians, almandine and turquoise, displays a further development of the polychrome animal style, since neither animal fights nor normal humans are depicted but rather ethereal fantastical creatures in fleet-footed, playful movement. Clear influences from China can also be seen. The diadem shows a landscape with winged horses and winged, feathered men, who, with long flying hair, ride astride winged dragons, lions, buffalos and ibexes, passing other animals like bears, deer and birds. Presumably depicted here are Daoist immortals at play with fantastical hybrid creatures. In the Chinese context dragons are never menacing but rather animals well disposed to humans, which symbolise spring and life-giving water.[439]

Two Sarmatian women's graves from the southern Ukraine, which both show striking parallels to Tillya Tepe, more than



The tradition of portraying horned animals symbolically in extremely abstract forms remains alive today in the production of felt and wool carpets by nomads in Kazakhstan, Kyrgyzstan and western Mongolia. Nomads near Khar Noor Lake, Bayan Ölgyi Aimag, western Mongolia, make such felt carpets.

3,000 km away, illustrate how permeable the Eurasian steppe was at that time and how large the Saka–Sarmatian cultural territory. In both graves from the first century AD, one of Nogajčik (Crimea) and the other of Sokolova Mogila (southern Bug), the hands of the dead rested on silver bowls, a custom also encountered in Tillya Tepe, where two plates were golden and one silver. The woman buried at Nogajčik, whose kurgan was doused with petroleum and set on fire after the end of the funeral solemnities, had golden spiral bands around her ankles, as at Tillya Tepe.[440]

The Sarmatian animal style came up with still more innovations. Among them were forest scenes, such as two wrestlers in a forest, a boar hunt or a warrior resting in the lap of a woman beneath a tree.[441] In Sarmatian toreutics there was also a kind of counter-movement to the baroque opulence, as expressed in the diadem of Khokhlach, in the form of a geometrisation of the portrayal of animals. Horned animals in particular were portrayed on golden discs sewn onto clothing either in extremely stylised form or, in line with the principle of ‘pars pro toto’, reduced to antlers or horns. Such abstract and geometrical portrayals of animals can still be seen today on Kazakh, Kyrgyz and western Mongolian felt carpets.[442] Finally, the Sarmatian armoured horsemen introduced phalerae as a new decorative element in horse-gear. The hemispheric breast phalera and the round side phalerae had diameters of up to 15 cm, were made of gold or silver and often decorated with agates, turquoise or garnets.[443] In the late Sarmatian period of the second to fourth centuries AD the animal style gave way to a Greco–Roman polychrome style, but Sarmatian goldsmithing with inlays of semiprecious stones was adopted and further developed by Germanic peoples such as the Goths, Vandals and Franks.[444] It should be noted in conclusion that for a few centuries Saka–Sarmatian toreutics represented a transcontinental artistic style, which extended from western China to the Eastern Roman Empire.

VIII

Greeks in Central Asia

Possession achieved by the sword is not of long duration, but gratitude for kindness is everlasting. If we wish to hold Asia and not merely pass through it, we must impart our clemency to these people [the conquered Bactrians and Sogdians] – it is their loyalty which will make our empire stable and enduring.

ALEXANDER THE GREAT in 327 BC. Quoted by Quintus Curtius Rufus[1]

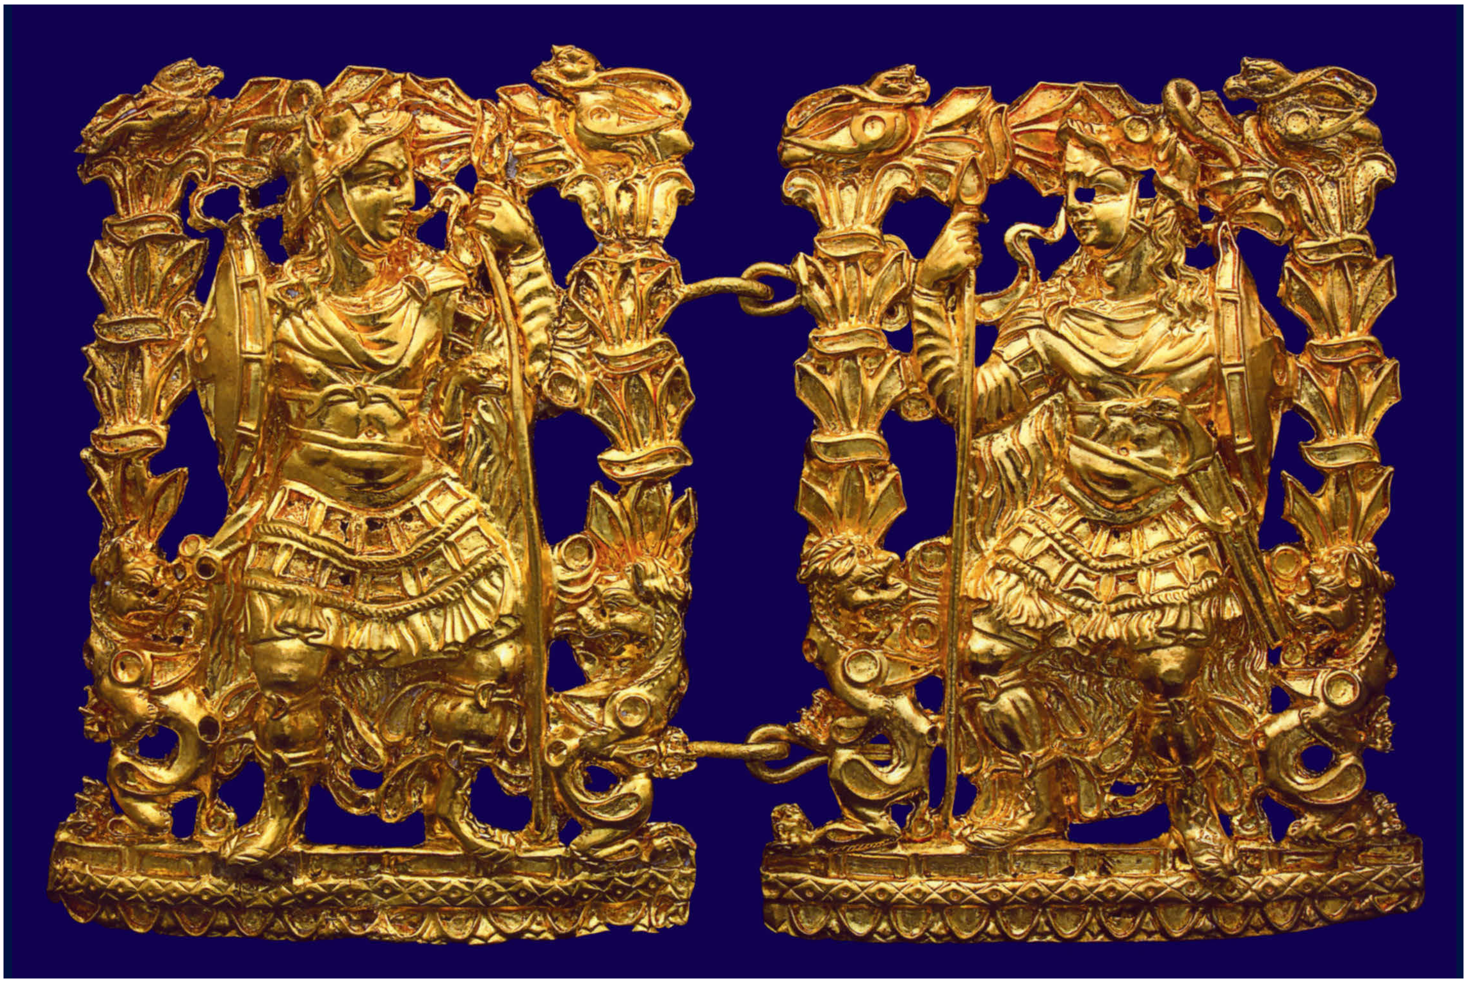
The wise saying attributed to Alexander, which anticipates Talleyrand's admonition of Napoleon, 'the only thing you cannot do with a bayonet is sit on it', does not disguise the fact that the Macedonian was a brutal and ruthless commander, who left behind in Bactria and Sogdia a bloody trail of destruction. Although he attempted to repair the rift between the victorious Macedonians and the vanquished Persians as well as the combative Bactrians by means of symbolic gestures such as arranged mass weddings between Macedonian officers and Asian women, he also tended towards excessive violence. Examples included the murder of his close friend Cleitos in Maracanda (Samarkand) and a series of systematic massacres of the civilian populace in rebellious Sogdia and Bactria. The extraordinarily rich influences that Greek art imparted to Central Asian cultures had nothing to do with the campaigns of Alexander but were rather associated with the subsequent Seleucids, the Greco–Bactrian Kingdom and Buddhism.

The Hellenistic period of Central Asia north of the Hindu Kush[2] lasted in a political sense for two centuries, from 329 to 145/30 BC, but in terms of culture it endured for a thousand years, as evidenced in the use of the Greek script and Buddhist sculpture in the Gandhara style, which extended from Central Asia as far as Korea and Japan in the first millennium AD. As a consequence of the incorporation of parts of Central Asia into the empire of the Achaemenids, the first contact between Central Asia and the Hellenistic world took place long before Alexander. For one, Greek architects, politicians, generals and soldiers were in service to the Persian rulers, and, for another, a Greek community had lived in southern Uzbekistan between the cities of Termez and Samarkand since the beginning of the fifth century BC. The Branchidae, descendants of the priests of the Greek oracle of Apollo at Didyma of Miletus, lived in this city. When Xerxes I (r. 486–465 BC) destroyed the shrine in 479 BC, the priests voluntarily surrendered the temple's



Pair of golden clasps featuring two warriors, holding a lance and a shield. Each wears a Greco–Bactrian helmet with a tiny bull's ear, as is seen on coins featuring Alexander or Bactrian kings; the bull's ear symbolising Dionysos, the alleged conqueror of India. Both soldiers wear a breastplate and a Greek griffin-hilted sword, and are surrounded by a frame consisting of plants, birds and dragons, which places the Hellenistic warriors in a typical setting of the art of the steppes. The clasps date from the second century BC and probably stem from an older Bactrian site. Tillya Tepe, grave 3, 40–70 AD. National Museum Afghanistan.

Although Alexander the Great did not reach the Wakhan Corridor in far north-eastern Afghanistan, in 329 BC he had to surmount similarly forbidding mountain chains in the Hindu Kush between Kabul and Bactra. Aerial view of the Afghan Pamir.

treasures to him. Fearing revenge from the Miletian Greeks, the Branchidae fled during the retreat of the Persian army and Xerxes resettled them on the Sogdian–Bactrian border. When Alexander reached the Branchidae city 150 years later, the inhabitants greeted him with joy, but his reaction was a harbinger of the coming massacre: 'The phalanx had been ordered to surround the city walls and, when the signal was given, to sack this city which had provided refuge for traitors, killing the inhabitants to a man. [...] Finally the Macedonians dug down to the foundations of the walls in order to demolish them and leave not a single trace of the city.' Curtius Rufus commented on this barbarity as follows: 'The guilt of their ancestors was being atoned for by descendants who had never seen Miletus and accordingly could not possibly have betrayed it to Xerxes.'[3]

The ruins of the round fort of Talashkan I, reinforced by 15 defensive towers, may be identical to the city of the Branchidae.[4] The fortress lay between the city of Termez on the Oxus and the so-called 'Iron Gates', a 10-km-long complex of two narrow mountain passes, which guarded the advance from Termez to Samarkand. Toward the end of the third century BC, when the Greco–Bactrian Kingdom lost Samarkand to the nomadic horsemen, the 'Iron Gates' were built up into a barrage as a defence against these dangerous neighbours.[5] The strongly fortified settlement of Talashkan I was built at the start of the fifth century BC and at the time of Alexander's campaign was set on fire and completely destroyed.

1. The campaign of Alexander the Great

Although Alexander (r. 336–323 BC) maintained that with his Asian campaign he was avenging the past Persian invasions of Greece from the fifth century BC, it was in fact a war of conquest, which his father, Philip II, had already begun with the deployment of General Parmenion to Asia Minor. At the same time the common military efforts of the Greek states, which had traditionally been at odds with one another, were united under the leadership of Alexander, who saw himself in the role of a second Achilles. In three great battles he defeated the Achaemenid army: namely on the river Granicus not far from Troy (334 BC), at Issus in Cilicia (333 BC) and at Gaugamela in the northern Iraqi plain of Arbil (331 BC). In all three battles Alexander started off defensively with his infantry phalanx, in order to tie up enemy power, then turned the tables with his heavy cavalry, which attacked in a wedge formation as soon as a gap appeared in the Persian line. Then, with his elite horsemen, he personally attacked the enemy commander; at Granicus half the Persian commanders fell; at Issus and Gaugamela the outclassed Achaemenid king Darius III (r. 336–330 BC) had to flee. Although outnumbered, the Macedonian army was superior, as it consisted of veterans and was divided into clear weapon divisions, which, thanks to their discipline, were able to carry out

During his pursuit of the Achaemenid usurper Bessus, Alexander the Great reached the plain of Kabul, where he wintered in 330/329 BC and founded the city of Alexandria ad Caucasum, today Bagram, north of Kabul. Fortress of Bela Hissar in Kabul, Afghanistan. Photo taken by John Burke in 1879. National Army Museum, London.

complicated manoeuvres in battle; in addition, they were led by a bold military genius. The Persian army, by contrast, was a mix of ethnicities of varying quality. Although Darius also had powerful units, such as the Sogdian and Bactrian cavalry led by the Bactrian satrap Bessus, as well as the mounted archers commanded by the Saka king Mauaces, the Persian army lacked coordination.[6]

Darius fled from the pursuing Alexander to the east, where he hoped to find safety and muster a new army. But he had lost all authority and during his flight, in July of 330 BC, the satraps of the Central Asian provinces took him prisoner. When Alexander came within range of the fleeing group, Bessus had Darius killed and declared himself the new king under the name Artaxerxes V.[7] Alexander, who had himself declared the legitimate successor to the defeated Darius and ordered his ceremonial burial, now pursued the murderer of the unfortunate ruler. This undertaking turned into one of the most spectacular chases in history and led Alexander into the heart of Central Asia. Bessus fled to the capital of his Bactrian satrapy, Zariaspa (Balkh in northern Afghanistan), where he believed himself to be protected from Alexander by the Hindu Kush – a mistake. Alexander wanted to capture Bessus before the latter could muster another army, as he had observed the military might of the Bactrian and Sogdian cavalry at Gaugamela. He continued his pursuit.

In order to stabilise the conquered empire, Alexander confirmed the satraps in their offices in several places, on condition that they surrendered and swore loyalty to him. In order to protect his back, during his advance through Central Asia he founded fortified cities and military bases, where he installed strong garrisons and Greek

settlers. These settlements, which often bore the name Alexandria, were arrayed along his route like a string of pearls; when Alexander left Bactria in 327 BC, he had covered Central Asia with a net of military installations manned by a total of about 23,000 soldiers and mercenaries. Thanks to the bematists, who measured distances with their steps, we are quite well informed about the distances covered and cities founded by Alexander's army.

After Alexander had Persepolis burned to the ground, he turned to the north-east, to Hyrcania, on the south-eastern rim of the Caspian Sea, and to Parthia (north-eastern Iran), and then to the south-east and across the satrapies of Aria (western Afghanistan), Drangiana (western Afghanistan and south-eastern Iran) and Arachosia (south-eastern Afghanistan and western Pakistan). On the way Alexander founded Alexandria in Aria (Herat); Prophtasia in Drangiana (Phrada, modern Farah), where Alexander had to put down the first conspiracy of some of his most trusted officers;[8] Alexandria in Arachosia (Kandahar); and Alexandria ad Caucasum (Bagram north of Kabul), where the army spent the winter in 330/329 BC.[9] Before them towered the Hindu Kush, reaching a height of up to 7,700 m, which the Greeks called Parapamisos. This name was derived from the Persian 'uparisana', which means roughly 'where the eagle does not fly'.[10] In the meantime, Bessus had not managed to assemble the hoped-for large army, as the odour of a regicide clung to him, so he adopted a 'scorched earth' strategy. As ancient historians mention neither Persian garrisons nor an Achaemenid government, it may be assumed that the satrap did not have his own troops but rather depended on the loyalty of Bactrian and Sogdian nobles.

In contrast to the Afghans, who were accustomed to the cold and high elevations, Alexander's soldiers suffered greatly under such conditions in the spring of 329 BC. A caravan of Afghan Kirghiz crosses from Afghanistan to Pakistan to reach the valley of Chapursan in northern Pakistan.

In order to avoid an enemy ambush in the mountains, in the spring of 329 BC Alexander crossed the snow-covered and icy Khawak Pass at an elevation of 3,540 m, where his soldiers suffered awful privations. The British lieutenant John Wood, who searched for the source of the Oxus in 1837/38, wrote about the Khawak Pass: 'Firm footing began to fail the horses. The depth of snow was about four feet; and most of the animals, after floundering till exhausted, sunk in up to their bellies.'[11] After the misery of the ice desert came that of the sand desert. Curtius Rufus describes northern Bactria between Bactra and the Oxus as follows: 'A large area of the country is engulfed by desert sands. [...] When the wind blows ... all traces of roads that existed before are obliterated. Consequently, people crossing the plains follow the practice of sailors, watching the stars at night and plotting their course by their movement. [...] The area is impossible to traverse by day, because one finds no track to follow and the light of the celestial bodies is hidden in a misty darkness.'[12]

The cities of Aornos (Kunduz) and Bactra (Balkh) fell to Alexander without a fight, as Bessus had fled in a panic to Nautaka (Shahr-i Sabz south of Samarkand) in Sogdia. Although Bessus had destroyed his pontoon bridge over the Oxus, the powerful river did not represent an insurmountable barrier for the Macedonian army. Alexander 'distributed to the men ... skins stuffed with straw. Lying on these the men swam the river. In this way Alexander deposited the entire army on the far bank in five days.'[13] On account of Bessus's weakness his allies let him fall, and the Sogdian noble Spitames, who would soon become a bitter enemy of Alexander, took him prisoner. While Alexander was waiting for Spitames to

bring him the naked and bound Bessus, he ordered the murder of the Branchidae. Bessus, however, was whipped and crucified after his ears and nose had been cut off.[14] After this Alexander marched to Maracanda (Samarkand), one of the most important cities in Sogdia, and further north-east to Cyropolis (Istaravshan in north-western Tajikistan). This march to the east was no blind drive for conquest; rather Alexander wanted to strengthen the north-eastern border of the empire, which was constantly threatened by the Saka. To help defend against them, he ordered the building of the fortified city of Alexandria Eschate, 'the most distant Alexandria' (present Khujand), north-east of Cyropolis. The city rapidly developed into a crossroads on the trade routes between Sogdia and China and Rome and, as Curtius Rufus reports, it maintained its Greek identity into the first century AD.[15]

While Alexander was pressing ahead with the building of Alexandria Eschate, news reached him of a widespread rebellion in Bactria and Sogdia. It marked the start of a brutal guerrilla war, which cost tens of thousands of civilian lives and left the region in ruins. Only decades later did the two Seleucid rulers Seleucus I (r. 305–281 BC) and Antiochus I (r. 281–261 BC) begin to reconstruct the cities and infrastructure there. Alexander responded to the rebellion with his usual speed. First he conquered the seven rebellious cities on the Syr Darya, which were not able to defend themselves against Greek catapults and mobile siege machines; the men were killed and the women sold into slavery. Then he sent a 4,000-man relief army under General Menedemus to break Spitames's siege of Maracanda. But Spitames lured Menedemus into an ambush and crushed his troops. In the meantime the first

of two Scythian delegations had reached Alexander's camp and warned him against mounting a campaign against Scythia, since the Scythians could quickly attack his homeland of Macedonia.[16] Nevertheless, Alexander crossed the Syr Darya and successfully attacked a division of Saka mounted warriors with his cavalry. Although Alexander retreated immediately to the southern riverbank, the Saka remained peaceful from then on and Choresmia offered him an alliance. The Macedonian then broke the siege ring around Maracanda and carried out a bloodbath in the valley of the Zerafshan River. 'Alexander divided his forces and ordered the burning of the countryside and the execution of men of military age', reported Curtius Rufus.[17] The army spent the winter in Balkh.[18]

In the spring of 328 BC Alexander continued his strategy of terror against supporters of Spitames and had inhabitants of rebellious cities between Bactra and Samarkand systematically killed. The cities were set on fire and razed to the ground, as is shown by the widespread archaeological traces of fire.[19] This strategy of making a terrible example of rebellious cities foreshadowed that of Genghis Khan. Alexander's brutality was possibly one of the reasons for the development of an early Sogdian diaspora in eastern Central Asia, first in the direction of the Tarim Basin and Gansu, much later throughout northern and central China as far as the capitals of Luoyang and Chang'an.[20] This Sogdian emigration created the necessary conditions for the later dominant position of the Sogdians as traders along the Silk Roads.

Alexander first marched north-east from Bactra to the Oxus (Amu Darya), which he reached east of the location of the future Oxus temple of Takht-i Sangin. The temple lies on the northern bank of the Oxus, about 6 km south-west of the confluence of the ancient Oxus (today's Vakhsh) with the Ochos (today's Panj).[21] Here he divided the army into five divisions: Hephaestion followed the Panj, which today forms the border between Tajikistan and Afghanistan till Dzong, to about 60 km upstream from the future Greek city of Eucratidia (Aï Khanum). Ptolemy purged the valley of the Vakhsh, and Perdiccas that of the Kafirnigan, both in southern Tajikistan, while Coenos and Arzabazos pursued the rebels in the broadly branching valley of the Sukhan Darya. Finally, Alexander 'crossed the Ochus and Oxus rivers and came to the city of Margiana [or Marginia], in the vicinity of which sites for six towns were chosen'.[22]

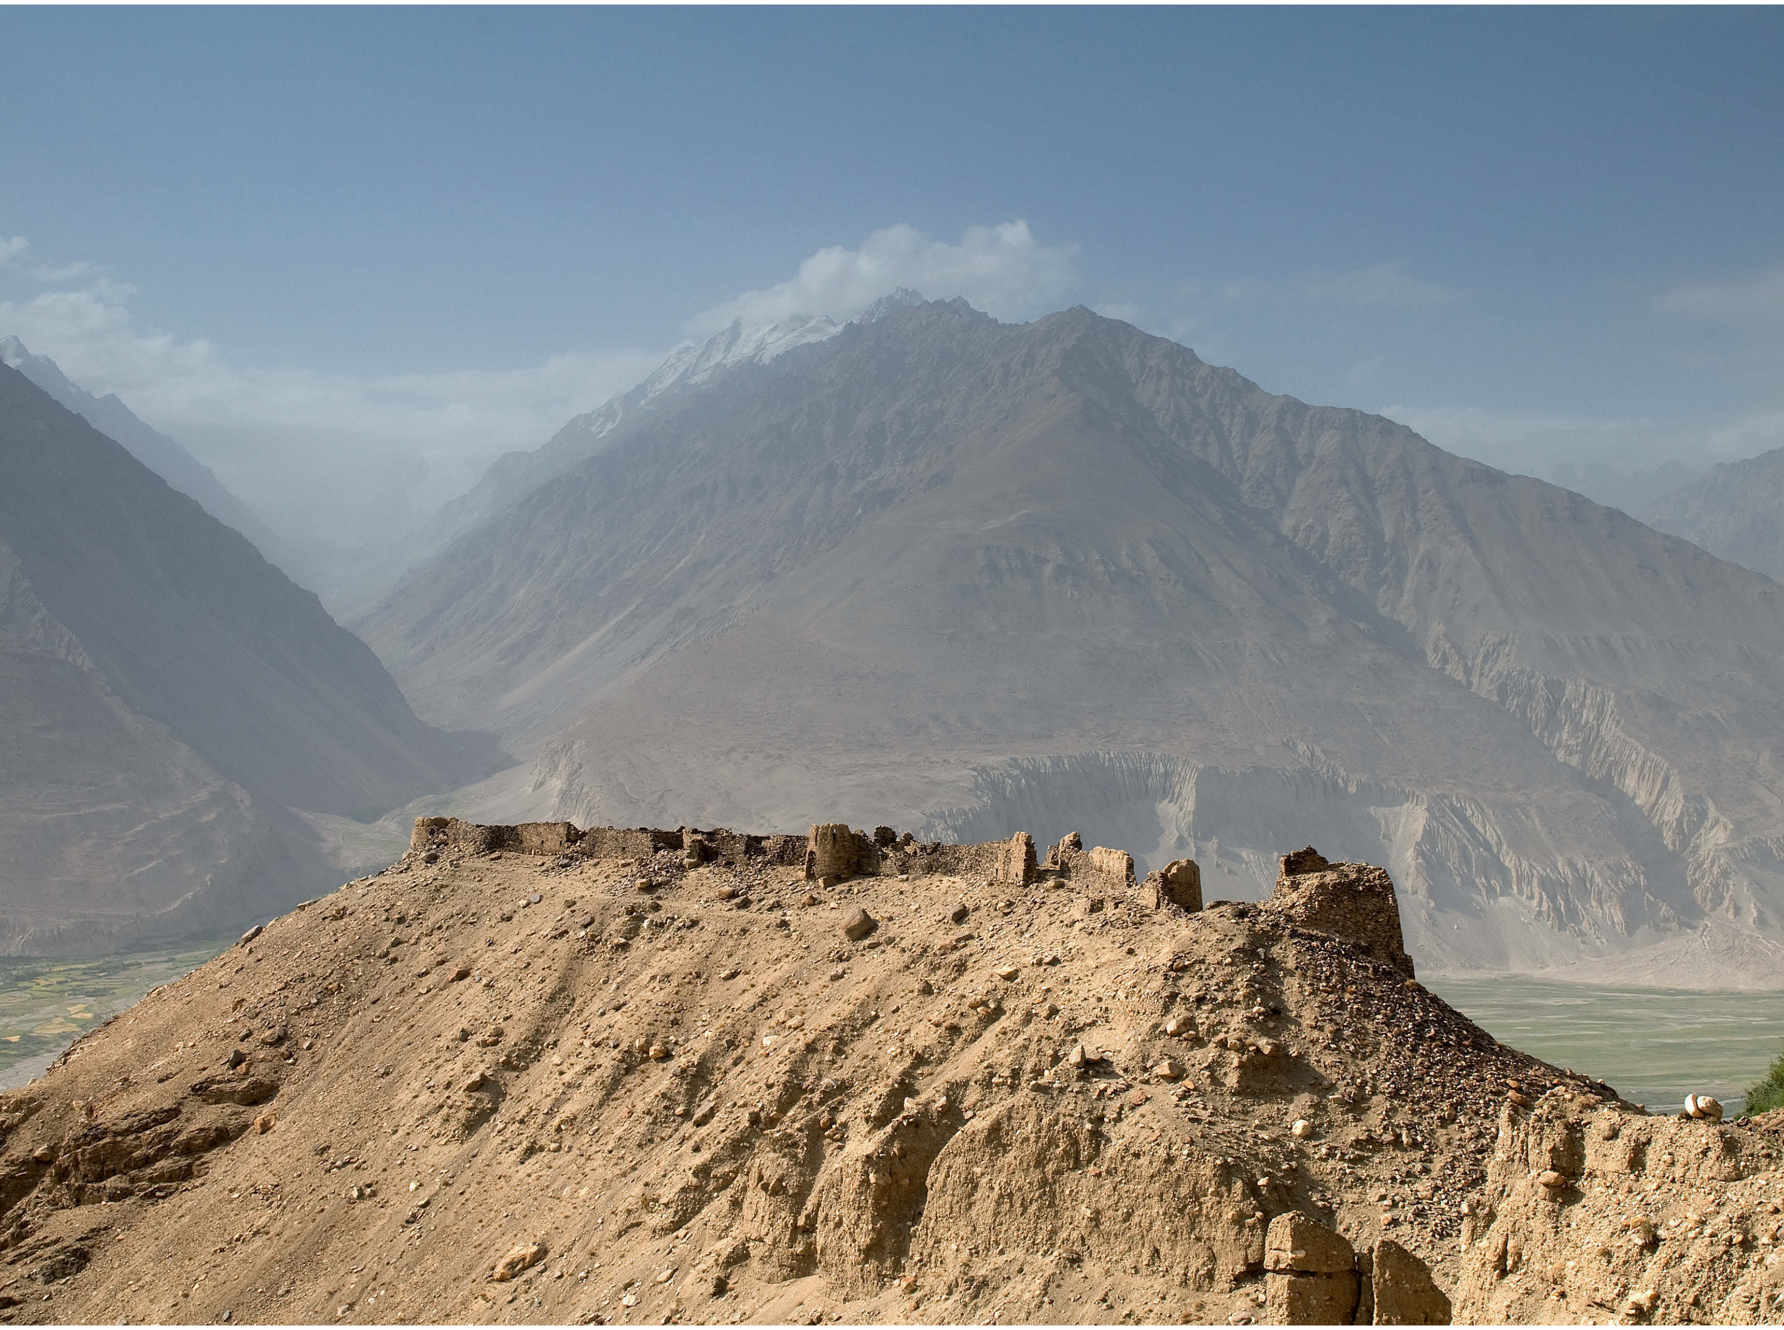
The city of Margiana that Curtius Rufus refers to is equated with either Termez[23] or with the smaller Kampyr Tepe, 30 km farther west, which could be identical with Alexandria Oxeiana.[24] Of the six military stations established by Alexander, one was discovered near Kurgansol in 2003/4. The fortress of Kurgansol stands about 100 km north of Termez high above an ancient route that linked the Oxus with Maracanda. The fortress, built at the time of Alexander's campaign, contained exclusively Hellenistic ceramics. It was fortified on its north-western and north-eastern sides with six strong, round towers, while on the southern and south-western side vertically sloping precipices ensured its security. The fortress withstood at least one severe attack, but it was abandoned at the start of the third century BC when the region had been sufficiently pacified.

While Alexander received the second Scythian delegation in Maracanda and, in frenzy, murdered his own friend Cleitos, Spitames, whose troops were bolstered by 800 mounted warriors of the Massagetae, succeeded in destroying a Greek division, but he suffered a bitter defeat against General Coenos. While Spitames prepared to flee, the Bactrians and Sogdians deserted him, after which the Massagetae took him prisoner. When they heard that Alexander was pursuing them, they decapitated Spitames and sent his head to the Macedonian as a peace offering. Thus Spitames suffered the same fate that he had inflicted upon Bessus. But a few nobles barricaded themselves in their mountain fortresses, so Alexander had to stay, and he made his winter camp in Nautaka (Shahr-i Sabz) in 328/27 BC.[25]

In the spring of 327 BC Alexander captured the last Bactrian mountain fortresses, including the 'Sogdian cliffs' of the noble Oxyartes.[26] After the surrender the wives and daughters of Oxyartes and other nobles fell into the conqueror's hands. One of these was Roxana, the 13-year-old daughter of Oxyartes, with whom Alexander fell in love. Instead of taking her as a concubine, he promised her a royal wedding. When the Macedonians grumbled that their king was marrying a woman of lower birth, he admonished them, saying that 'intermarriages of Persians and Macedonians would serve to consolidate the empire, that only thus could the conquered lose their shame and the conquerors their pride'.[27] Whether love was really involved is unknown, but the marriage was a politically brilliant move. The Bactrian nobles were impressed by Alexander's treatment of the prisoners and became steadfast allies of Oxyartes's son-in-law. 'Alexander was no longer viewed as a foreign invader, but instead became a Bactrian king.'[28] The resistance collapsed, and Alexander left the region via Kabul in the direction of the Indus, reinforced by Massagetae cavalry units. Presumably Alexander wanted to reach the end of the world, traditionally imagined as disc-shaped, which was surrounded by the world ocean Okéanos, although Greek scholars like Pythagoras (*ca.* 570–510 BC) or his teacher Aristotle (384–322 BC) knew the earth was a sphere. But Alexander must have noticed that the Okéanos was always on the horizon, no matter how far he marched.

For Alexander Central Asia was no sideshow but rather the place he stayed the longest and had to fight the most difficult battles. In the short term Alexander's campaign was a destructive episode for Central Asia; in the long term its consequences changed the political and cultural landscape of the region, and, with regard to art, the canon of Greek sculpture gave emergent

Near the confluence of the Rivers Pamir and Wakhan, which form at Dzong the River Panj, a feeder of the Oxus. Gorno-Badakhshan, southern Tajikistan.



During his Bactrian campaign Alexander's armies had to conquer several practically impregnable fortresses. The fortress of Zamr-i Atish Parast near the village of Yamchun in Gorno-Badakhshan, southern Tajikistan, founded at the end of the Kushan period (first–third centuries AD), protected the trade route that ran along the northern bank of the Oxus. In the background is the Hindu Kush Range.

Buddhism a visual face. The reconstruction of Bactria by the early Seleucids cleared the way for the splendid Greco–Bactrian culture, and when the nomadic horsemen of the Saka and Yuezhi threatened Bactria beginning in 145 BC, Hellenistic artists fled south into the region of Gandhara. Here, along with itinerant Roman artists and local sculptors, they founded the aesthetic style of Gandhara Buddhist sculpture.

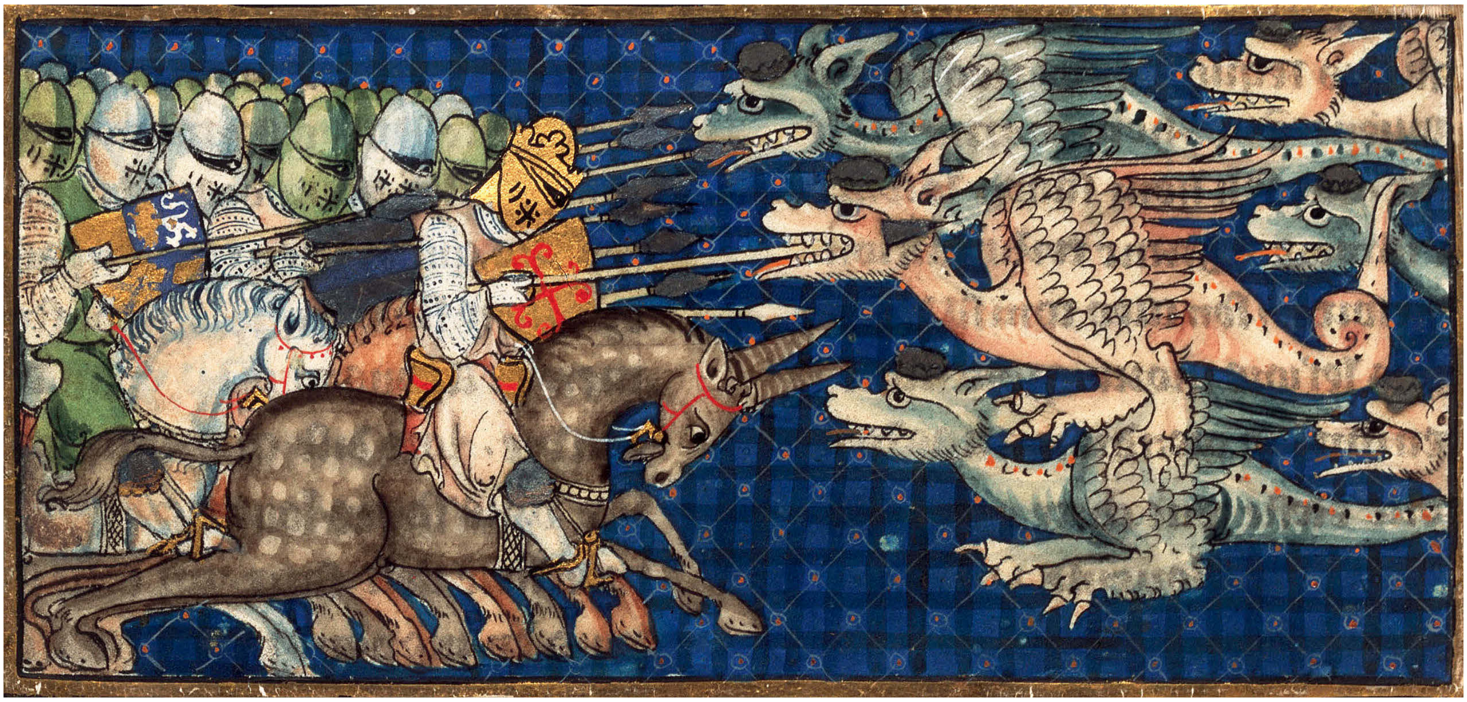
Just two years after Alexander's withdrawal there was a mutiny by the Greek mercenaries and veterans who had remained behind in Bactria but still longed for their homeland. Alexander either had them massacred by loyal Macedonian troops or removed them from the army.[29] This episode suggests that the chief threat to the young empire of Alexander came not from outside but rather from within. In fact, immediately after Alexander's death in 323 BC, the wars of the Diadochi broke out.

2. The Greco–Bactrian Kingdom

No sooner had news of Alexander's death reached the 23,000 forcibly settled Greek mercenaries and settlers in Central Asia than they rebelled again and planned the return to their homeland. But the imperial regent Perdiccas (d. 320 BC) sent General Peithon (*ca*. 355–315 BC), son of Crateus, to Bactria with Macedonian troops, who quickly quelled the revolt and accepted the surrender of the rebels. But the Macedonian army ignored Peithon's pact with the surrendered Greeks and massacred them ruthlessly.[30] In the western part of the empire the wars between Alexander's former commanders took their course; at times the five kings, Antigonus, Ptolemy, Seleucus, Lysimachus and Cassander claimed Alexander's legacy as their own. Conflict developed among the Diadochi, the 'successors', because Alexander's two heirs to the throne were minors: Alexander's half-brother Philip III was feeble-minded and his own son, the future Alexander IV, was not yet born. Cassander had Alexander IV and his mother Roxana poisoned in 310 BC. The war within the Macedonian elite came to an end only with the victory of Seleucus over Antigonus in 301 BC.

In Central Asia, Oxyartes, the father of Roxana, continued to rule as satrap of Paropamisadae and the other Greek satrapies were assigned to army officers: Arachosia to Sibyrtius, Aria and Drangiana to Stasanor and Bactria and Sogdiana to Philip, son of Balakros.[31] In 317 BC the satraps of Central Asia entered the Diadochi conflicts. First they repulsed Peithon, who was expanding to the east, and then supported Eumenes in the war against Antigonus. As a result of the betrayal of his two Macedonian generals, Eumenes could not take advantage of two victories. The Argyraspides, the so-called 'silver shield' that had constituted Alexander's personal guard, later handed Eumenes over to Antigonus. He left the satraps of Central Asia, who had fought against him, in their offices after subjugation.[32] Towards the end of the fourth century BC Antigonus (*ca*. 382–301 BC), who ruled in Asia Minor, and Seleucus I (b. *ca*. 358; r. 305–281 BC) remained as the chief rivals. Before Seleucus carried out the decisive attack on Antigonus, he wanted to secure his eastern flank, so in 307 BC he took off to Central Asia, which nominally belonged to his territory but whose satrapies had been virtually autonomous since Peithon's campaign. Seleucus succeeded without great effort in getting Bactria, Sogdia, Margiana and Aria to recognise his authority. The Macedonian Seleucus was well served not only by his military and diplomatic skills but also by the fact that he was married to

The southernmost tower of the citadel of Zamr-i Atish Parast near Yamchun in Gorno-Badakhshan, southern Tajikistan.



While for the Greeks and Macedonians of the time the campaigns of Alexander and the Seleucids represented adventurous but real undertakings in genuinely existing lands, a millennium later in medieval Europe, on account of a loss of geographic knowledge, they entered the realm of fantasy, inhabited by dragons, horse-headed people, giants and other monsters. The Alexander Romance declares that: 'King Alexander and his army battled against dragons with large emeralds on their foreheads.' Manuscript 78.C.1 from France in the 1290s. Apama, the daughter of the Sogdian resistance fighter Spitames. Apama and their son, the future Antiochus I (b. 324; r. 281–261 BC), accompanied him, which contributed to the benevolent attitude of the Sogdian and Bactrians.

South of the Hindu Kush, where Greek authority had been eroding gradually since 316 BC, an entirely different opponent awaited Seleucus, namely Chandragupta (d. 297 BC), founder of the Maurya Empire. Instead of subjecting himself to a possible defeat by a numerically far superior foe, Seleucus chose the path of negotiation. He was also aware that in the event of a victory he would have been unable to hold on to the Indus Valley after his return to the Near East. Thus in 303 BC he recognised the de facto rule of Chandragupta over Gedrosia, Paropamisadae and Arachosia (southern Afghanistan and northern and central Pakistan). In return he gained 500 war elephants, which two years later contributed substantially to his decisive victory over Antigonus at Ipsus in Phrygia. About 80 percent of Alexander's empire now stood under Seleucus's control.[33]

With the peace treaty between Seleucus and Chandragupta the Greek colonies south of the Hindu Kush were under Indian foreign rule for a century, until the Greco–Bactrian king Demetrius I (r. *ca.* 195–171/70 BC) reconquered northern India. Thanks to the good relations between the Seleucids and the Maurya, which included the exchange of diplomatic missions, the Greek colonies and their culture flourished even under Indian suzerainty, as can be seen, for instance, in the edicts of Emperor Ashoka (r. 268–234/32), which were also written in Greek,[34] and in the Greek funerary epigram for a man called Sophytos from Kandahar.[35]

As mentioned above, around 293/92 BC Margiana, Bactria and Aria became targets of a powerful invasion of Saka horsemen, who belonged to the confederation of the Dahae; General Demodamas drove them back to the Jaxartes, however.[36] In order to secure Seleucid rule in Central Asia, Seleucus sent his half-Sogdian son Antiochus, whom he appointed viceroy of the eastern satrapies, to Bactria to oversee the reconstruction of the cities and the renovation and construction of irrigation projects. Antiochus promoted the immigration of Macedonian and Greek settlers and supported a rapprochement between Greeks and Bactrians. He replaced Aramaic with Greek as the official administrative language and opened a royal mint, the first in Central Asia, in the newly founded city of Aï Khanum. It produced a full range of gold, silver and bronze coins, in the name first of Seleucus, later of Seleucus and Antiochus and, beginning in 281 BC, of Antiochus alone. It is above all the bronze coins of low value, used in everyday transactions, which show the degree of monetisation of an economy. Central Asia, particularly Bactria, experienced under the first two Seleucids an unparalleled economic boom, founded on the three pillars of flourishing agriculture, lively intercontinental trade and increased urbanisation – not for nothing did ancient authors like Pompeius Trogus and Strabo call Bactria the 'land of a thousand cities'.[37] The navigability of the Oxus – along which, according to Strabo, 'Indian goods ... could easily be transported to Hyrcania [on the Caspian Sea]'[38] – also contributed to the economic upswing. When Seleucus was murdered in 281 BC, Antiochus returned to western Asia, where he immediately had to defend himself from attacks by the Egyptian Ptolemys and the Celtic Galatians.

In order to secure for himself the important resources of Central Asia in the struggle with his enemies in the west, Antiochus I (r. 281–261 BC) appointed his son Seleucus viceroy of the eastern satrapies around 279 BC. Antiochus's wars in the west led him to neglect the eastern satrapies, however, and moreover, his incessant demands for their economic resources weakened their military readiness against the omnipresent threat of the Saka nomads. While the north-eastern satrapies were able to stave off the invasion of 293/92 thanks to the help of the central government, ten years later they were not only forced to fight on their own but also had to provide the government with troops. At that time the region of Maracanda made an agreement with the encroaching nomads, who left the city undisturbed, and Maracanda became independent from the Seleucid Empire.[39] Presumably the viceroy Seleucus also planned the independence of the eastern satrapies, because in around 268/66 Antiochus had his son, who had begun to mint his own coins, executed for conspiracy.[40]

Unfortunately only sparse and fragmentary written sources exist for the history of Greco–Bactria, since most relevant works of history have been lost, so the reconstruction of Greco–Bactrian history is based on numismatics and archaeological data.[41] Antiochus I's successor, Antiochus II (r. 261–246 BC) was constantly embroiled in wars in the Near East, which the Greek satraps of Bactria, Diodotus (*ca.* 285–235 BC), and Parthia, Andragoras (d. *ca.* 238 BC) took advantage of in order to gradually secede from the Seleucid Empire. In the turbulent time around Antiochus's death in 246 BC both satraps declared themselves independent and minted coins in their own names; presumably Diodotus opened a second mint in Bactra.[42] While **Diodotus I** (r. *ca.* 246–235 BC) founded the Greco–Bactrian Kingdom, which included the satrapies of Bactria, Sogdia, Margiana and perhaps eastern parts of Aria; that is, southern Uzbekistan, north-western Afghanistan and south-eastern Turkmenistan, his ally Andragoras was unable to assert himself. Around 239 or 238 BC Arsaces (d. 218 or 211 BC), a leader of the Sakan Parni, who belonged to the confederation of the Dahae, first attacked Diodotus in Bactria. Diodotus was, however, able to drive Arsaces out. Arsaces then descended upon Parthia, killed Andragoras and settled his Parni there. He founded the dynasty of the Parthians, which slowly advanced westwards after 190 BC or after 176 BC and in 141 BC captured the Seleucid capital of Seleucia, near the modern city of Baghdad.[43] Although Parthia lay between Bactria and Greece, Greco–Bactria was in no way isolated, as can be seen in the flow of trade by land and by water.

▶ From 208 to 206 BC the Seleucid king Antiochus III besieged the strongly fortified city of Zariaspa (Bactra) in vain, after which he made a compromise with the Greco–Bactrian king Euthydemos I: Antiochus recognised Euthydemos as king and received in return his war elephants. Shown here are Bactra's walls from the late medieval period, after both Genghis Khan (in 1220) and Tamerlane (in the fourteenth century) had destroyed the city.

King Diodotus I died around 235 BC, and was succeeded by his son **Diodotus II** (r. *ca.* 235–225 BC). When Seleucus II (r. *ca.* 246–225 BC) advanced into Central Asia before 227 BC, to reconquer the renegade satrapies, Diodotus II and Arsaces formed an alliance and staved off the attack.[44] Around 225 BC Diodotus became the victim of a bloody military putsch by his ostensible satrap of Sogdia, **Euthydemos I** (r. *ca.* 225–195 BC), who had the entire royal family murdered. Widespread traces of fire at Aï Khanum from the year 225 BC suggest that Euthydemos captured the city, which lay at the confluence of the Panj and the Kokcha, by violent means.[45] In 209 BC Parthia and Greco–Bactria found themselves again confronted by a Seleucid attempt at reconquest, as Antiochus III (r. 223–187 BC) had stabilised his empire in the west to the point that he could advance to the east with a powerful army. After the conquest of the Parthian capital of Hekatompylos south-east of the Caspian Sea and the subjugation of Arsaces II (r. 218 or 211–191 BC) Antiochus destroyed the Bactrian cavalry of Euthydemos, who sought refuge in his strongly fortified capital, Zariaspa, and withstood a two-year siege from 208 to 206 BC.[46]

Antiochus then sent an intermediary to Euthydemos, who informed the Seleucids of the nomadic threat in the north. He emphasised that a strong Greco–Bactria represented an ideal bulwark against the barbarians, and for this reason he was also protecting the eastern flank of the Seleucid Empire. Moreover, Euthydemos threatened to open the northern border, which would give the nomadic horsemen, who also ruled Maracanda, unimpeded access to the Seleucid Empire. In a peace treaty Antiochus confirmed Euthydemos as the Bactrian king and relinquished claims to tribute. In response Euthydemos handed his war elephants over to Antiochus, who then turned to the south. He crossed the Hindu Kush and occupied Paropamisadae, where the Indian king Sophagasenus, perhaps a descendant of the Maurya dynasty, subjugated himself without opposition. Antiochus confiscated his war elephants, demanded a large tribute and returned to Seleucia stronger than before.[47] Euthydemos and his son Demetrius surely noticed the lack of opposition among the northern Indians and understood that, in light of this power vacuum, a rich bounty awaited their conquest. If one believes a report by Strabo, who quotes Apollodoros, Euthydemos also exploited Antiochus's withdrawal to expand his territory to the north-east to Fergana as far as 'Seres' and the 'Phryni'. Presumably 'Seres' refers to the Tarim Basin and the Phryni may be equated with the Xiongnu, who subjugated the north-eastern part of the Tarim Basin at the start of the second century BC.[48] It is conceivable that General Demodamas had occupied parts of Fergana as early as around 290 BC and that Euthydemos's northern campaign advanced along one of the trade routes as far as Kashgar or Aksu.

Around 195 BC Euthydemos's son and hitherto co-regent **Demetrius I** (r. *ca.* 195–171/70 BC) became the sole ruler of Greco–Bactria and continued the conquests south of the Hindu Kush that had been begun by his father. Demetrius annexed the provinces of Gandhara with the valley of Kabul, Arachosia and Drangiana and thus reconquered the regions with Greek colonies that the Seleucids had lost between 316 and 303 BC. Demetrius advanced further south to Taxila, 35 km north-west of the modern Pakistani capital of Islamabad, where he founded the city of Sirkap. The successful expansion of the Greco–Bactrian Kingdom south of the Hindu Kush marked the start of the Indo–Greek calculation of time in the year 186/85 BC.[49] Demetrius was presumably the first and also the last Greco–Bactrian king who ruled unchallenged on both sides of the Hindu Kush. Numismatic studies from 189 to 171 BC provide the names of six different kings, however. Either they ruled in rapid succession, which seems unlikely, or Demetrius was the most powerful king and the others were regional viceroys. Among them were Pantaleon, Agathocles and Apollodoros I, who ruled in the newly conquered regions. A few of these rulers had bilingual coins minted in Greek/Brahmi and Greek/Kharoshthi.[50]

Pendant with the 'Lord of Animals' holding two dragons, whose rear legs are twisted 180 degrees, a typical motif of eastern steppe art. Gold decorated with turquoise, garnet, lapis lazuli, carnelian and pearls. Tillya Tepe, grave 2, *ca.* 40–70 AD. National Museum Afghanistan.

Around the year 171 BC, when Demetrius was south of the Hindu Kush, **Eucratides I** (r. 171/70–145 BC), who may have been allied with the Seleucid ruling family,[51] staged a coup in the Bactrian heartland. It rapidly developed into a bloody civil war. The first victim was the ostensible viceroy of Bactria, Euthydemos II. Demetrius marched northwards and, after an initial success, fell in the second battle. After the victory over Demetrius Eucratides killed the viceroy Antimachos I and presumably captured the city of Aï Khanum, which he renamed Eucratideia.[52] Immediately after this Eucratides turned to the north, crossed the Oxus, marched through the 'Iron Gate' and reconquered Maracanda, which was under the control of the nomads of the Kangju federation, and had the city walls fortified.[53] Greco–Bactria was now split in two: Eucratides ruled north of the Hindu Kush, and three viceroys of the defeated Demetrius ruled to the south. In order to re-establish imperial unity, Eucratides crossed the Hindu Kush to the south, where he vanquished Pantaleon, Agathocles and Apollodoros I and presumably pressed on to Sirkap. Here he encountered the successor of Apollodoros, the Indo–Greek king Menandros I (r. *ca.* 165/155–130 BC), the future conqueror of northern India and great champion of Buddhism.[54] Far from his Bactrian power base, Eucratides had to recognise Menandros's domain and returned empty-handed to Bactria, where he fell victim to an attack in 145 BC. Shortly before his death the Parthian king Mithridates I (r. 171–138 BC) succeeded in seizing several areas in western Greco–Bactria, presumably including Margiana.[55]

The circumstances surrounding Eucratides's murder are mysterious. According to Justin, who cited the work of Pompeius Trogus, now lost, Eucratides 'was killed on his march [back to Bactria] by his son, with whom he had shared the throne, ... and who drove his chariot through his blood and ordered his body to be cast out unburied.'[56] Who was the alleged parricide? Several authors incriminate either Heliocles, the last Greco–Bactrian king north of the Hindu Kush, or his brother Plato, who is said to have ruled for only a short time, presumably as viceroy.[57] But Tarn proposed as long ago as 1938 that Eucratides was not killed by his own son but rather by Demetrius II, son of Demetrius I, who had been defeated by Eucratides in 171/70 BC, with the help of the Parthians. Tarn's view is shared by Sidky.[58] Eucratides's son or brother **Heliocles** (r. *ca.* 145–130 BC), perhaps in alliance with **Eucratides II** (r. *ca.* 145–?) and the viceroy of southern Bactria **Plato I** (r. *ca.* 145–140 BC) overthrew **Demetrius II** (r. 145 BC–?), who may have been appointed by

Mithridates.[59] The disappearance of copper coins during the time of these four kings reveals a collapse of the monetisation of the Bactrian economy and the urban trade structures.[60]

Heliocles quickly began to lose control of the northern regions. The civil war provoked by Eucratides, the costly campaign to Gandhara, the loss of Margiana to the Parthians, and Eucratides's murder resulted in a tremendous weakening of the Greco–Bactrian Kingdom, with dramatic consequences. Nomadic riders from the north took advantage of the chaos following Eucratides's death and promptly attacked. In the next 15 years Greco–Bactria suffered an onslaught of nomadic riding peoples at least twice. Both attacks were the result of a domino-like migration of peoples, brought about the conflicts between the Chinese empire and the Xiongnu nomadic horsemen. After the Xiongnu had dealt three serious defeats to the nomadic horsemen of the Yuezhi, who lived in north-western China, in the years 207, 176, and 162 BC, the latter left their homeland for the west.[61] The majority settled in the fertile valley of the Ili, driving out the Saka who lived there. As the Han Shu records, the 'Sai [Saka] tribes split and separated'.[62] One group of Saka moved into the western Tarim Basin, in particular the oasis of Khotan, another to Sogdia and Bactria, and a third further south: 'The King of the Sai [Saka] moved south, crossed over the Suspended Crossing'[63] and 'established himself as master of Chipin.'[64] The frightening Suspended Crossing, called in Chinese *xuandu,* was located in the Upper Hunza Valley. The path was only 50 to 100 cm wide and consisted of flat stones placed upon sticks jammed into cracks in bare cliffs, often hanging dozens of metres over a stormy river. Having mastered the Suspended Crossing, these Saka established themselves in Kashmir.[65]

In 133 or 132 BC the Wusun nomads, who had once been oppressed by the Yuezhi, attacked the Yuezhi with the help of the Xiongnu and drove them out of the Ili valley.[66] Most of the Yuezhi fled to the south and crossed Fergana and Kangju unopposed, after which they forced the Saka out of the former Greco–Bactria.[67] The Saka then attacked the eastern part of the Parthian Empire, where they defeated and killed the two Parthian kings Phraates II (r. 138–128 BC) and Artabanos I (r. 128–123 BC). Mithridates II (r. 123–88/87) was finally able to resettle some of the Saka in Sakastan, today's Sistan, and force others into the Indus Valley.[68]

The second group of those Saka fleeing the Ili valley *ca.* 160 BC from the invading Yuezhi attacked first Maracanda and then Aï Khanum around the year 145 BC. The attackers systematically plundered the city and set the palace on fire, burning it to the ground. Around 130 BC the Yuezhi moved in and plundered the city again.[69] When the Chinese ambassador Zhang Qian (195–114 BC) visited northern Bactria and the city of Bactra in 128 or 127 BC, to recruit the Yuezhi for an alliance against the Xiongnu, he found them firmly established on the northern bank of the Oxus, while they also ruled the part of Bactria south of the river, although they did not occupy it. He reported: 'Daxia [Bactria] is situated over 2,000 li (*ca.* 800 km) southwest of Dayuan [Fergana], south of the Gui [Oxus] river. It has no great ruler but only a number of petty

Cupids riding a dolphin or catfish. A pair of golden clasps decorated with turquoise and mother of pearl. Tillya Tepe, grave 3, *ca.* 40–70 AD. National Museum Afghanistan.

chiefs ruling the various cities. The people are poor in the use of arms and afraid of battle, but they are clever at commerce. After the Great Yuezhi moved west and attacked and conquered Daxia, the entire country came under their sway. The capital is Lanshi [Bactra] where all sorts of goods are bought and sold.'[70] It appears that the new nomadic rulers interfered with neither trade nor agriculture.[71]

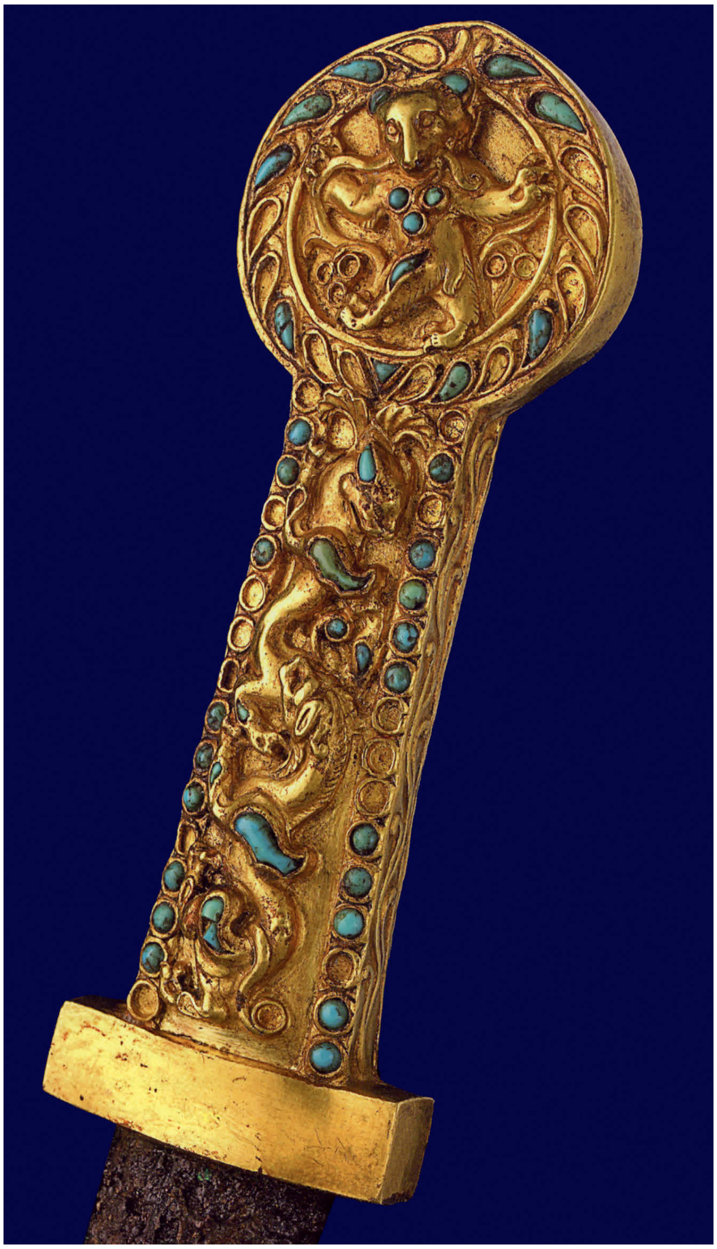
Zhang Qian's report makes no mention of a great king, an army or a unified government. The state structures established by the Greeks had evidently disappeared. Heliocles I, who died around 130 BC, was the last Greek ruler of Bactria; south of the Hindu Kush the last Greek, Hermaios, ruled until about 70 BC, and in the eastern Punjab Strato II, a distant descendant of Manandros I, ruled until about 10 AD.[72] The former territory of Greco–Bactria north of the Hindu Kush underwent a transition to an age of semi-settled stockbreeding of nomadic origin.

3. Bactrian art of the steppe, Hellenism and Zoroastrianism

The art of Greco–Bactria developed unique syntheses between nomadic art, Greek, Iranian and local stylistic elements, as well as between Hellenistic and Central Asian architectural principles.

3.1 The golden treasure of Tillya Tepe

One of the most spectacular archaeological discoveries of the twentieth century in Central Asia was left behind by nomadic horsemen of Bactria who had become settled. In 1969 an Afghan–Soviet expedition under the leadership of Viktor Sarianidi began work at Emshi Tepe in northern Afghanistan, about 100 km west of Bactra. Here they uncovered a 20-ha round city from the first century AD.[73] In 1978 Sarianidi set his spade to Tillya Tepe, the mound 500 m south of Emshi Tepe, where he first exposed a village from the third century BC and under that a fortified hall from the late second millennium BC, which he interpreted as a temple. On 15 November one of the Afghan workers made a completely unexpected discovery of gold, which came from the grave of a young woman, on the west side of the small fortress. Between then and 7 February 1979 the team revealed six extremely rich graves, the burials of a chief and five noblewomen. A seventh grave was resealed since Sarianidi had planned his return for autumn of 1979. He handed the find, including the 21,618 gold objects, over to the Afghan National Museum. Unfortunately, due to the worsening civil war and the Soviet invasion at the end of December 1979, the planned continuation of the excavation never took place.



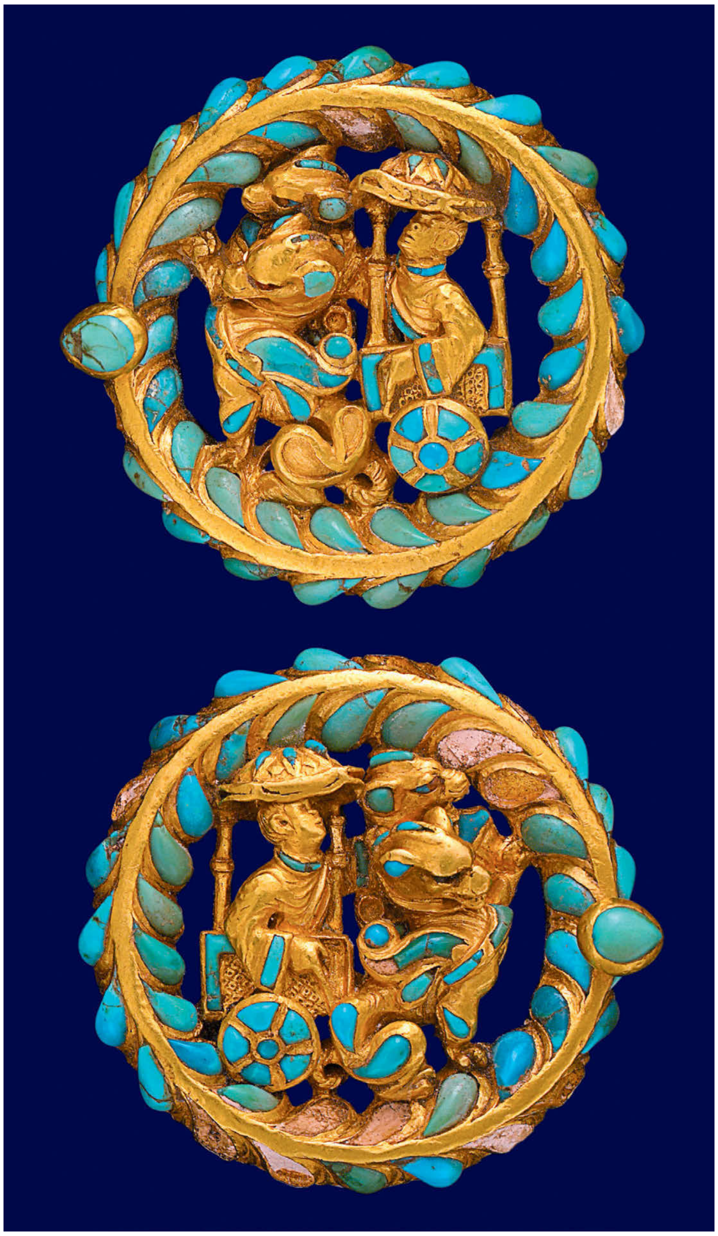
Golden handle of an iron akinakes decorated with turquoise. A dancing bear holding a vine branch in his mouth is shown on the pommel. Tillya Tepe, grave 4, *ca*. 40–70 AD. National Museum Afghanistan.

Looking back, Sarianidi wrote, 'The seventh grave had not yet been examined, and the eighth emerged [in 1979] with the rains, as we sat in Moscow. Since then, darkness has again engulfed the treasures. Soldiers we had trusted apparently looted the two unexcavated graves left in the necropolis. The next spring [1980] there turned up in Kabul's shopping district gold ornaments highly reminiscent of those recovered from Tillya Tepe.' Prophetically he advised the reader: 'Look well on these pieces of the Bactrian masterpieces that follow. Who knows when they will be seen again?'[74] The treasures came within a hair's breadth of falling victim to the chaos of war and the destructive zeal of the Taliban. In 1981 the museums of Hadda and Jalalabad were completely plundered, as was the National Museum in Kabul in 1992, 1994 and 1996, after which the Taliban destroyed most of the statues there in 2001. Fortunately the treasure of Tillya Tepe had been placed securely in a safe in the national bank in 1988 and thus, thanks to the discretion of those few people who knew of it, eluded the grasp of the Taliban. In April 2004 the collection was again secured in the presence of Sarianidi.

According to Sarianidi's description,[75] a young woman lay in grave 1, holding in her hand a coin of the Kushan chief Heraios (r. *ca.* 0–30 AD), the presumed father of the dynastic founder Kujula Kadphises. Her clothing was decorated with seven gold appliqué plates, which show a male figure with snake-like legs, analogous to the primordial mother of all Scythians. This figure carries on his shoulders a huge fish, probably a catfish, and he most likely represents a water god.

In grave 2 lay a 30–40-year-old woman with a Chinese mirror, two daggers decorated in the animal-style and an iron battle axe. Whether the weapons represented a status symbol or identified the woman as a warrior remains unknown. She wore a caftan-like dress with more than 1,500 gold discs and a gold appliqué of a winged 'Aphrodite' or rather Psyche, a pair of gold bracelets ending in the heads of antelopes, which probably date to the third or second century BC,[76] a tall conical headdress decorated with gold discs and a pair of golden pendants in the Sarmato–Alanic style set with semiprecious stones and each showing a 'lord of animals' taming two dragons. To these were added two gold clasps, likewise set with semiprecious stones and depicting a cupid riding on a dolphin or catfish, and three rings, of which two intaglios portray the Greek goddess Athena. In the coffin there also lay tiny amulets made of semiprecious stones in the form of a hand, a foot or animal teeth. Similar amulets were placed in tombs 3, 5 and 6.

Grave 3 also contained the body of a young woman, her head resting on a golden plate. This grave was also rich in grave goods. Although it had not been disturbed by grave robbers, it had been damaged by rodents, who took small gold objects into their lairs and scattered them about the area around the necropolis, which led to the graveyard's local name 'Tillya Tepe', 'Hill of Gold'. Among the grave goods were a silver mirror with Chinese characters and a second mirror with a handle made of ivory, which had been imported from northern India, as well as an Indian ivory comb. There were also two large clasps, each with a warrior in Greco–Bactrian gear and two smaller clasps with cupids riding on dolphins or catfishes, a gold collar, two armbands and two hair pins, three fingerings and a pair of gold shoe soles. Finally, two coins were placed with the woman, a silver Parthian one of Mithridates II (r. 123–88/87 BC) and a gold coin of Emperor Tiberius (r. 14–37 AD). The latter is the oldest Roman coin found in Bactria and provides the terminus post quem, the earliest possible date, not only for the grave but also most likely for the entire necropolis, which is dated to between 40 and 70 AD.

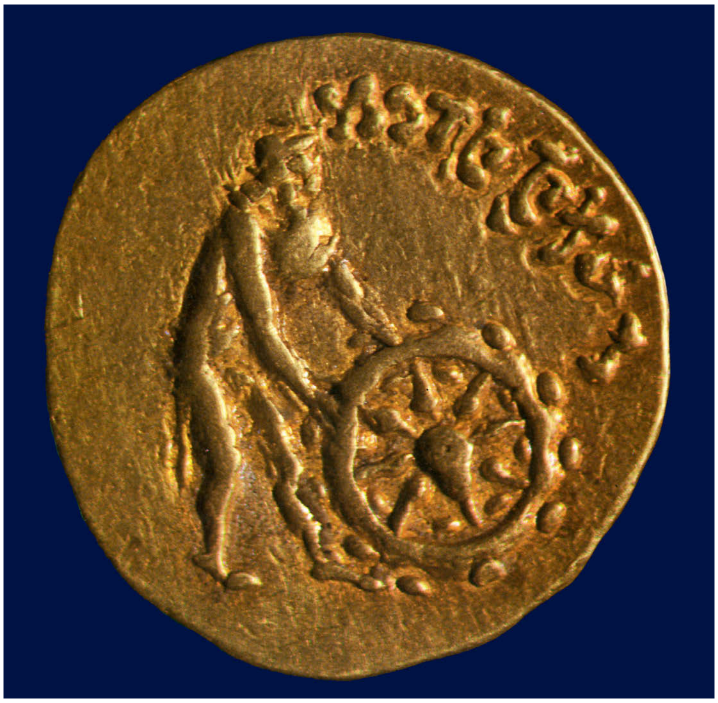


Golden shoe buckles with turquoise and carnelian. They show a man sitting in a chariot under a parasol and pulled by two winged lions. Tillya Tepe, grave 4, *ca.* 40–70 AD. National Museum Afghanistan.

In the main grave 4 lay an adult man, 30 years old, whose head rested on a golden bowl. He was armed with a long iron sword, two daggers, two bows and two full quivers and who was followed into the grave by a sacrificed horse. He was clearly a chieftain, who had either led the life of a mounted warrior or at least been buried according to the traditional customs of nomadic horsemen. One dagger is the one described above,[77] made in the Sarmato–Alanic polychrome style, whose knob is decorated with a bear and whose gold sheath, adorned with turquoise, has one bottom and four side bulges in the form of a coiled, winged carnivore. It is very similar to the dagger of Datchi, as is the second ceremonial dagger from grave 4, on whose gold sheath a winged dragon attacks a predatory creature with a wolf's head and deer antlers. On the rim of this second sheath, 18 swastikas made of blue glass paste surround the scene of animal combat. This second iron dagger has an ivory knob; two small knives are stuck in the back of the sheath, a combination familiar from Tuva and the Altai. With the predator with deer antlers, the dragon and the swastikas, the dagger unites artistic elements from southern Siberia, China and India. Also crafted in opulent Sarmato–Alanic polychrome style were two shoe buckles with two winged lions pulling a chariot, on which sits an aristocratic man under a baldachin. The scene is framed by a double row of rotating turquoise droplets. This portrayal suggests associations with a silver platter from Aï Khanum, on which two lions pull Cybele's chariot,[78] and the type of light, covered chariot recalls one that was discovered in the grave T1 of a chief of the Xiongnu at Gol Mod in northern central Mongolia and that, analogous to Tillya Tepe, dates to the second quarter of the first century AD.[79] As Markus Mode hypothesises, adoption of the theme of the ascension of Alexander by means of griffins in flight is also conceivable.[80] Both buckles were most likely crafted by a local artisan.

Equally spectacular is a golden belt, consisting of an eight-part flexible band and nine medallions, on which a fully sculpted female figure rides a panther. She holds in one hand a cup and with the other one of her breasts in the direction of the cup. The figure could represent the Bactrian goddess Nana, also worshipped by the Kushan people, on her lion, or Cybele who was also venerated in Greco-Bactria. The deceased wore a tall felt or leather cap decorated with a gold moufflon figurine, a headdress decoration similar to those from Arzhan 2 and from the Altai, and a small gold tree, recalling both the diadem of Khokhlach and Chinese money trees.

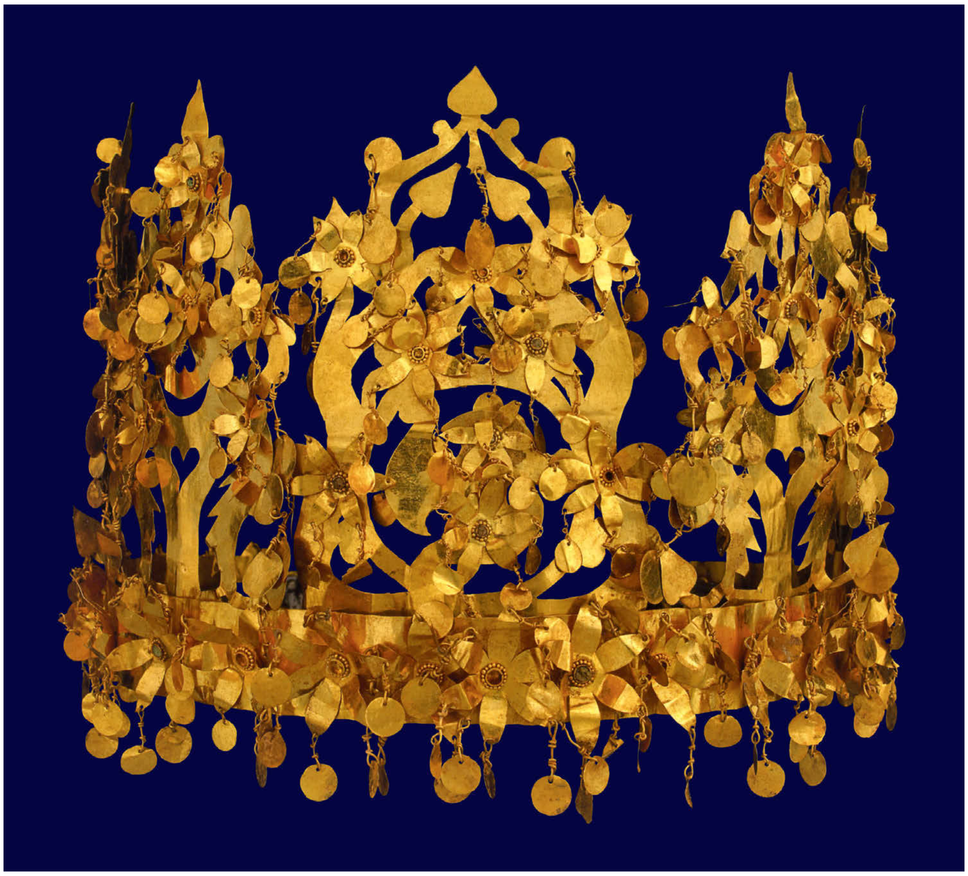
Also highly notable was a tiny gold medallion that shows on its front a pacing man, rolling an eight-spoked wheel before him; above it is written in Kharoshthi, 'He who puts in motion the Wheel of Law'. On the back stands a lion and a second Kharoshthi inscription: 'The lion has driven out fear'. Both sides show key scenes of Buddhism. The setting in motion of the Wheel of Law signifies the first sermon of the Buddha in Sarnath near Varanasi; the eight-spoked wheel, the eightfold path of enlightenment. The lion symbolises the spiritual power of the fearless Buddha and his roar awakens people to the call of the dharma. It appears that the front of the medallion represents one of the oldest, pre-canonical depictions of the Buddha.[81]



Golden Indian medallion of 1.6 cm diameter showing a man, most probably Buddha Shakyamuni in a yet non-canonical representation, pushing the eight-spoked Wheel of Law in front of him. Tillya Tepe, grave 4, *ca*. 40–70 AD. National Museum Afghanistan.

In the less richly appointed grave 5 was buried a woman no older than 20, who was given as grave goods a gold collar set with semiprecious gems and two intaglios, one depicting a griffin and the other the Greek goddess of victory Nike. The intaglio with the griffin is the oldest piece found at Tillya Tepe and dates from the fifth to fourth century BC. She wore gold bands on her wrists and ankles and had a sceptre like the corpse in grave 6. To these were added a mirror with a handle, a lidded silver cosmetics box, a silver dish and a bronze bell.

In grave 6 the most distinguished of the five women found her final resting place. The skull of the woman, about 20 years old at death, had been artificially shaped after birth, as was the custom among the nobility of a few Sarmatian tribes, and it lay on a silver dish – two distinguishing features of the contemporaneous 'princess



Foldable golden crown featuring five stylised trees with two tiny birds perched on the upper branches of four of them. The five removable trees are secured with golden tubes to the headband. The lower band is decorated with 20 rosettes having six leaves each. Tillya Tepe, grave 6, *ca.* 40–70 AD. National Museum Afghanistan.

of Kök Tepe', 30 km north of Samarkand, as well.[82] The woman in tomb 6 held in her left hand a gold coin, which was a Bactrian reproduction of a Parthian silver coin of Gotarzes I (r. *ca.* 90–81/80? BC) and in her mouth was a Parthian silver coin of Phraates IV (r. 37–2 BC) with a countermark of a Yuezhi chief. This is reminiscent of the Greek burial ritual of placing a coin under the tongue of the deceased so they can pay Charon, the ferryman of the underworld, to cross the Styx, the river of the dead.[83]

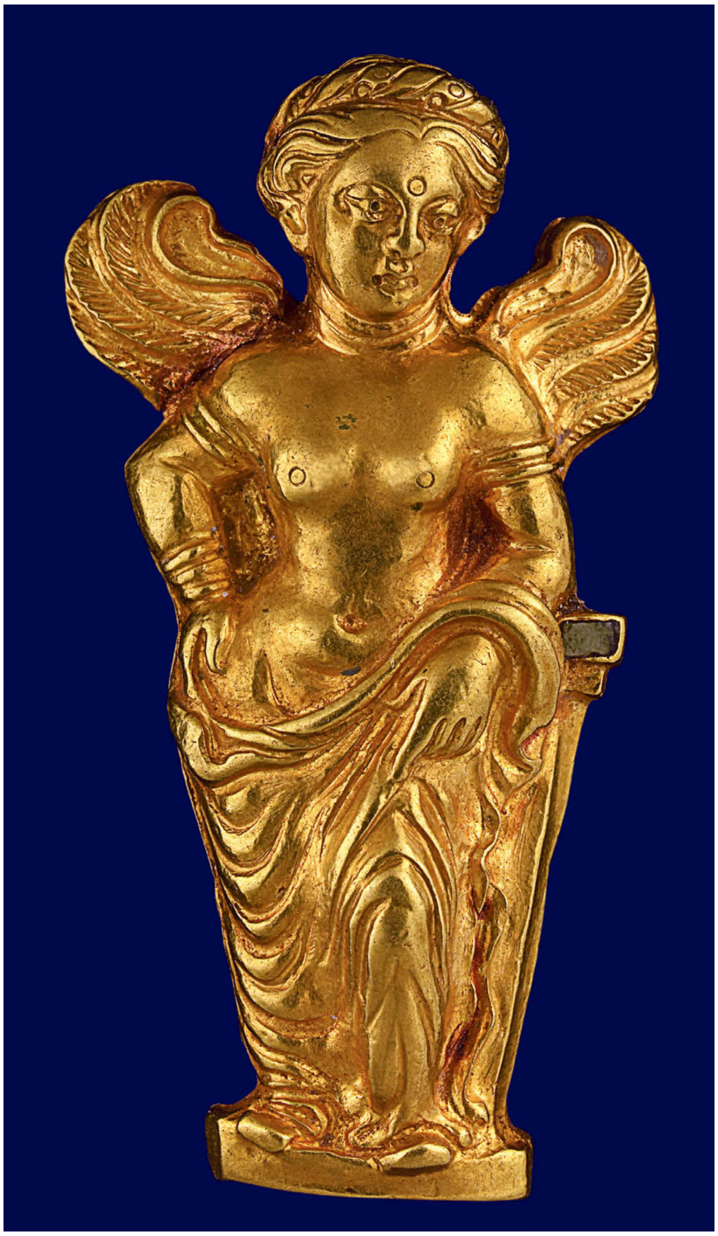
The head of the deceased was adorned with a golden, five-part crown that could easily be folded up and carried in a saddlebag. This crown is decorated with small, stylised trees, similar to those of grave 4, with tiny birds sitting in the upper branches. The branches and twigs of these trees are formed by twisted gold wires hung with thin, sequin-like gold leaves. The Saka and Sarmatians often decorated headdresses with birds and trees of life, as can be seen in the discoveries at Issyk, Khokhlach and Kobiakovo. This splendid crown suggests that the deceased was the main wife of the chieftain. Astonishingly, this crown is very similar to the Korean gold crowns of Silla, also made of sheets of gold and decorated with stylised trees, from the fifth–sixth centuries AD.[84] Presumably Xianbei nomadic horsemen of eastern Mongolia and Manchuria adopted the style and technique of such crowns from the Central Asian Sarmatians and Alans and passed them on to artisans of the northern Korean kingdom of Goguryeo, who in turn passed them on to Silla in the south.

The woman was further adorned with a pair of pendants set with turquoise, each showing a 'mistress of animals' holding a monstrous animal with a wolf's head and gaping jaws and a kind of fishtail, on top of which a raptor sits within the surrounding frame. Sarianidi interprets the figure as Anahita, the Zoroastrian goddess of water and fertility, who in the Avesta lent her name to the Oxus River.[85] The long, caftan-like dress of the deceased was decorated with a gold figurine of a winged 'Aphrodite' or Psyche with a nude upper body, and on the two gold clasps Dionysus and Ariadne ride a bearded griffin, typical of steppe art. In front of the griffin on the ground sits Silenus, associated with Dionysus, with his pointed, horse-like ears. He presents Dionysus with a rython, which the god fills with wine from his cup. Nike hovers behind the couple, holding a wreath above their heads. As Véronique Schiltz observed, 'this kind of explicit unity between man and woman is unknown in the iconography of both the Greeks and the settled Iranians, but seems to fit more naturally into the world of the nomads'. Perhaps this symbolises 'the woman's status as consort to the leader and her apotheosis in death'.[86] As in tomb 3, a silver mirror with Chinese characters lay on her breast and also a mirror with a ivory handle was found. Finally, the deceased wore a gold necklace, two bracelets ending in lions' heads from the third or second century BC, and two simple anklets made of gold. The necklace consisted of ten spherical and two elongated, 25-mm-thick gold beads, whose surface was divided into eight segments by rows of gold filigree, with every other segment decorated with a heart-shaped turquoise. These two goldsmithing techniques were also found in Silla, which is why the expert in Korean art of the Silla period, Young-sook Pak, stated, 'the Tillya Tepe jewelleries [look] as if they were the prototypes for Silla goldsmiths'.[87]

The man, buried in grave 4 in the centre of the small cemetery, may have been a chief of the neighbouring city of Emshi who had maintained the old customs of the nomads and whom five women had to follow into death. Since Bactria was part of a trade network at the time, the treasure of Tillya Tepe brought together objects from every direction: coins and glass from Rome and Parthia, ivory and an early Buddhist medallion from India, silver mirrors from China and motifs of hybrid creatures, weapons and the Sarmato–Alanic polychrome style from the northern steppes. Individual objects, such as the intaglios, came from the Greco–Bactrian period, but the great majority attest to the eclecticism of the local goldsmiths. At the same time the gold objects form a link between the Hellenistic art of Greco–Bactria and the early Buddhist art of the Kushan, as can be seen, for instance, in the clasps from grave 3, where the Macedonian warrior's clothing also appeared in Buddhist sculpture.[88]

To which nomadic group did the princely family of Tillya Tepe belong? Sarianidi proposed one of the five tribes of the Yuezhi, from which the Kushan descended; other scholars, a group of Saka.[89] The Sarmato–Alanic polychrome style of the toreutics, which is not found among the Saka or the Yuezhi, suggests that neither theory is correct. The obvious affinity of the goldwork of Tillya Tepe with the contemporaneous work of the late Sarmatians and Alans of the northern Pontic region, whose homeland lay in Alanliao/Yancai in the delta of the Syr Darya and who were at that time, as the Chinese annals *Hou Hanshu* report, a 'dependency of Kangju', leads to the hypothesis that a chieftain of the Alans, who belonged to the tribal group of Kangju, was buried here.[90]

Two ancient authors reported that, besides the Yuezhi and the Saka, at least one other nomadic tribe played an important role there.[91] Referring to the Scythians, Strabo wrote around the time of the birth of Christ: 'The best known nomads [east of the Massagetai and Sakai] are those who took away Bactriana from the Greeks. I mean the Asii, Pasiani, Tochari and Sacarauli, who originally came from the country on the other side of the Jaxartes River [Syr Darya] that adjoins that of the Sacae and the Sogdiani and was occupied by the Sacae.'[92] The Sacarauli, called 'Sacaraucae' by Pompeius Trogus,[93] may be identified with those Saka who attacked Maracanda and Aï Khanum around 145 BC and, under pressure from the Yuezhi, invaded the eastern Parthian Empire just after 130 BC. The Tochari are the same as the Yuezhi of Chinese sources, whom Zhang Qian encountered on the northern bank of the Oxus in 128 or 127 BC and who, after 200 years of migration through half of Central Asia, founded the Kushan Empire.[94] The



Golden figurine of a winged woman nicknamed 'Aphrodite', but rather representing Psyche. Based on a stylistic analysis it may be dated to the third to second century BC. Tillya Tepe, grave 6, 40–70 AD. National Museum Afghanistan.

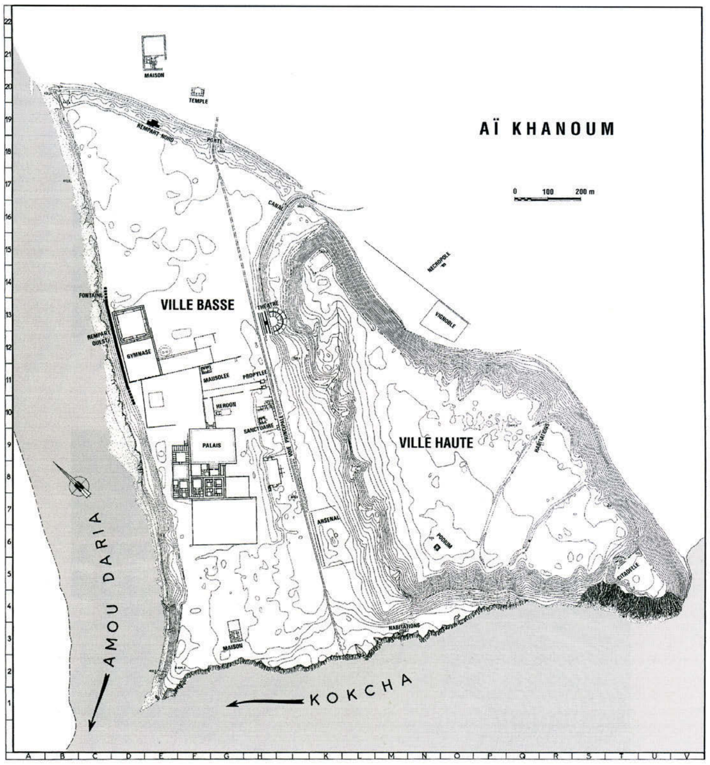
Asii and Pasiani are one and the same people, whom Pompeius Trogus called 'Asiani', and to whom he attributed the 'annihilation of the Sacaraucae'.[95] These Asii/Asiani cannot be equated with the Wusun, as Lebedynsky suggests,[96] because after the expulsion of the Yuezhi from the Ili valley, the Wusun settled there in 132 BC and did not pursue the fleeing Yuezhi. As proposed first by Vernadsky and Maenchen-Helfen and later by Grenet, de la Vaissière and Rapin, the Asii/Asiani may be identified with a later group of Alans.[97] In those days around the birth of Christ these Alans belonged to the federation of Kangju.

Since Pompeius Trogus also referred to a victory of the Asiani over the Tochari, the Alans of Kangju not only defeated those Saka who still lived in northern Bactria but also exerted strong pressure against the Yuezhi. The Alans' traces are found in Kök Tepe, and they are different from those of the Sacaraucae.[98] Around the time of Tillya Tepe or shortly thereafter the Kushan forced the nomads belonging to the Kangju northwards and re-established the 'Iron Gate' as border fortification.[99] The Kushan memorialised their triumph over the nomadic bands of Kangju in the great painted clay statues in the palace of Khalchayan north of Termez.[100] The contemporaneous elaborate Alanic graves of the northern Pontic region and of Tillya Tepe from the first century AD reflect the expansion of the Alans to the west and south.

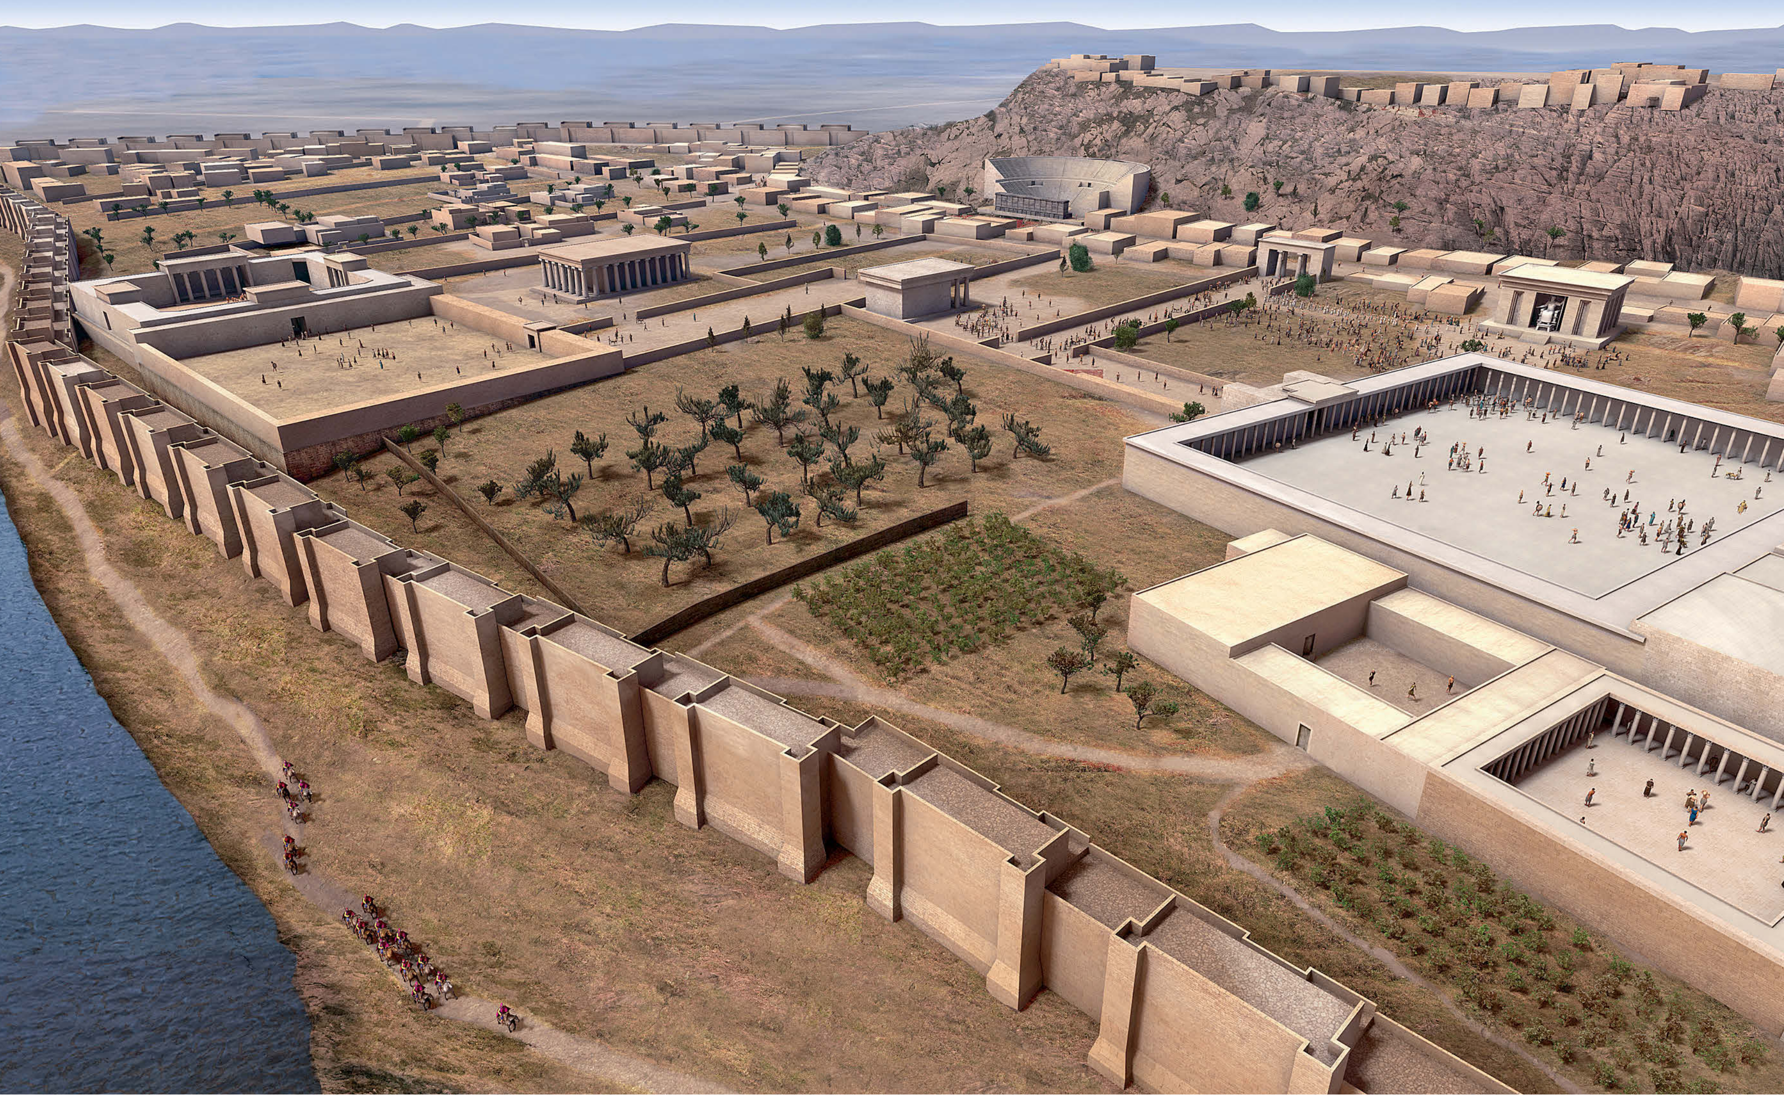
3.2 Aï Khanum – a Greek city in northern Afghanistan

On 18 March 1838 Lieutenant John Wood, who had also discovered one of the sources of the Oxus in the Pamirs, climbed a tall hill in the northern Afghan province of Kunduz. 'From the summit of I-khanam we had a glorious view of the surrounding country. At the foot of the hill was the junction of two rivers. From the point of confluence the Kokcha could be traced to its exit from the mountains on the south, while the eye followed the Oxus westward. [...] Here, we were informed, stood an ancient city. [...] The appearance of the place, however, does indicate the truth of their tradition that an ancient city once stood here.'[101] Wood was the first European to see the ruins of Aï Khanum, but its significance eluded him, as it did the French archaeologist Jules Berthoux when he visited the site in 1926.[102] The honour of recognising the outstanding importance of Aï Khanum is due to the Afghan king Muhammed Zahir Shah (r. 1933–73, d. 2007), when he coincidentally stopped there during a hunt in 1961, noticed the outline of a sunken city and spotted a Corinthian capital in a nearby house. He immediately asked the *Délégation archéologique française en Afghanistan (DAFA)*, which was working in Afghanistan, to investigate the site. Unfortunately the Soviet invasion in late 1979 brought an end to the excavations, which had uncovered only a quarter of the lower city.[103] In the 1990s Aï Khanum was systematically plundered, the excavated monuments were destroyed and the unexplored sections ravaged to such an extent that today the land looks like the surface of the moon. In 2002 a few Ionic and Corinthian capitals as well as columns appeared in neighbouring villages, in one case serving as roof beams in a tea house.[104]

The city, founded by Seleucus I[105] and renamed Eucratideia by Eucratides I around 170 BC, lay in a strategically significant location at the confluence of two rivers near mines for semiprecious gems and on a trade route linking Bactria with China and India. The importance of Aï Khanum as a trading city can be seen in the discovery of 676 Indian silver coins here.[106] An Achaemenid city once stood just 2 km away. Aï Khanum has a triangular plan. The sides along the banks of the Panj and the Kokcha measured 1.8 and 1.5 km respectively, and the third, landward side, 2.6 km, two-thirds of which was protected by tall hills, where the acropolis was located.[107] A strong defensive wall made of unfired clay, 7 m thick



Plan of the Hellenistic city of Aï Khanum in northern Afghanistan, which lay at the confluence of the rivers Panj and Kokcha. To the left is the lower city with the great palace and public buildings; to the right, the sparsely built upper city. According to B. Staviskij, *La Bactriane sous les Kushans*, 1986, p. 162 (illustration J.-Cl. Liger).



Illustrations according to archaeological discoveries of the Hellenistic city of Aï Khanum in northern Afghanistan. From left to right and front to back: The River Ochus (Panj); a patrol of the prodromoi, the light cavalry; the city walls; the gymnasium complex; a mausoleum; the theatre; the palace complex; the temple dedicated to Zeus and the upper city.

in exposed sections and fortified with rectangular towers, surrounded the entire city. In contrast to the conventional defensive walls of Central Asia, such as those of Maracanda, which were caved to offer protection for people, those of Aï Khanum were solid in order to withstand the assaults of large siege machines.

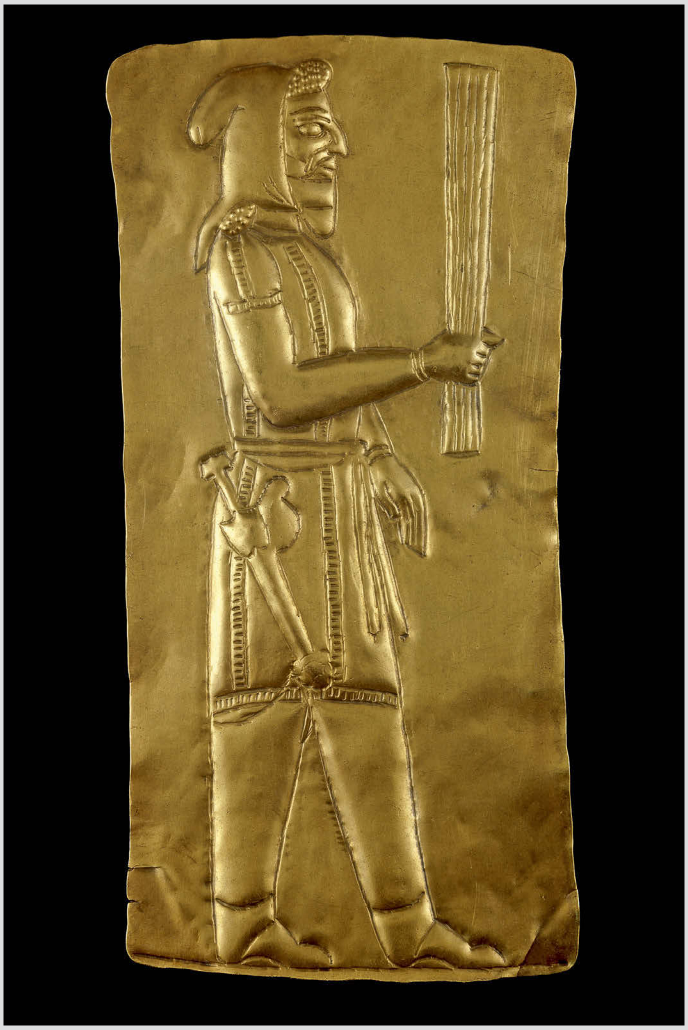
Most of the buildings stood in the lower city, which was less exposed to the wind than was the upper city; a long, straight street ran through the lower city. Among the most notable buildings were a spacious palace, a temple, a public gymnasium with an adjacent bath, a classical theatre that offered space for 5,000 spectators – the easternmost in Hellenistic Asia – an arsenal and two heroii (memorial monument) – all markers of a classical Greek polis. The palace, built at ground level out of fired bricks and above that of unfired clay bricks, reveals a fascinating synthesis of Greek and traditional Central Asian architectural principles. The floor plan of the great halls and the supporting columns corresponded to Greek models, as the latter consisted exclusively of stone, the shaft rested on an Attic base and it was topped by a Corinthian capital. The columns were constructed without mortar but secured by iron bolts – also a typically Greek practice. In the traditional architecture of the region, by contrast, shaft and capital were made of wood, which gave the structure greater flexibility in earthquake-prone Central Asia. On the other hand, the buildings did not have Greek pitched roofs but rather Central Asian flat roofs. They did, however, have two rows of Greek tiles on the edges for decoration, as did the roofs at Khalchayan. Roof tiles only make sense for pitched roofs; they are out of place on flat roofs, as they only add unnecessary weight.

The Oxus treasure

The history of the Oxus treasure, which includes about 180 objects and 500 coins and which can be seen in the British Museum, is just as spectacular as the objects themselves.[108] In the nineteenth century, near the ancient fortress of Takht-i Kuwad, at a ford through the Oxus in southern Tajikistan, local treasure-hunters were looking for gold and silver objects on the riverbank. Around 1877 a few of them made a discovery near the fortress, which is not far from the confluence of the Vakhsh and the Panj. In 1880 they sold a large portion of the hoard to three merchants from Bukhara, who intended to sell the goods in the metropolis of Rawalpindi.[109] At the Afghan border and at sentry points they had to give soldiers individual items, mostly gold and silver coins, as 'tolls', so their treasure slowly dwindled, but they reached Kabul safely. Between Kabul and Peshawar, however, they were set upon by local villagers, robbed and carried off to nearby caves. But one servant escaped and at nightfall alerted the British political officer F.C. Burton, who set out immediately with two orderlies. 'Towards midnight [he] made an unexpected appearance among the bandits, who had already been quarrelling over their plunder. Four of them were lying wounded on the floor.'[110] The thieves handed the officer their loot. Returning to his camp, Burton declared the start of a punitive operation, whereupon other villagers returned more of the goods. Thus the three merchants, who had been freed in the meantime, got back three-quarters of their possessions.

Soon the gold and silver objects in question were being traded by the merchants of Rawalpindi, where they were subject to further dangers. A few merchants supplemented their supply with additional objects of other provenance; others offered hastily produced copies and kept the originals. The odyssey of the Oxus treasure came to an end when Major General Sir Alexander Cunningham, director of the Archaeological Survey of India, bought up the objects and pressured them to sell him the originals, too. Later Sir A.W. Franks acquired Cunningham's collection and bequeathed it to the British Museum in 1897. The museum believes that the objects are authentic.[111] Among the most outstanding finds are a pair of golden armlets with horned griffin protomes,[112] a miniature golden chariot pulled by four horses with a charioteer and a passenger,[113] a silver statue of a naked youth,[114] a golden akinakes sheath with Assyrian-looking motifs,[115] a gold vessel in the shape of a fish and about 40 thin golden plaques, on which is embossed a standing man, in profile, holding either a barsom or a lotus blossom.[116] The barsom has a cultic connection to Zoroastrianism, as it is a consecrated bundle of twigs that priests hold during the reading of the Avesta. Other round gold plaques feature a bearded face similar to the Egyptian god Bes.

Immediately after the publication of Dalton's catalogue in 1905, a lively discussion began about the treasure, which focused on the following questions: Was the treasure a unified collection and was it discovered in a single location or did the discoverers assemble it between 1877 and 1880? Did objects and coins belong together? Were they real? How should the discoveries be dated and where did they come from? Did the hoard have a function? Today most scholars believe that the majority of the objects are genuine[117] and were discovered, and thus had been buried, in the same place, while many items had found their way into other collections or been melted down. The coins presumably belonged to the hoard, but only a third of the original number of about 1,500 made it to the British Museum. Except for some of the inexpertly produced local gold discs, a large number of the objects came from the Achaemenid period[118] and were probably of western Iranian provenance.[119] A few pieces, such as the silver statues of a naked youth, show Greek



Gold disc with a man in Median clothing armed with an akinakes and holding a barsom; presumably he is a priest or worshipper at a fire temple. Oxus Treasure, fifth–fourth centuries BC. The British Museum, London.

influence, and others were produced nearby in Greco–Bactria. A unique gold badge came from the steppe territory.[120]

Like the objects, the coins are of varied origin and period; they came from: Athens (fifth century BC), Macedonia (500–323 BC), Ionian Asia Minor (fifth–fourth centuries BC), Achaemenid royal mints (fifth–fourth centuries BC), Achaemenid satrapies of Asia Minor (400–332 BC), Central Asian satrapies under Greek rule (321–300 BC), Bactra (fourth century BC), Seleucids (312–246 BC), the rulers Andragoras and Wahshuwar (fourth–third centuries BC) and Taxiles (fourth century BC), Greco–Bactria (256–170 BC). The Seleucid and Greco–Bactrian coins made up by far the largest single group.[121] The coins and objects thus define a hypothetical time frame for the hoard from the early fifth to the beginning of the second century BC. The gold plaques, depictions of animals and miniature models of chariots were most likely votive gifts, which suggest a temple origin. Since 1976, with interruptions archaeologists have been excavating a fire temple 5 km upstream near Takht-i Sangin, also dedicated to the river god Oxus.[122] These factors led to the hypothesis that the Oxus collection was originally the treasure of the Oxus temple and had been buried at Takht-i Kuwad. Why and when the hoard was buried remains unknown; it is likely that the looming invasion of the Saka or, soon after, the Yuezhi was a factor.[123]

As in Greece the dead were buried outside the city in family crypts in a cemetery; the construction of a heroon within the city was permitted only in extraordinary cases. Two Greek inscriptions were engraved on one of the two memorial monuments of Aï Khanum. One names Kineas as one of the city fathers; the second comes from the philosopher Clearchus of Soli (*ca.* 340–250 BC), a student of Aristotle who visited Aï Khanum and had the 150 ‘maxims of Delphi’, attributed to the Seven Sages, engraved there. The extant fragment reads:

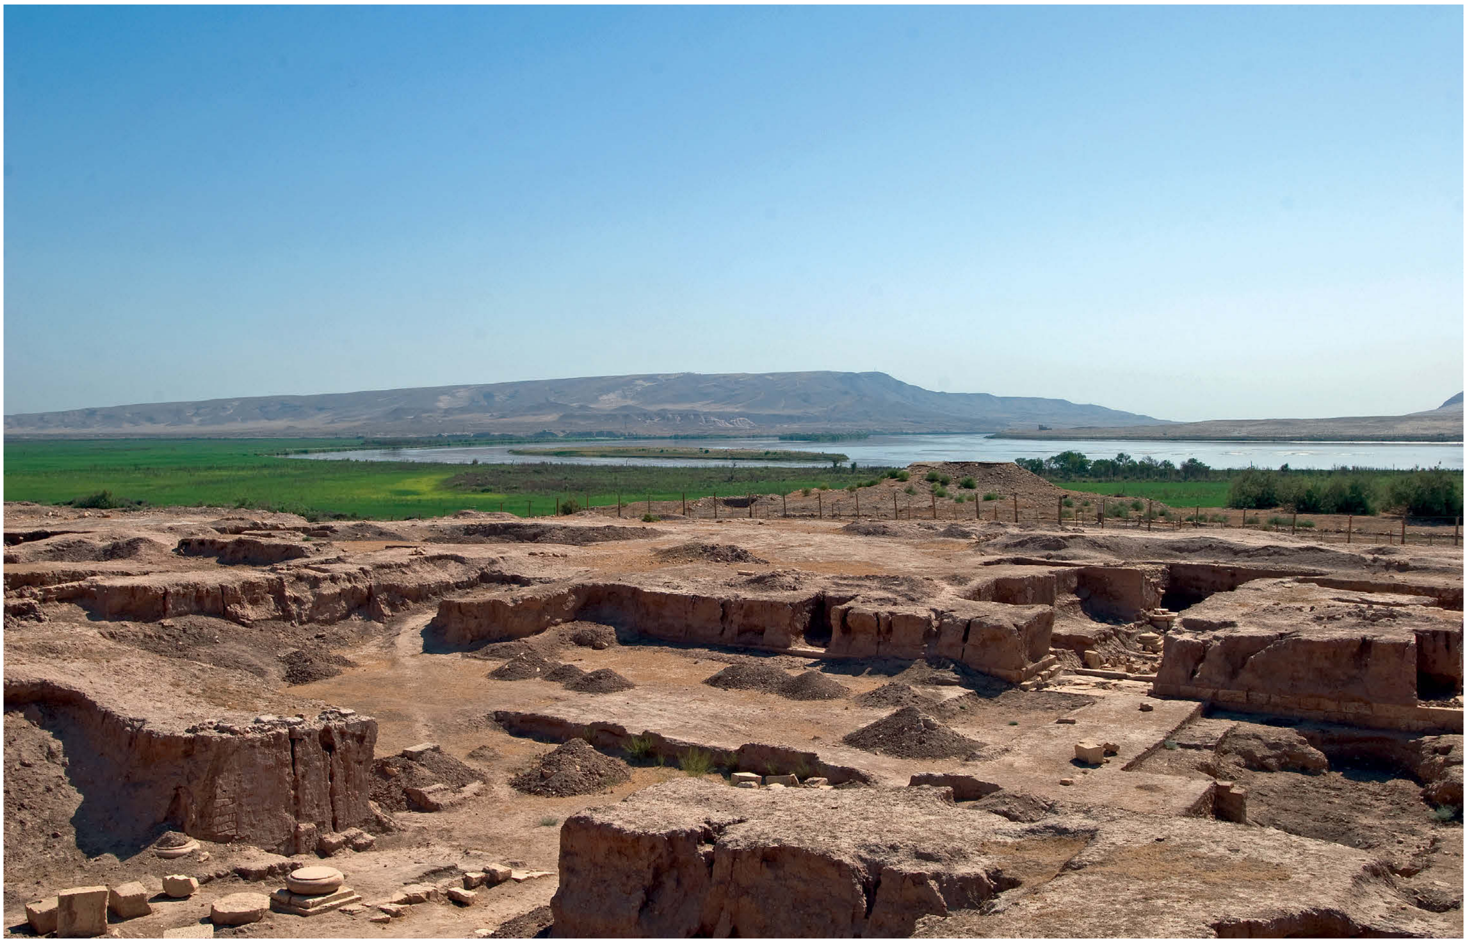
> *As a child, be well-behaved.*
> *As a youth, be self-controlled.*
> *As an adult, be just.*
> *As an elder, be wise.*
> *As dying, don’t regret.*[124]

The sojourn of a pupil of Aristotle in Aï Khanum shows that a lively intellectual exchange took place between the Greek homeland and this outpost of Greek culture in Central Asia.

Aï Khanum had three shrines, whose architecture featured few Greek elements. The main temple, with a square plan of 20 x 20 m, stood in the lower city and within it was a seated statue of Zeus, under whose guise presumably Ahura Mazda or Mithra was worshipped simultaneously.[125] The statue was an acrolith, and it consisted of a combination of materials: head, hands and feet were made of marble, and the torso was sculpted out of clay over a wooden frame.[126] In the temple, the above-mentioned silver plate featuring Cybele, dated to the third century BC, was found. The goddess of nature stands on a light chariot pulled by two lions. The winged goddess Nike is her charioteer, behind her a priest holds a parasol and a second priest makes an incense offering on a altar with high steps; in the sky Helios, the moon and a star observe the scene.[127] The plate is a typical example of hybrid Greco–Oriental art: while the two goddesses standing on a chariot drawn by lions and Helios are Hellenistic motifs, the priest holding a parasol above Cybele’s head and the shape of the altar are eastern.

Outside the city, not far from the city gate, stood a second temple and, on the acropolis, a monumental open-air altar. As reported by ancient authors, Iranians tended to worship their deities in such elevated places. While Greco–Bactria adopted many Central Asian elements into its architecture, in the minting of coins it remained faithful to the Greek models. On the coins it can be seen that the official pantheon consisted exclusively of Greek deities, predominantly Zeus, Apollo, Hercules, Poseidon, Athena, Artemis and the Dioscuri. However, the occasional appearance of non-Greek attributes, such as rays of light, indicates that Asiatic gods were being worshipped in the form of a Greek deity, such as Mithra in the form of Zeus or Hercules and Anahita in that of Artemis.[128]

The city of Saksanochur in what is today southern Tajikistan, built a few decades later than Aï Khanum and 40 km north of it, demonstrates that Aï Khanum was not an isolated case. Like Aï Khanum, the city, which still existed in the third century AD, had a palace and temple complex with stone columns and Corinthian capitals.[129] Similar, smaller Hellenistic towns flourished north of the Oxus near Dalverzin Tepe (valley of the Sukhan Darya), which was destroyed by the Saka at the same time as Aï Khanum and rebuilt at the start of the Kushan dynasty, as well as near Kalai Mir (valley of the Kafirnigan Darya).[130] Dilbergine Tepe stood south of the Oxus, 40 km north-west of Bactra. It was one of the many Achaemenid settlements intended to secure the trade routes, but it was destroyed by Alexander. Early Greco–Bactrian kings rebuilt it, fortifying it with strong defensive walls and building a temple dedicated to the Dioscuri, as can be concluded from a mural of the twins Castor and Pollux riding a white horse.[131]



The fire temple of Takht-i Sangin on the northern bank of the Oxus (Amu Darya) in southern Tajikistan was also dedicated to the river god Oxus. From back to front: propylon, temenos (temple plaza area), passageway to the aiwan, aiwan eight-columned room. The central four-columned room was reburied in 1990.

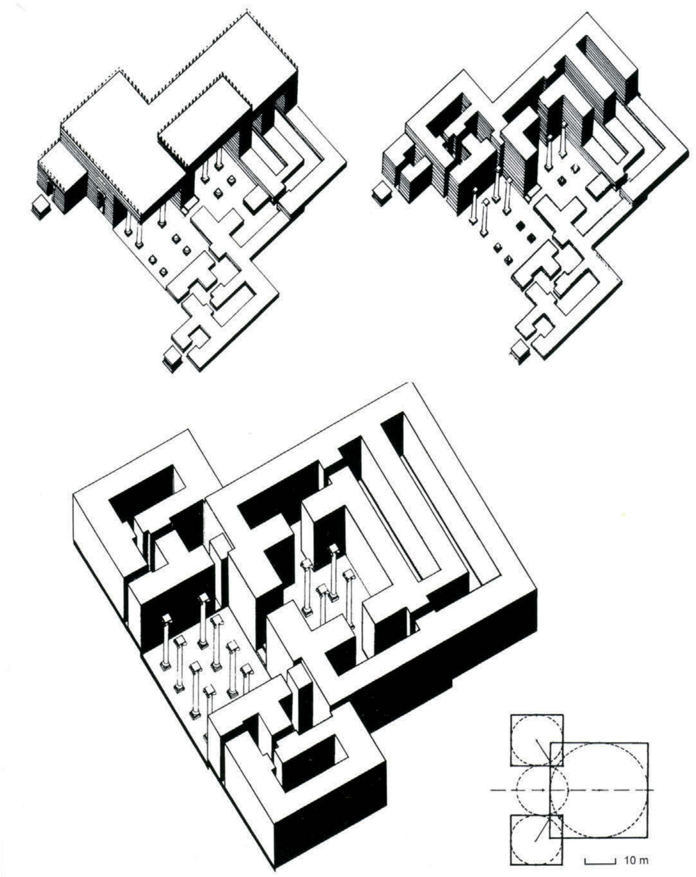
3.3 The Oxus temple

The Oxus temple, which today is called Takht-i Sangin, meaning 'stone throne', may correspond with the ancient settlement of Oxeiana, as it is recorded on the seventh Asian map of Ptolemy.[132] The large temple, 51 x 51 m in extent, and the city, which extended over 2 km south and north of it along the northern bank of the Oxus, were likely to have been built by the Seleucid Antiochus I at the start of the third century BC in his capacity as viceroy of the eastern satrapies.[133] Today the shrine stands in the centre of a citadel 238 x 167 m in extent, which was built toward the end of the Greco–Bactrian Kingdom when invasions threatened from the north.

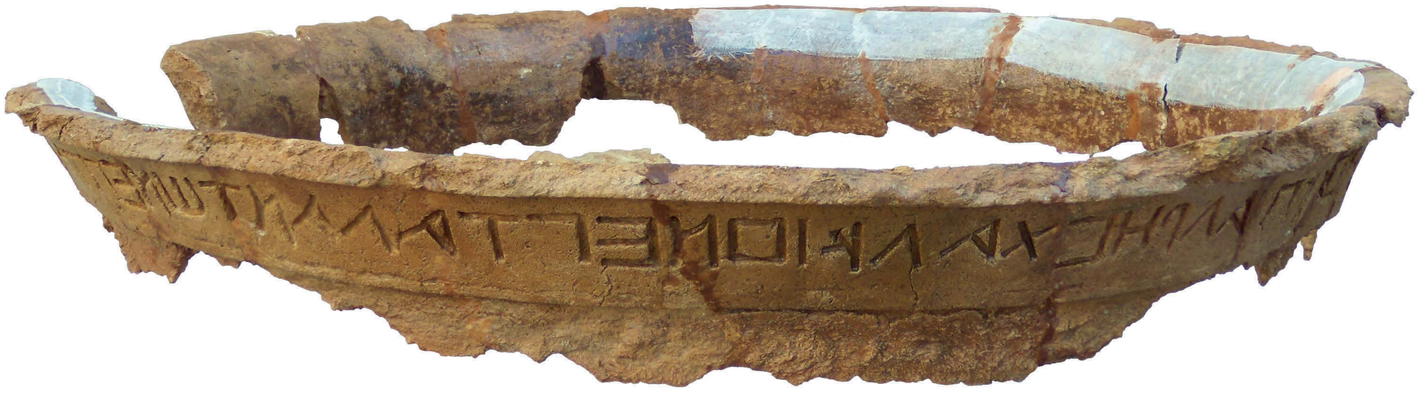
The temple, built of unfired clay bricks, displays an Iranian layout. One entered through a propylon (gate) into the temenos, the temple plaza, and proceeded through a passageway to a rectangular, covered courtyard, with two side structures connected to the short sides. The hall, enclosed on three sides, remained fully open to the front and formed an *aiwan*, a type of structure later very common in Central Asia and Iran. The flat roof was supported by eight columns, which rested on double plinths and culminated in Ionic capitals.[134] On one plinth nomads had drawn so-called *tamga* symbols, indicating use of the temple for profane purposes during the interruption in temple activity between the end of Greco-Bactria and the early Kushan.[135] In each of two symmetrically placed rooms north and south of the eight-columned hall there stood a fire altar and the sacred ashes were also kept in special pits here. The excavators Litvinsky and Pitschikjan assert that these small complexes, are 'the real hallmark of Iranian fire temples'.[136] For Pitschikjan the Oxus temple represents 'of all the known fire temples in both the territory of middle or Central Asia and Achaemenid Iran, the most complete and least damaged of this type of complex'.[137]

From this eight-columned hall a passage led to the central, square, four-columned room, which was surrounded by long corridors on three sides. This entire complex was again enclosed by long corridors, created when the later enclosure with strong defensive walls and corner towers was built. Under the floor of the central hall archaeologists found pits containing consecrated temple offerings. The bones of sacrificed animals and votive gifts, some ritually shattered, had also been placed in the long corridors surrounding the room.[138] Among the thousands of votive offerings were sculptures made of unfired clay and covered with colourfully painted plaster, of which two impressive portraits of Seleucid or Greco–Bactrian rulers and a third representation of a local chieftain are especially outstanding. To these were added a statue of a seated woman, ivory figurines and objects produced in Bactria, jewellery, coins and gold plaques similar to those found in the Oxus treasure. In the second period, during the time of the Kushan (first–third centuries AD), more weapons of all types appeared in the collection of temple offerings, among them spears, lances and arrowheads, miniature swords and replicas, which suggests a change in cultic activity or in the temple clientele and their concerns.

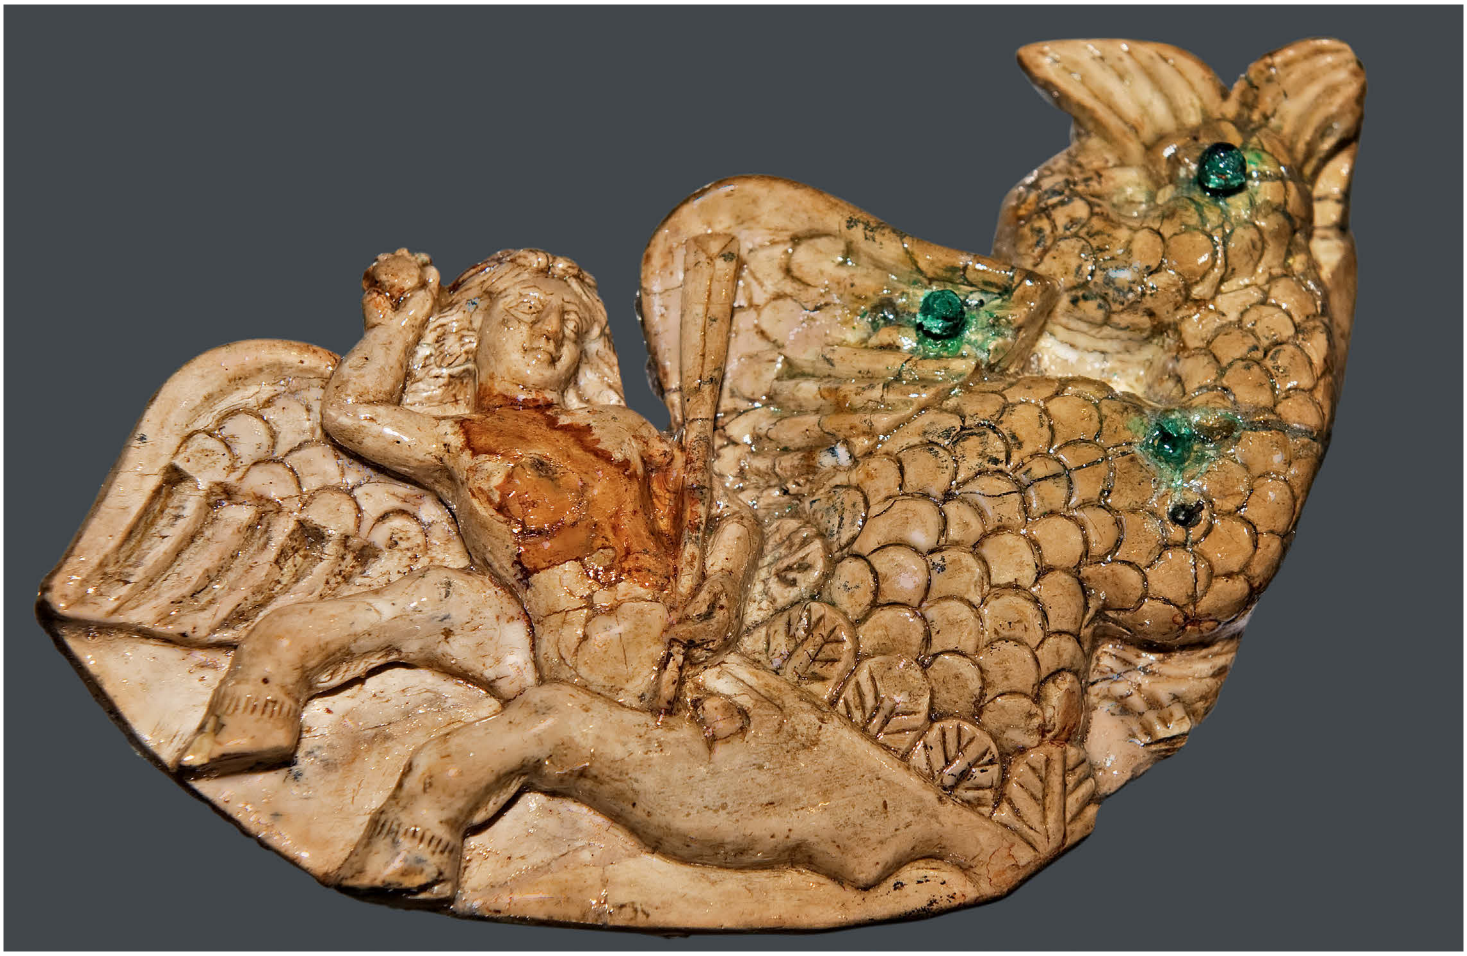
The most important discovery, however, is the 16-cm-tall bronze statue of Silenus playing an *aulos*, a Greek double flute, from the third/second century BC. Silenus stands on a limestone base with the Greek inscription, 'Following a vow, Atrosokes dedicated [this] to the Oxus'; that is, the river god of the same name.[139] From this inscription it can be concluded that the temple was also consecrated to the river god Oxus. With regard to the geographic location of the shrine, it stood at the 'birthplace' of the river, the confluence of the Vakhsh and the Panj. The small votive statue also illustrates a 'synthesis of Iranian–Bactrian and Greek traditions: the venerated



Elevation of the Oxus temple (Taxt-i Sangin), southern Tajikistan: the eight-column aiwan with two side-chapels and the central four-column hall with surrounding corridors. According to: B. Litvinskij, I. Picikjan, *Taxt-i Sangin*, 2002, p. 93, illustration. I. Picikjan, G. Arzumanov.



A Greek inscription on the edge of a mould for a bronze cauldron found in the temple plaza of Takht-i Sangin, southern Tajikistan, confirms that the temple was dedicated to the river god Oxus. Second century BC. National Museum of Antiquities of Tajikistan, Dushanbe.



A winged hippocamp with a female torso and forelegs of a horse holds an oar. Painted ivory with bronze inlays, Takht-i Sangin, southern Tajikistan. Second century BC. National Museum of Antiquities of Tajikistan, Dushanbe.

Oxus is local Bactrian, the name of the donor is of Iranian origin and the inscription and the iconography of the figurine are clearly Greek'.[140] A small ivory statuette of a female hippocamp in the shape of the upper body of a winged woman with the lower body of a fish and the forelegs of a horse was also appropriate for the environs of a river god.[141]

Two additional inscriptions from the first half of the second century BC confirm the interpretation of the shrine as an Oxus temple. One is on the rim of a fragment of a stone bowl and the other on the casting mould for a bronze cauldron found in 2007 in a pit in the temple plaza. The inscription, in mirror image in the mould, reads, 'Seiromios, son of Nemiskos of Molpalres, placed the bronze cauldron [of] seven talents [weight] (approx. 180–250 kg) as a votive gift in the temple of the newly arisen Oxus'.[142] It is likely that both Bactrians and Greeks visited the temple. As both fire and water were worshipped in this temple in the guise of the river god Oxus, it recalls the temple of Jarkutan, more than a millennium older.[143] The temple was destroyed at the same time as Aï Khanum after 145 or around 130 BC, rebuilt at the start of the Kushan period in the first century AD and remained in use into the third century.

Although 27 excavation campaigns have already been carried out at Takht-i Sangin, several questions remain unanswered, not least the one of who deposited the Seleucid votive gifts discovered in the temple. Litvinsky and Pitschikjan assume that there was an earlier, Achaemenid shrine, not yet found, from which the pre-Seleucid votive gifts were transferred to the Seleucid Oxus temple.[144]

IX

Outlook

For the first time the states of the north-[west, that is Central Asia] came into communication with Han-[China]. It was [Zhang] Qian who had pioneered the way between 139 and 115 BC.

SSU-MA CH'IEN (SIMA QIAN)[1]

A lone traveller in the Badain Jaran Desert, Inner Mongolia, northern China.

This volume, the first of four, has addressed the emergence of early Central Asian cultures, which were initially based for many millennia on a hunter-gatherer economy. The first Neolithic revolution made possible the first steps towards a transition to farming in southern and north-western Central Asia. This led to the establishment of larger settlements and proto-urban centres. Later on, metallurgy, horsemanship, the wheel and the wagon revolutionised life in the northern half of Central Asia – it was the moment of birth for an extensive stockbreeding economy, from which nomadic lifestyles later evolved. In these epochs animals played a leading role in religious thought and in forms of artistic expression.

About 5,000 years ago Indo–European languages started to crystallise and a spectacular expansion of Indo–European people began, until they had spread as far east as the border with China and south to the Indian subcontinent. Around 1000 BC the highly mobile nomadic riding peoples of the Scythians and the Saka, as well as related groups, appeared, shaping history and culture in Central Asia for a millennium. Superior weaponry, mastery of horsemanship and marked tactical skill ensured their political dominance.

In the second half of the last pre-Christian millennium on the periphery of Central Asia there appeared stable, centralised states of settled societies with professional armies or at least elite corps. In conflicts with Achaemenids, Macedonians and Romans the Central Asian riders were able to hold the invading forces in check, assimilate them or contribute to their defeat.

The second volume tells the thousand-year history of the age of the classical Silk Roads (*ca.* 200 BC–900 AD), from the establishment of the first nomadic empire by the Xiongnu to the kingdom of the Uyghurs in eastern Turkestan (Xinjiang). Around 200 BC the empire of the Xiongnu nomadic horsemen formed as a response to increasing pressure from the Chinese empire, united for the first time. The expansion of the Xiongnu led to successive waves of migrations of peoples towards the south-west and west, including the Yuezhi, Wusun and Ili-Saka, who advanced as far as Kashmir. These migrations also marked the start of almost 2,000 years of migratory movements of Turko–Mongolian peoples out of eastern Central Asia to China, Turkestan, Iran and Europe. The Huns were the prelude, followed by the Xianbei and the Turkic peoples, who founded two empires in eastern Central Asia and undertook diplomatic relations with Iran and the Eastern Roman Empire.

The beginning of the first millennium bore witness to the expansion of Buddhism in eastern Central Asia and from there to China and Mongolia. The trade routes of Central Asia were travelled not only by caravans laden with exotic goods but also by artistic ideas and further world religions. Among the former was the Buddhist style of Gandhara, a synthesis of elements from Indian, Iranian and Greco–Roman art, and among the latter were Manichaeism and ‘Nestorian’ Christianity. With the Sogdians, who originated in the region around Samarkand and conducted much of the trade that ran through Central Asia, Iranian cultural assets spread to Turkestan and China. The epoch of the Silk Roads was also the age of the Chinese pilgrim monks who crossed Central Asia in order to study at the Buddhist universities of India and bring Buddhist sutras back to their homeland. The travel diaries of Faxian and Xuanzang in particular provide valuable information about the cultural history of Central Asia which archaeology has confirmed countless times.

In Central Asia the first Christian millennium was shaped not only by a creative and enriching exchange of culture and ideas but also by clashes of great powers such as the two Turkic empires, China, Tibet, Iran and, beginning in the late seventh century, the Arabs. The Arabs distinguished themselves from all other conquerors in that they imposed their own beliefs on those they subjected. Christianity, Judaism and Zoroastrianism were, with limitations, tolerated, but Buddhism was eradicated. Additionally, Islamic iconoclasm represented the first cultural earthquake that shook eastern Central Asia.

The millennium covered in the second volume was an age in which the states on the periphery of Central Asia decisively determined its fortunes. On the other hand, eastern Central Asia was a continuing source for the migration of Turko–Mongolian peoples to the south and west. They ruled northern China from the fourth to the sixth centuries AD; in Central Asia they founded several kingdoms and, towards the end of the first millennium, began to push back the Iranian dominance that had existed until then with regard to ethnicity and language. The expansion of Turkic peoples, which led to a Turkicisation of the previously Indo–European steppes, reached its first climax with the capture of Baghdad in 1055 and its most spectacular triumph in 1453 with the conquest of Constantinople; in 1683 they stood at the gates of Vienna.

An intriguing mixture of ethnicities developed in the Tarim Basin particularly, mostly Buddhist cultures, flourished in the oases. Thanks to itinerant artists from Gandhara, Bactria, Sogdia and China, there were fascinating and at the same time harmonious syntheses of corresponding styles, which reached their zenith in the cave paintings of Kizil and Kumtura on the northern rim of the Tarim Basin and in the neighbouring province of Gansu at the Mogao cave paintings of Dunhuang. The visual transmission of important Buddhist content contributed essentially to the spread of Buddha’s teaching and achieved in Central Asia pinnacles of expressiveness and spiritual power.

Appendix: The most important prehistoric and early historic cultures of Central Asia

	WEST OF THE URALS	EAST OF THE URALS	EASTERN KAZAKHSTAN	MINUSINSK
NEOLITHIC	**Elshanka** Volga, 7000–6000 BC

Notes

Introduction

1. We largely abstain from using the term ‘civilisation’, as in the past it has often been used, from a Eurocentric outlook, to imply a superiority over so-called ‘barbarians’ or ‘uncivilised’ ways of life.
2. The ‘Han Shu’ was begun around 36 AD by the historian Ban Biao, further developed by his son Ban Gu, and completed by the latter’s sister Ban Zhao around the year 110.
3. *History of Civilizations of Central Asia* (Unesco Publishing, Paris, 1992–2005).

I. Geography, Climate and Prehuman History of Central Asia

1. Ellsworth Huntington, *The Pulse of Asia* (Boston, 1907), pp. 15, 359.
2. Alexandre de Humboldt, *Asie Centrale. Recherches sur les chaînes des montagnes et la climatologie comparée* (Paris, 1843).
3. This book takes the view that the origin of the Proto-Indo–European language is to be found in the region north-east of the Black Sea. See p. 135.
4. Akiner Shirin, ‘Silk Roads, Great Games and Central Asia’, *Journal of the Royal Society for Asian Affairs*, London, Vol. XLII, No. 3, November 2011, p. 392.
5. ‘Inner Asia’ is a purely geographical term and encompasses Xinjiang, Outer Mongolia, Tibet and Tuva in southern Siberia.
6. Roy Chapman Andrews, *Under a Lucky Star* (1943) 2009, p. 3.
7. Andrews, *Under a Lucky Star*, p. 9.

16. Andrews, *Under a Lucky Star*, p. 251.
17. *History of civilizations of Central Asia*. Vol. I. (Paris, 1992), pp. 29–37.
18. Inner Mongolia refers to the Inner Mongolia Autonomous Region in northern China, and Outer Mongolia to the independent Republic of Mongolia.
19. A striking exception were the early Xiongnu rulers, who valued control over strategic territories as essential. For example, when the founder of the Xiongnu Empire, Maodun Chanyu, was asked after 209 BC by his powerful eastern neighbours, the Dong Hu, to hand over his favourite horse and later his favourite consort, he immediately obliged. But when the Dong Hu asked for some eastern parts of the Gobi Desert, ‘Maodun flew into a rage [saying]: “Land is the basis of a nation”.’ Then he attacked and destroyed the Dong Hu (Ssu-ma Ch’ien. *Shih chi*. Translated by Burton Watson, 1971, Vol. II, p. 162). See also Vol. II of the present work.

II. The Settlement of Central Asia in the Palaeolithic

1. Charles Darwin, *The Descent of Man* (London, 1871), Vol. I, p. 199.
2. Robin Dennell, *The Palaeolithic Settlement of Asia* (Cambridge, 2009), p. 438; Johannes Krause et al.,

'The complete mitochondrial DNA genome of an unknown hominin from southern Siberia', *Nature* 10:1038/08976 (advance publication) (2010).

3. Anatoli Derevyanko, for instance, postulated that the Mongolid race began to emerge 'several hundred thousand years ago' (Anatoly Derevyanko (ed.), *The Palaeolithic of Siberia* (Urbana and Chicago, 1998), pp. 333ff).
4. Donald Johanson, *Origins of Modern Humans: Multiregional or Out of Africa?* (Washington, 2001); Martin Kuckenberg, *Als der Mensch zum Schöpfer wurde* (Stuttgart, 2001), pp. 56–71, 188, 197. See also: Dennell, *The Palaeolithic Settlement of Asia*, pp. 456f, 470 note 12.
5. The discoverer of the human fossils of Dmanisi, David Lordkipanidze, sees connections to the still older *Homo habilis*, which is why he introduced the taxon *Homo georgicus* – which is not recognised internationally – and positioned it between *Homo habilis* and *Homo ergaster*, the African *Homo erectus* (David Lordkipanidze and Jean Gagnepain, *La Géorgie, berceau des Européens* (Quinson, 2003), p. 4, 24ff; Paule Valois, 'Quand l'homme a peuplé la terre,' *Archéologia* no. 480 (2010), pp. 53ff). However, still older traces of *ca*. 2-million-year-old hominins are reported to have been discovered in central Syria near Hummal and Aïn al-Fil (Valois, *Quand l'homme a peuplé la terre,* p. 53).
6. Dennell, *The Palaeolithic Settlement of Asia*, pp. 128, 167–176, 183f. The fossils of the purportedly 2.0-million-year old 'Wushan Man' of Longgupo, central China, were from a non-human ape. See: Russell Ciochon, 'The mystery ape of Pleistocene Asia,' *Nature* 2009, pp. 910f. The meagre collection of pebble tools, alleged to be 1.9 million years old, discovered at Riwat, northern Pakistan, are disputed, in part because they were not found in their original context (Dennell, *The Palaeolithic Settlement of Asia*, pp. 84, 123ff, 136ff, 321).
7. Henri de Lumley, 'Les premiers homes en Chine', *Dossiers d'Archéologie* no. 292 (2004), pp. 14f; Jean-Jacques Bahain, 'Les premiers homo erectus en Chine', *Dossiers d'Archéologie* no. 292 (2004), p. 37; 'Les gisements d l'Homme de Lantian', *Dossiers d'Archéologie* no. 292 (2004), pp. 45f.
8. Dennell, *The Palaeolithic Settlement of Asia*, pp. 98–113. *Homo erectus* presumably also invented the raft, in order to cross the Red Sea and to reach the island of Flores.

23. Dennell, *The Palaeolithic Settlement of Asia*, pp. 279–287, 453; Johanson, *Origins of Modern Humans*.
24. The approximately 800,000-year-old 'Ceprano Man', discovered south of Rome in 1994, remains to this day an isolated discovery; his name does not constitute a taxon. He is considered an early form of *Homo heidelbergensis* (Francesco Mallegni et al., 'Homo capranensis sp. nov. and the evolution of African-European Middle Pleistocene hominids,' *Comptes Rendus Palevol* ii/2 (2003), pp. 255–259).
25. *Homo antecessor*, at least 780,000 years old, is disputed as a taxon. Most palaeontologists consider it to belong to *Homo erectus* or as an early form of *Homo heidelbergensis* (Dennell, *The Palaeolithic Settlement of Asia*, p. 458).

41. Analyses of the lithic material from Obi-Rakhmat led a few researchers to posit a gradual development from Middle Palaeolithic to Upper Palaeolithic stone tools, from which they postulated a region inhabited simultaneously by Neanderthals and sapiens. See: Andrei Krivoshapkin and Jeffrey Brantingham, ‘The Lithic industry of Obi-Rakhmat Grotto, Uzbekistan’, *Actes du XIV Congres UISPP, 2–8 septembre 2001. BAR International Series 1240* (2001), pp. 203, 214; Vishnyatsky, ‘The Palaeolithic of Central Asia’, p. 98.
42. Vishnyatsky, ‘The Palaeolithic of Central Asia’, p. 112.
43. Hallam Movius, ‘Teshik-Tash: A Mousterian Cave Site in Central Asia’, in *Société Royale Belge d’Anthropologie et de Préhistoire, en l’honneur du Professeur Hamal-Nandrin* (Brussels, 1953), pp. 75, 79.
44. The oldest known burial sites in the world are those in the cave of Qafzeh near Nazareth in the Levant. Here modern humans of the species *Homo sapiens* were intentionally buried 115,000 (+/-15,000) years ago. Well documented by the stratigraphy are the double grave of a young woman with a young child and the grave of a youth whose hands held a deer antler (H.P. Schwarcz, ‘ESR dates for the hominid burial site of Qafzeh in Israel’, *Journal of Human Evolution* xvii (1988), pp. 733, 736); Bernard Vandermeersch, ‘The excavation of Qafzeh: Its contribution to knowledge of the Mousterian in the Levant’, *Bulletin du Centre de recherche français de Jérusalem* x (2002), pp. 66ff.

46. Allchin, ‘Middle Palaeolithic culture’, p. 86.
47. Ralph S. Solecki, ‘Shanidar cave: a Palaeolithic site in northern Iraq’, *Annual Report of the Smithsonian Institution* (1954), pp.389–425; Ralph S. Solecki and P. Agelarakis Anagnostis, *The Proto-Neolithic Cemetery in Shanidar Cave* (Texas A&M University Press, 2004). A tenth Neanderthal, who died very young, was discovered by Melinda Zeder in 2006.
48. The thesis proposed by Steven Churchill in 2009 that Shanidar III was killed by a modern sapiens because the Neanderthals ostensibly were unfamiliar with the spear is unsustainable. Neanderthals certainly used spears and, secondly, no contemporaneous signs of sapiens have been found in Kurdistan (Steven Churchill and Robert Franciscus, ‘Shanidar 3 Neandertal Rib Puncture Wound and Palaeolithic Weaponry,’ *Journal of Human Evolution* lvii/2 (August 2009)).
49. Other researchers believe, however, that the flower pollen could have been brought into the cave by a rodent, such as a jerboa.
50. Based on the discovery of Palaeolithic tools which are supposed to have been manufactured by modern *Homo sapiens* at Jebel Faya, United Arabian Emirates, it has been claimed in January 2011 that *Homo sapiens* crossed the then almost dry straits of Bab al Mandeb already some 130,000 to 125,000 years ago. It remains so far unproven that these tools were made by modern humans (Armitage Simon J. et al., *The Southern Route ‘Out of Africa’: Evidence for an Early Expansion of Modern Humans into Arabia,* Science 2011).
51. Dennis Etler: ‘Based on the fact that modern human Upper cave remains from Zhoukoudian [China], dated to *ca.* 20,000 ya, cannot be identified as belonging to any particular living “racial” group, I would conclude that the differentiation of modern ethnicities in Asia is relatively recent, most likely only within the last 10–12,000 years.’ Letter of Professor Dennis Etler, Cabrillo College, Aptos, USA, to the author dated 8 April 2010; Nicole Maca-Meyer et al., ‘Major genomic mitochondrial lineages delineate early human expansions’, *BMC Genetics* ii/13 (2001); Stephen Oppenheimer, *The real Eve: Modern Man’s Journey Out of Africa* (London, 2003), pp. 195–242; E.D. Phillips, *The Royal Hordes. Nomad Peoples of the Steppes* (Thames & Hudson, 1965), p. 14.

III. A Global Climatic Warming Ushers in the Mesolithic

1. A.P. Okladnikow, *Der Hirsch mit dem goldenen Geweih* (Wiesbaden, 1972), p. 7.
2. Frank Sirocko, *Wetter, Klima, Menschheitsentwicklung* (Darmstadt, 2010), pp. 93, 100–102.
3. We will not use the term ‘Epipalaeolithic’, sometimes equated with the Mesolithic, because the former term is defined differently, depending on the author. The epoch between the Palaeolithic and the Neolithic is sometimes called the Epipalaeolithic for cultures of southern regions that were never affected by ice ages. In the archaeology of Russia and northern Europe, the term ‘Mesolithic’ predominates.
4. Vadim Ranov, ‘Toward a new outline of the Soviet Central Asian Palaeolithic’, *Current Anthropology* xx/2 (1979), p. 258; Georg Renner and Christa Selic, *Abseits der großen Minarette* (Leipzig, 1992), p. 29.
5. Esther Jacobson (ed.), *Répertoire des pétroglyphes d’Asie Centrale. Fascicule 6: Mongolie du Nord-Ouest, Tsagaan Salaa/Baga Oigor,* Vol. I (Paris, 2001), pp. 9–11.
6. The first scholars to give attention to the stone engravings were two Chinese: the philosopher Han Fei (289–233 BC) and the geographer Li Daoyuan (fifth century AD) (Paul Bahn, *Prehistoric Art* (Cambridge, 1998), pp. 1–3). An interpretation of Bronze Age petroglyphs as Shamanistic is problematic since we do not know if a Siberian type of Shamanism existed at that period. Also the alleged first millennium BC petroglyphs of men beating a drum along the Middle Yenissei River are not conclusive, since their dating is unsure and the representation of a drum does not in itself provide evidence of ‘Shamanism’. For pictures see: Ekaterina Devlet. *Rock Art and the material culture of Siberian and Central Asian Shamanism* (London, 2001) p. 47, Fig. 3.5.
7. Two exceptions may be the wagons shown in the top view, which could recall a view of an open grave with a wagon burial, as well as possible portrayals of a horse sacrifice. See photos pp. 85 and 92.
8. Jacobson, *Répertoire des pétroglyphes d’Asie Centrale. Fascicule 6,* p. 7; Esther Jacobson and James Meacham, *Archaeology and Landscape in the Mongolian Altai: An Atlas* (Redlands, CA, 2010), pp. 22f.
9. Esther Jacobson, ‘The Rock Art of Mongolia’, *The Silk Road Journal*, iv/1 (2006), p. 7.
10. Interpretations of the mushroom-shaped head coverings as bronze helmets decorated with feathers seem improbable, since such helmets, discovered in Mongolia, date to a later time, *ca.* eleventh–eighth century BC. In a few battle scenes from the late Bronze Age, this interpretation may be correct. See: D. Erdenebaatar, ‘Burial materials related to the history of the Bronze Age in the territory of Mongolia’, in Katheryn Linduff (ed.), *Metallurgy in ancient Eastern Eurasia from the Urals to the Yellow River* (Ceredigion, 2004), p. 197.

IV. The Economic Revolution of the Neolithic

1. Nicholai Przhevalsky, *Mongolia: The Tangut county and the solitudes of Northern Tibet: Being a narrative of three years travel in Eastern High Asia* (London, 1876), p. 120.
2. While the camel was only domesticated around 2600 BCE, Przhevalsky’s statement applies to most animals domesticated in the Neolithic.
3. In Western scholarship the new methods of production are the prerequisite for designating a culture as Neolithic. In Soviet and Russian scholarship, however, knowledge of ceramics most often defines the start of the Neolithic, so that a hunter-gather society that produced ceramics and refined stone tools would be described as Neolithic, while in traditional Western accounts it would be considered Mesolithic. Since in the Eurasian steppe the people remained hunter-gatherers but had advanced stone tools and ceramics many centuries after sedentariness and food production had begun in Old Europe and the Near East, we follow Parzinger in adopting the Russian view. According to classic Western scholarship, these steppe cultures would have experienced no Neolithic phase and would have jumped from the Mesolithic directly to the Chalcolithic. David Anthony, *The Horse, the Wheel and Language: How Bronze Age riders from the Eurasian Steppes shaped the modern world* (Princeton, 2007), pp. 125f; Hermann Parzinger, *Die frühen Völker Eurasiens: Vom Neolithikum bis zum Mittelalter* (Munich, 2006), pp. 41f.

V. The Chalcolithic and the Early Bronze Age

1. Herodotus, I, 216. The English translation is taken from: Herodotus, *The Histories* (London 2003).
2. David Anthony, *The Horse, the Wheel and Language. How Bronze-Age riders from the Eurasian Steppes shaped the modern world* (Princeton, 2007), pp. 123f.
3. The term 'Metal Age', sometimes used as an alternative, unnecessarily obscures important differences in the development of a culture and between contemporaneous cultures.
4. The Copper Stone Age is also called the Eneolithic. The frequently encountered term 'Copper Age' is actually wrong, since this period was characterised by the use of both copper and stone objects. In archaeology one speaks of the 'Chalcolithic' only when proper copper objects appear, not only copper sheets.
5. Evengy Chernykh, 'Ancient metallurgy in northeast Asia: From the Urals to the Saiano-Altai', in Katheryn Linduff (ed.), *Metallurgy in ancient Eastern Eurasia from the Urals to the Yellow River* (Ceredigion, 2004), p. 16; Evengy Chernykh, 'The "Steppe Belt" of stockbreeding cultures in Eurasia during the Early Metal Age', *Trabajos de Prehistoria* lxvi/2 (2008), pp. 75ff; Philip Kohl, *The making of Bronze Age Eurasia* (Cambridge, 2007), pp. 29ff.
6. The term 'circumpontic' derives from the Greek name for the Black Sea, *Póntos Euxeinos* (Πόντος Εὔξεινος), meaning 'hospitable sea'. At first, however, it was called *Póntos Áxeinos* (Πόντος Ἄξεινος), which means 'inhospitable sea'. The original name was presumably chosen by the Greeks on account of the often stormy swells and the fearsome coastal inhabitants. After the founding of colonies it became the 'hospitable' sea.
7. Chernykh, 'Ancient metallurgy in northeast Asia', pp. 16f, fig. 1.1; Ludmila Koryakova and Andrej Epimakkhov, *The Urals and Western Siberia in the Bronze and Iron Ages* (Cambridge, 2007), pp. 26–33.

49. The influence of the proto-Elamite culture that may be observed in Altyn Tepe and other oasis cities of Kopet Dag can be traced back to this trade contact and not to a sometimes postulated mass emigration out of Mesopotamia or Iran. On this thesis see: Masson and Sarianidi, *Central Asia*, 1972, pp. 51, 81, 85, 89.

78. The hypothesis formulated by Marija Gimbutas in the 1970s of a brutal destruction of the peaceful, egalitarian, and matrilineally organised agrarian culture of 'Old Europe' by militaristic and patriarchal Indo–European rider hordes from the east has been laid to rest. There is also no evidence that Chalcolithic agrarian culture was matriarchal and egalitarian, nor that steppe peoples had an armed cavalry as far back as the fifth/fourth millennium BC. It is true, however, that the semi-nomadic herders had an armed elite and erected kurgans.
79. Anthony, *The Horse, the Wheel and Language*, pp. 229f, 346. On the proto-Indo–European language family PIE and on the problem of associating a prehistoric culture that finally consists of a cluster of particular archaeological discoveries with specific languages and these then with ethnicities, see note 151 and p. 135.

134. Contrary to popular belief, not all lapis lazuli must stem from the famous Sar-i Sang-mine in Badakhshan, northern Afghanistan, although it is the largest and longest exploited mine; other lapis lazuli mines exist in the Pamirs, in the Chagai Hills in Baluchistan, Pakistan, and at the southern shore of Lake Baikal in southern Siberia. Furthermore, other feldspathoid such as sodalite and lazurite which can be found in several other sites in Central and Southeast Asia may be confused with true lapis lazuli. Hence caution is advised when deducing from the find of a lapis lazuli or related feldspathoid a trade connection with Badkhshan (Good, Irene, *When East met West: Interpretative Problems in Assessing East-West Contact and Exchange in Antiquity*, in Vth ICAANE Congress, Madrid. Edited by Allison Betts and Fiona Kidd (Louvain 2008) pp. 28–30).

We will use the term 'Europid' in an ethnic sense, which should be distinguished from the linguistic term 'Indo–European'. Not all Europids spoke Indo–European languages, and not all Indo–European-speakers were Europids. While the two terms can be congruent, they need not be. Regarding the historically loaded term 'Aryan', the Rig Veda, one of the four canonical scriptures of Hinduism, makes clear that Aryan is a cultural-linguistic category, not a racial one. Anyone who offers the proper rituals to the right gods and recites the appropriate hymns is an Aryan. The same holds true with regard to the Avesta, the most sacred book of Zoroastrianism. Here we add that blond hair and light skin are in no way inherent distinguishing features of Nordic Europids, but rather the result of depigmentation as a consequence of a colder climate and less UV-radiation. See: Lebedynsky, *Les Indo-Européens*, p. 91.

VI. The Middle and Late Bronze Age

1. Nicola di Cosmo, *Ancient China and its enemies: The rise of nomadic power in East Asian history* (Cambridge, 2002), p. 13; Sima Guang, *Zizhi tongjian* (Bloomington 2009), pp. 14f; Ssu-ma Ch'ien, *Shih chi. Records of the grand historian of China* (New York 1971), Vol. II, p. 159.
2. The hypothesis of Soviet archaeologists and Claude Rapin is now broadly accepted, that the upper reaches of the ancient Oxus, as defined by the geographers of the classical antiquity, are not identical with the Darya-i Panj, which forms the modern border between Tajikistan and Afghanistan east of Takht-i Sangin as far as Dzong. (East of Dzong the border follows the River Pamir.) Instead, the ancient upper Oxus coincides with the Vakhsh, whose source lies in southern Kyrgyzstan; hence ancient Bactria also included present south-eastern Tajikistan. However, it remains unclear whether the 'Bactria' mentioned by Strabo (*ca.* 63 BC) and Ptolemy was identical with the Bronze Age Bactria. It is unlikely that this was the case. The Darya-i Panj is identical with the ancient Ochus. Askarov Akhmadali, *La Bactriane à l'aube de la civilisation,* 1993, p. 60; Claude Rapin, 'L'Afghanistan et l'Asie Centrale dans la géographie mythique des historiens d'Alexandre et dans la toponymie des géographes gréco-romains', in Osmund Bopearachchi and Marie-Françoise Boussac (eds), *Afghanistan. Ancien carrefour entre l'est et l'ouest* (Turnhout, 2005), p. 144; Ptolemaois Claudios, *Handbuch der Geographie* (2006), VI, 11, 1; 12, 1; Strabo, *Geographica* (2007), II, 1, 15; XI, 8, 8; 12, 1).
3. Viktor Sarianidi, *Margush: Ancient Oriental Kingdom in the Old Delta of Murgab River* (Ashgabat, 2002), p. 86.
4. Despite this limitation we prefer the term 'Bactria–Margiana Archaeological Complex' to the alternative, introduced by H.-P. Francfort, of an 'Oxus Civilisation', because the Murgab River and Margiana do not belong to the natural watershed of the Oxus River, today called the Amu Darya. A more precise description would be 'Murgab-Oxus Civilisation' (Henri-Paul Francfort, 'La civilisation de l'Oxus et les Indo–Iraniens et Indo–Aryens en Asie Centrale,' in Gérard Fussman et al., *Aryas, Aryens et Iraniens en Asie Centrale* (Paris, 2005), p. 253).

55. Three well-preserved 'foundation pegs', in the forms of a personal patron deity, a lion, and King Shulgi of Ur, are exhibited at the Metropolitan Museum of Art, New York: 1989, 281.5; 1948, 48.180 and Rogers Fund, 1959, 59.41.1. Six additional pegs are on display in the British Museum. See also: Aruz, *Art of the first cities*, pp. 65, 80, 222, 438f.
56. Rossi-Osmida, *Adji Kui Oasis*, pp. 67–120.
57. Sarianidi's interpretation of the citadel as a public temple, in whose necropolis a priestess was buried with a sacrificed man, is debated. Sarianidi, 'Temples of Bronze Age Margiana', p. 391; Sarianidi, *Margush,* pp. 165ff.
58. Hiebert et al., *Origins of the Bronze Age Oasis Civilization*, p. 121. Here as well Sarianidi interprets the complex as an Indo–Iranian temple with archaic fire altars. Traces of ephedra, whose alkaloid ephedrine has stimulant effects, in a few vessels led him to the hypothesis that the sacred intoxicant of the Indo–Aryans called *haoma* (mentioned in the Avesta) or *soma* (in the Rig Veda) was prepared in Togolok 21, and he postulated a connection with the Indo–Europeans who advanced into northern India and the Saka Haumavarga, the 'haoma-worshiping Saka', mentioned by Darius I more than a thousand years later. Hiebert et al., *Origins of the Bronze Age Oasis Civilization*, p. XXXIV; Sarianidi, 'Temples of Bronze Age Margiana', pp. 391–397; Sarianidi, *Margush,* pp. 178–181.

110. Wang et al., *The ancient corpses of Xinjiang*, pp. 228, 234. See also: Barber, *The mummies of Ürümchi*, p. 81. On the basis of craniometric studies Hemphill and Mallory question this hypothesis and suggest a development of an indigenous population of 'unknown origin' (Hemphill and Mallory, 'Horse-mounted invaders from the Russo-Kazakh Steppe', pp. 214, 218).
111. Abdulressul Idriss et al., 'The Xiaohe Graveyard in Luobupo, Xinjiang', *Chinese Archaeology* viii (2008), p. 95.
112. That these statues were not buried wooden mock-corpses is shown by a photograph from 1905, when E. Huntington documented an 80-cm-tall female wooden statue, standing at the head of a grave, about 50 km north of Xiaohe (Ellsworth Huntington, *The Pulse of Asia* (Boston, 1907), pp. 262f).
113. Christoph Baumer, 'Indo–europäische Mumien im Herzen der Wüste Taklamakan. Die Ayala Mazar-Xiaohe Kultur', in *Antike Welt* (Mainz, 2010). *The Ayala Mazar – Xiaohe Culture. Results from an archaeological exploration of the ancient Keriya Delta, China, in 2009*, Self-published (June 2010) and in *Kristi*, New Delhi, Vol. 3 (2011), pp. 1–23; 'The Ayala Mazar-Xiaohe Culture: New archaeological discoveries in the Taklamakan Desert, China', in *Journal of the Royal Society for Asian Affairs* (London, Vol. XLII, No. 1, March 2011), pp. 49–70.
114. Surprisingly, such a wooden mask is also included in the Otani-Collection assembled before 1914. See: *Central Asian objects brought back by the Otani mission* (Toyko 1971) fig. 84, no provenance given. The piece was most probably sold by the Uighur guide and treasure-hunter Ördek to the Japanese member of the Otani mission Tachibana Zuicho when he guided him in winter 1910/11 in the Lop Nor Desert. More than two decades later Ördek volunteered to lead Folke Bergman to Xiaohe which he called a 'hill covered with a thousand coffins' and admitted that he had visited (and looted) the site many years earlier. This initial visit by Ördek must have taken place before November 1910 (Bergman Folke, *Archaeological researches in Sinkiang* (Stockholm 1939), pp. 51f).
115. On Xiaohe see: Christoph Baumer, 'Die 'Tausend-Särge-Nekropole' von Xiaohe', in *Antike Welt* (Mainz, 2006), pp. 39–49; Idriss, 'The Xiaohe Graveyard in Luobupo, Xinjiang', pp. 85–95; Victor Mair, 'The Rediscovery and Complete Excavation of Ördek's Excavation', *Journal of Indo–European Studies* xxxiv/3&4 (2006), pp. 273–318; Mair, *Secrets of the Silk Road*, pp. 46ff, 160–180.
116. Li Chunxiang et al., 'Evidence that a West-East admixed population lived in the Tarim Basin as early as the early Bronze Age', *BMC Biology* viii (2010), pp. 1–12. Mitochondria are inherited only maternally and y-chromosomes only paternally. A study published in 2004 of 20 mummies, approximately 3,800 years old, from the northern Lop Nor and 11 mummies, about 2,500 years old, from Turfan showed that the mummies from the Bronze Age had significantly more Europid mtDNA lines of descent than the later mummies from the Iron Age (Christopher Thornton and Theodore Schurr, 'Genes, language and culture: an example from the Tarim Basin', *Oxford Journal of Archaeology* xxiii (2004), pp. 93ff).
117. The Uyghur word 'darya' means 'river'. On Jumbulakum see: Corinne Debaine-Francfort, *Keriya. Mémoires d'un fleuve* (Paris, 2001), pp. 120–225.
118. More recently, Victor Mair's March 2010 exhibition catalogue *Secrets of the Silk Road* mentioned on pp. 49–52 a 'northern cemetery' lying 70 km north of Jumbulakum, but no pictures were published. The description suggests that it is Ayala Mazar, which a Uyghur archaeologist had ostensibly already visited briefly in 2008. The first publications of the author occurred in Swiss newspapers on 22 January 2010 (*Thurgauer Zeitung*) and on 14 February 2010 (*Zentralschweiz am Sonntag*). See also note 119.
119. Possnert Göran, Sundström. Result of ^{14}C dating of human hair from Xinjiang, China (Uppsala 11 March 2011).
120. These tiny wooden masks look very different from those found in burials of the Okunev Culture.
121. Two additional residential complexes from the Bronze Age, 'H 16' and 'H 17', are 32 and 37 km from the necropolis respectively.
122. 123. Mei, *Copper and Bronze Metallurgy*, pp. 14, 25, 28ff, 36, 72, 89, 119, 123, 142.
124. Presumably there were other, still unknown sites of this culture between the Keriya Darya and Lop Nor in the inland deltas of the former Niya, Andier or Karamiran rivers.
125. The fact that the craniometric studies of Hemphill and Mallory, which compared material from the Tarim Basin, the steppe, south-eastern Central Asia, and the Near East, showed no great affinity between skulls from the Lop Nor and from Bactria–Margiana is not an argument against the 'Bactria hypothesis', as their sample contained no material from the Keriya delta and a transfer of technology does not imply a mass migration. See: Hemphill and Mallory, 'Horse-mounted invaders from the Russo-Kazakh Steppe', pp. 214f.

162. On account of its non-Indo–Iranian sponsorship affiliation, we do not consider the Okunev Culture part of the Andronovo cultural complex. The phenomenon of Seima Turbino, sometimes referred to as a forest steppe culture, was not a culture but rather an industry of high-quality objects made of tin bronze found in several cultures of northern Central Asia.

165. Parzinger, *Die frühen Völker Eurasiens*, pp. 251ff.
166. Lumley Henri de. *Arkaïm*, 2010, pp. 12–17. A mildly similar architectural concept is found in Anatolia at Mersin, Demircihöyük and Pulor. Since these three settlements date from the last quarter of the fifth millennium to the mid-third millennium BC, they are considerably older than Sintashta or Akraim, which rules out an (already improbable) influence (S.A. Grigoryev, *Ancient Indo–Europeans* (Chelyabinsk, 2002), pp. 31–34).
167. On the settlements of Sintashta: Grigoryev, *Ancient Indo–Europeans*, pp. 20–105; Koryakova and Epimakkhov, *The Urals and Western Siberia*, pp. 37f, 68–75, 89; Parzinger, *Die frühen Völker Eurasiens*, pp. 251ff.

Sackler Collections* (New York, 1997), p. 194; Emma Bunker, *Nomadic Art of the Eastern Eurasian Steppes* (New Haven, 2002), p. 24; Gu Fang, *The harmonious beauty of jade* (2008), p. 74; Mayke Wagner and Herbert Butz, *Nomadenkunst* (Mainz, 2007), pp. 46f.
62. An example of speculative interpretations is put forth by Ivan Marazov, ‘The "coiled-up carnivore": visual etymology of the motif', in *Silk Road Art and Archaeology*, Vol. 8 (Kamakura, 2002).
63. Kossack, ‘Mittelasien und skythischer Tierstil', pp. 91f.
64. M. Rostovtzeff, *The Animal Style in South Russia and China* (Princeton, 1929), p. 68. See also: M. Rostovtzeff, *Iranians and Greeks in South Russia* (Oxford, 1922), p. 197; Parzinger, *Die Skythen*, pp. 35ff, 99f.
65. Bunker, *Nomadic Art of the Eastern Eurasian Steppes*, 2002, p. 17.
66. Ellis Minns, *Scythians and Greeks: A survey of ancient history and archaeology on the north coast of the Euxine from the Danube to the Caucasus* (Cambridge, 1913), pp. 241, 252, 267f, 278. At first Rostovtzeff sharply attacked Minns on account of this hypothesis and rejected any connection between Scythian and Siberian toreutics of the Iron Age. In 1922 he changed his opinion and adopted Minns's view (Gregory Bongard-Levin, ‘E.H. Minns and M.I. Rostovtzeff: Glimpses of a Scythian friendship', in *Scythians and Greeks* (Exeter, 2005), p. 17).
67. Herodotus, *Histories* IV, 71. Askold Ivantchik has shown that 15 of the 17 characteristics of a Scythian royal burial listed by Herodotus have been substantiated by archaeology (Menghin et al., *Im Zeichen des goldenen Greifen*, p. 241).
68. Menghin et al., *Im Zeichen des goldenen Greifen*, p. 239.
69. Renate Rolle, *Totenkult der Skythen* (Berlin, 1979), Vol. I. p. 100; *Gold der Steppe*, pp. 62f. The additional 50 horse skeletons found on a platform at Ul'skji Aul correspond to Herodotus's description of a memorial ceremony one year after the burial, at which 50 horses and 50 young men were sacrificed (*Histories* IV, 72).
70. The explanations of Arzhan 2 are based on the following sources: Konstantin Čugunov, Hermann Parzinger and Anatoli Nagler, ‘Der skythische Fürstengrabhügel von Arzhan 2 in Tuva. Vorbericht der russisch-deutschen Ausgrabungen', in *Eurasia Antiqua* 9 (2003), pp. 113–162; Konstantin Čugunov, *Der skythenzeitliche Fürstenkurgan Aržhan 2 in Tuva,* (Mainz, 2010); Menghin et al., *Im Zeichen des goldenen Greifen*, pp. 69–100; Parzinger, *Die frühen Völker Eurasiens*, pp. 611–614.

81. Menghin et al., *Im Zeichen des goldenen Greifen*, pp. 158f.
82. Renate Rolle, *Königskurgan Čertomlyk: Ein skythischer Grabhügel des 4. vorchristlichen Jahrhunderts* (Mainz, 1998), Vol. I, p.102.
83. Herodotus, *Histories* IV, 71.
84. Iaroslav Lebedynsky, *Les Scythes* (Errance, 2001), p. 198; Wolfgang Scharlipp, *Die frühen Türken in Zentralasien* (Darmstadt, 1992), p. 27.
85. See p. 116. Not all the stone circles are extant; on the south-west side, where a tarred road runs through the landscape, they are missing entirely.
86. On account of a 16-kg (?) gold ring found on the upper Indus in Pattan in northern Pakistan, Parzinger extends this cultural territory even as far as the southern foot of the Karakorum (Čugunov, *Der skythenzeitliche Fürstenkurgan Aržhan 2 in Tuva*, pp. 311–317). It seems questionable that a single discovery could suffice to expand a cultural range so significantly.
87. Wilhelm Radloff, *Aus Sibirien* (Leipzig, 1893), Vol. II, p. 167.
88. I thank Mr Jürg Rageth of Riehen, Basel, for the evidence for this new dating (I. Hajdas, G. Bonani et al., 'Chronology of Pazyryk 2 and Ulandryk 4 Kurgans based on high resolution radiocarbon dating and dendrochronology – a step towards more precise dating of Scythian burials', in *Impact of the Environment on Human Migration in Eurasia* (2004), p. 114). Despite this more precise dating, Parzinger maintains an earlier dating: 'Pazyryk I and II belong accordingly in the fifth and Pazyryk V at the turn of the fifth to the fourth centuries BC' (*Die frühen Völker Eurasiens*, p. 599).
89. The most important source on Pazyryk is Rudenko Sergei, *Frozen Tombs of Siberia: The Pazyrik Burials of Iron Age Horsemen* (London, 1970). The book also contains 180 illustrations. See also: Grjaznov, *Südsibirien*, pp. 158–220; Menghin et al., *Im Zeichen des goldenen Greifen*, pp. 118–131; Parzinger, *Die frühen Völker Eurasiens*, pp. 586–596; Schiltz, *Die Skythen und andere Steppenvölker*, pp. 260–289.

175. Herodotus, *Histories,* IV, 128.
176. Herodotus's listing of the 20 satrapies can be reconciled with the lists of Persian peoples only with difficulty and reservations, all the more so since Herodotus mentions certain peoples twice, assigning them to different satrapies (Walser, *Die Völkerschaften auf den Reliefs von Persepolis*, pp. 42–49).
177. Harald Haarmann, *Universalgeschichte der Schrift* (Frankfurt, 1998), p. 501.
178. Herodotus, *Histories,* IV, 44.
179. While Strabo and most modern historians accept the identification of Zariaspa with Bactra/Balkh, Ptolemy clearly differenciates between Zariaspa and Bactra. Ptolemaios Claudios, *Handbuch der Geographie* (Basel, 2006), VI, 11, 7 + 9 (Vol. II, p. 649); Strabo, *Geographica* (Wiesbaden, 2007), XI, 8, 11. The absence of Achaemenid findings at Bactra/Balkh and the recent discovery of a major Achaemenid site at Chesm-e Shafa 24 km south-east of Balkh raises the question of whether Chesm-e Shafa could be identical with Achaemenid Zariaspa (Lawler Andrew, 'Edge of an Empire. An ancient Afghan fortress offers rare evidence of Persia's forgotten territories', *Archaeology*. Archaeological Institute of America, Boston September/October 2011, pp. 42–47).

199. Arrian, *The Campaigns of Alexander* (London, 1971), pp. 201, 227.
200. Arrian confirms that Alexander was planning an attack on the northern Pontic Scythians. Alexander is said to have sent spies to the Scythians and to have announced to Pharasmanes a joint campaign against the Scythians after the conquest of India. Arrian, *The Campaigns of Alexander*, pp. 201, 227; Quintus Curtius Rufus, *The History of Alexander*, Vii, 6, 12.
201. Quintus Curtius Rufus, *The History of Alexander*, Vii, 8, 19–30. See also: Rolle, *Königskurgan Čertomlyk,* Vol. I, pp. 176–178. Like the early historians of Alexander, Curtius Rufus mistakes Herodotus's River Tanaïs, which formed the border between Europe and Asia for Greek historians and corresponds to today's Don, with the Jaxartes, the Syr Darya, which he also describes as the border between Europe and Asia (Vii, 6,7). Arrian, however, was aware of this confusion and differentiated between the two rivers (Arrian, *The Campaigns of Alexander*, p. 199). Likewise confusing is the reference in several ancient authors to the Hindu Kush as the 'Indian Caucasus' (Claude Rapin, 'L'Afghanistan et l'Asie Centrale dans la géographie mythique des historiens d'Alexandre et dans la toponymie des géographes gréco-romains', in *Afghanistan: Ancien carrefour entre l'est et l'ouest*, pp. 149ff).

255. It is highly improbable that the Thracian populace belonged to the Cimmerian groups, as the Thracians were sedentary and the Cimmerians nomadic. The only commonality was that each had elite warrior horsemen. Ivantchik, *Kimmerier und Skythen*, pp. 48f, 279; Esther Jacobson, *The Art of the Scythians* (Leiden, 1995), pp. 37f; Lebedynsky, *Les Cimmériens*, pp. 19, 73–76, 104f, 116, 152; Renate Rolle et al., *Gold der Steppe: Archäologie der Ukraine* (Schleswig, 1991), pp. 49, 58.
256. Ivantchik, *Kimmerier und Skythen*, pp. 55, 61; Hermann Sauter, *Studien zum Kimmerierproblem* (Bonn, 2000), pp. 219, 222, 247, 251.
257. Whether Sargon really fell in a battle against the Cimmerians remains debated (Lebedynsky, *Les Cimmériens*, p. 30).
258. Ivantchik, *Kimmerier und Skythen*, pp. 21ff, 42–49; Sauter, *Studien zum Kimmerierproblem*, pp. 226, 247.
259. Lebedynsky, *Les Cimmériens*, pp. 17, 31, 126f; Sauter, *Studien zum Kimmerierproblem*, 2000, p. 167. Whether there was one Phrygian king with the name Midas or two is debated, and it is also uncertain whether the King Midas mentioned in 738 BC is the same as the Midas who took his own life 63 years later.
260. Herodotus, *Histories* I, 15; Sauter, *Studien zum Kimmerierproblem*, pp. 166, 171f, 249. Strabo, *Geographica*, XIII, 4, 8.
261. Sauter, *Studien zum Kimmerierproblem*, p. 232. See also: Lebedynsky, *Les Cimmériens*, p. 45.
262. Hermann Parzinger, *Die Skythen* (Munich, 2004), p. 19.
263. Ivantchik, *Kimmerier und Skythen*, p. 71; Lebedynsky, *Les Cimmériens*, pp. 19, 33, 45, 169; Parzinger, *Die Skythen*, p. 23. The historian Callisthenes (*ca*. 370–327 BC) refers to a second conquest of Sardes by the Lycians and the Treri, and, in another context, Strabo calls the Treri a Cimmerian people (Sauter, *Studien zum Kimmerierproblem*, pp. 166, 171, 235, 248).
264. Ivantchik’s interpretation of a single bone disc putatively in the shape of a coiled animal, found in Sardes in a building layer from the mid-seventh century BC, as a material trace of the Cimmerians and as evidence that they were familiar with the early Scythian animal style is unpersuasive (Ivantchik, *Kimmerier und Skythen*, pp. 72–79).
265. Andreï Alexeev et al., ‘Some problems in the study of the chronology of the ancient nomadic cultures of Eurasia (9th–3rd centuries BC),’ *Geochronometria* 21 (2002), pp. 144f. To what extent the pre-Scythian material cultures of Chernogorovka (tenth–ninth centuries BC) and Novocherkassk (late ninth–eighth centuries BC) were associated with the Cimmerians remains debated. Jacobson, *The Art of the Scythians*, pp. 36. Elke Kaiser, *Begraben, aber nicht vergessen. 310. Ibid, pp. 146, 188. In light of the obvious lack of a clergy, interpretations of women's graves with finds of (symbolic) weapons, mirrors and possibly portable altars as 'proof' of 'warrior princesses' and a female priestly caste are pulled out of thin air. For examples of such interpretations see: Jeannine Davis-Kimball, 'Amazons, Princesses and other Women of Status: Females in Eurasian Nomadic Societies', in *Silk Road Art and Archaeology*, Vol. 5 (1997/98), pp. 1–50; Jeannine Davis-Kimball, *Warrior women* (New York, 2002).

444. Rostovtzeff, *Iranians and Greeks in South Russia*, pp. 14, 124, 190; *The Animal Style in South Russia and China*, pp. 43–46. Whether a distant connection exists between the animal style and genres of medieval Western European art such as the Irish book arts or Romanesque capitals remains debated (Andreï Alexeev, *Trésors des Steppes* (Hauterive, 2006), p. 124). In the sixth to ninth centuries AD the *Permian animal style* developed along the Kama, a tributary of the Volga. The Permian style evinces no connection to the Sarmatian animal style. See Vol. II.

VIII. Greeks in Central Asia

1. Curtius Rufus, *The History of Alexander*, VIII, 8, 11–12
2. The last Greco–Bactrian king north of the Hindu Kush was Heliocles I (r. *ca.* 145–130 BC), and the last Indo–Greek king south of the Hindu Kush was Strato II (r. *ca.* 25 BC–10 AD). Osmund Bopearachchi et al., *De l'Indus à l'Oxus* (Lattes, 2003), pp. 98, 130f, 139; Frank Holt, *Thundering Zeus: The making of Hellenistic Bactria* (Berkeley, 1999), p. 135; H. Sidky, *The Greek Kingdom of Bactria: From Alexander to Eucratides the Great* (Lanham, 2000), pp. 192, 226–228.
3. Curtius Rufus, *The History of Alexander*, VII, 5, 32–35.
4. Nasiba Baimatowa, *5000 Jahre Architektur in Mittelasien: Lehmziegelgewölbe vom 4./3. Jt. v.Chr. bis zum Ende des 8. Jhs. n.Chr* (Mainz, 2008), pp. 167–172; Anatoli Sagdullaev and Shakir Pidaev, 'L'âge du Fer en Bactriane', in *La Bactriane de Cyrus à Timour* (Quétigny, 1999), pp. 26f.

12. Curtius Rufus, *The History of Alexander*, VII, 4, 27–29. On the logistical issues see: Donald Engels, *Alexander the Great and the Logistics of the Macedonian Army*, 1978.
13. Curtius Rufus, *The History of Alexander*, VII, 5, 17f.
14. Arrian, *The Campaigns of Alexander*, pp. 197f; Curtius Rufus, *The History of Alexander*, VII, 5, 23–43.
15. Curtius Rufus, *The History of Alexander*, VII, 6, 27.
16. See pp. 207f.
17. Curtius Rufus, *The History of Alexander*, VII, 9, 22.
18. Arrian, *The Campaigns of Alexander*, pp. 201–226; Curtius Rufus, *The History of Alexander*, VII, 6, 13–9, 22.
19. For example, at Djandavlat, Dilbergine and Talashkan Tepe. Pierre Leriche, 'Bactria: Land of thousand cities', in *After Alexander* (2007), p. 128; Shakir Pidaev and Pierre Leriche, 'Quelques villes moyennes de Bactriane', in *La Bactriane de Cyrus à Timour* (Quétigny, 1999), pp. 52–55.
20. Annette Juliano and Judith Lerner (eds), *Monks and Merchants. Silk Road treasures from Northwest China*, 2001, p. 315, n. 2. De la Vaissière questions this hypothesis and dates the beginning of the Sogdian trade with China to the first century BC (Étienne de la Vaissière, *Sogdian Traders* (Leiden 2005) pp. 22f, 38–41).
21. While Soviet research consistently identified the ancient Oxus with the Vakhsh, western scholarship of the twentieth century mostly saw the Panj as the Oxus. Today the Soviet interpretation has prevailed. Bopearachchi et al., *De l'Indus à l'Oxus*, p. 115. Frantz Grenet and Claude Rapin, 'Alexander, Aï Khanum, Termez: Remarks on the Spring Campaign of 328', *Bulletin of the Asia Institute* 12 (1998), p. 80; Rapin, 'L'Afghanistan et l'Asie Centrale dans la géographie mythique', pp. 144.
22. Arrian, *The Campaigns of Alexander*, pp. 228f; Curtius Rufus, *The History of Alexander*, VII, 10, 13–16. The city of Margiana mentioned here cannot, as so often assumed, be identified with the city of Merv, more than 600 km further west, but rather should be sought near Termez. Such a far march away from the nucleus of Spitames' revolt made no military sense and the six fortified cities near 'Margiana' mentioned by Curtius Rufus as being 'all…founded on high hills', 'spaced only a short distance apart' (VII, 10) cannot be located near Merv as its environment is flat. Grenet and Rapin believe that 'Margiana' is a spelling mistake and should read 'Marginia'. Grenet and Rapin, 'Alexander, Aï Khanum, Termez,' pp. 79–85; Rapin, 'L'Afghanistan et l'Asie Centrale dans la géographie mythique', p. 167.

49. Richard Salomon, ‘The Indo–Greek era of 186/5 BC in a Buddhist reliquary inscription’, in *Afghanistan: Ancien carrefour entre l’est et l’ouest*, pp. 365, 370. Joe Cribb, however, dates the start of the Indo–Greek period to the year 174 BC (Cribb, ‘The Greek kingdom of Bactria, its coinage and its collapse’, p. 214).
50. Craig Benjamin, *The Yuezhi: Origin, Migration and the Conquest of Northern Bactria* (Turnhout, 2007), pp. 178f; Sidky, *The Greek Kingdom of Bactria*, pp. 199, 208–213.
51. Tarn, *The Greeks in Bactria & India*, pp. 196f.
52. Sidky, *The Greek Kingdom of Bactria*, pp. 199, 209, 215.
53. Claude Rapin, ‘La Sogdiane d’Alexandre le Grand aux derniers Gréco-Bactriens’, in *Samarcande* (Quétigny, 2010), p. 31.
54. For Menandros see Vol. II. Benjamin, *The Yuezhi*, p. 179; Sidky, *The Greek Kingdom of Bactria*, p. 216.
55. Masson, *Das Land der tausend Städte*, p. 148; Sidky, *The Greek Kingdom of Bactria*, p. 221. A first attack of the Parthians on the province of Aria may have happened as early as the 160s BC. Phraates II (r. 138–129/28 BC) was the first to have coins minted in Merv (V. Gaïbov and G. Kochelenko, ‘La Margiane’, in *Les Parthes* (Quétigny, 2002), p. 50).
56. Sidky, *The Greek Kingdom of Bactria*, p. 221. In another place, however, Justin attributes the death of Eucratides to the victorious Parthians (Tarn, *The Greeks in Bactria & India*, pp. 219f).
57. Narain, *The Indo–Greeks*, pp. 88–90.
58. Sidky, *The Greek Kingdom of Bactria*, pp. 225f. Sidky gives 160 BC as the death date of Eucratides (Tarn, *The Greeks in Bactria & India*, pp. 220–222).
59. For an overview of various chronologies of kings, see: Cribb, ‘The Greek kingdom of Bactria, its coinage and its collapse’, p. 216; Holt, *Thundering Zeus*, 25.
60. Cribb, ‘The Greek kingdom of Bactria, its coinage and its collapse’, p. 212f.
61. Benjamin, *The Yuezhi*, pp. 64–74. John Hill lists in his book *Through the Jade Gate to Rome: An annotated translation of the Chronicle on the ‘Western regions’ in the Hou Hanshu* (Australia, 2009) on pp. 312–314 the same three Xiongnu victories over the Yuezhi, but on p. 577 he adds a fourth one in ‘166 BCE at the latest’.
62. A.F.P. Hulsewé and M.A.N. Loewe, *China in Central Asia. The Early Stage: 125 BC – AD 23. An Annotated Translation of Chapters 61 and 96 of the History of the Former Han Dynasty* (Leiden 1979) 96A 10B.
63. Hulsewé and Loewe, *China in Central Asia*, 96B 1B. It remains unclear if the Chinese term *Sai wang* is to be understood literally as ‘king of the Sai’ or if it names a tribe called Royal Sai.
64. Hulsewé and Loewe, *China in Central Asia*, 96A 10B.
65. Benjamin, *The Yuezhi*, pp. 110f; I.V. Piankov, ‘The Ethnic History of the Sakas’, in *Bulletin of the Asia Institute*, Vol. 8 (Bloomfield Hills 1996) p. 38.
66. Benjamin, *The Yuezhi*, pp. 114f.
67. For the conflict between the Xiongnu and the Yuezhi see Vol. II, chapter I and Benjamin, *The Yuezhi*, pp. 48–151.
68. Gardiner-Garden, *Apollodoros of Artemita and the Central Asian Skythians*, pp. 34, 57, 60; G.A. Koshelenko and V.N. Pilipko, ‘Parthia’, in *History of civilizations of Central Asia*, Vol. II (Paris, 1994), p. 132.
69. Benjamin, *The Yuezhi*, pp. 179–189; Lyonnet, ‘Les Grecs, les nomades et l’indépendance de la Sogdiane’, 143. The last inscription found in Aï Khanum dates to the year 147 BC (Pierre Leriche, ‘Aï Khanoum’, in *La Bactriane de Cyrus à Timour*, p. 39).

73. The most important sources for Tillya Tepe are: Pierre Cambon, Jean-François Jarrige et al., *Afghanistan, les trésors retrouvés: Collections du musée national de Kaboul* (Paris, 2006); Pierre Cambon, *Hidden Afghanistan* (2007); Viktor Sarianidi, *The Golden Hoard of Bactria: From the Tillya-tepe Excavations in Northern Afghanistan* (New York, 1985); Viktor Sarianidi, ‘The golden hoard of Bactria’, *National Geographic* 177.3 (1990).
74. Sarianidi, *The Golden Hoard of Bactria*, p. 16; ‘The golden hoard of Bactria,’ p.65.
75. Sarianidi, *The Golden Hoard of Bactria*, pp. 19–55. See also: Cambon, *Hidden Afghanistan*, pp. 155–227.
76. Referring to some objects we follow the dates given in the exhibition at the British Museum rather than those in the catalogues.
77. See p. 268, photo p. 291.
78. Cambon, *Hidden Afghanistan*, p. 138.
79. Jean-Paul Desroches et al., *Mongolie, le premier empire des steppes* (Paris, 2003), pp. 112, 120, 124, 130f.

80. Markus Mode, *Hunnen, Sogder und das Erbe Alexanders in Mittelasien* (2008), p. 106.
81. Cambon, *Hidden Afghanistan*, p. 206.
82. A Chinese mirror and three incense holders made of clay were also found in the grave (Rapin et al., 'La tombe d'une princesse nomade', pp. 42ff, 48–50, 61).
83. A few corpses with coins placed in their mouths were also discovered in the Bactrian cemeteries of Tulkhar and Tup-Khona in southern Tajikistan, a custom that was common not only in ancient Greece but also in China. Judith Rickenbach (ed.), *Oxus: 2000 Jahre Kunst am Oxus-Fluss in Mittelasien* (Zurich, 1989), pp. 55f; Boris Staviskij, *La Bactriane sous les Kushans* (Paris, 1986), pp. 178, 186.
84. Roger Goepper and J. Lee-Khalisch, *Korea. Die alten Königreiche* (Zurich, 2000), pp. 150–153; Young-Sook Pak, 'The Origins of Silla Metalwork', *Orientations Magazine* (September 1988), pp. 45–52; Staffan Rosén, 'Korea and the Silk Roads', *The Silk Road Journal* 6/2 (2009), pp. 3–5.
85. S.G. Kljastornyj and T.I. Sultanov, *Staaten und Völker in den Steppen Eurasiens: Altertum und Mittelalter* (Berlin, 2006), pp. 30–33; Sarianidi, *The Golden Hoard of Bactria*, p. 49.
86. Véronique Schiltz. 'Tillya Tepe Catalog', in Hiebert and Cambon, *Afghanistan, Crossroads of the Ancient World* (2011) p. 286.
87. Pak, 'The Origins of Silla Metalwork', p. 52.
88. Staviskij, *La Bactriane sous les Kushans*, p. 183.
89. Cambon, *Hidden Afghanistan*, p. 63; Lebedynsky, *Les Saces*, p. 147; Sarianidi, *The Golden Hoard of Bactria*, p. 18.
90. John Hill, *Through the Jade Gate to Rome: An annotated translation of the Chronicle on the 'Western regions' in the Hou Hanshu* (Australia, 2009), p. 33.
91. Strabo quotes extensively from the now-lost history *Parthika* of Apollodoros of Artemita (first century BC); the likewise lost work of Pompeius Trogus (age of Augustus) *Historiae Philippicae* is quoted by Justin. The *Parthika* of Apollodoros presumably also served as a source for Trogus (Gardiner-Garden, *Apollodoros of Artemita and the Central Asian Skythians*, pp. 1–10).
92. Strabo XI, VIII, 2. English from: Gardiner-Garden, *Apollodoros of Artemita and the Central Asian Skythians*, p. 35.
93. The name Sacaraucae means essentially 'Royal Saka'. Whether they are the same as the Sai Wang of Chinese chronicles is somewhat unclear, although that term likewise means 'Royal Saka'.
94. The identification of these four nomadic peoples has been the subject of controversy since the eighteenth century. See: Craig Benjamin, 'The Yuezhi and their Neighbours: Evidence for the Yuezhi in the Chinese Sources *ca.* 220 – 25 BCE', in *Realms of the Silk Roads: Ancient and Modern* (Turnhout, 2000), pp. 184–189; G. Enoki, A. Koshelenko and Z. Haidary 'The Yüeh-chih and their migrations', in *History of civilizations of Central Asia*, Vol. II, pp. 173, 180; Gardiner-Garden, *Apollodoros of Artemita and the Central Asian Skythians*, pp. 35–60; Staviskij, *La Bactriane sous les Kushans*, p. 118.
95. Pompeius Trogus/Justin, *Prologi*, XLI, in Gardiner-Garden, *Apollodoros of Artemita and the Central Asian Skythians*, p. 35. Gardiner-Garden is inclined, however, to identify the *Pasianoi* with the *Apasiakai*, the 'water Scythians', from whom Arsaces may have descended. Ibid. pp. 42f.
96. Lebedynsky, *Les Saces*, p. 63.
97. Gardiner-Garden, *Apollodoros of Artemita and the Central Asian Skythians*, p. 40; Claude Rapin, 'Nomads and the shaping of Central Asia', in *After Alexander: Central Asia before Islam* (London, 2007), p. 59. Also Bivar's identification of the Asiani with the early Kushans having conquered the four other Yuezhi tribes is problematic since the Chinese *Hou Han Shu* (118.9a) attributes the conquest of the Yuezhi tribes to Kujula Kadphises who came to power not before 25 to 30 AD, but Strabo died in 24 AD (A.D.H. Bivar, 'The history of Eastern Iran', in *Cambridge History of Iran*, Vol. 3 (1) (Cambridge University Press, Cambridge 1983), p. 197).
98. Rapin et al., 'La tombe d'une princesse nomade', p. 77.
99. Ibid, pp. 77, 90f.
100. Boris Staviskij, *Kunst der Kuschan* (Leipzig, 1979), p. 103. See also Vol. II.
101. Wood, *A journey to the source of the River Oxus*, pp. 259f.
102. Paul Bernard, 'Aï Khanoum en Afghanistan hier (1964–1978) et aujourd'hui', in *Académie des Inscriptions & Belles-Lettres, Paris. Comptes rendus des scéances de l'année 2001* (2001), pp. 978f. Jules Bartoux was not really an archaeologist but rather a geologist and his real name was Jules Couyat (Zamariallai Tarzi, 'Jules Bartoux: le découvreur oublié d'Aï Khanoum', in *Académie des Inscriptions & Belles-Lettres, Paris. Comptes rendus des scéances de l'année 1996* (1996)).
103. Bernard, 'Aï Khanoum en Afghanistan', pp. 971–975; Holt, *Thundering Zeus*, p. 16.
104. Bernard, 'Aï Khanoum en Afghanistan', pp. 994–1008; Marie-Claude Bianchini (ed.), *Afghanistan: Une histoire millénaire* (Paris, 2002), p. 86.
105. The hypothesis that Aï Khanum was founded by Seleucus I is based on the numerous discoveries of coins from Seleucus I and Antiochus I; other scholars attribute the establishment of the city to Alexander's general Hephaestion (Sidky, *The Greek Kingdom of Bactria*, pp. 131f).
106. Staviskij, *Kunst der Kuschan*, p. 55.
107. On Aï Khanum: Paul Bernard, 'L'architecture religieuse de l'Asie Centrale à l'époque hellénistique', in *Akten des XIII. Internationalen Kongresses für Klassische Archäologie, Berlin 1988* (1990); Bernard, 'The Greek kingdoms of Central Asia'; Bernard, 'Aï Khanoum en Afghanistan'; Guy Lecuyot and O. Ishizawa, 'La restitution virtuelle d'Aï Khanoum. Une cité hellénistique en Afghanistan', in *Archéologia* no. 420 (Dijon, 2005); Guy Lecuyot and O. Ishizawa, 'Aï Khanum Reconstructed', in *Proceedings of the British Academy* 133 (2007); Staviskij, *La Bactriane sous les Kushans*, pp. 163–172.
108. The adventurous-sounding but finally unverifiable story was reconstructed by the first buyer of the objects, Sir Alexander Cunningham. O.M. Dalton, *The treasure of the Oxus with other examples of early oriental metal-work* (London, 1964); Boris Litvinskij, *Taxt- Sangin: Der Oxus-Tempel* (2002), pp. 1–12; Igor Pitschikjan, *Oxos-Schatz und Oxos-Tempel* (Berlin, 1992), pp. 61–67.
109. What happened to the objects during the three years from 1877 to 1880 is unknown.
110. Dalton, *The treasure of the Oxus*, p. XIV.
111. John Curtis, *Ancient Persia* (London, 2000), p. 62. Igor Pitschikjan's claim that a 'collection' of about 2,500 (!) precious metal objects offered for sale on the antiquities market in 1993 and acquired by the Miho Museum, which opened in 1997, represents the 'second part of the Oxus Treasure' is unfounded ('Rebirth of the Oxus Treasure: Second part of the Oxus Treasure from the Miho Museum Collection', in *Ancient Civilizations from Scythia to Siberia*, Vol. 4, No. 4 (Leiden, 1997)). The authenticity of the Miho collection is uncertain.
112. See photo p. 196.
113. See photo p. 87.
114. Curtis, *Ancient Persia*, p. 64.
115. Georges Rougemont and David Stronach, 'On the Date of the Oxus Gold Scabbard and other Achaemenid Matters', *Bulletin of the Asia Institute* 12 (1998), pp. 232f.
116. A standing woman, a camel or a horse are depicted on another dozen discs (Dalton, *The treasure of the Oxus*, pl. XIV, XV, pp. 19–26).
117. Recently the controversial researcher Muscarella strongly questioned the authenticity of the Oxus treasure (Oscar White Muscarella, *The lie became great*, 2000, pp. 208f, note 30; *All that glisters isn't gold*, 2003).
118. For some objects a pre-Achaemenid, Median dating is considered, for example for the akinakes sheath. Rougemont and Stronach, 'On the Date of the Oxus Gold Scabbard'; Pitschikjan, *Oxos-Schatz und Oxos-Tempel*, p. 80.
119. How individual objects got from western Iran to the Oxus remains unclear. Pitschikjan's hypothesis that they were carried to the Oxus as war trophies of the invading Macedonian army cannot be substantiated (*Oxos-Schatz und Oxos-Tempel*, 1992, pp. 85, 92, 100).
120. Curtis, *Ancient Persia*, p. 65.
121. Pitschijkan, *Oxos-Schatz und Oxos-Tempel*, pp. 69f.
122. The first explorations in Takht-i Sangin by B. Denike from 1926 to 1928 were never published, and in 1956 A.M. Mandelshtam did not dig deep enough to yield any finds (Litvinskij, *Taxt- Sangin*, p. 7). The excavations lasted from 1976 to 1991 and started again in 1998.
123. Given the later coins, significantly earlier dates, such as the invasion of Alexander, the campaign of Seleucus I or the threat from the north mentioned by Euthydemos I, either are impossible or negate the inclusion of the coins in the hoard. Grenet and Rapin, 'Alexander, Aï Khanum, Termez', 89; Litvinskij, *Taxt- Sangin*, p. 38; Pitschijkan, *Oxos-Schatz und Oxos-Tempel*, pp. 71, 74, 93.
124. Slightly adapted from: Holt, *Thundering Zeus*, p. 175.
125. Bernard, 'Aï Khanoum en Afghanistan', p. 1021.
126. Osmund Bopearachchi, 'A Faience Head of a Graeco–Bactrian King from Aï Khanum', *Bulletin of the Asia Institute* 12 (1998), p. 24.
127. Hiebert and Cambon, *Afghanistan, Crossroads of the Ancient World*, (2011) p. 118.
128. Bernard, 'The Greek kingdoms of Central Asia', pp. 114ff.
129. Litvinskij, *La civilisation de l'Asie centrale antique*, pp. 54ff.
130. Holt, *Thundering Zeus*, p. 66.

131. Pidaev and Leriche, ‘Quelques villes moyennes de Bactriane’, pp. 53ff; Staviskij, *La Bactriane sous les Kushans*, pp. 268–272. Bernard believes that the temple was dedicated to Zeus and the Dioscuri were merely his attendant deities (‘L’architecture religieuse de l’Asie Centrale à l’époque hellénistique’, p. 55).
132. Ptolemaios Claudios, *Handbuch der Geographie* (Basel, 2006), VI, 12, 5; VIII, 23, 11 (Vol. II, pp. 653, 877, 880f); Anjelina Drujinina, *Wohnen im hellenistischen Baktrien – Wohnhäuser in der Stadt Oxeiane (Tachti Sangin)*, (Mannheim, 2009), p. 177.
133. On the Oxus temple: Anjelina Drujinina, ‘Gussform mit griechischer Inschrift aus dem Oxos-Tempel’, in *Archäologische Mitteilungen aus Iran und Turan* 40 (Berlin, 2008); Anjelina Drujinina, ‘Excavations of Takht-i Sangin City, Territory of Oxus Temple, in 2006’, *Bulletin of Miho Museum*, *Koka* 9 (March 2009); Gunvor Lindström, ‘Graeco–baktrische Symbiose’, in *DAMALS, Kontadin, Leinfelden-Echterdingen* 1 (2009); Boris Litvinskij, ‘The Hellenistic Architecture and Art of the Temple on the Oxus’, *Bulletin of the Asia Institute* 8 (1994); Litvinskij, *Taxt- Sangin*; Pitschijkan, *Oxos-Schatz und Oxos-Tempel*.
134. Litvinskij, ‘The Hellenistic Architecture and Art of the Temple on the Oxus,’ figs. 6.–9.
135. Litvinskij, *Taxt- Sangin*, pl. 17.
136. Ibid, p. 96.
137. Pitschijkan, *Oxos-Schatz und Oxos-Tempel*, p. 20. Gignoux and Litvinsky however speculated in 1996 that the Oxus Temple wasn’t a fire temple, but that the ‘temple of the god Oxus at Takht-i Sangin merely had two chapels reserved for the worship of fire’ (Ph. Gignoux and B.A. Litvinsky, *Religions and religious movements I,* 1996, p. 410).
138. For images of the objects see: Hansen et al., *Alexander der Große und die Öffnung der Welt*, pp. 351–368; R. Masov et al. (eds), *National Museum of Antiquities of Tajikistan* (Dushanbe, 2005), pp. 97–106.
139. Hansen et al., *Alexander der Große und die Öffnung der Welt*, p. 354.
140. Ibid.
141. Litvinskij, ‘The Hellenistic Architecture and Art of the Temple on the Oxus’, p. 59.
142. Drujinina, ‘Gussform mit griechischer Inschrift’, pp. 124–133. It is unclear how to interpret the phrase ‘newly arisen Oxus’: Had the temple been restored or did it refer to a kind of myth of rebirth?
143. See p. 114.
144. This hypothetical older shrine could also have served as a storage site for the pre-Seleucid objects from the Oxus treasure (Litvinskij, *Taxt- Sangin*, pp. 104, 107, 112).

IX Outlook

Acknowledgements

This book is based on dozens of expeditions and journeys undertaken in the last three decades. My research was successful only thanks to hundreds of kind people in China, India, Iran, Iraq, Kazakhstan, Kyrgyzstan, Mongolia, Pakistan, Russia, Tajikistan, Tibet, Turkmenistan, Ukraine and Uzbekistan; to all of them I remain grateful. The book itself was produced only with the help of many people. A few preferred to remain anonymous; others are briefly acknowledged here, in alphabetical order.

Mrs Susanne Annen, Kabul, who helped me obtain permission to publish the photos from Tillya Tepe.

Mr John Vincent Bellezza, Charlottesville, for drawing my attention to the Iron Age petroglyphs in the Changtang, Tibet.

Dr Nikolaus Boroffka, Berlin, who indicated a similarity between ceramics from Satma Mazar and Charwighul.

Dr Anjelina Drujinina, Berlin, who put her unpublished material about the Oxus temple at my disposal.

Prof. Denis Etler, Aptos, who suggested a date when modern Asian ethnicities differentiated.

Prof. Don Johanson, Tempe, who put me in touch with Denis Etler.

Dr Sharofuddin Kurbanov, Panjikant, who gave me several valuable indications concerning archaeological facts in Tajikistan.

Dr Anatoli Nagler, Berlin, who shared his wide knowledge about the Scythians and gave me an advance copy of his publication on the stylistic representation of deer on deer stones of Central Asia.

Jürg Rageth, Riehen, who made me aware of the newest dating of the Pazyryk kurgans and gave other valuable inputs concerning Central Asian textiles.

Dr Alexei Savchenko, Kiev, whose inputs in the fields of Central Asian archaeology and religions I highly appreciate.

Dr St. John Simpson, London, who helped me obtain permission to publish the photos from Tillya Tepe.

Mrs Verhecken-Lammens, Antwerp, who provided interesting insights into the textiles discovered at Ayala Mazar and Satma Mazar, Taklamakan Desert.

Prof. Therese Weber, Arlesheim, who accompanied me on numerous journeys and expeditions and contributed to the research results, especially concerning the analysis of ancient textiles.

Dr Judith Wörner-Hasler, Lörrach, who carefully reviewed the German manuscript.

Contents

Introduction 1

I. Early Empires and Kingdoms in East Central Asia 3

1. The Xiongnu, the First Steppe Nomad Empire 4
  1.1 The Chinese Sources 4
  1.2 The Early Xiongnu and their Ancestors 4
  1.3 The Xiongnu Rise to Power 8
  1.4 The Xiongnu Exact Tribute from China 12
  1.5 The Xiongnu and China Fight Over East Turkestan 14
  Excursus: *Ambassador Zhang Qian Scouts Out the Silk Road to Sogdiana and Bactria* 15
  1.6 China Acquires 'Horses that Sweat Blood' and East Central Asia Becomes a Chinese Protectorate 18
  1.7 The Collapse of the Xiongnu Steppe Empire 25
  1.8 Xiongnu Customs in Life and Death 29
  1.9 The Second Chinese Protectorate over the 'Western Regions' 33
2. The Wusun 37
3. The Parthians: An Empire between East and West 39
4. Kingdoms of Central Asian Peoples in Afghanistan and the North of the Indian Subcontinent 43
  4.1 The Indo-Greek Kingdoms 44
  4.2 The Indo-Saka Rulers 45
  4.3 The Indo-Parthian Kingdom 46
  4.4 The Yuezhi and the Kushan Empire 46
    4.4.1 The 'Long March' of the Yuezhi 47
    4.4.2 The Kushan Empire 47
    4.4.3 Silk and the Kushan Trade Network 54
    4.4.4 The Kushan Pantheon and its Dynastic Art 56

II. Early Buddhism in Central Asia and the Gandhara School 59

1. Indian Buddhism before the Kushans 60

2. Diffusion into Central Asia 61

Excursus: *A Murder Uncovers East Turkestan's Pre-Islamic Past* 66

3. The Art of Gandhara 66

III. The Migration of Hunnic Peoples to Northern China, Central Asia and Eastern Europe 81

1. Mongolia and North-West China: the 'Barbarian' Kingdoms of the Xiongnu, the Xianbei and the Rouran, supporters of Buddhism 82

1.1 The Four Xiongnu States and the Emergence of Early Buddhist Art in North-West China 83

1.2 The Northern Wei and the Yungang Grottoes 86

1.3 The Rouran and Gaoche 90

2. Hunnic Peoples of Central Asia 94

2.1 The Chionites 94

2.2 The Kidarites 96

2.3 The Central Asian Hephthalites 97

2.4 The Alkhan 99

2.5 The Nezak 100

3. Pre-Islamic Chorasmia 101

4. The Huns of Eastern Europe 105

IV. The Kingdoms of the Tarim Basin and their Schools of Buddhist Art 113

1. The Archaeological Exploration of the Tarim Basin – An Overview 114

1.1 Early Explorers of the Southern Silk Road 114

1.2 The Riddle of the Lop Nor Lake – Nikolay Przhevalsky and Sven Hedin 117

1.3 Sir Aurel Stein, Pioneer Archaeologist of the Tarim Basin 123

1.4 The Exploration of the Northern Silk Road 129

1.5 Latest Research 133

2. The Southern Silk Road 136
  2.1 Kashgar and Yarkand 136
  2.2 The Kingdom of Khotan 138
    2.2.1 Origins and History 138
    2.2.2 Artworks in the Sands 142
    Excursus: *Jade, Silk and Paper* 148
  2.3 The Kingdom of Shan-shan 151
3. The Northern Silk Road 158
  3.1 The Kingdom of Kucha 158
  3.2 The Kingdoms of Jiaohe and Gaochang in the Turfan Oasis 166
  Excursus: *The* Karez *Irrigation System* 170

V. The First Turkic Khaganate 173
1. A Two-in-One Khaganate 174
  1.1 A Military and Commercial Alliance with Byzantium 175
  1.2 Buddhism, Funerary Rituals, and the Splitting of the Khaganate 182
2. The Eastern Turkic Khaganate 187
  Excursus: *Chinese Pilgrim Monks* 193
3. The Western Turkic Khaganate 198

VI. Turkic Kingdoms of Eastern Europe 207
1. The Empire of the Avars (568–796) 208
2. The Pre-Christian Bulgar Empires 209
  2.1 Great Bulgaria on the Sea of Azov 209
  2.2 The Empire of the Volga Bulgars 210
  2.3 The First Empire of the Danube Bulgars 211
  Excursus: *Ahmad ibn Fadlan's Journey to the Volga Bulgars* 213
3. The Khazars and the Adoption of Judaism 213

VII. The Sogdians 221

1. A Trade Empire from the Crimea to China 222
    1.1 Sogdian Trade before Old Turkic Rule 222
    1.2 The Sogdian-Turkic Alliance 226
2. Sogdian Religion and Art 231
    Excursus: *The Church of the East* 238
3. De Facto Independence under Nominal Chinese Rule 242
4. The Arab Conquest of Sogdiana 244

VIII. The Second Turkic Khaganate and the Türgesh 255

1. The Unification of the Turkic Tribes 256
2. A Short-Lived Great Power 258
3. The Western Turkic Türgesh 267

IX. China, Tibet and the Arabs: The Struggle for Supremacy in Central Asia 271

1. The Emergence of Tibet as a Major Central Asian Power 272
2. Sassanid Princes Seek Chinese Military Assistance 280
3. The Tibetan-Chinese War in the Pamirs 281
    3.1 The Turkic-Sogdian Insurrection of An Lushan 285
4. East Turkestan and the Pamirs under Tibetan Suzerainty 289
    4.1 The Tibetan Reconquest 289
    4.2 Central Asian Influence on Tibetan Culture 292
    4.3 Tibetan Withdrawal from Central Asia 295

X. The Uyghurs 297

1. The Early Period 298
2. The Uyghur Empire 299
    Excursus: *Manichaeism* 305
3. The Flight of the Uyghur Tribes 310

3.1 Refugees at China's Northern Border 310
3.2 Western Uyghur Kingdoms 311
3.2.1 The Kingdom in Gansu 312
3.2.2 The Kingdom of Kocho 313

XI. Outlook 317

1. Cave GK 21 of Kumtura, west of Kucha on the Northern Silk Road, previously called 'New Cave 2', was discovered by chance in 1979. In the cupola 13 bodhisattvas stand around an open lotus flower which symbolises the presence of the Buddha. The numerous bodhisattvas who, like Indian princes, are depicted with rich jewellery on their naked torsos, show that the cave was designed in the Mahayana cultural sphere. It dates from the early second half of the 5th c. CE. Like the neighbouring cave GK 20, whose cupola shows 11 bodhisattvas, the cave is cut into fragile gompholite-like stone which is frequently shaken by earthquakes. Both cupolas are seriously endangered.

Introduction

In Central Asia, history lies outspread before the traveller like the page of a Chinese manuscript, waiting to be deciphered.

ADAPTED FROM **GEORGE N. CURZON**, *RUSSIA IN CENTRAL ASIA IN 1889 AND THE ANGLO–RUSSIAN QUESTION*, 1889.[1]

The period from the Xiongnu steppe empires (before 244 BCE–93 CE) to that of the Uyghurs (744–840 CE) was marked by the extraordinarily dynamic and multifaceted relationships between the peoples of Central Asia and the states of sedentary cultures at the peripheries, such as those of China, north India and Iran, and the Roman and Byzantine empires. These contacts involved both active trading and political and military conflicts, the migration of peoples and the diffusion of religions and artistic styles.

The peoples and empires of Central Asia formed the hubs of the trade networks which we call the Silk Roads, which connected the sedentary empires by land and sea. Thanks to increased mobility and the rapid economic growth of the great empires to the east, south and west, the first millennium CE saw a vast expansion in transcontinental trade – a trade that slowed down towards the end of the ninth century. A comparable dynamic returned only a thousand years later with the Russian advance into the region and the 'Cold War' with British India that ensued. The steppe peoples and oasis cities of Central Asia not only lay at the geographical centre of the trade routes, but they controlled the flow of trade itself, either by levying tolls or through their own mercantile activities. Thus, for example, the thriving economy of the oasis cities of Sogdiana in today's southern Uzbekistan and north-western Tajikistan formed the basis for a complex trade network that included far-flung Sogdian enterprises which extended from the Crimea and Byzantium in the west to Mongolia and the Chinese capitals of Chang'an (today's Xian) and Luoyang in the east.

Silk, probably the most important commodity, was not just an article of commerce but served as an official means of payment in China, for soldiers' pay, as currency for purchase of the much sought-after horses of Mongolia and eastern Tibet, and for tribute to the powerful steppe empires in the north. The rulers of the Xiongnu and of the Turkic khaganates, loosely structured tribal confederations, were, however, economically dependent on China's prosperity. While nomadic stock rearing allowed self-sufficiency and a meagre subsistence, it did not provide the leaders of these extensive confederations with enough surplus to distribute it to subordinate tribal princes or allies in order to secure their loyalty. For several hundred years, therefore, the rulers of the steppe empires exerted a permanent military pressure on China in order to exact yearly tribute in the form of coveted luxuries, notably silk in bales or made up into clothing. Tribal leaders presented with bales of silk swiftly sold these to Sogdian merchants, thus feeding Chinese tribute into trade. China's silk roads to the steppe empires were 'tribute routes', and silk played an essential role in holding together the powerful steppe empires of east Central Asia.

The relationship between the steppe empires and China was one of mutual but asymmetrical dependency. The elites of the steppe confederations needed China's luxury goods, especially silk, to guarantee internal stability, while China required horses from them in order to resist with its own cavalry the border raiding and blackmail of these same empires, for China's potential grasslands were all under cultivation. For both the Xiongnu and their Chinese contemporaries of the Han and Xin dynasties (202 BCE–220 CE) Clausewitz's maxim certainly applied: war was 'a mere continuation of politics by other means'.[2]

The outstanding importance of the silk trade and the Silk Road also determined the policy of the great powers of the day. China thus strove over centuries to extend its zone of influence westward so as to ensure the security of the trade route through the Hexi Corridor in Gansu, along the Taklamakan Desert and on to Samarkand, while the First Turkic Khaganate (552–630/59) established diplomatic relations with Byzantium in the winter of 568/69 in order to break the trade blockade imposed by the Sassanids who ruled Iran and Iraq. The Sassanids then struck back by occupying Yemen so as to disrupt Byzantine maritime trade with India. If today 'it's all about oil', then in the Eurasia of the first millennium CE it was 'all about silk'.

The wealthy empires of sedentary cultures exerted an irresistible attraction on the steppe peoples of Central Asia, who suffered from internal military conflict and sometimes harsh climatic conditions. Towards the end of the third century CE, Turkic and Turco-Mongol peoples began a westward and south-westward migration, one of the most important population movements of the last two millennia, which would culminate in the general Turkification of Anatolia and a wide swathe of Central Asia.

The Silk Roads conveyed not only goods and peoples but also ideas, discoveries and religions. In the first century CE, Buddhism began to spread into Central Asia, followed from the third century on by Manichaeism, Zoroastrianism, and Nestorian Christianity which officially reached the Chinese capital Chang'an in 635. The eighth century, finally, saw Islam begin to establish itself in Central Asia, sometimes by force. Diffused along with these religions were their characteristic means of visual communication, in the form of sculpture and painting, most notably the art of the Buddhist Gandhara School, which combined a Greco-Roman aesthetic with Indian wisdom. Curiously familiar to the European eye, Gandharan representations of buddhas and bodhisattvas had a profound influence on the canon of Buddhist art, still felt today from north India, across Central Asia, to China, Korea and Japan. The 'Age of the Silk Roads' led to a kind of globalisation not only of commodities but also of religious ideas and visual art forms. One of the most important inventions to find a staging post in Central Asia before going on to conquer the world was paper, for Samarkand had a flourishing paper industry centuries before paper reached Western Europe.

Compared with the first volume of this History of Central Asia, this second, covering the last two centuries BCE and the first millennium CE, can draw on much more extensive written sources. But, apart from the brief proclamations of Kushan and Turkic rulers recorded on stone stelae, these texts were written not by Central Asian authors but by foreigners from neighbouring empires of sedentary cultures. These sources are Chinese, Roman, Byzantine, Armenian, Syriac and Arabic. Archaeological, linguistic and numismatic data are therefore still indispensable for the reconstruction of the history of the peoples and cultures of Central Asia.

I

Early Empires and Kingdoms in East Central Asia

All the people who live by drawing the bow are now united in one family [of the Xiongnu] and the entire region of the north is at peace.

Letter of 176 BCE from **MODU CHANYU**, RULER OF THE XIONGNU, to the CHINESE EMPEROR HAN WENDI, following his victories over the Yuezhi and Wusun tribal confederations, the city-state of Loulan and 27 other states and tribes.[1]

1. The Xiongnu, the First Steppe Nomad Empire

The sphere of control and influence of the Xiongnu tribal confederation extended from Lake Balkhash in East Kazakhstan in the west to Manchuria in the east, and from Lake Baikal in the north to the Qilian Shan Mountains, in what is today the Chinese province of Gansu, in the south. As the Xiongnu were for five centuries China's chief enemy, a great deal is known about their history and customs from Chinese chronicles. China was for almost 3,000 years an 'empire of historians', where the history of dynasties of past and present, and also the biographies of leading political actors, were regularly recorded in writing. The name Xiongnu is Chinese, and means something like 'ferocious slaves', though it may also represent an attempt to reproduce the sound of the Xiongnu's name in their own Turkic language, or that of one of the component tribes, such as the Hunyu or Hunxie. The choice of name was also a deliberate slight against this foreign people, representing as it does the Chinese as their masters.[2]

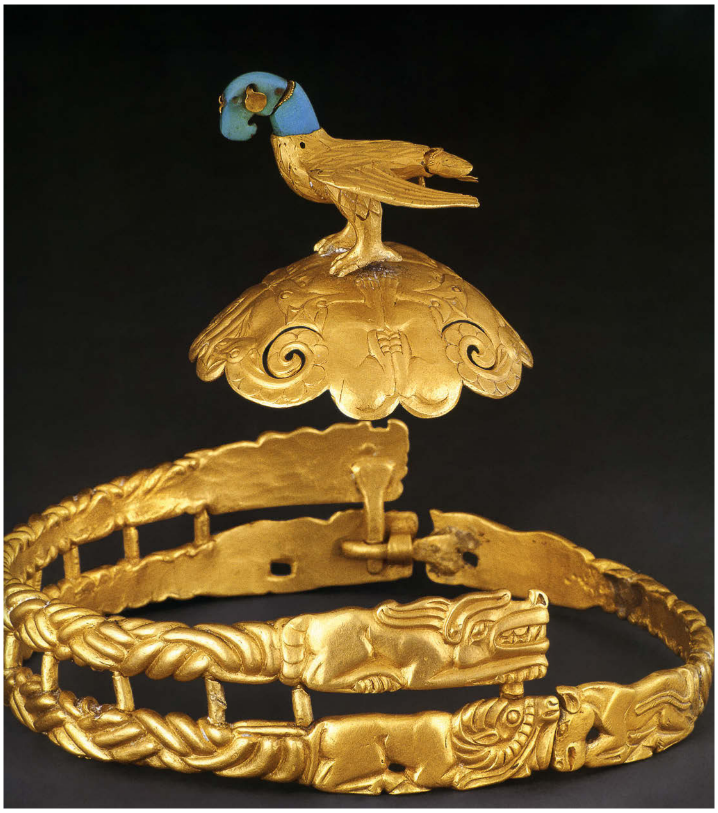
1.1 The Chinese Sources

In matters relating to the Xiongnu, four chronicles are of particular relevance. The first is the *Shiji*, the 'Historical Records' of historian Sima Qian (*ca.* 145–87 BCE), which deals extensively with China's relations with the Xiongnu and also their history. Sima Qian found himself personally affected by China's wars against the Xiongnu in quite unintended fashion, for in 99 BCE he was castrated on the orders of Emperor Han Wudi (r. 141–87 BCE), whom he had enraged by his defence of the general Li Ling, after the latter had been overcome in the field by superior Xiongnu forces. It was Sima Qian who coined the paradigmatic idea that since the earliest times there had existed a bottomless gulf between the settled Chinese and the nomadic 'foreigners' in the north.[3] Overlapping in parts with the *Shiji* is the second source, the *Han Shu*, the 'History of the Western Han dynasty' (202 BCE–9 CE) from the first century CE. This chronicle was begun in 36 CE by the historian Ban Biao, continued by his son Ban Gu, and finished by the latter's sister Ban Zhao around 110 CE.[4]

The third source is the *Hou Han Shu*, the chronicle of the Eastern Han dynasty (25–220 CE) compiled by the historian Fan Yen (398–446 CE). Relevant to the Xiongnu and China's Western policy are volumes 47 and 88,[5] which deal with three generals who fought the Xiongnu[6] and the 'Chronicle of the Western Regions'. Both volumes are highly informative, as they are based on the reports of two imperial generals, who both fought successfully against the Xiongnu in what is today Xinjiang: Ban Chao (d. 102), who was the brother of Ban Gu, the principal author of the *Han Shu*, enforced China's interests in the west between 73 and 102 CE, and his son Ban Yong (d. *ca.* 128) between 123 and 127.[7] The fourth source is the monumental *Zizhi Tongjian*, the 'Comprehensive Mirror for Aid in Government' written by Sima Guang (1019–1086), a chronological account in 354 volumes of 1,362 years of Chinese history.[8]

1.2 The Early Xiongnu and their Ancestors

The antecedents of the Xiongnu, who are first explicitly mentioned in 244 BCE, are unknown.[9] Sima Qian identifies a descendant of the legendary Chinese dynasty of the Xia (21st c.–17/16th c. BCE) by the name of Chunwei as forefather of the Xiongnu, so attributing a shared origin to the Chinese and their nomadic enemies.[10]



2. Golden crown of a Xiongnu leader. The eagle's head and the back of its neck are made of turquoise; the eagle is standing on four groups of stylised wolves which are attacking *argali* (mountain sheep). At both ends of the band, which is double in the front and single in the back, are a tiger, an *argali* and a horse. Excavated in 1972 in Aluchaideng, Inner Mongolia, late 3rd c. BCE. Inner Mongolia Museum, Hohhot.

Already by the time of the Shang dynasty (*ca*. 16th–11th c. BCE) China had to ward off attacks by peoples from the north, who at first used light war chariots, as did the Xianyun, for example, in the late ninth century BCE.[11] Soon afterwards, the Quanrong – a tribe living in the Ordos, the area enclosed within the great northward loop of the Yellow River – toppled the Chinese Western Zhou dynasty (*ca*. 11th c.–771 BCE). The successor dynasty of the Eastern Zhou (770–256 BCE) had to transfer the capital from Shaanxi province to Luoyang.[12] The Chinese would later call these threatening neighbours, generically, *Di* in the north-west, *Rong* in the north, or more generally *Hu*, 'barbarians'. To protect themselves against attacks, Qin, Zhao and Yan, the three most northerly of the seven states of the period of Warring Kingdoms (475–221 BCE), built defensive walls on their northern borders, forerunners of the Great Wall of China.

These defensive measures could not make up for the military inferiority of China's poorly trained infantry and heavy war chariots when faced with the mounted archers of the steppe nomads. King Wuling of Zhao (r. 325–299 BCE) therefore reformed his army, introducing independent units of mounted archers, and so succeeded not only in repelling the attacks of the Linhu and the Lufan, but in pushing on to Gansu, later the heartland of the Yuezhi.[13] Soon after, Zhao's eastern neighbour, the kingdom of Yan, followed the former's example, and the general Qin Kai, who only a few years earlier had been living among the Donghu, the 'eastern barbarians', as a hostage, now used his newly established mounted units to drive them out of the kingdom's northern frontier regions.[14] At the same time, both Zhao and Yan extended their northern walls, as Zhao's western neighbour Qin also began to do in 295 BCE.[15] The value of well-trained mounted archers was again demonstrated in 244 BCE, when Zhao's general Li Mu first halted the advance of an enormous Xiongnu army with infantry and chariots, before attacking them from behind with 30,000 bowmen on horseback, whom he had been drilling for years, thus annihilating the enemy. The ruler of the Xiongnu, the chanyu, managed, with great difficulty, to escape, and 'for the next ten or more years the Xiongnu did not have the courage nor the strength to venture near the borders of Zhao'.[16] Li Mu's triumph revealed that agrarian China was now the military equal of the steppe empires on its northern borders, possessing sufficient war horses and a cavalry adequately trained in bowmanship and fast manoeuvre, and generals who adopted for themselves the military tactics of the riders of the steppes.

But the switch from war chariots to cavalry brought with it a massive increase in demand for suitable horses, which agrarian China could not meet since the potential pastures of the northern part of the country were under cultivation. China was thus dependent on the import of horses, which at first it could only obtain from its arch-enemies in the north, in exchange for luxury goods, chiefly silk.[17] First established on a large scale in the late fourth century BCE, this flourishing trade rapidly effected a drastic change in the self-images of the steppe elite, as witnessed by the imported grave goods found in their tombs. This reorientation towards China on the part of the steppe nomads is exemplified by Kurgans 3, 5, and 6 at Pazyryk, Kurgan 5 being especially notable for the wooden chariot with four spoked wheels of a Chinese type that was found in the burial chamber.[18]

3. Terracotta figure of a Chinese equestrian warrior. Grave good, Han dynasties (202 BCE–220 CE). Private collection.

The accession of Prince Zheng (r. 246–221 BCE) to the throne of Qin had far-reaching consequences for both China and the Xiongnu. Eliminating his competitors one after another, he succeeded by 221 BCE in uniting China politically for the first time, assuming the title of *Qin Shihuangdi* (r. 221–210 BCE).[19] Consolidating his

power, he not only standardised the Chinese characters, weights, measures and currencies, but turned from a defensive to an offensive strategy in relation to the Xiongnu: in 215 BCE he ordered General Meng Tian to drive the Xiongnu from their territory in the Ordos, which formed a steppe nomad enclave in the lands south of the Huang Ho (the Yellow River). 'He seized control of all the lands south of the Yellow River and established border defences along the river, constructing forty-four walled district cities . . . The whole line of defences stretched over ten thousand *li* from Lintao [180 kilometres south of Lanzhou in Gansu] to Liaotung [in Liaoning] and even extended across the Yellow River.' 'The Chanyu Touman, unable to hold out against the Qin forces, withdrew [in 214 BCE] to the far north.'[20] Qin Shihuangdi did not, however, raise the first Great Wall from scratch, but had the internal walls of the defeated states demolished while linking Qin's northern walls with those of Yan and Zhao; extended east and west, this wall was some 2,500 kilometres long.

It is significant that the new Great Wall stood on the far side of the Huang Ho, and thus beyond the Ordos. While it still had the role of protecting China from nomad incursions, it now also had offensive functions. For Emperor Qin Shihuangdi, like Han Wudi one century later, built his wall only *after* his troops had advanced

into enemy territory, planting the newly created buffer zone with self-sufficient military colonies called *tuntian*.[21] The walls then secured the occupied nomad territory, which might thus serve as a concentration zone for future offensive campaigns.[22] Their building also had consequences for the trade between nomads and Chinese, which had earlier been distributed along the whole length of the frontier, but which was now concentrated at the gates in the wall. Until the end of the Ming dynasty (1368–1644 CE), the Great Wall would represent for the Chinese the boundary between Chinese civilisation and the alien world of the barbarians. As very soon became clear, Qin Shihuangdi's unification of the empire and his occupation of the then lush pastures of the Ordos provoked profound social transformations among the Xiongnu. If the nomads were not to be reduced to vassals of China, they would have to find another way to organise themselves.

When Qin Shihuangdi died in 210 BCE, palace intrigues and revolts led to the fall of the dynasty and a ferocious struggle for power, won in the end by Liu Bang. Reigning as the emperor Gaozu (r. 202–195 BCE), he would be the founder of the Han dynasty. Under **Touman Chanyu** (d. 209 BCE), the first chanyu whose name we know, the Xiongnu took advantage of these troubles to cross the border and occupy the southern part of what is today Inner

Mongolia, western Shanxi, northern Shaanxi, Ningxia and eastern Gansu. In those days, the Xiongnu were bordered by two great tribal federations: to the west by the Europoid Yuezhi, probably speakers of a proto-Tocharian language, and to the east by the Mongoloid Donghu, who spoke an Altaic, proto-Mongolian language. The Xiongnu for their part were a heterogeneous tribal confederation whose leading clans also spoke an Altaic, but in their case proto-Turkic, language. Proto-Mongolian- and proto-Tungusic-speaking groups would join the confederation after their speedy conquest in the early second century BCE, to be followed after 176 BCE by proto-Tocharian speakers.

1.3 The Xiongnu Rise to Power

The transformation of the Xiongnu into a major power followed a bloody coup and a radical reorganisation of the confederation. According to Sima Qian, Crown Prince Modu, eldest son of Touman Chanyu and the future **Modu Chanyu** (r. 209–174 BCE), fell into disfavour with his father. To get rid of him, Touman sent him to the Yuezhi as a hostage, soon afterwards attacking them in the hope that they would kill Modu in retaliation. The attack was a failure, and Modu succeeded in escaping. On his return, Touman gave him command of 10,000 horsemen. Having trained his men rigorously, Modu made whistling arrows and ordered them: 'Shoot wherever you see my whistling arrow strike! Anyone who fails to shoot will be cut down!'[23] He first shot a whistling arrow at one of his best horses, then at his favourite wife, and any one of his following who failed to shoot as he did was killed on the spot. When he aimed at a splendid horse of his father's, they all followed him, and Modu knew they would now obey him blindly: when he was next out hunting with the chanyu, he loosed his bow at his father, who was instantly riddled with arrows. Modu then had his step mother, his half-brother and every reluctant minister executed, and in 209 BCE he declared himself the new chanyu.

When the powerful Donghu nomads to the east learnt of this coup, they hoped to take advantage of the unrest among the Xiongnu, first demanding Touman's most famous horse, which 'went a thousand *li* a day',[24] and then Modu's favourite concubine. Against the advice of his ministers, Modu complied each time, leading the Donghu to think the new chanyu weak and fearful, and so to demand that he hand over an area of uninhabited land. When some of his ministers advised giving in, Modu became enraged and cried out: 'Land is the basis of a nation!'[25] This remark ran counter to the traditional thinking of nomadic peoples, for whom not control of land but control of tribes was important; clearly, Modu was thinking in new and different political terms. Taking advantage of the impression of weakness he had made, he mobilised his warriors and in 209 or 208 BCE attacked the Donghu, whose false sense of security had left them unprepared. In twice giving in without a struggle, Modu had employed the classic tactic of feigning flight before launching a decisive blow. The Xiongnu won an overwhelming victory, capturing enormous spoils before making their way to the west. There in around 208–207 BCE they defeated the Lufan in Shanxi and drove the Yuezhi out of their homeland west of the Ordos Loop, in today's Inner Mongolia and central Gansu. The Yuezhi fled westward, to the area between the Qilian Mountains and Tian Shan.[26] With China engaged in civil war, Modu was able to win back all the territory that had been lost in 214 BCE, and extend his dominion east and west. Not long after, Modu subdued other tribal confederations in the north, among them the Dingling, who inhabited what is today northern Mongolia and Buryatia south-east of Lake Baikal, thus bringing arable lands under Xiongnu control.

After his early military victories, Modu undertook decisive reforms so as to endow his tribal confederation with stable structures. One such measure was the division of people and army, and also of time, in accordance with the decimal system. The Xiongnu week had ten days,[27] while the traditional structure of tribe and clan was overlaid with a decimal-based system[28] that organised the people like an army in accordance with the principles of rigorous hierarchy and central command. Modu Chanyu ruled every tribe of the confederation, held the supreme command, and resided at the centre of his steppe empire; he divided people and army – every adult nomadic horseman was a soldier in time of war – into symmetrical halves. 'Under the Chanyu are the Wise Kings of the Left and Right, the left and right Luli kings, left and right generals, left and right commandants, left and right household administrators, and left and right Kutu marquises.'[29] As direction was specified in relation to the south, the dignitaries of the left lived in the eastern sector, those of the right in the western; the eastern king took precedence over the western, and his office was often filled by the crown prince. The ten most important of these 24 leaders commanded 10,000 horsemen, the others some thousands, but all bore the title 'Ten Thousand Horsemen'. Under them were the leaders of units of 1,000, 100, and 10 warriors. This organisation of people and army in two symmetrical halves would later be adopted by other steppe empires, such as the Turkic khaganates.

Within the decimal structure of the empire, the leaders of individual tribes enjoyed a certain autonomy as regards their own tribal affairs, but they were bound to absolute obedience in matters concerning relations with other tribes of the confederation or with foreigners. To the chanyu fell the difficult task of securing the financial resources required to support the governmental structure and to ensure the loyalty of the four highest royal dignitaries, whether by levying high taxes on vassal states, exacting tribute from China, or raiding. As a second priority, the chanyu pressed for the opening of markets at selected locations along the Great Wall, so that his merchants and stock breeders might profit from barter with China. The Xiongnu Empire's relations with China were essentially parasitic. From the economic point of view, the chanyu functioned as the manager of his nation, a manager who had a powerful army at his disposal to enforce the national interest. Because the power structures of the Xiongnu ultimately depended on the acquisition and redistribution of luxury goods and the personal skills of the chanyu, the Xiongnu confederation might well have formed an empire, but it hardly constituted a stable state.[30] The empire's stability did not depend on the chanyu's personal charisma, as it did in other tribal confederations, but on recognition of his line of descent.

At the same time, Modu modernised the army, replacing the heavy cavalry with a more lightly armoured, much more mobile force, and introducing the long, asymmetric, composite bow. A wood-framed saddle gave riders a better seat. The saddle tree consisted of at least four elements: two saddle-bows; that is, the pommel and cantle, and two side panels, which were all held together loosely by leather straps.[31] Also carrying a cavalry sword up to 130 centimetres long, Xiongnu warriors so equipped must have feared only the Chinese crossbow. As in the case of other steppe nomads living in a harsh climate, everyday life offered an ideal and continuous preparatory training for war.[32] However, nomads lost their military advantage as soon as they changed their lifestyle. China was aware of the nomadic mounted warriors' Achilles' heel, and sought always to soften them with opulent gifts such as silk clothing, jewellery, rare foodstuffs and other luxury goods. As early as around 174 BCE, Zhong Xing Shuo, a Chinese adviser to the chanyu Laoshang, warned that 'The strength of the Xiongnu lies in the very fact that their food and clothing are different from those of the Chinese, and they are therefore not dependent upon the Han for anything. Now the Chanyu has his fondness for Chinese things and is trying the Chinese customs. . . . From now on, when you get any of the Han silks, put them on and try riding around on your horses through the brush and brambles! In no time your robes and leggings will be torn to shreds and everyone will be able to see that silks are no match for the utility and excellence of felt or leather garments.'[33]

A structured empire had to possess a clear centre of power, which the chanyu physically embodied. Whether, as has sometimes been claimed, his favoured residence and hence his 'seat of government' lay in the Orkhon Valley, where the administrative centres of the Uyghurs, the Mongols or the Turkic khaganates were actually located, is highly uncertain.[34] For only sparse traces of the Xiongnu have been found in the Orkhon Valley, and most importantly, no elite tomb has been discovered there. On the contrary, the great majority of Xiongnu elite tombs, with the exception of those of Takhiltin-khotgor in the south-west Mongolian province of Khovd, stand on the middle and lower course of the Selenge river. Here, necropoles such as Noin Ula or Gol Mod represented religious centres in a place where there might have been a geographical centre of power. Until the serious defeats of 121 and 119 BCE, there also existed a second centre of power south of the Gobi Desert. It remains an open question, though, whether the Xiongnu did not in fact operate with a mobile power centre, with the chanyu and his court moving their yurt encampment to different places in turn.

In contrast to earlier nomad confederations, the economy of the Xiongnu was not based on pastoralism alone but, thanks to their conquests in Buryatia and Transbaikalia, also extended to agriculture, which gave them a high degree of economic independence and greater flexibility in creating political structures.[35] In areas of agricultural activity, the Xiongnu established fortified settlements, such as Ivolga, south of today's city of Ulan Ude. The settlement, which measured approximately 350 metres x 200 metres, was surrounded by four earthworks and three ditches. Here lived some 3,000 people, engaged in irrigated agriculture, fishing and metalworking; their houses were for the most part dug into the ground. As the nomadic pastoralists disdained cultivation, they put deserters and Chinese prisoners of war to work in such centres of agriculture.[36] The harvested cereals were then transported to the Xiongnu heartland, where they were stored in fortified granaries. Further rectangular walled sites were discovered in north-eastern Mongolia, for example in the southern foothills of the Khentii mountains near Terelzhiin Dörvölzhin and Bürkhiin Dörvölzhin. The numerous eaves tiles which have been found on the ground of those sites are decorated in a manner which is very similar to that of Chinese Han dynasty eaves tiles.[37] As the excavator of the settlement of Boroo Gol, Denis Ramseyer, emphasises, the 20 or so huge quadrangular enclosed sites discovered in the last few decades 'are not villages or cities surrounded by walls: they are rather cult sites, centres of public, of political or of military life which were occupied temporarily'.[38] So far, only four sites of the Xiongnu have been certainly identified as settlements: Boroo Gol in Mongolia, and in Russia, south of Lake Baikal, the sites of Ivolga, Dureny and Nijnii Mangirtai.[39]

1.4 The Xiongnu Exact Tribute from China

Laying great store by the territorial integrity of his own dominion, which he could control through a small number of people, Modu Chanyu noted the fragility of China's newly established Han Empire. When the Han emperor Gaozu (r. 202–195 BCE) laid claim to absolute power, his pretensions were opposed by a number of local kings, and in order to destabilise China's fragile unity, Modu and his successors provided military support to these rebellious vassals. In autumn 201 BCE, Modu therefore encouraged the king of Han, in today's Shanxi province, to join the Xiongnu and rebel against the emperor, thus affording the Xiongnu a gateway to the Chinese heartland. Early the following year, as the emperor Gaozu advanced with a huge army, Modu feigned a retreat: the emperor pursued him with the vanguard alone, without awaiting the main body of infantry. At Baideng, not far from today's Datong, Modu suddenly attacked with 400,000 horsemen, surrounding the imprudent emperor. Gaozu was able to escape the trap only by bribing Modu's wife with rich gifts and offering Modu himself the prospect of tribute.[40] Modu had won an overwhelming victory, and he looted the border region unhindered as Gaozu withdrew his troops.

The humiliated emperor had to recognise that his army of foot soldiers, light war chariots, and inadequately trained and outnumbered cavalry had been no match for the Xiongnu forces, just as the Chinese generals were far from equalling the Xiongnu commanders in strategy and tactics. Even though the Xiongnu numbered fewer than 1.5 million adults, while China had 60 million,[41] because every horseman was a warrior they had been able, with their allies, to put as large an army into the field as their much bigger neighbour. Gaozu therefore abandoned military efforts to halt the Xiongnu's continuous raids: he recognised them as equals, sued for peace, and offered tribute. In 198 BCE a treaty put the seal on China's *heqin* policy (the word means 'peace and kinship' and so 'alliance by marriage'), the emperor undertaking to offer the chanyu a Chinese princess for a wife, and to pay an annual tribute in the form of silk, luxury clothing, gold, jewellery, alcohol, cereals and other foodstuffs. The chanyu for his part promised to renounce raids and incursions. In its weakness, China maintained the *heqin* policy for 60 years, even though the Xiongnu regularly harried the borderlands, forcing the Chinese emperor just as regularly to increase the tribute. In 166 BCE, for example, Laoshang Chanyu even threatened China's capital, Chang'an.[42]

To reinforce the stability of his confederation, Modu Chanyu needed a broader economic base, and to ensure the loyalty of the tribal princes he needed military victories; he therefore ordered one or more large-scale campaigns to the south-west. The results he reported to Emperor Wendi (r. 180–157 BCE) in a letter of 176 BCE: '(I have sent) the Wise King of the Right . . . to search out the Yuezhi people and attack them. He has succeeded in wiping out the Yuezhi, slaughtering or forcing them into submission, every member of the tribe. In addition he has conquered the Loulan, Wusun and Huquie tribes as well as the twenty-six states nearby, so that all of them have become part of the Xiongnu nation. All the people who live by drawing the bow are now united in one family [of the Xiongnu] and the entire region of the north is at peace.'[43] These victories brought Modu a quantum leap in power, for the Xiongnu now controlled Gansu and Xinjiang with their wealthy oasis cities, so crucial to trade, and 20 to 30 years later, even Fergana as well. The Xiongnu not only demanded tribute and hostages from the local ruling families, but controlled the trade routes to Central Asia, to Sogdiana, Bactria and the Caspian Sea. At the same time, they gained for their comparatively barren heartland a further source of food supply. To oversee the newly conquered vassal states and to ensure the collection of taxes, the chanyu appointed a 'commander of the slaves' who resided at Yanqi (Karashahr), south-west of Turfan, in Xinjiang.[44]

For half a century, continental East Asia was divided into two zones of great-power influence, the north being dominated by the Central Asian empire of the Xiongnu, the south by China. This status quo was acknowledged by Emperor Wendi in a letter to Laoshang Chanyu of 162 BCE: 'The land north of the Great Wall, where men wield the bow and arrow, receives its commands from the chanyu, while within the wall, whose inhabitants dwell in houses and wear hats and girdles, is to be ruled by us.' And he went on to acknowledge China's tribute to the Xiongnu: 'We have decreed that our officials send to the chanyu each year a fixed quantity of millet, leaven, gold, silk cloth, thread, floss and other articles.'[45]

Although Emperor Wendi acknowledged the humiliating payments of tribute, in 169 BCE, on the advice of his minister Chao Cuo (d. 154 BCE), he undertook important reforms of the army and of settlement policy, reforms that would only come to full fruition under Emperor Wudi (r. 141–87 BCE). Chao Cuo advised replacing heavy chariots with much lighter versions, and establishing a cavalry as an independent branch, for the Xiongnu were much superior to the Chinese troops in mobility. Like the Scythians and the Saka they relied on lightning attacks and feigned retreats, and if battle turned against them they could take flight and scatter without loss of honour in their own eyes.[46] 'When they catch sight of the enemy, they swoop down like a flock of birds, eager for booty, but when they find themselves hard pressed and beaten, they scatter and vanish like the mist.'[47] As Emperor Gaozu's adviser Zheng Jin warned, 'Trying to catch them [the Xiongnu] is like grabbing at a shadow'.[48]

6. The Kelpin Tagh mountain range at the southern foot of the Tian Shan Mountains between Maralbashi and Artush. Xinjiang, China.

Chao Cuo called for stronger and hardier horses and riders better trained in the use of the bow – in adverse weather conditions, too, he insisted. Battle should more often be sought on flat terrain, where well-trained infantry equipped with crossbows and halberds would have the edge over Xiongnu fighters reluctant to engage in close combat. Chao Cuo also advocated the use of offensive units armed with heavy crossbows and light repeating crossbows whose bolts could easily penetrate the Xiongnu's wooden shields and leather armour. The earliest Chinese crossbows date from the sixth to the fifth centuries BCE, the first repeating crossbows to the third. The latter had a magazine fastened to the bow which made it possible to shoot ten light but poisoned bolts in 20 seconds, so that a compact unit of soldiers armed with single-shot and repeating crossbows could unleash a volley devastating in its effect at ten to 20 metres. The sale of crossbows to foreigners was strictly forbidden.[49] Chao Cuo also advised the emperor to recruit mercenary companies from among nomadic peoples like the Yuezhi, or the Qiang of Eastern Tibet, so as to 'fight barbarians with barbarians'. Finally, he argued for blanket coverage of the northern frontier with the self-sufficient military colonies called *tuntian:* freemen looking for opportunity would be encouraged to settle there, trained militarily, and exempted from all taxes, but they were also manned with reprieved criminals and slaves.[50] Chao Cuo's programme represented an attempt to combine Chinese virtues in the way of agriculture and technology with the traditional strengths of the nomadic horsemen of the steppes.

Modu was succeeded by **Laoshang Chanyu** (r. 174–161 BCE), whose personal name, as rendered in Chinese, was Jizhu.[51] Laoshang continued his father's policy of expansion, driving away the Xiongnu's only surviving rivals in the south-west, the Yuezhi. These, it seems, had quickly recovered from Modu's attack, and in 173 BCE they attacked their north-western neighbours, the smaller Wusun tribe (perhaps Indo-Europeans like them), driving them out of north-east Xinjiang and north-west Gansu. 'The Da Yuezhi attacked and killed [the king of the Wusun] Nantoumi, seizing his lands, and his people fled to the Xiongnu.'[52] For the Yuezhi, the victory proved to be doubly short-lived, firstly making a sworn enemy of the dead king's son, who 40 years later would avenge his father, and secondly prompting Laoshang Chanyu to inflict on them in 162 BCE a third and this time shattering defeat. 'The Xiongnu defeated the king of the Yuezhi people and made his skull into a drinking vessel.'[53] The majority of the Yuezhi fled westward to the fertile Ili Valley or to Lake Issyk Kul, a smaller fraction southward to the land of the Qiang people, and another to the area between Turfan and Kucha in Xinjiang.[54]

1.5 The Xiongnu and China Fight Over East Turkestan

Junchen Chanyu (r. 161–126 BCE) succeeded his father Laoshang, and by the end of his reign he found himself confronted by the new, offensive strategy of the emperor Han Wudi (r. 141–87 BCE). When in 135 BCE he demanded the continuation of the *heqin* policy and a Chinese princess to go with it, Wudi reluctantly gave in, perhaps in order to win time. For the following year he decided to solve the problem of the constant Xiongnu incursions and the shameful Chinese tribute by means of a consistently offensive strategy, implemented in three stages: in the first phase (134/33–119 BCE) the Ordos would be won back and the Xiongnu driven far to the north, beyond the Gobi Desert. In the second phase (119–101 BCE), the Xiongnu would be robbed of control over the oasis cities and the trade routes to the west, depriving them of the economically all-important inflow of tribute, foodstuffs and arms. Following the example of Qin Shihuangdi, the borders would be moved northward and north-westward in the wake of the armies' advances, secured with forts and signal towers, and manned with self-sufficient troops. The third phase, intended to break up the Xiongnu Empire, was brought to a successful conclusion between 53 and 51 BCE with a first split between the still independent Northern Xiongnu and the Southern Xiongnu under Chinese suzerainty.

An attempt in 134 or 133 BCE to take the chanyu prisoner failed, when the Xiongnu ruler saw through Wudi's wiles, and the first major Chinese attack in 129 BCE was also unsuccessful, though General Wei Qing (d. 106 BCE) did win the Han dynasty's first ever victory against the Xiongnu.[55] Wudi accelerated the mass production of crossbows of different types, of scale armour and helmets, and the breeding of horses suitable for warfare.[56] In 128 and 127 BCE General Wei Qing won two overwhelming victories, regaining the Ordos for China and organising the repair of Shihuangdi's frontier walls on the far side of the Yellow River. When Junchen Chanyu died in 126 BCE, he was succeeded by his younger brother **Yizhye Chanyu** (126–114 BCE), whose reign was dominated by the full force of ceaseless Chinese attacks. Three years later, Wei Qing penetrated 250 kilometres into Xiongnu territory, routing the forces of the Wise King of the Right, which led to Yizhye moving his main camp northward, 'beyond the desert' around 122 BCE.[57] Yet before Emperor Wudi took the war to the Xiongnu heartland, he would be offered entirely new strategic options by his ambassador and spy, Zhang Qian.

Ambassador Zhang Qian Scouts Out the Silk Road to Sogdiana and Bactria

Shortly after his accession to the throne, Emperor Wudi began to consider the military options available to him against the Xiongnu, and to look around for allies. When he questioned Xiongnu deserters, they told him that the Yuezhi, who had had to flee westward in around 162 BCE, hated the Xiongnu, brooded on revenge, and were looking for allies against them. 'When the emperor heard this, he decided to try to send an envoy to establish relations with the Yuezhi.'[58] Zhang Qian (195–114 BCE), a palace attendant, volunteered for the role, and in 139 BCE he set off for the west, accompanied by a Xiongnu who knew the country. However, the route to the Ili Valley and Lake Issyk Kul, where the Yuezhi had settled, passed through Xiongnu territory, where they were captured and taken to Junchen Chanyu. He treated the enemy spy with courtesy, even providing him with a wife, but he would not let him go. In 129 BCE, after ten years' captivity, Zhang Qian succeeded in escaping, and continued on his journey. As the Yuezhi had since been driven south, by the Wusun, among others, he turned south-west, travelling through Fergana and Kangju to find the Yuezhi in northern Bactria. Though he stayed a year with them, gathering information about the peoples who lived further south, the king of the Yuezhi was not interested in avenging his father with another war, and Zhang Qian had to set off on his return journey empty-handed.[59] After another period of captivity among the Xiongnu, he was able to escape once again on the death of the chanyu, to reach the Chinese capital of Chang'an in 126 BCE.

For Emperor Wudi, Zhang Qian's report on the distant lands of Sogdiana, Bactria, India, Parthia and Mesopotamia was a fourfold revelation. Firstly, he learnt of rich lands, with which it would be profitable to trade – Zhang Qian had travelled the traditional Silk Road, though the Hexi Corridor in Gansu and Xinjiang was still in the hands of the Xiongnu. Secondly, in the market in the city of Bactra, in today's northern Afghanistan, the traveller had discovered Chinese Sichuan ware imported from India. From this he concluded that a southerly trade route connected Sichuan to India, and 'it would seem that the most direct route, as well as the safest, would be that out of Shu' (Sichuan).[60] Thirdly, Zhang had heard that the Wusun, who lived west of the Xiongnu, were ill-disposed to the latter, offering another possibility of alliance. Finally, he told of strong 'horses that sweat blood' and were descended from 'heavenly horses'.[61] It was clear to the emperor that the acquisition and breeding of such animals would offer an immediate solution to the chronic lack of war horses. Trusting his envoy, the emperor decided to pursue energetically all four possibilities for strengthening China's position that Zhang had outlined.

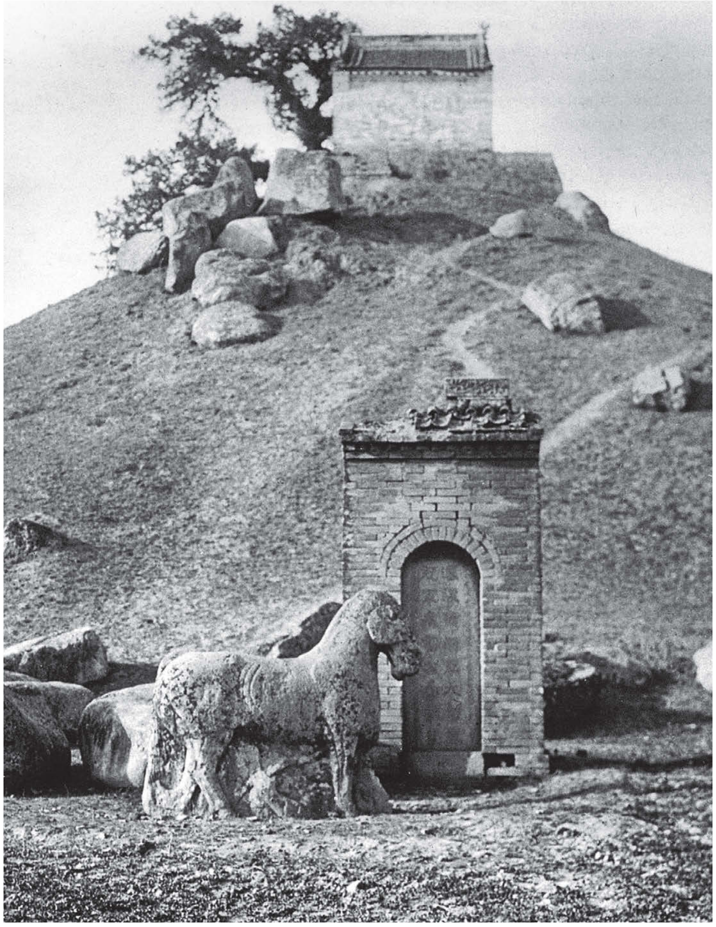
Two of these four projects would involve Zhang himself. Around 123 BCE, the emperor sent him to Sichuan with four scouting parties to find the southerly trade route to India. While they were prevented by hostile tribes from getting any further than north Yunnan, they did hear for the first time about the rich kingdom of Dian.[62] Two years later, Zhang successfully guided General Wei Qing through Xiongnu territory, but not long afterwards, serving as a colonel under General Li Kuang, he and his unit were late in making a rendezvous, leading his commander to suffer severe losses. As a result, he was fined and degraded to a commoner.[63]

Despite Zhang's diminished social status, the emperor still often consulted him, while Zhang himself was looking for some opportunity to regain his lost rank. He told the emperor of the Wusun, who had fled to the Xiongnu on their defeat by the Yuezhi and the death of their king Nantoumi. A young baby of the slain king had been left with his guardian, who took him and fled. Then the guardian left the infant on the grass while he searched for food, and when he returned he saw 'a wolf suckling the child . . . and ravens holding meat in their beaks and hovering at [the child's] side. Believing this to be supernatural, he then carried [the child] back to the Xiongnu, and the Chanyu loved and reared him.'[64] The myth of the future founder of a warlike nation, exposed as an infant and suckled by a she-wolf, was to be found across the whole Eurasian land mass. It appeared in different variants: committed to writing among the Romans in the late fourth century BCE; in the legend recorded by the Roman writer Justin, according to which the future Cyrus the Great, founder of the Achaemenid dynasty, was suckled by a bitch;[65] on Sassanid seals of the sixth century CE;[66] among the Turkic clan of the Ashina in the fifth to sixth centuries CE;[67] and the myth was also known as a motif in late Sogdian painting. Furthermore, in the wall paintings (8th–9th c. CE) of the palace of the Afshin rulers at Kala-i Kahkaha I near Bunjikat (in north Tajikistan), a standing she-wolf suckles two boys. The image's great resemblance to the Capitoline Wolf was mediated by the Byzantine coinage of the fifth to sixth centuries CE, which is known to have circulated in Sogdiana – at Panjikant, for example. And finally, the Turkic Gaoche – members of the Tiele confederation, to which the Uyghurs also belonged – and also the Mongols of Genghis Khan honoured a male wolf as their first ancestor.[68]

When the chanyu of the Xiongnu heard this wondrous tale, he took in the infant and later granted him kingship over the Wusun. In 133 or 132 BCE, Lieqiaomi, the new king, who bore the title 'kunmo', attacked the Yuezhi in the Ili Valley and on Lake Issyk Kul, avenging the death of his father and driving them out, before himself settling there with his people. Zhang further reported that the kunmo had declared himself independent, and had repulsed a punitive expedition by the Xiongnu. Now – in 119 BCE – if the Xiongnu were to be expelled from Gansu,[69] the Wusun could return to their old homeland: 'we could make use of the present opportunity to send generous presents to Wusun, and induce [its people] to move east and live in their old lands. This would result in cutting off the right arm of the Xiongnu.'[70] Thereupon, Emperor Wudi appointed Zhang Qian leader of a 300-strong mission whose goal would be to persuade the Wusun king to return to his homeland in

Gansu, and invite him to ally himself by marriage with the emperor. When Zhang met the Wusun, there was a serious conflict going on between one of the aged ruler's sons and one of his grandsons, because of which he did not dare decide on his own whether to return.[71] Despite this setback, Zhang took advantage of his visit to send emissaries to Fergana, Kangju (in central Kazakhstan and northern Uzbekistan), Sogdiana, Bactria, Parthia (Iran), India, and Khotan in southern Xinjiang. Around 115 BCE, Zhang returned home, bringing with him horses and Wusun envoys. Back in Chang'an, the emperor appointed him minister for state missions, effectively minister for foreign affairs. He died a year later, just as the envoys he had sent far into the west started to return to China, accompanied by foreign diplomats. Wusun allied itself by marriage with the imperial house, and became a highly dependable ally to China. Zhang Qian's last mission had been a complete success, as the *Han Shu* underlines: 'For the first time the states of the north-[west] came into communication with Han. It was [Zhang] Qian who had pioneered the way.'[72]

In the spring of 121 BCE, Emperor Wudi embarked on a decisive campaign against the Xiongnu. General Wei Qing's nephew, the 19-year-old General Huo Qubing (140–117 BCE), pushed deep into the western half of the Xiongnu Empire, which was under the control of the Wise King of the Right. He traversed Gansu, and Juyan[73] in the delta of the Etzin Gol, besieged the sub-king Xiutu Wang and seized from him the golden figure of a man that Xiutu Wang used in the worship of Heaven, the supreme deity of the Xiongnu.[74] It is conceivable that this 'golden man' was a gilt statue of the Buddha. After both sub-kings, Xiutu Wang and his western counterpart Hunye Wang, had suffered a number of heavy defeats at the hands of Huo Qubing, Yizhye Chanyu summoned them to him, intending to put them to death. Fearing for their lives, they both decided to surrender to General Huo. On the way, Hunye killed Xiutu, united the murdered general's troops with his own, and surrendered to Huo Qubing with 40,000 men. With Hunye's capitulation, Ganzu and northern Shanxi fell to China, whereupon Emperor Wudi settled some 700,000 people there.[75] This marked the beginning of a policy that would continue into the twenty-first century, of integrating and developing territories to the west through colonisation and cultivation.



7. The mausoleum of the Chinese general Huo Qubing (140–117 BCE). The stone horse is standing on a dead Xiongnu warrior. As a mark of recognition, Emperor Han Wudi commissioned the mausoleum of this illustrious general as a satellite tomb near his own Maoling Mausoleum. Shaanxi Province, China.

Two years later, Wudi decided to venture upon the hitherto unthinkable, to cross the Gobi Desert with two armies and engage the chanyu in his own heartland. The campaign would be recorded in history as the Battle of Mobei, the name meaning 'northern' (*bei*) 'desert' (*[Sha]mo*). Huo Qubing led the Eastern Army, with the Chinese elite troops, and pushed 2000 *li* – some 800 kilometres – into enemy territory, where, east of today's Ulaan Baatar, he annihilated the army of the Wise King of the Left. More than 70,000 Xiongnu warriors died in the battle. Wei Qing commanded the Western Army, and after advancing more than 400 kilometres into central Mongolia he unexpectedly ran into the chanyu and his elite cavalry, which the Chinese command had believed to be further east, on Huo Qubing's route of march. Wei Qing arranged his armoured chariots in a circle, protecting archers, crossbowmen, infantry and the larger part of the cavalry, and ordered a small detachment of cavalry to assail the attacking Xiongnu from the rear. At dusk, a sandstorm arose and Wei Qing took advantage of the loss of visibility to send the main body of the Chinese cavalry out from within the wagons, to encircle and attack the now worn-out Xiongnu. Yizhye Chanyu lost courage and fled under cover of night, as 19,000 Xiongnu warriors died. Wei Qing pursued the chanyu for almost 100 kilometres, until they came to his

8. Fort 86, which was built towards the end of the 2nd or beginning of the 1st century BCE, was part of a Chinese *limes* (a series of watchtowers) in the region of the Etzin Gol river, which controlled the path from Mongolia to China along the Etzin Gol. Inner Mongolia, China.

fortified granary. There, the Chinese satisfied their hunger, burnt the remaining cereal, and then turned back.[76]

For the Xiongnu, the wars of 121 and 119 BCE were a disaster from which they would never recover. They lost 100,000 warriors, millions of livestock, fertile pastures south of the Gobi, and the income from taxes on trade through the Hexi Corridor. China for its part lost three-quarters of its war horses, which limited in the short term Emperor Wudi's freedom of action and drew attention to the urgent necessity of finding an alternative supply. However, before he sought out the wondrous 'horses that sweat blood' in distant Fergana, he had to secure the newly conquered territories and establish military bases along the road to Fergana. Among the Xiongnu, who around 106–05 BCE moved the royal residence to the upper reaches of the River Orkhon,[77] a rapid succession of rulers followed one upon the other. Yizhye was succeeded on the throne by his son **Wuwei Chanyu** (r. 114–105 BCE) and Wuwei in turn by **Wushilu'er Chanyu** (r. 105–102 BCE), so young he was known as *Er Chanyu,* the 'Child Chanyu'. **Xulihu Chanyu** reigned only briefly (r. 102–101 BCE), to be followed by **Quedihou Chanyu** (r. 101–96 BCE) and then **Hulugu Chanyu** (r. 96–85 BCE). That so many under-age chanyus should die after a 'reign' of only a few years leads one to doubt that they died natural deaths. Around 100 BCE, the domestic political situation in China also began to deteriorate. To finance the wars, taxes were raised and monopolies on salt, wine and even iron introduced, and offices were sold to the wealthy rather than awarded to capable candidates.[78] At the same time, at the imperial court, intrigue and conspiracy became rife, culminating in the rebellion of Crown Prince Liu Ju in 91 BCE, when the ageing emperor began to suffer from paranoia.[79]

Because the then fertile valley of the northward-flowing Etzin Gol offered the Xiongnu an easy approach to Gansu, in 119 BCE Emperor Wudi started to build a chain of watchtowers and signal towers along the lower reaches of the river, from Maomu to the fort of Jiuquan in the south, and to the city of Juyan, on the now dried-up Lake Juyan, in the north. Standing within sight of each other, these towers communicated by day with coloured flags or smoke signals, and by night with fire signals. The system of fortifications that Emperor Wudi built first in north Gansu and then in Xinjiang can be compared with the early Roman *limes.* In

102 BCE, General Lu Pute was charged with upgrading the border fortifications on the Etzin Gol, remaining directly responsible to the central government until his death in 89 BCE. In 72 BCE civil administration was split from the military, and four subordinate commanders called *houguan* introduced beneath the chief commandant of Juyan, called the *Duwei*. The Xiongnu were now barred from entry to the Etzin Gol Valley.[80]

As the Wusun did not want to return to Gansu, Wudi decided to incorporate the territory into China, for the Hexi Corridor in central Gansu was of outstanding strategic importance. The trade route between China and Central Asia had necessarily to use this narrow passage squeezed between the Gobi Desert on the one side and the Qilian Mountains that form the north-eastern edge of the Tibetan Plateau on the other. Furthermore, the new Chinese prefectures cut all communications between the Xiongnu in the north and the tribes of the proto-Tibetan Qiang people in the south, thus preventing any alliance between them. The settlement of Chinese crop farmers in Gansu led to the transformation of pastureland into irrigated farmland. At the same time, existing fortresses were extended and made prefectural capitals: Jiuquan in 115 BCE, Wuwei before 111 BCE, Zhangye and Dunhuang in 111 BCE, Jincheng in 81 BCE; these were the Five Prefectures.[81] By this means, China's trans-Gansu trade with Central Asia, above all with Kangju and Bactria, was protected from attack by Xiongnu from the north or Qiang from the south. And the Great Wall ensured that Xiongnu and Qiang could no longer undertake joint military actions against China.

1.6 China Acquires 'Horses that Sweat Blood' and East Central Asia Becomes a Chinese Protectorate

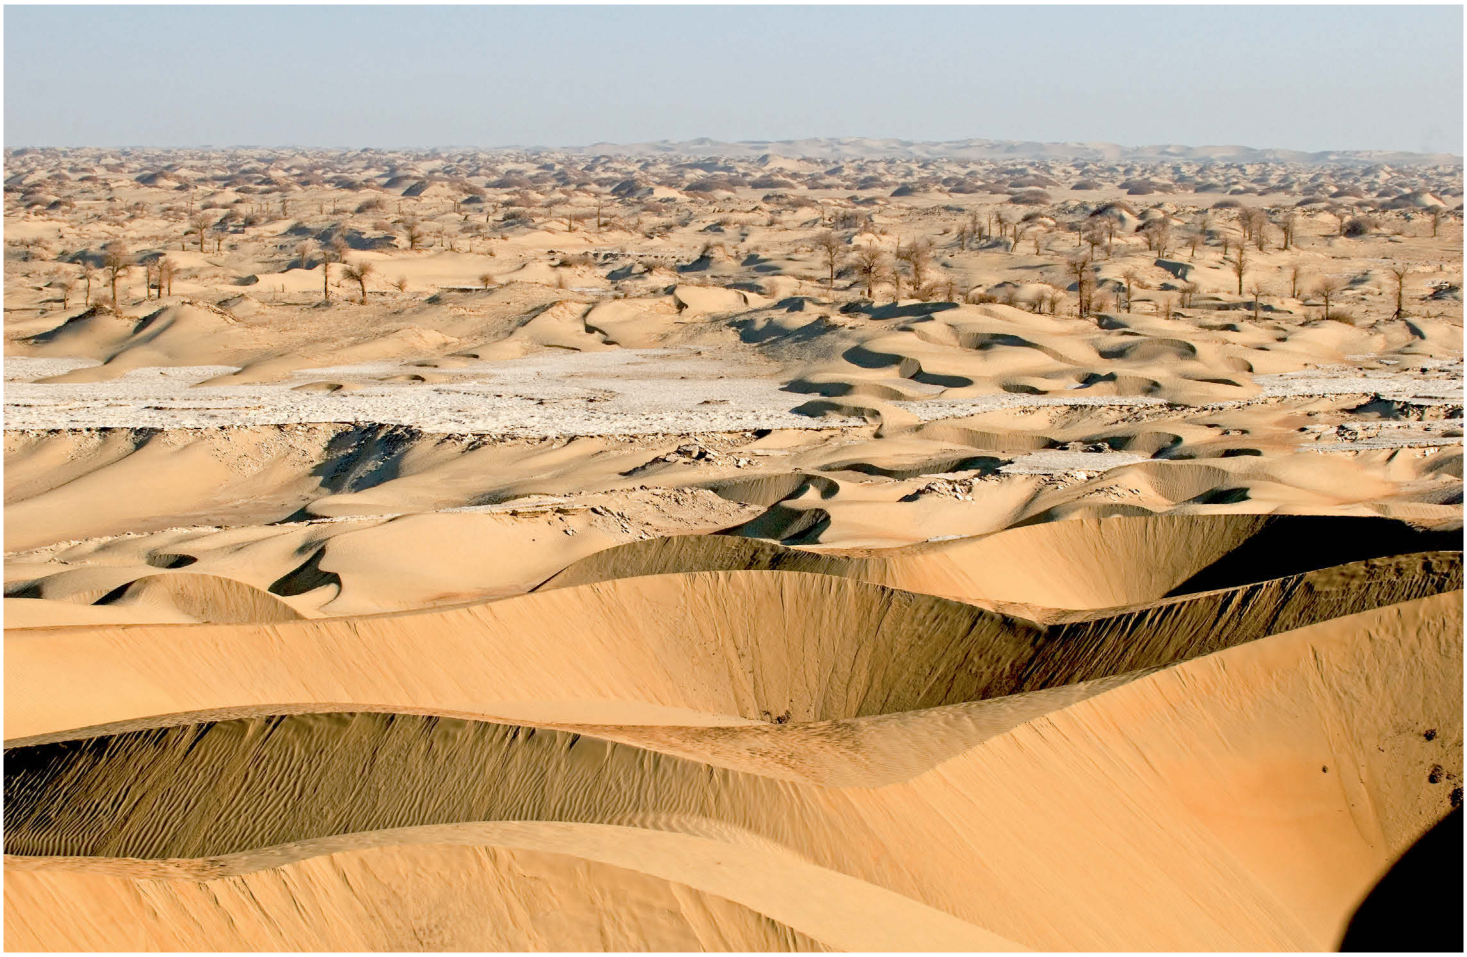
With the occupation of Jiuquan, China for the first time gained access to *Xiyu*, the 'Western Regions', today's province of Xinjiang. Here too, the system of watchtowers and major and minor fortresses was not merely defensive in function but also served Wudi's forward strategy, forming the central spine of the Chinese advance into Central Asia. Beyond the prefecture of Jiuquan, three Xiongnu territories blocked China's progress: to the west were Hami and Jushi, the latter extending along the Tian Shan Mountains from

9. The Jade Gate (Yumen Guan), situated 70 km north-west of Dunhuang and built between 96 and 94 BCE, marked the south-western border of China and controlled the beginning of the middle and southern sections of the Silk Road in the Tarim Basin. Gansu Province, China.

10. **This collection of yardangs, which are up to 30 m high, is called 'Dragon City' in ancient chronicles. Yardangs are composed of dried-up lacustrine sediment layers. Their formation in the Lop and Kum Tagh deserts probably often started when flowing water repeatedly cut out ridges, although running water is not always essential in the initial phase of yardang formation. Then a sand-laden wind, which always blows in the same direction, erodes the pre-shaped sediment formations. Kum Tagh Desert east of the Lop Nor, Gansu, China.**

Turfan in the south to Beiting in the north, and to the south-west was Loulan. Standing on the most direct route to the blood-sweating horses of Fergana, the city-state of Loulan had been since 176 BCE an isolated outpost of the Xiongnu and it thus became the next target of Wudi's expansionist designs, to be followed soon after by Jushi, while Hami remained for the time being a vassal of the Xiongnu. With the establishment in 111 BCE of the prefecture of Dunhuang,[82] whose old Chinese name *Shazhou* means 'desert district', Wudi set up two frontier posts: the fortress of Yan Guan some 40 kilometres south-west of Shazhou, and the Yumen Guan or 'Jade Gate' (fig. 9) around 60 kilometres north-east.[83] The name refers to the old trade in the jade that was imported into China from Khotan on the southern edge of the Taklamakan Desert.

The hostility of Loulan and Jushi toward Chinese missions passing through, which were plundered by marauding Xiongnu, provided a pretext for their conquest by General Zhao Ponu in 108 BCE. The two Xiongnu vassals provided their overlords with valuable information about Chinese missions: 'They frequently acted as ears and eyes for the Xiongnu, enabling their troops to intercept Han envoys.'[84] The then capital of Loulan – whose real name, in the north Indian Gandhari language, was Kroraina, rendered by Ptolemy as Kharauna[85] – corresponds to Sir Aurel Stein's 'ruin L.A.' (fig. 122).[86] Discovered on 28 March 1900 by Sven Hedin (1865–1952), Swedish geographer and pioneer explorer of the Taklamakan Desert, the Loulan ruins lie in the north of the Lop Desert, one of the most uninhabitable places on earth.[87] Once the city lay west of the Lop Nor Lake, which the *Han Shu* calls Puchang, the 'sea of abundant reeds'.[88] Lake Puchang was fed with water by the Konqe and Tarim rivers from the west. When in 330 CE they shifted their course southward, the lake dried up. Today, a thick salt crust with razor edges and needle-sharp spikes lies over a treacherous, thick morass. No animal can survive in this waterless wasteland, neither insect nor reptile, and should a bird stray into this desert it falls down and dies. North-west and east of the former lake rise two vast



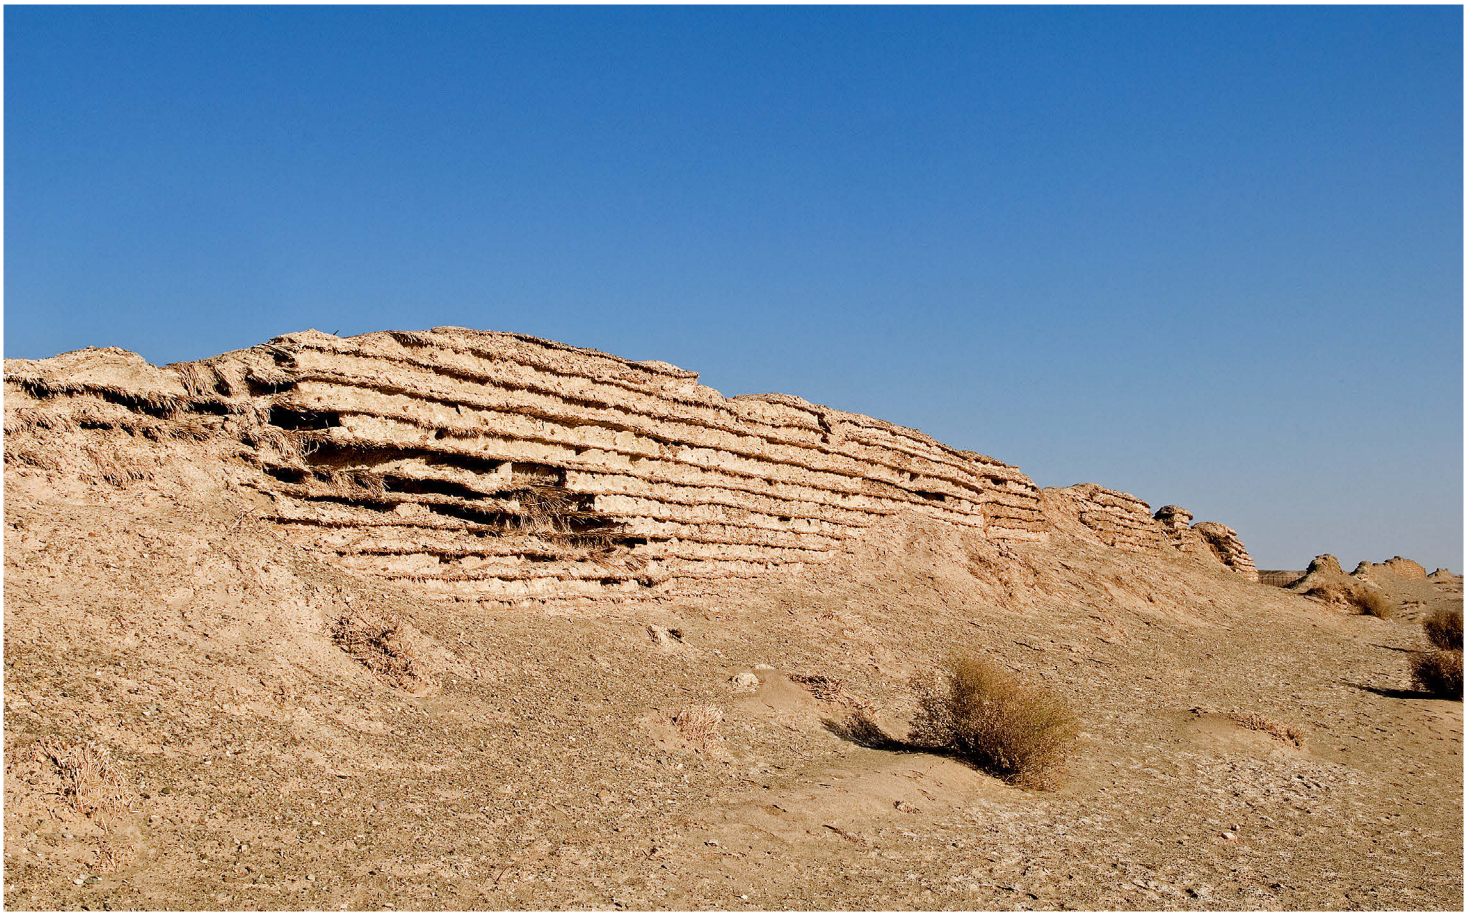
11. The Lop Desert, some 30 km east of the dried-up bed of the Tarim, south of the settlement of Alagan. The whitish silt deposits indicate an earlier river bed, behind which thickets of tamarisk and living poplars can be seen, suggesting an underground water source. Xinjiang, China.

fields of silt deposits, standing up to 30 metres high, called *yardangs*. These remind us that hundreds of thousands of years ago the Lop Nor was part of an inland sea that filled the whole of the Tarim Basin. When Sir Aurel Stein set foot in this wasteland in 1914, he wrote: 'As we left behind the withered and bleached fragments of the last dead tamarisk trunk lying on the soil, I felt that we had passed from the land of the dead into ground that never knew life.'[89]

General Zhao Ponu and his cavalry had to cross this barren desert with its close-set agglomerations of yardangs, called in ancient chronicles 'dragon cities' or 'white dragon hills'.[90] He took the king of Loulan prisoner before making his way north and capturing Jushi, which however would afterwards remain contested between China and the Xiongnu until 67 BCE. The Chinese advance convinced the still hesitant Wusun of China's power, whereupon they sent 1,000 choice war horses to the Chang'an as dowry for the alliance by marriage negotiated sometime between 108 and 105 BCE.[91] With the conquest of Loulan, the trade route and military road from Dunhuang through Loulan, Ruoqiang, Khotan and Kashgar to Fergana was open, and for the time being free of Xiongnu. In 104 BCE, General Li Guangli took this southern Silk Road through the Tarim Basin to reach Fergana, there to acquire 'horses that sweat blood'. Much weakened by their passage through the desert, the expedition could not, however, overcome the resistance of the expert horse breeders of Fergana and returned empty-handed to Yumen Guan, whose door they found closed to them. A return home was forbidden on pain of death. Two years later, Li Guangli returned to Fergana, now at the head of a much stronger force of 180,000 conscripts.[92] In view of this Chinese military superiority, the beleaguered leaders of the city cut off their king's head and sent it to Li Guangli with the message: 'If Han will not attack us, we will bring out all the fine horses; Han may choose what it likes. If Han does not listen to us, we will kill all the fine horses.'[93] General Li selected a few dozen of the best stallions and a further 3,000 horses of both sexes and returned home in 101 BCE. The Fergana horses were taller and more muscular than the ponies of northern China, with harder hooves that wore more slowly. They had been fed on the highly nutritious lucerne (alfalfa), which led to China adopting this forage crop from Fergana, together with the vine.[94] Li Guangli's campaign also made it clear to China's adversaries that Chinese armies were able to reach destinations in their territories which were thousands of kilometres away from Chang'an.

The political position of the small state of Loulan in outer east Central Asia remained precarious. It had thwarted Li Guangli's first expedition, and around 103 BCE General Renwen therefore led a punitive campaign against it. The embattled ruler of Loulan declared, 'When a small state lies between two great kingdoms, if it has not an alliance with both, it cannot be at rest',[95] and sent both China and the Xiongnu a son as hostage. Emperor Wudi then ordered the frontier fortifications to be extended west and north-west, from Yumen Guan to Loulan and then along the old course of the Tarim River through Yingpan and Korla as far as Kucha. Granaries such as He Zhang Chen (fig. 14) were set up at regular intervals along it. 'The government established . . . defence stations at various points from Dunhuang west to the Salt Swamp [Lake Lop Nor]. A force of several hundred agricultural soldiers was sent up to set a garrison at Luntu [Luntai at Bugur east of Kucha[96]], headed by an ambassador who saw to it that the fields were protected and stores of grain laid away to be used to supply the Han envoys who passed through on their way to foreign countries.'[97]

This construction was a gigantic achievement: the distance from Dunhuang to Kucha was more than 1,000 kilometres. It consisted at the Jade Gate first of a 3-metre-high and 60-kilometre-long wall, which Sir Aurel Stein called 'Chinese Limes';[98] then further west of watchtowers and forts built at varying distances up to Kucha. The large Han dynasty fortifications, first L.E. and L.A., and later L.K., L.L. (figs. 95f, 125) and Yingpan, were constructed in the same manner as the fortified wall west of Dunhuang, with layers of stamped silt alternating with thick bundles of tamarisk branches bound with raffia. This was either finished with a final layer of strong poplar branches laid horizontally, covered with a thick layer of silt, or two parallel rows of closely set, slim poplar trunks



12. The *limes* built by Emperor Han Wudi around 100 BCE as an extension of the Great Wall, a few kilometres west of the Jade Gate. This section of the pounded-earth wall, which was *ca.* 3 m high, extended over 60 km. It was followed by a series of watchtowers and forts at irregular intervals, which stretched as far as the Kucha Oasis, 1,000 km away. Gansu, China.

were rammed vertically into the wall and the space between them filled with silt. As was noted by Sir Aurel Stein (1862–1943), the pioneer of Xinjiang archaeology, this construction technique was highly resistant to erosion by the furious winds of the Lop Nor.[99] Foreshadowing the principle of reinforced concrete, the technique would remain in use for a millennium, being taken over not only by China's Tang dynasty (618–907 CE) but also by the Tibetans, who, with some interruptions, controlled the Tarim Basin from around 670 to around 850 CE. However, the Bronze Age fortified settlement of Sebier discovered by the present author in 2009, in the middle of the Taklamakan Desert, shows that this technique was by no means a Chinese invention, but was known as early as the second half of the second millennium BCE.[100]

In 78 BCE **Huyandi Chanyu** (r. 85–68 BCE) attempted to win back the Hexi Corridor, but his army under the command of the Wise King of the Left suffered an ignominious defeat.[101] The following year, the chanyu tried once again to end Chinese supremacy in outer east Central Asia. When the king of Loulan died in 77 BCE, he immediately sent home the crown prince, Angui, who had been living at his court as a hostage. On taking power, King Angui broke off diplomatic relations with China, and killed a number of Chinese envoys, prompting Emperor Zhaodi (r. 87–74 BCE) to send General Fu Jiezi to Loulan. By subterfuge, Fu Jiezi succeeded in killing King Angui, and then set on the throne his younger brother Weituqi, who had been brought up as a hostage at the Chinese court. As a symbol of this political change, Fu Jiezi renamed the state Shan-shan, allegedly at the wish of Weituqi, and moved the capital south-west to Yixun, the previous capital retaining the name of Loulan.[102] The location of the new capital Yixun with its Chinese garrison is still disputed, but it was probably not far from the present-day city of Ruoqiang or the ruins of Miran.[103]

In 71 BCE Huyandi Chanyu suffered another serious reverse when a quadruple coalition launched a coordinated attack on his already weakened empire from all four points of the compass. A joint Chinese and Wusun army first penetrated deep into the Xiongnu heartland, taking 40,000 prisoners and capturing several hundred thousand head of stock, and then a few months later the Dingling steppe horsemen attacked from the north, the Wuhuan from the east, China from the

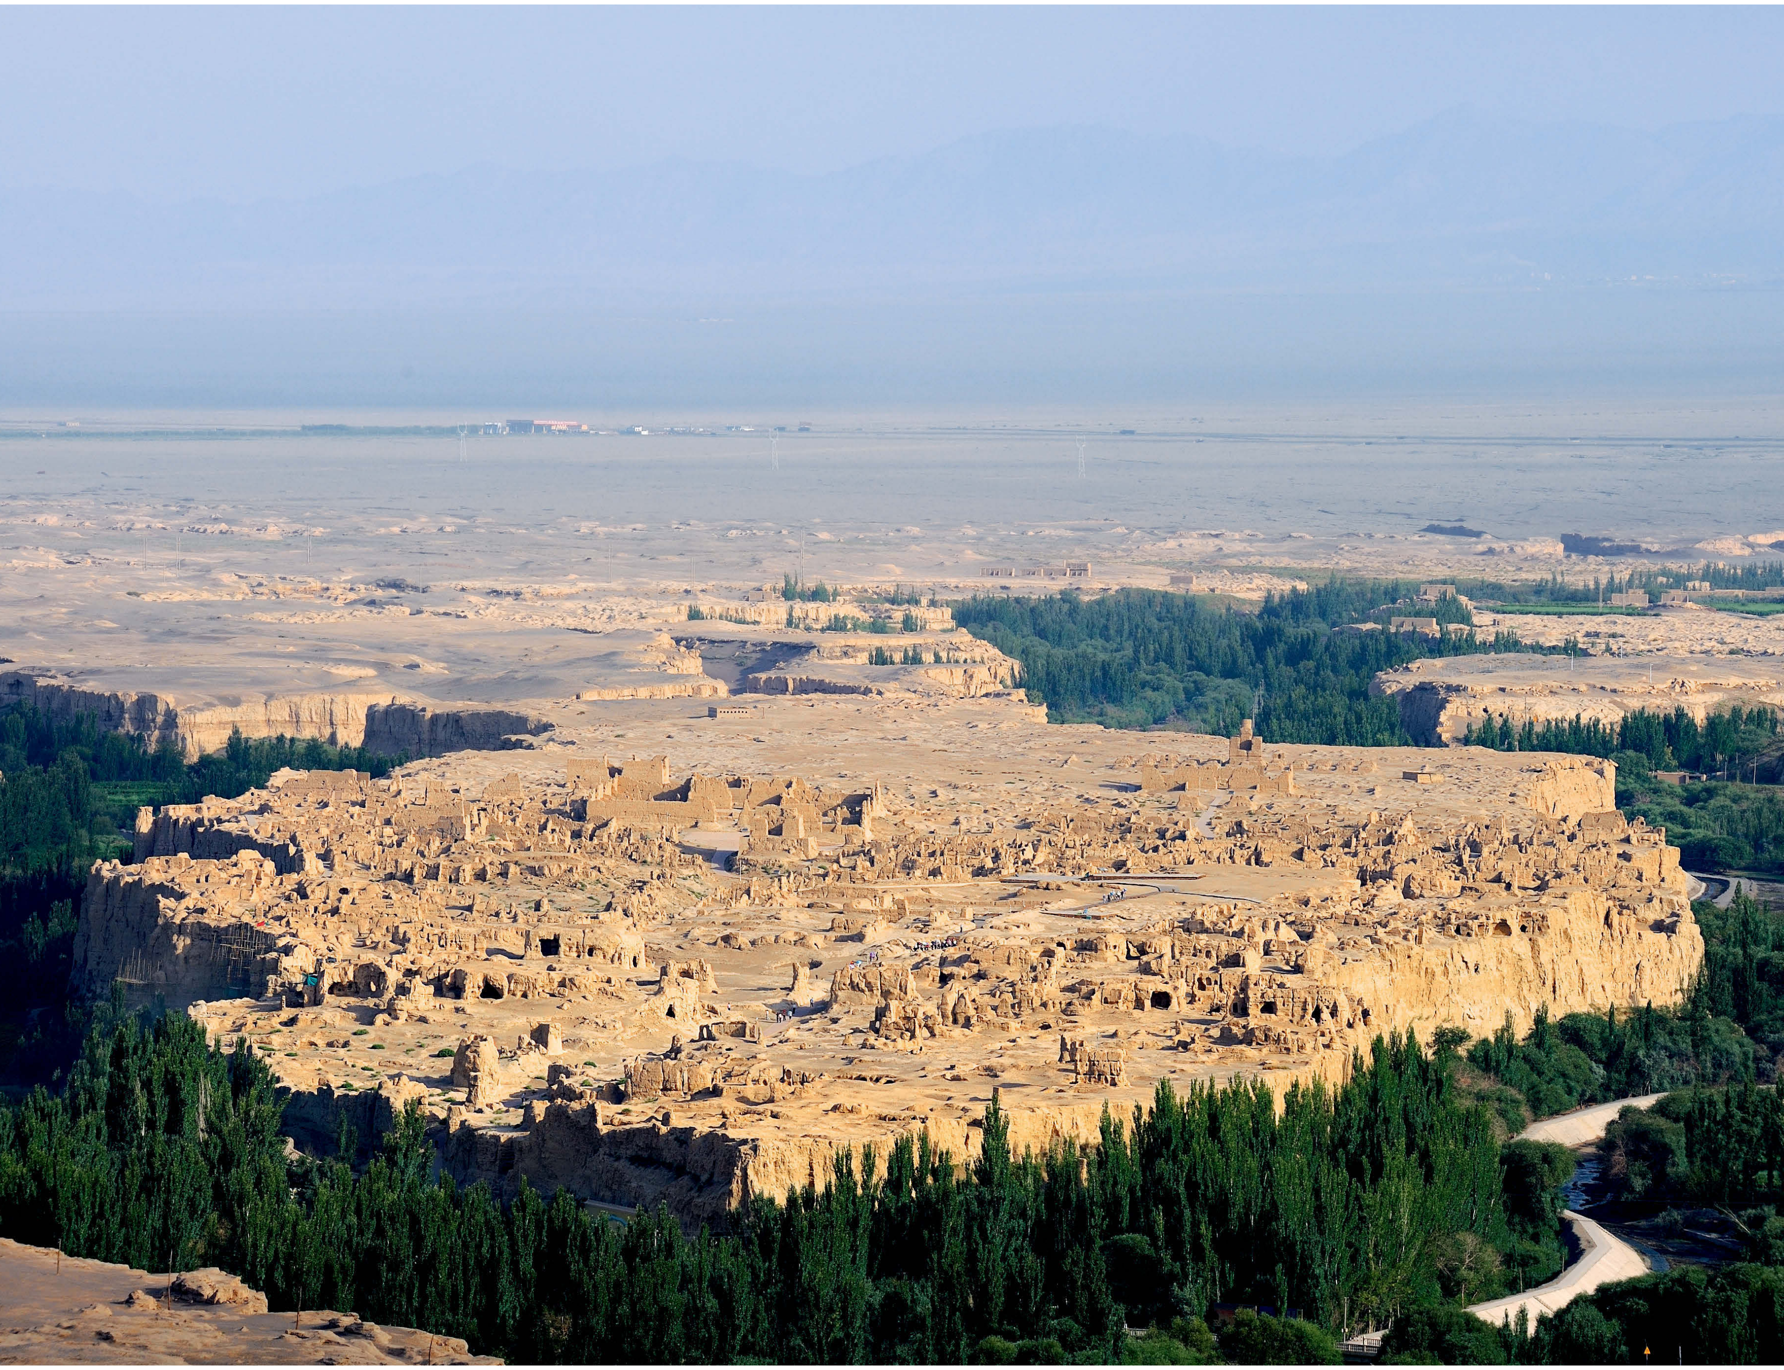
14. The complex of He Zhang Chen, which was built in the early 1st c. BCE, 13 km north-east of the Jade Gate, was 174 m long and served as a military camp and granary until the end of the 8th century.

south and the Wusun from the west.[104] This attack by a hostile tribal alliance was particularly dangerous for the Xiongnu, as they knew that while Chinese troops could not occupy the steppes, another horse people could well drive them out of their lands or keep them in subjection. As Yap remarks: 'Thus the mighty nomadic Empire had become a subject of prey by their former subjugated enemies, who were waiting like vultures going in for the kill.'[105] China, however, had become a master at inciting distant and weaker nomad confederations to make war on a nearer and more powerful steppe empire, a strategy that would also prove itself under the Tang dynasty, when it was deployed against the Turkic khaganates.

In the following years, too, the Xiongnu found themselves in a battle with China, this time for the strategically important town of Jushi, but equally without success. Following an initial defeat in 67 BCE, it was **Xuluquanqu Chanyu** (r. 68–60 BCE) who succeeded three years later in recapturing Jushi,[106] but on his death his widow intrigued to have her lover succeed him as **Woyanqudi Chanyu** (r. 60–58 BCE). This brought to an end the stability associated with the last ten more or less uncontested successions, and the new chanyu lacked the legitimacy of a consensus among the tribal chiefs. Faced with the brutality of the new ruler, Rizhu Wang, the sub-king of Jushi, surrendered to the commissioner Zheng Ji, whose residence lay east of Kucha, and Jushi thus fell to China.[107] Jushi was now divided into Nearer Jushi, with its capital at Jiaohe in the Turfan Oasis, and Further Jushi, ruled from Beiting, near Jimisar.[108] From 60 BCE to 450 CE, Jiaohe remained the political, economic and cultural centre of the extensive Turfan Oasis, which developed into a thriving outpost of Chinese culture. At the same time, Zheng Ji (in office 60–49 BCE), was appointed as the first protector-general of the 36 States of Xiyu, with his residence at Wulei, east of Kucha. The protector-general replaced the Xiongnu 'commander of the slaves'. He was directly responsible to the emperor, and according to the *Han Shu* enjoyed wide-ranging powers: 'If the situation was suitable for a peaceful settlement, he settled it peacefully; if it was suitable for launching an attack, he attacked.'[109] The strategic importance of Nearer Jushi was demonstrated in 48 BCE,



15. Jiaohe, the Chinese name of the city which the Uyghurs called Yarkhoto, means 'river's fork', for it stands on a 30-metre-high rock between two rivers. From the 1st century BCE to the 5th century CE, Jiaohe was the capital of the Turfan Oasis; in the background on the right is the Buddhist complex of 105 stupas. Xinjiang, China.

when an additional military commandant was appointed, with his headquarters at Gaochang, south-west of Jiaohe.[110] With this appointment of a powerful official responsible for the small states of the Western Regions, East Turkestan became for the first time a vassal of China. The Xiongnu Empire, however, had had its right arm cut off, in Zhang Qian's words, having lost essential inflows of tribute, taxes, foodstuffs and craft products.

1.7 The Collapse of the Xiongnu Steppe Empire

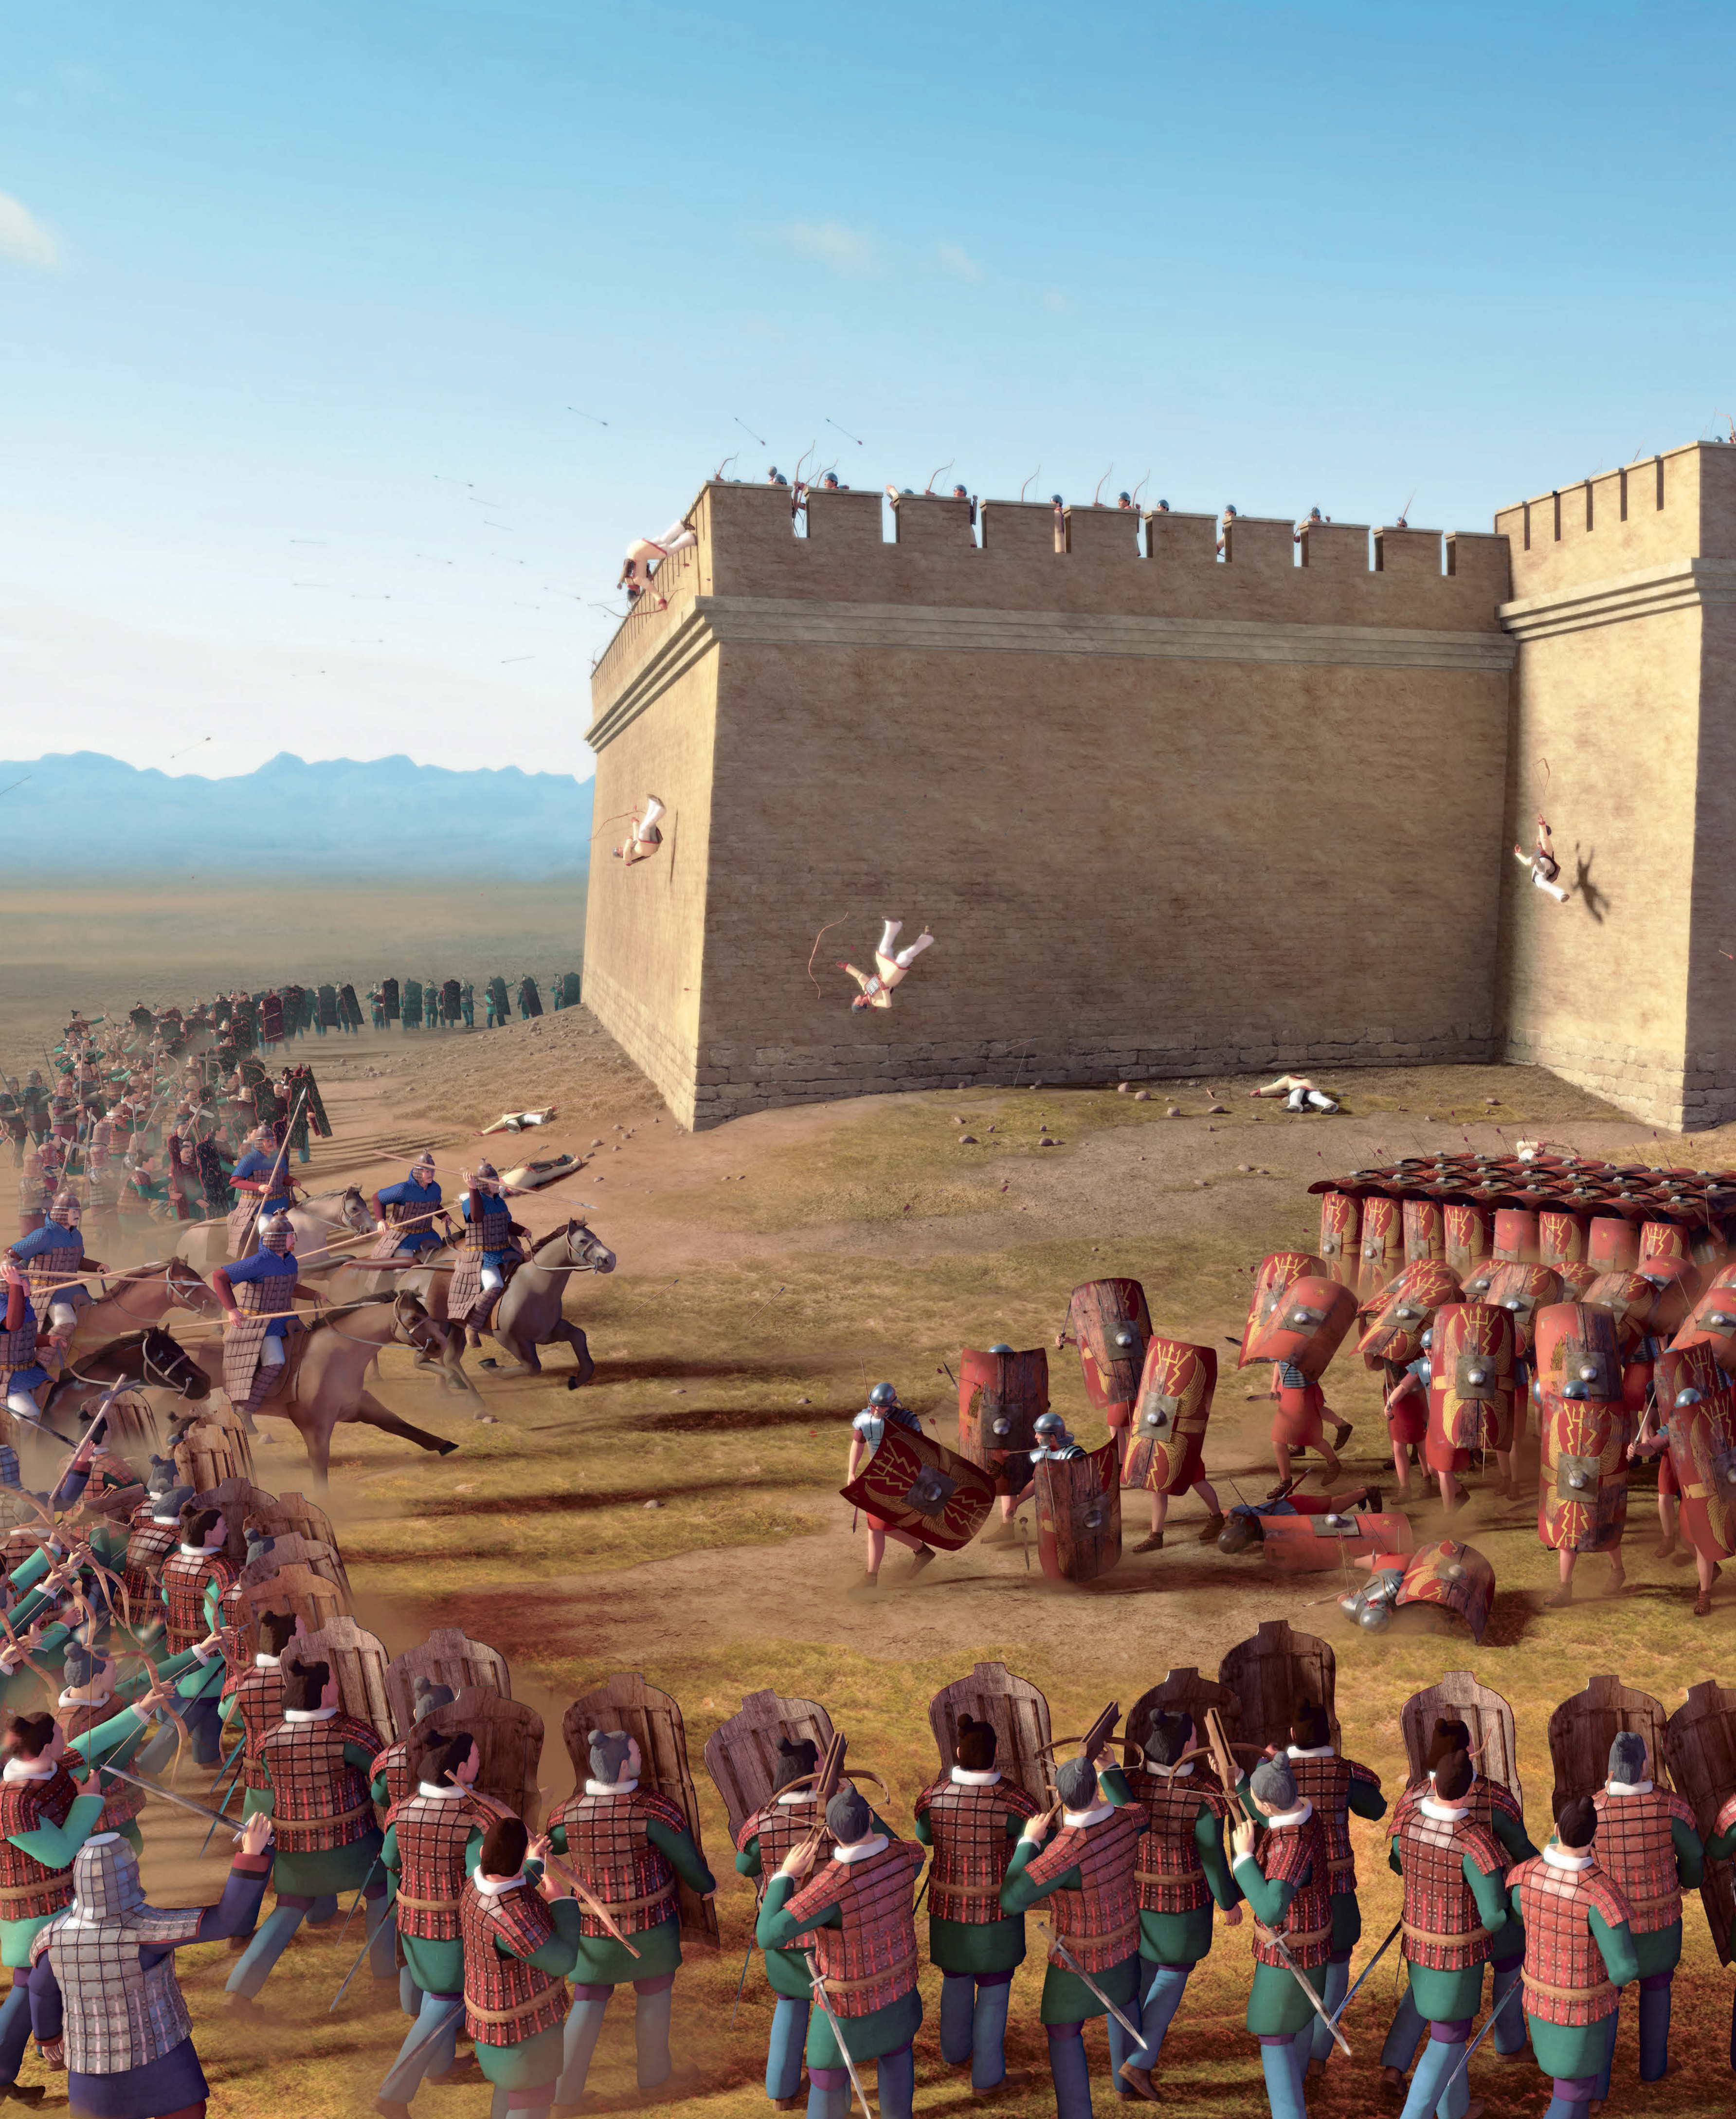
Woyanqudi Chanyu's boundless brutality hastened the break-up of the Xiongnu Empire, provoking an internal split. In 58 BCE, rebels chose one of Xuluquanqu's sons as **Huhanye Chanyu** (r. 58–31 BCE), and Woyanqudi Chanyu committed suicide. Rather than bringing peace, this led to civil war: in 57 BCE, five chanyus contended against each other, a year later three, and in 54 BCE only Huhanye and his older brother **Zizhi Guduhou Chanyu** (r. 56–36 BCE) remained.[111] China looked on fascinated at the spectacle of the self-destruction of the Xiongnu Empire. In 53 BCE, after suffering a grievous defeat at the hands of Zizhi, Huhanye asked to submit to China, and in 52–51 BCE he crossed the border with his troops and presented himself as a supplicant at Chang'an. Emperor Xuandi (r. 74–49 BCE) allowed him and his people to settle, as Chinese vassals, on infertile lands between the Gobi and the Ordos,[112] bringing about the division of the once mighty steppe empire of the Xiongnu into a still independent realm to the north of the Gobi, and a vassal state to its south.

Supported by China, Huhanye attacked his brother Zizhi in the north and drove him to the west, where he occupied part of Kangju in East Kazakhstan. Plagued by intrigue at court, China could not prevent Huhanye Chanyu's return to the north in 43 BCE where he stabilised the Xiongnu position to a certain extent. Zizhi Chanyu had in the meantime installed himself in a newly constructed fort on the river Talas, probably near today's city of Taraz, intended as the nucleus of a new empire. The Chinese protector-general Gan Yanshou and his deputy Chen Tang observed Zizhi's efforts with suspicion, fearing that a strengthened Zizhi might one day threaten the Western Regions. Chen Tang recommended a pre-emptive attack, but Gan Yanshou hesitated. When the latter fell ill in 36 BCE, Chen Tang counterfeited imperial marching orders and assembled an army of Chinese crossbowmen and allied cavalry units to march on Zizhi's fortress and lay siege to it. During the siege, the superiority of the Chinese crossbow companies became clear, as they advanced under the protection of large shields carried by foot soldiers and shot the defending bowmen down from the battlements. The fortress fell, and Zizhi became the only chanyu of the Xiongnu to die in battle against the Chinese.[113]

Fighting alongside the chanyu there may have been Roman legionaries. The *Zizhi tongjian* records: 'One hundred or so infantry warriors marched out [of the city] lining the flanks of the city-gate and commenced to display a fish-scale battle formation.'[114] This description accords with the Roman tortoise formation called the *testudo* (fig. 16). In this, the front row of a densely packed infantry detachment held their large, rectangular shields in front of them, while those behind held theirs overlapped above their heads in such a way as to protect themselves and those in front. Soldiers at the sides held their shields to right or left as the case might be, protecting the flanks too from enemy arrows. Only the Romans at that time used this formation, and the sinologist Homer Dubs believed that these soldiers of Zizhi's were Roman legionaries, who, as Pliny the Elder reports, were taken prisoner by the Parthians at the Battle of Carrhae (in south-east Turkey) in 53 BCE, and taken to Margiana (in modern Turkmenistan), probably to Merv.[115] It is conceivable that these captured legionaries escaped to neighbouring Kangju and there offered their services to Zizhi Chanyu (fig. 16).[116]

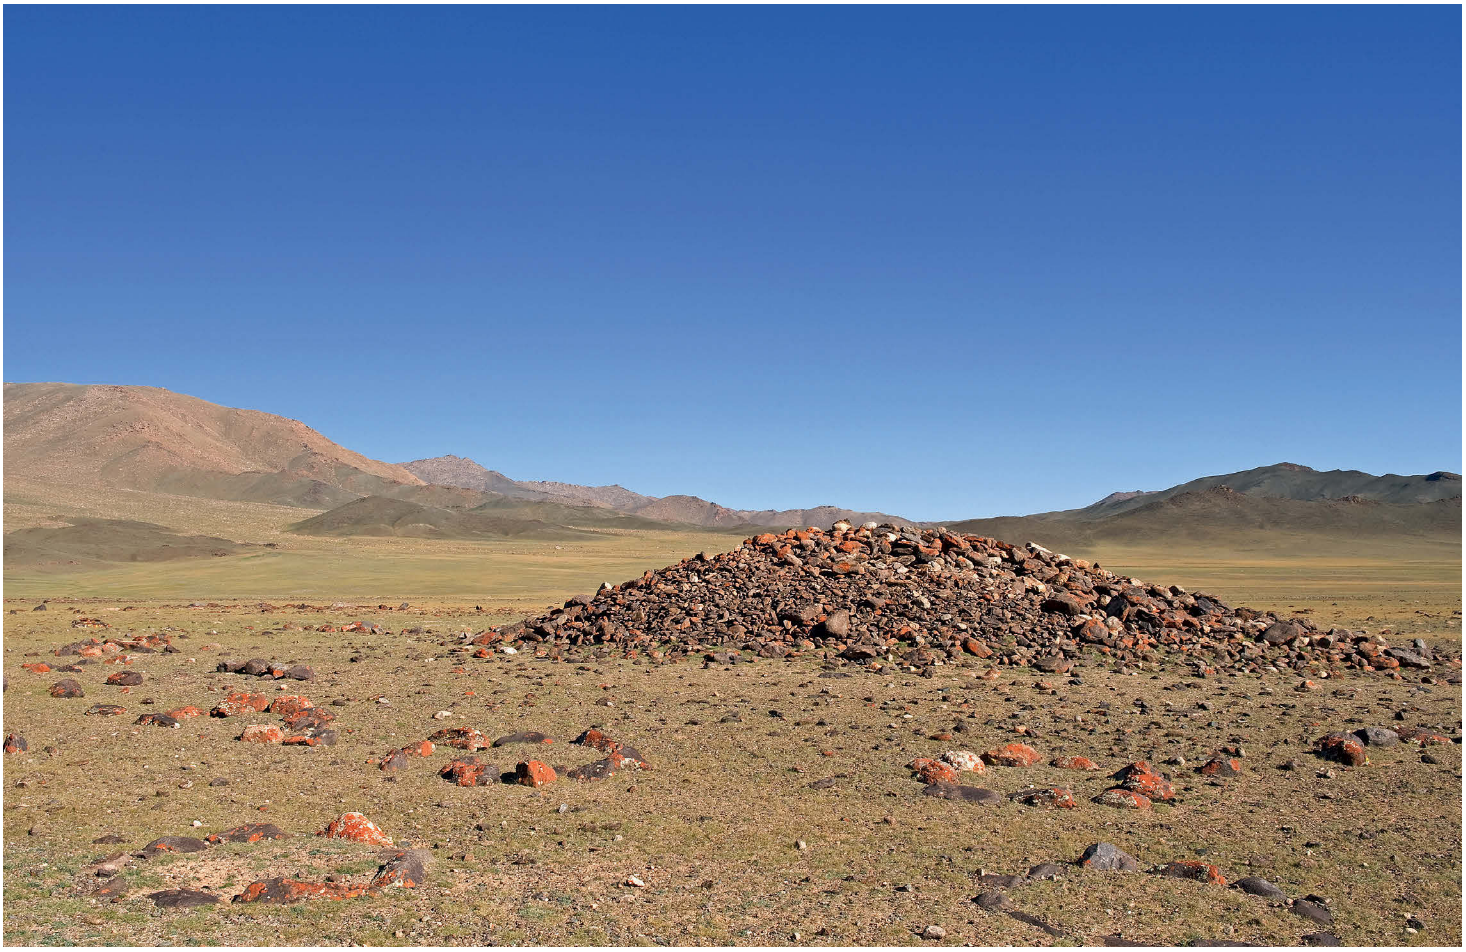
After Zizhi's death, the Chinese chronicles were concerned above all with the palace intrigues of the declining Western Han dynasty, which had effectively abandoned any active foreign policy, so that reports on the Xiongnu became scarce. It would appear that chanyus **Fuzhuleiruodi** (r. 31–20 BCE), **Souxieruodi** (r. 20–12 BCE), **Cheyaruodi** (r. 12–8 BCE) and **Wuzhuliuruodi** (r. 8 BCE–13 CE) succeeded in consolidating their shrunken empire. The last was able to take advantage of Chinese domestic troubles to throw off Chinese overlordship. For in 9 CE, power was seized in China by the minister Wang Mang, a relative of the imperial family (r. 9–23 CE) and founder and sole member of the short-lived Xin dynasty, which ended with his death. Imbued with the old Confucian values and principles of government and driven

▶ 16. Illustration based on historical records of the Chinese siege in 36 BCE of the fort of Zizhi Chanyu, which stood on the river Talas. The troops of the Xiongnu chanyu probably included a unit of Roman legionaries who, after being captured at the battle of Carrhae in 53 BCE, were transported to the east. The legionaries in this picture, in a tortoise formation, a *testudo*, are trying in vain to attack the Chinese archers and crossbowmen. The first line of the Chinese besiegers consists of a chain of infantrymen, who are holding large shields protecting the archers and crossbowmen shooting at the legionaries and the defenders on the battlements. At the left flank of the besiegers, armoured horsemen attack the legionaries with lances as soon as the *testudo* breaks up, and at the right flank armoured and helmeted infantrymen prepare to attack the legionaries with halberds. Behind the Chinese infantrymen stand their armoured officers.



by reforming zeal, Wang Mang attempted to change everything at once, but the simultaneous introduction of administrative, legal, economic, fiscal and foreign policy reforms led to chaos. In 10 CE he reduced the chanyu of the Xiongnu from an allied ruler to a mere vassal. Affronted, Wuzhuliuruodi Chanyu broke off diplomatic relations and began to raid Chinese frontier towns, provoking an immediate exodus to central China. Wuzhuliuruodi was succeeded by **Wuleiruodi Chanyu** (r. 13–18 CE), who continued the raids on northern China, especially when he found out that Wang Mang had in 12 CE ordered the public execution of his son Deng, who had been living at the Chinese court as a hostage.[117] Wuleiruodi's successor **Huduershidaogaoruodi Chanyu** (r. 18–46 CE) intensified the border conflict with China, which prompted Wang Mang, in the spring of 19 CE, to call up all those liable to military service in defence against the Xiongnu. As a result, the fields remained uncultivated and seed was not sown, which led to a catastrophic famine. Revolts broke out all across China, leading to the fall of Wang Mang in 23 CE.[118] The Western Regions, too, took advantage of the opportunity this offered. Yanqi (Karashahr), which until 60 BCE had traditionally maintained a close relationship with the Xiongnu, rose in rebellion in 13 CE, killing Protector-general Danjin. Three years later Wang Mang appointed Li Chong as the new protector-general of Xiyu, but the latter's army fell into a trap laid by Yanqi, and Li Chong took refuge in Kucha.[119] East Central Asia had freed itself of Chinese tutelage; only in 73 CE would China once more gain a foothold in Xiyu (East Turkestan).

The relative weakness of Guangwudi (r. 25–57 CE), first emperor of the Eastern Han dynasty (25–220 CE), brought Huduershidaogaoruodi Chanyu external peace, and he brought important Xiyu states back into the Xiongnu sphere of influence; domestically, however, his authority was not uncontested. On his death, a civil war broke out that led in 48 CE to an irreversible split between the Northern Xiongnu of **Punu Chanyu** (r. 47–?) and the



17. The necropolis in the Bodonch Gol valley, which extends over a length of more than 20 km, was used for over a millennium by the Scythians, the Xiongnu and the Göktürks. This picture shows the *khirigsuur* of a Scythian prince from the 6th–5th c. BCE with *ca.* 60 satellite tombs, which are arranged in concentric rings. The inner ring, which is intact, contains 26 satellite tombs, the outer one 15, of what were originally some 34 tombs. The total number of satellite tombs probably corresponded to the same number of horse sacrifices. Khovd Aimag, south-western Mongolia.

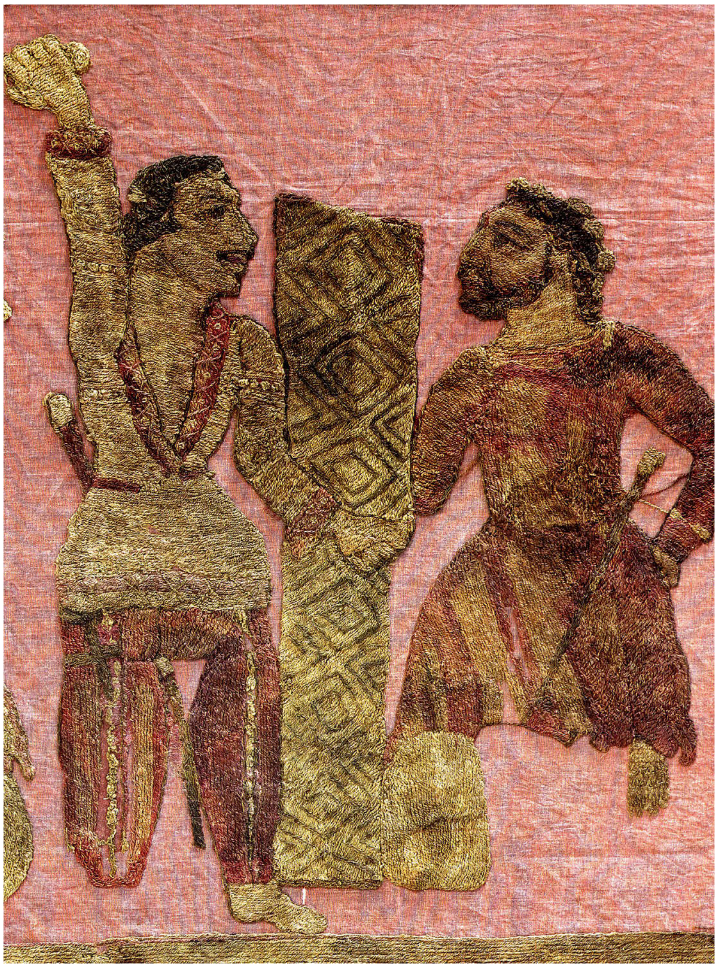
Southern Xiongnu of **Bi Chanyu** (r. 48–56). Plagued by famine and threatened by Punu Chanyu, in 50 CE Bi Chanyu submitted to Emperor Guangwudi, who settled him and his tribes in uninhabited north China, to form a kind of buffer state. The emperor at the same time compelled crop farmers from central China to move there as well, leading to the mixing of the two groups. Among the Southern Xiongnu, power now lay in the hands of a Chinese emissary, the chanyu retaining only a ceremonial role.[120] When the Southern Chanyu rebelled in 109 CE, a Chinese army forced his capitulation a few months later.[121] The last chanyu of all the Southern Xiongnu, Huchuquan by name, would be deposed in 215 CE by the Chinese warlord Cao Cao, who then divided the Southern Xiongnu into five separate tribes, but in the early fourth century the now highly sinified Xiongnu would invade China, toppling the Jin dynasty in 316 CE.[122]

Faced with increasing Northern Xiongnu military activity in north Gansu and Xiyu, Emperor Han Mingdi (r. 57–75), decided to drive the nomads out of all the Western Regions, a task accomplished by General Ban Chao between 73 and 91 CE.[123] In 87 CE the descendants of the Donghu, the Mongolic-speaking Xianbei, attacked the Northern Xiongnu, killing the chanyu and cutting off his head as a trophy before occupying a great part of Mongolia.[124] Two years later an alliance of Xianbei, Southern Xiongnu and Chinese troops under General Dou Xian inflicted a heavy defeat on **Bei Chanyu** (r. 88–?),[125] upon which 200,000 Xiongnu transferred their allegiance to the Xianbei. In 91 CE the chanyu suffered another defeat at the hands of Dou Xian's troops, who in 93 CE would go on to kill the last chanyu, **Yuchujian** (r. 91–93 CE).[126] The Central Asian steppe empire of the Xiongnu had ceased to exist. Some of the defeated Xiongnu tribes still roamed northern Xinjiang in the second century CE, others migrated west to the Wusun, or further towards the Aral Sea, and around 150 CE Ptolemy could refer to *Khunoi* on the Black Sea.[127] After another victory in 155 CE, over the Xiongnu who had remained in Mongolia, the Xianbei became the most powerful force in north-east Central Asia, a position they would succeed in maintaining until around 235 CE.[128]

1.8 Xiongnu Customs in Life and Death

The free Xiongnu lived mostly in yurts (in Mongolian, *ger*) with dome-shaped felt roofs, which either stood directly on the ground or were set on a wide cart drawn by oxen. The artisans who worked for the Xiongnu lived sometimes in settlements with houses dug into the ground, as can be seen at Ivolga and Boroo Gol. Rudenko, the Russian excavator of the Xiongnu necropolis of Noin Ula, was convinced that the Xiongnu also had log cabins whose walls were hung with artful rug-like hangings, matching the burial chambers there.[129] As in Mongolia today, the animals most important to the Xiongnu were horses, camels, cattle, sheep and goats, whose numbers they used to measure their wealth. The life of the nomadic stock breeder offered an excellent training for warfare. Hunts regularly organised by tribal leaders provided an opportunity to carry out coordinated manoeuvres in the field. Children learnt to



19. Embroidery fragment from kurgan no. 31 of Noin Ula, Töv Aimag, Mongolia, *ca.* 1st c. CE, which was researched in 2009. National Museum of Mongolia, Ulaan Baatar.

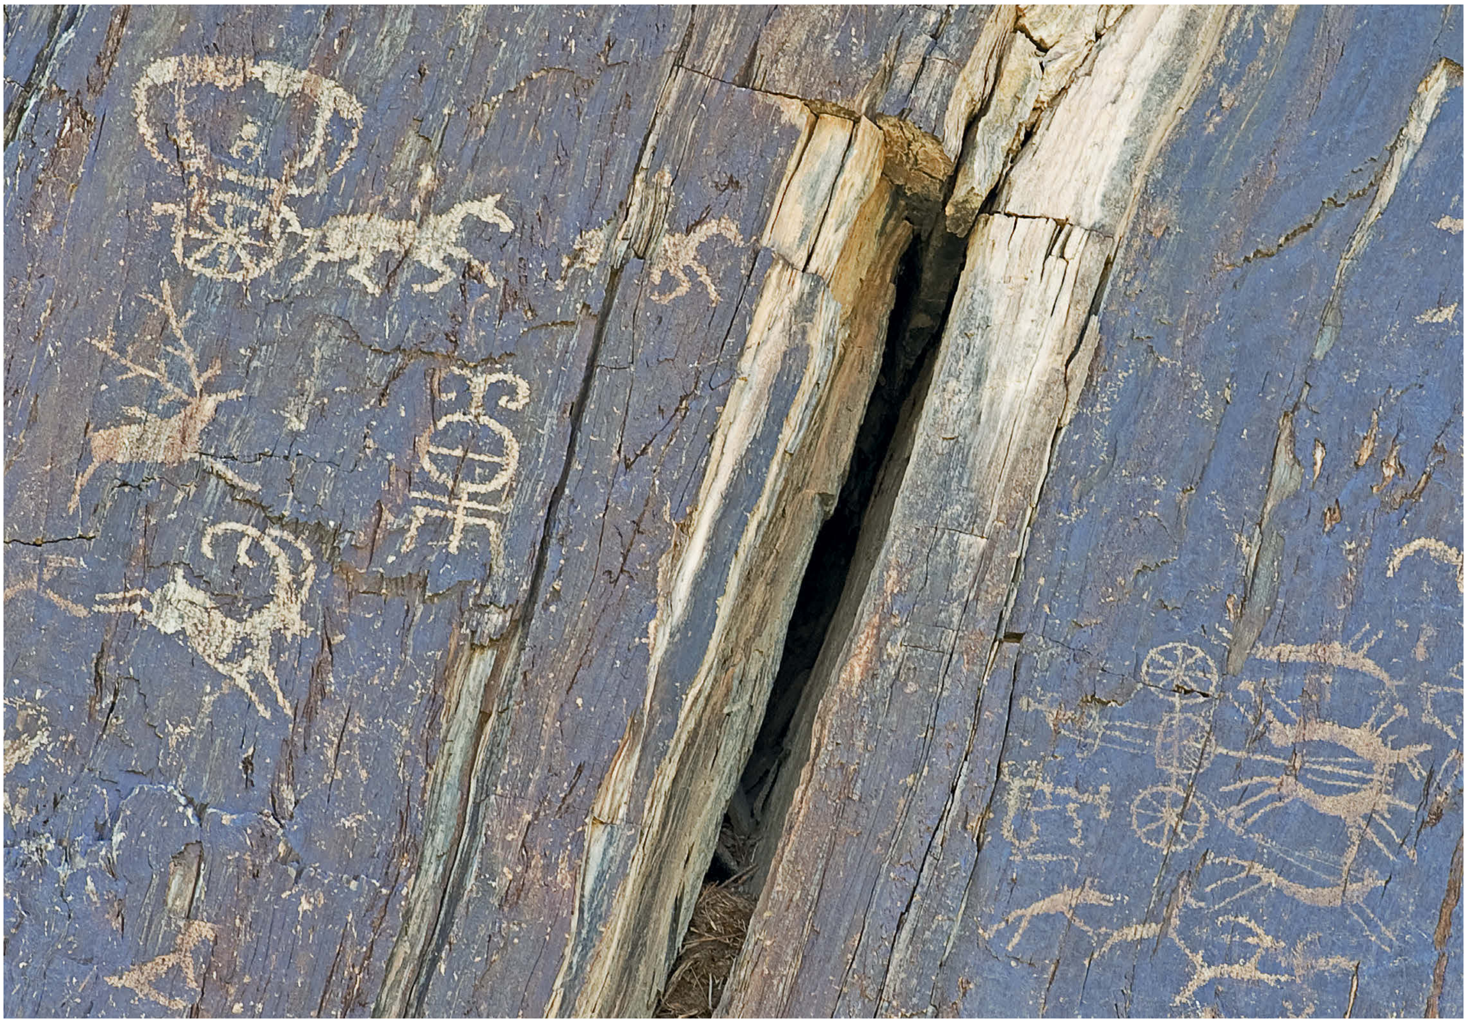
ride and to handle a bow at a young age, and if necessary women, too, would take up arms in defence of their property. Many Chinese who lived among the Xiongnu by their own choice appreciated the freedom of living according to rules strict but few and simple when compared to the extremely hierarchical bureaucracy and innumerable pointless rituals of life in China. Sima Qian described the laws of the Xiongnu as follows: 'Anyone who in ordinary times draws his sword a foot from the scabbard is condemned to death. Anyone convicted of theft has his property confiscated. Minor offenses are punished by flogging and major ones by death. No one is kept in jail awaiting a sentence longer than ten days, and the number of imprisoned men for the whole nation does not exceed a handful.'[130]

As Sima Qian tells us, the Xiongnu had no script,[131] but they had two forms of spiritual or religious practice. On the one hand was the soothsayer, who could divine the future from the cracks in the scorched shoulder blades of sheep, or from observing the stars before a battle. It is likely that all Xiongnu could use the services of soothsayers, who perhaps also had shamanic functions, such as communicating to humans the wishes or demands of the spirits. On the other hand, the most important national leaders would meet twice a year, in the first month at the chanyu's residence and in the fifth month at the capital Lungcheng, and sacrifice to their forefathers, to Heaven and Earth, and to the gods and spirits.[132] The sun and the moon were held in reverence by members of the elite and by the chanyu in particular: 'At dawn the Chanyu leaves his camp and makes obeisance to the sun as it rises, and in the evening he makes a similar obeisance to the moon.'[133] It is possible that the chanyu regarded himself as an incarnation of the most important divinities of heaven and earth. This is suggested by the way Laoshang Chanyu presents himself at the beginning of a letter to the Chinese emperor: 'The great Chanyu of the Xiongnu, born of Heaven and Earth and ordained by the sun and moon.'[134] These heavenly bodies' great importance to the Xiongnu is shown by the many grave finds of paired golden ornaments in the form of little suns and moons.[135]

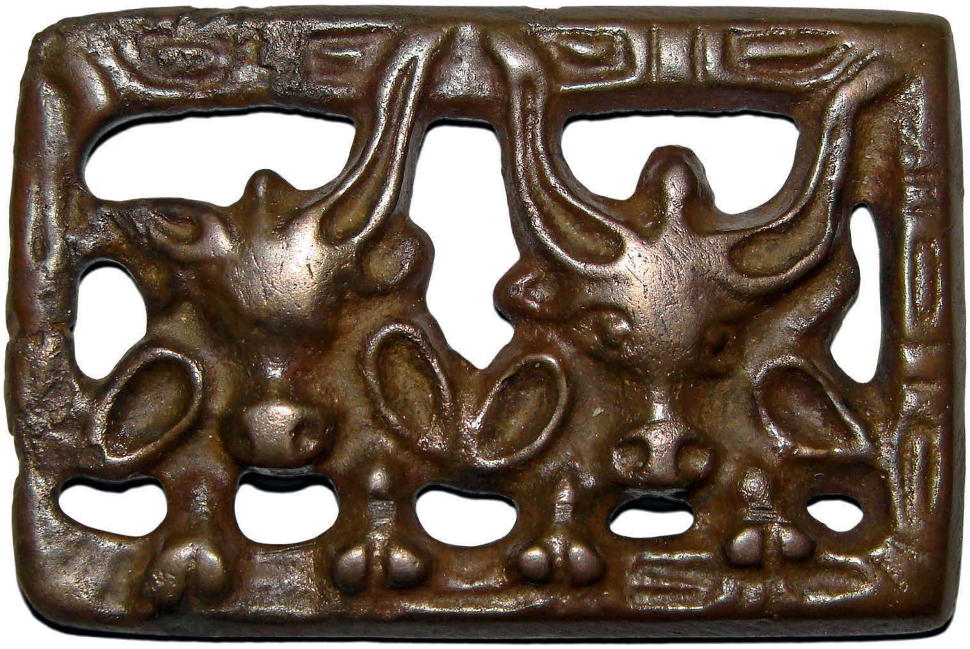
Of funerary rites the *Shiji* tells us that, 'In burials the Xiongnu use an inner and outer coffin, with accessories of gold, silver, clothing and fur, but they do not construct grave mounds. When a ruler dies, the ministers and concubines who were favoured by him and who are obliged to follow him in death often number in the hundreds or thousands.'[136] Archaeology has confirmed Sima Qian's description in every point but the last, as can be seen in the excavations of the two most important aristocratic necropoles. Dating from the first to second centuries CE, the necropolis of **Noin Ula** lies north-west of Ulaan Baatar, on the Selenge river; it was investigated in 1924–25 by Pyotr Kozlov, who excavated eight of the 212 kurgans, or tumuli.[137] In six princely tombs unfortunately already looted in antiquity, beneath a low, rectangular mound was a burial pit that narrowed stepwise to the bottom, like an inverted step-pyramid. At depths of 9 to 18 metres the archaeologists each time discovered two massive, nested chambers constructed of wooden timbers, the floor of the inner chamber being laid with rugs and the walls hung with decorative felt hangings.[138] The mode of construction of the nested timber chambers is continuous with the Pazyryk burial culture.[139] As the Mongolian archaeologist Gelegdorj Eregzen has observed, the Xiongnu took their tomb architecture from the Pazyryk culture and the form of the burial pit from China, while the superstructure was the Xiongnu's own.[140] A Chinese lacquer bowl with two inscriptions, one of them identifying its date of production as 2 BCE, makes it possible to date Kurgan No. 6 accordingly. As the bowl was made in an imperial workshop 'for the use of the Emperor', it may be supposed – following the hypothesis of the Soviet archaeologist Bernshtam – that it was a gift from Emperor Han Aidi (r. 7–1 BCE) to Wuzhuliuruodi Chanyu, who died in 13 CE.[141] Kurgan No. 6 is so far the only known example of a chanyu's tomb.

In spite of their fragility, Chinese painted lacquer caskets were not only found in tombs of the Xiongnu, but even in late Scythian graves in the Crimea, more than 7,000 kilometres away from their probable place of manufacture in the eastern Chinese province of Jiangsu. In several female burials in the necropolis of Ust'Al'ma in south-western Crimea, dating from the Late Scythian Culture (second century BCE – third century CE), small stacking lacquer caskets were discovered, which were probably manufactured in the Chinese principality of Guangling in today's province of Jiangsu between the last century BCE and the second century CE.[142]

Among the outstanding finds from Noin Ula are felt carpets with embroidered decoration showing a struggle between a yak and a horned lion, for example, or a lion and a deer, and also imported Greco-Bactrian textiles (figs. 18f). One of these depicts horsemen,[143] on another is a male head that is practically identical with a coin portrait of the early Kushan ruler Heraios (r. *ca.* 0–30 CE),[144] and on yet another a naked boy armed with an oval shield and a javelin.[145] The motif of an armed, naked boy can be found not only in the Hellenistic world but also on the kaftan on the fourth to fifth century CE Yingpan mummy discovered in the western Lop Desert.[146] A well-preserved embroidery discovered in 2006 in tomb 20 shows a seated prince surrounded by nine followers with Iranian or Bactrian facial features.[147] Also found in Noin Ula were gilded bronze buckles in a sophisticated animal style, the animals being depicted either geometrically simplified or in life-like forms, the



20. Rock engravings of Yamaan Uus, Khovd Aimag, Mongolia. On the cliffs consisting of multi-layered, chimney-like rock formations, petroglyphs from the Bronze Age (2400–900 BCE) to the Turkic period cover an area measuring 20 x 12 m. On the right a quadriga from the Bronze Age, shown in top view, on the left a single-axle Chinese ceremonial chariot with canopy. Such ceremonial chariots were often given as gifts by Chinese emperors to the chanyu or the princes of the Xiongnu, and were added to graves after being taken apart. The rock engravings of the Xiongnu are realistic rather than stylised.



21. Bronze belt buckle with two yaks from the Hunno-Scythian stone cist grave 5 in the necropolis of Terezin, Tuva, Russia, 1st c. BCE. The National Museum of the Republic of Tuva, Kizil.

latter showing Chinese influence. Also featured are human activities and animals symmetrically paired in heraldic fashion.

The second great Xiongnu necropolis is **Gol Mod**, south-west of Noin Ula in the province of Arkhangai, which has 393 graves, 128 of them aristocratic burials.[148] As in Noin Ula, a square or rectangular low stone platform covered the burial pit, which was shaped like a stepped pyramid, and a south-facing, trapezial low stone ramp led to the platform. Under the first layer of stone were often the skeletons of sacrificial horses and cattle, and under the second, which covered the burial chamber, were one or two dismantled two-wheeled chariots of high quality.[149] Within the burial chamber are two nested timber chambers, the wooden coffin in the inner one often being painted.[150] Single-axle chariots like the ones found here were for the most part official gifts from the Chinese emperor to the chanyu or the king of the Wusun, such as the *Han Shu* records on the occasion of the marriage of a Chinese princess to the king of the Wusun between 105 and 108 BCE.[151] The chanyu would then present these imperial gifts to his own most important chiefs. Just as in China the body of a fallen officer was carried away from the battlefield on a chariot, deceased Xiongnu nobles were conveyed to the grave on chariots.[152] In one of the two chariots from tomb T20, dateable to the last decade of the first century BCE, the archaeologists found in the spokes of the parasol which sheltered the passenger a blank piece of hemp and linen paper, one of the oldest papers in the world.[153] As for the human sacrifices described by Sima Qian, while the archaeologists found no bones of sacrificed followers or concubines in the elite graves, there were dozens of plaits of hair: symbols of self-mutilation and signs of mourning.[154] Such plaits have also been found at Noin Ula, and in the Iron Age tombs of Pazyryk (Altai), Besshatyr (East Kazakhstan) and Satma Mazar (Taklamakan Desert).[155] The monumental tombs are surrounded by smaller and simpler satellite tombs of young, armed men, and it is conceivable that these young warriors were obliged to accompany their chanyu into the afterlife.[156] While the elite graves had a rectangular or square, above-ground stone platform and a dromos, the smaller graves of the lesser nobility had a circular stone platform without dromos.[157]

In Tuva, in the north-west of the Xiongnu Empire, there developed two remarkable mixed burial types belonging to the **Hunno-Scythian culture**. Dating from the first century BCE, the **Terezin** cemetery stands on the southern shore of the Saian-Shusheskoe reservoir; investigations there began in 2006.[158] The archaeologists discovered many stone cist graves of East Scythian type, but the grave goods found in them belonged unambiguously to the material culture of the Xiongnu. Among them were the bone plaques of a Hun bow, and bronze buckles in both realistic and geometric animal style.[159] The second instance of a hybrid culture is the Hunno-Sarmatian cemetery at **Kokel**, dating from the second century BCE to the first century CE, ascribed to the **Surmak culture**. In this necropolis of 381 graves, which hold the remains of 475 people, the burials were made either in small wooden constructions, on boards or in log coffins. Some of the dead were mutilated on burial, or were found with boulders on their breast, possibly to prevent their return to the land of the living. Surprising was the discovery in men's graves of many wooden anthropomorphic and zoomorphic figures, together with wooden swords and daggers. These wooden weapons are signs of high social standing, as are the ceramic reproductions of Hunnish bronze kettles. Either iron objects were too precious to put in the grave alongside the deceased, or wood had a particular significance unknown to us.[160]

1.9 The Second Chinese Protectorate over the 'Western Regions'

If on their detachment from China in 13 CE the small states of the Tarim Basin believed they were again to enjoy independence, they were mistaken, for they soon fell back into the sphere of influence of the Xiongnu, who imposed heavy taxes on them. In 45 and 46 CE the states of Further Jushi (Beiting), Yanqi (Karashahr) and Shan-shan (in the south-west of the Tarim Basin) offered China their submission, asking for protection and even a protector-general. But Emperor Guangwudi (r. 25–57) was weak, and replied: 'We are not able, at the moment, to send out envoys and Imperial troops so . . . each kingdom [should seek help] as they please, wherever they can, to the east, west, south, or north.'[161] In 73 CE, however, Emperor Mingdi felt strong enough to try and deprive the Xiongnu of control over the Silk Road, turning east Central Asia into a theatre of war for China, the Xiongnu, the Kushans, who were advancing from northern India, and the small states who were battling between themselves. Chapter 47 (77) of the *Hou Han Shu* tells of the course of the war.

General Tou Ku first re-established peace and security in the Hexi Corridor, where the towns had been keeping their gates closed even during the day. His subordinate, the cavalry general Ban Chao (32–102) drove the Xiongnu out of their stronghold in Hami, which 'meant breaking their left [eastern] horn' in Xiyu.[162] The

22. A Xiongnu grave in the 4 km^2 necropolis of Aduun Chuluumi Belchik near Most, Khovd Aimag, Mongolia. As in the Bodonch Gol valley, tombs of Scythians, Xiongnu and Göktürks can be found side by side here.

Chinese troops then captured Nearer Jushi, installing Chen Mu as protector-general, after which Ban Chao advanced to Shan-shan with a small number of troops. He was, however, received in unfriendly fashion by the king, for the latter had a Xiongnu envoy with a large escort in residence. To his frightened companions Ban Chao declared that, 'He who ventures not into the tiger's lair will not catch the tiger cubs'. They then killed all the Xiongnu, and the following day Ban Chao took the Xiongnu envoy's head to the king of Shan-shan, who submitted immediately. As Ban Chao set off westward on the Southern Silk Road, riding to the mighty kingdom of Khotan, its ruler was overcome by great fear, and he immediately killed the great Xiongnu delegation that was staying at his court, and submitted to Ban Chao, who shortly afterward installed in Kashgar a new, more acceptable king.[163]

In 75 CE, however, the king of Yanqi killed the protector-general Chen Mu, and at the same time the ruler of Kucha attacked Ban Chao in Kashgar, whereupon, in 76 CE, the latter was recalled by Emperor Zhangdi (r. 75–88). Ban Chao, though, resisted the imperial order to evacuate the Western Regions, and clung on in Xiyu, using guerrilla tactics. After four years of fighting alone, Ban Chao proposed to the Emperor the idea of 'using barbarians against barbarians'.[164] Zhangdi agreed, and sent him 1,000 soldiers: some volunteers, some pardoned criminals. Over the next six years, Ban Chao, emerging as one of the most capable generals of the Eastern Han, succeeded in largely pacifying Xiyu and the Wusun, and in 91 CE Emperor Hedi (r. 88–105) appointed him protector-general.[165]

In the 80s, Ban Chao's diplomatic skills were particularly in demand. Zong, the king he had installed in Kashgar, first allied himself with Kangju, which had just contracted an alliance by marriage with the powerful Kushans of north India, and then, in 84 CE, rebelled against Ban Chao. Finding himself powerless in

23. Modern monument in honour of the general and protector-general Ban Chao (32–102 CE) in Kashgar, Xinjiang, China.

the face of Kangju's elite troops, the latter bribed the ruler of the Kushans, probably Vima Takto[166] (r. *ca*. 80–102?), with rich gifts of silk, to induce him to stop supporting the rebellious Zong. Three years later, with assistance from the Kushans, Ban Chao besieged Kashgar and mighty Kucha, and subjugated Yarkand. Yet in 88 CE, when the Kushans requested a Chinese princess in return for their help, Ban Chao stopped their richly laden mission and sent it back to north India. His honour offended, Vima Takto sent a 70,000-strong army across the Hindu Kush and through the Pamir mountains to attack Ban Chao, who quickly moved all grain stocks north-east. He used the nomads' strategy of pinprick attack and rapid retreat, allowing the enemy army to advance into the void and starve, until its leader, vice-king Xie, begged to be allowed to withdraw unmolested.[167] In this way Ban Chao prevented the Kushans from intervening in the affairs of Eastern Turkestan, where their ancestors had lived 250 years earlier, between 176 and 162 BCE. Although the Kushans' attempt to conquer Xiyu by military force had failed, their art and culture would soon become a lasting influence there, thanks to trade and the activity of Buddhist missionaries.

On the other hand, Ban Chao's attempt to make contact with the Roman Empire, the ultimate buyer of Chinese silks, ended in relative failure. After the rebellious Yanqi, too, had finally submitted in 94 CE, the three Silk Roads through the Tarim Basin were once again secure. The southern route led from Dunhuang to Loulan, branched south for the Shan-shan capital near Ruoqiang, and then continued westward to Khotan, Yarkand and Kashgar. From Loulan the middle route followed the old course of the Tarim river, through Yingpan to Korla, Kucha and Kashgar, while the northern one led from Anxi to Korla via Hami and Turfan, or, avoiding the often unsafe Hami, left from Dunhuang to cross the eastern outliers of the Tian Shan Mountains, passing through Beiting via Qigujing before continuing to Turfan and Korla.[168] Of these three caravan routes, the northern was the easiest, but it remained vulnerable to Xiongnu raids, while the southern was the hardest, due to its long stretches through waterless desert. The Chinese pilgrim monk Xuanzang described it in connection with his return from India in 644 CE, noting that, 'There was no path, and wayfarers had to look for human and animal skeletons as road signs when they travelled'.[169] Leaving the choice of route aside, no private trading caravans travelled along the complete trade route; the pack animals were often exchanged, and the goods were temporarily kept in caravanserais or larger monasteries. It was different for the many envoys in Central Asia who under the pretext of bringing tribute to China actively conducted trade at their destinations of Chang'an or Luoyang. These semi-official caravans were often travelling for thousands of kilometres with their 'gifts' and the goods that they had traded them for in China. In this context, around 25 BCE the imperial adviser Du Qin cautioned against receiving a group of envoys from Jibin in north-west India: 'There are no members of the royal family or noblemen among those who bring the gifts; the latter are all merchants of low origin. They wish to exchange their goods and to conduct trade, under the pretext of presenting gifts.'[170]

In 97 CE Ban Chao sent the administrator Gan Ying in Xuanzang's footsteps, as it were, his mission being to find the Roman Empire, in Chinese called *Da Qin*. Through making direct contact with Rome, Ban Chao hoped to break the Parthian monopoly on trade by land by finding alternative routes, whether through the northern steppes or through an extension of maritime trade.[171] Gan Ying reached what is today the Iranian province of Khuzestan at the head of the Persian Gulf, where he allowed himself to be discouraged by the Parthians, as the *Hou Han Shu* reports: 'The ocean is huge. Those making the round trip can do it in three months if the winds are favourable. However, if you encounter winds that delay you, it can take two years . . . The vast ocean urges men to think of their country, and get homesick, and some die.'[172] The Parthians had deliberately deceived him, for there was a direct land route to Da Qin, from Ecbatana (Hamadan) through Ctesiphon (Baghdad) to the Roman city of Antioch. Their wiles were successful, as Gan Ying gave up and turned back. Direct contact between trade partners China and Rome would be established only 70 years later, when in the reign of Marcus Aurelius (r. 161–180) a Roman trade delegation landed on the coast of Vietnam and made its way to the Imperial Court. They probably had no official accreditation from Marcus Aurelius, and the gifts they brought with them were judged too ordinary: 'This was the very first time there was [direct] communication [between the two countries]. The tribute brought was neither precious nor rare, therefore raising suspicions that the accounts [of Da Qin] might have been exaggerated.'[173] The *Hou Han Shu*'s undertone of criticism of the Chinese government for having spurned the Roman delegation is unmistakeable here. For in those days, the opening of a direct sea route to Rome would have been of great advantage to China, as it had again lost control of the Western Regions.

In 95 CE Ban Chao made a remarkable foray into south-east Central Asia. From Khotan he crossed the Pamir Mountains, called in Chinese *Congling*, the 'Onion Mountains', and reached the fearsome *Xuandu*, the 'hanging passages' of the Karakorum

Mountains, in the upper Hunza Valley.[174] Perched high above the raging mountain torrent, and impassable by pack animals, the path consisted of 40- to 50-centimetre-wide wooden planks, or flat stones, laid loose on wooden supports driven into the cliff face. A fall meant certain death. Despite its dangers, this route from Tashkurgan in the Pamirs to Hunza and Gilgit in the Karakorum was one of the most important of the Silk Roads connecting the Tarim Basin to north India, as it was not only the shortest and fastest, but also almost snow-free – the 'Xuandu Route' was the only all-year link between the Western Regions and the Indus Valley and, beyond that, the Indian Ocean ports.

In 102 Ban Chao asked to be allowed to retire, and died on his return to Luoyang. His successor Ren Shang, however, was arrogant and not up to the job. After the rebellions in Xiyu in 106, which saw China lose all the territories north-west of Dunhuang to some Xiongnu tribes and suffer defeats at the hands of the Qiang of east Tibet, Ren Shang was executed in 119.[175] In 123, two decades after Ban Chao's departure from Xiyu, his son Ban Yong went back to Lukchun, east of Turfan, to drive out the Xiongnu who remained there. Within four years, he had succeeded in winning acknowledgement of China's supremacy from the *36 States*[176] of the West. Chenpan, the king of Kashgar whom the Kushans had installed by military force, also submitted, thereby putting paid to the Kushans' renewed attempt to gain a foothold in Kashgar.[177] In that same year of 127, Ban Yong was recalled. Over the following decades, China was able to maintain a certain supremacy over the Western Regions, until in 175 it withdrew its administrators and its soldiers, and ten years later even gave up Gansu.[178] It would be another 500 years before China once again had a presence in east Central Asia.

24. The Jeti Oguz valley south of Karakol in eastern Kyrgyzstan was probably the base of the 'Greater Kunmi', the main kings of the Wusun in the 1st c. BCE. The Chinese *Han Shu* called the royal court Chigu, meaning 'red valley'.[1]

2. The Wusun

A small tribal confederation, the Wusun lived in north-west Gansu and on the northern side of the Tian Shan Mountains. If, as seems very likely, they spoke an Iranian language, the Wusun would have belonged to the Saka cultural sphere.[179] When the neighbouring Yuezhi drove them from their lands in 173 BCE, killing their king **Nantoumi** (d. 173 BCE), they fled to the Xiongnu and asked for their protection. Laoshang Chanyu took them into his confederation, giving Nantoumi's son **Lieqiaomi** (r. ?–*ca.* 105 BCE), who bore the title of kunmo, command over the Wusun warriors. Some 40 years later, in 133 or 132 BCE, the kunmo was given a chance to avenge his father and find a new land of their own for his people: defeated by Laoshang in 162 BCE, the Yuezhi had for the most part fled westward, to the lush pastures of the Ili Valley and the lands bordering Lake Issyk Kul, driving south in turn the Saka who had lived there.[180] The kunmo 'asked permission of the Chanyu [Junchen] to avenge his father's wrongs. Going west he attacked and defeated the Da Yuezhi, who again fled south-west.'[181] The Wusun, who had a relatively small but highly effective army of mounted bowmen, settled on their new territory, incorporating the remaining Saka and Yuezhi, and declared independence from the chanyu. And as Modu had done, Lieqiaomi divided army and people into right and left halves.

As Zhang Qian reports, not long after 119 BCE there developed a power struggle between one of the kunmo's sons, rich in military experience, and Cenzou, the youthful son of the recently deceased crown prince. To avoid the prospect of civil war, the kunmo assigned separate regions to each of them, together with the associated military units, himself retaining overall command.[182] When some

time after 108 BCE Lieqiaomi was given the Chinese princess Xijun for a wife, the chanyu immediately sent him a Xiongnu princess. In a careful political balancing act, the kunmo appointed Xijun 'Lady of the Right', and his Xiongnu wife 'Lady of the Left', the latter enjoying precedence. A little later, he gave Xijun to his grandson Cenzou, who soon succeeded him as kunmo, taking the name of **Junxumi** (r. *ca.* 105–?BCE). Xijun, however, had died not long before, prompting China to send Junxumi the princess Jieyou as a replacement. Junxumi was succeeded by his nephew **Wenguimi** (r. before 74–*ca.* 60 BCE), whom the Chinese called 'the Fat King'. In accordance with the practice of levirate marriage that prevailed among the nomadic horse peoples, which generally obliged a widow to marry the brother or a non-consanguineous son of her deceased husband, Jieyou then married the new ruler, Wenguimi. When in 74 BCE the Xiongnu and the state of Jushi came together to attack the Wusun, she asked the Chinese emperor for military assistance, leading to the two successful Chinese-Wusun joint campaigns of 71 BCE.[183]

When Wenguimi died around 60 BCE, Yuanguimi, the crown prince designated four years earlier, failed to enforce his claim, the chiefs raising to the throne instead Junxumi's son **Nimi** (r. *ca.* 60–55), whose mother was a Xiongnu. He was known to the Chinese as 'the Mad King'.[184] Once again the Chinese princess Jieyou had to marry the new ruler. However, as the Chinese government was incensed by the choice of Nimi as king of the Wusun, she sought to intervene in the domestic politics of her adoptive people, plotting with a Chinese envoy to have her third husband killed at a banquet. The attack miscarried, Nimi escaping with a wound, but new power struggles would soon break out that would lead to a division of the Wusun. In 55 BCE, Wenguimi's son **Wujiutu** (r. 55–53 BCE) killed Nimi and declared himself king, leading China to assemble an expeditionary force in Dunhuang. As the wife of Wusun's sub-king of the Right was a literate and diplomatically experienced Chinese woman named Feng Liao, Emperor Xuandi summoned her to him so that they might consult together. Accompanied by an escort and bearing official emblems of authority, Lady Feng then returned to the principal royal residence in Wusun, where she announced the division of the confederation: **Yuanguimi** (r. 53–51 BCE) was declared the 'Greater King', with 60,000 households under him, and **Wujiutu** (r. 53–?) the 'Lesser King', with 40,000.[185]

The division of the Wusun into two kingdoms brought not peace but a succession of weak rulers, assassinations, and costly Chinese interventions. The *Hou Han Shu* concludes the section on the Wusun with the resigned observation, 'From the time Wusun was split between the two Kunmi, Han suffered sorrows and troubles and had no years of tranquillity'.[186] That China exerted a strong cultural as well as political influence on the Wusun is evidenced in an exemplary manner by the famous gold diadem of Kargaly, which depicts an enchanted world of Daoist immortals.[187] For the *Hou Han Shu* the simultaneous visit of Great Kunmo Ichimi and Chanyu Wuzhuliuruodi to the court of Emperor Han Aidi (r. 7–1 BCE) in 1 BCE was 'a magnificent achievement',[188] even though China had to shower both rulers, nominally Chinese vassals, with outrageously costly gifts.[189] For the chanyu in particular, the presentation of symbolic tribute was such a profitable business that he would continually insist on being 'allowed' to pay homage to the emperor, while the Chinese court would be horror-struck by the financial implications. As regards the Wusun, the Chinese sources generally fall silent with the end of the Western Han. The Xianbei tribal confederation inflicted three heavy defeats on them in the mid-second century CE and in 318, after which they withdrew to the Tian Shan Mountains, and in the mid-fifth century were defeated by the Hephthalites.

3. The Parthians: An Empire between East and West

As recounted in volume I,[190] the Greek satraps of Parthia and Bactria – Andragoras (d. *ca.* 238 BCE) and Diodotus (*ca.* 285–235 BCE) – took advantage of the Near Eastern wars of Seleucid ruler Antiochus II (r. 261–246 BCE) and the latter's death in 246 BCE to assert their independence. At the same time, however, they found themselves facing attack by Saka horse nomads from the north. Mentioned by Strabo,[191] **Arsaces** (d. 218 or 211 BCE) was the leader of the semi-nomadic Parni tribe of equestrian people; he broke away from the Dahae confederation of Saka tribes, who lived east and south-east of the Aral Sea, to first attack Diodotus in Bactria: an attack which was successfully repelled. Arsaces then turned west to conquer Parthia, killing its ruler Andragoras around 238 BCE and then adopting the name of that province for the realm that he and his successors, the Arsacid dynasty,[192] would now govern in southern Turkmenistan and eastern Iran. The Parthian calendar began its reckoning of years in 247 BCE, presumably to coincide with the beginning of Arsaces' reign.[193] Some ten years later Seleucus II (r. 246–225 BCE) marched into Central Asia to recover the seceded satrapies. Arsaces first retreated, then formed an alliance with Saka tribes and the Greco-Bactrian king Diodotus II before going on either to defeat the already homeward-marching Seleucus II, as Justin tells, or to drive out of Parthia the occupying troops he had left behind.[194]

After stabilising his rule in the west, the Seleucid Antiochus III. (r. 223–187 BCE) embarked in 209 BCE on a new attempt to win back Parthia and Greco-Bactria. Advancing eastward with a strong army, he took the Parthian capital of Hecatompylos, not far from the south-eastern end of the Caspian Sea, whose name means 'city of a hundred gates', forcing **Arsaces II** (r. 218 or 211–*ca.* 191 BCE) to recognise Seleucid suzerainty.[195] Continuing his Central Asian campaign, Antiochus succeeded in defeating Euthydemus's cavalry but failed to capture the strongly fortified Bactrian capital Zariaspa (Balkh) in northern Afghanistan. When, after a two-year siege (208–206 BCE), Euthydemus threatened to form an alliance with the Saka nomads who lived on the northern border, Antiochus relinquished his claims and turned south to conquer Paropamisadae.[196] As Arsaces II's successor **Phriapatios** (r. *ca.* 191–176 BCE) appears to have struck no coin of his own, it is likely that Parthia remained a Seleucid vassal for more than 30 years. Phriapatios's own successor, his eldest son **Phraates I** (r. 176–171 BCE), threw off Seleucid overlordship and began the advance on the west that his brother and successor **Mithridates I** (r. 171–139 BCE) would bring to an end with the conquest of the Seleucid capital of Seleucia, not far from today's Baghdad, and with it the whole of Mesopotamia.[197]

Mithridates also extended the Parthian Empire eastward, taking advantage of the departure of the Bactrian king Eucratides I (r. 171/70–145 BCE) on an expedition south of the Hindu Kush to capture the satrapies called Turiva and Aspionus by Strabo – which most probably included the important trading city of Herat. Then, shortly before Eucratides' death, Mithridates also robbed him of Margiana and the city of Merv.[198] By taking possession of the important cities of Herat and Merv, Mithridates had laid the foundation for control of the eminently important middle section of two of the overland Silk Roads, namely those from China and from northern India to Rome: control of these trade routes provided the economic basis for the power and wealth of the Parthian Empire. The delegation that Zhang Qian sent to Mithridates II in the years between 119 and 115 BCE would lead the Parthian king to realise the immense economic potential implied by control over the trade route and the power to tax the goods that travelled it.[199] As the *Hou Han Shu* reports, Parthian emissaries later arrived at the imperial court, as for example in the year 87 CE: 'This kingdom [Parthia] sent an envoy to offer lions and fuba [Persian gazelle]. The fuba looks like a female unicorn but it has no horn.'[200] Lions, gazelles and the ostrich or 'Anxi bird' were valued as lucky 'creatures of the West'. Mithridates I also went on to contrive the downfall of Eucratides, still a dangerous military opponent, probably helping the latter's arch-enemy, the son of Demetrius I whom Eucratides had overthrown and killed in battle, to ambush and kill the unsuspecting king.[201] Set upon the throne of Bactria by Mithridates, Demetrius II (r. 145–?) would very soon be removed by Heliocles (r. *ca.* 145–130 BCE).

With the conquest of Mesopotamia, the Parthian Empire's centre of gravity moved westward, not least because its first capital, Nisa in the Parthian heartland, was increasingly threatened by the attacks of savage Saka horse nomads. Three factors led the Parthians to shift their strategic focus west: firstly the death of Antiochus VII Sidetes, the last great Seleucid ruler, who fell in battle against **Phraates II** (r. 138–128 BCE) in 129 BCE, which saw the Seleucid Empire reduced to its Syrian territories; secondly, Parthian intervention in Armenian politics; and thirdly, Roman expansion to the east. The advancing Roman border soon halted on the Euphrates, the Parthian cavalry with its armoured horse archers inflicting many grievous reverses on Roman forces, most spectacularly in 53 BCE at Carrhae, when the legions of Crassus – the ally of Caesar and Pompey in the First Triumvirate – were lured into the desert and crushingly defeated.

Regardless of this turn to the west, nomadic migrations triggered in 133/32 BCE by the Wusun's expulsion of the Yuezhi from the Ili Valley and the Issyk Kul region made the Parthian Empire's Central Asian 'backyard' a perpetual trouble spot.[202] For the Yuezhi then went to Bactria, pushing the Saka who lived there further south, where beyond the Hindu Kush they encountered the Indo-Greek Kingdom, which turned them west towards Herat in the eastern Parthian Empire.[203] Some of these Saka horsemen were recruited as mercenaries by Phraates II, to fight against Antiochus VII when he invaded Media. When the latter was killed in a chance encounter, Phraates wanted to dismiss without compensation the mercenaries he no longer required, whereupon the Saka set about looting Media, and in 128 BCE they defeated and killed the Parthian king in battle.[204] His successor **Artabanus I** (r. 128–123 BCE) also fell in battle against the Saka, struck in the arm by a poisoned arrow.[205] Only **Mithridates II** (r. 123–88/87 BCE) succeeded in dealing with the Saka, forcing some out into the Indus Valley, and resettling others in Sakastan, today's Sistan.[206] The minor Saka principalities established there remained within the Parthian sphere of influence, some of them becoming Parthian vassals. That the Saka continued to play an important role in the Empire was made evident when in 78 BCE they raised to the throne

of Parthia the Arsacid prince **Sanatruces** (r. 78/77–70 BCE), who had lived among them.[207]

'The kingdoms of Parthia are eighteen in all': so wrote Pliny the Elder of Rome's eastern neighbour.[208] Parthia was never as centralised as the Achaemenid Empire that preceded it or the Sassanid Empire that followed, being a typical feudal state. Some provinces were governed by semi-autonomous local dynasties, their rulers styling themselves kings and striking some coins of their own. Among them was the 'King of Kings, the great Sanabares', who ruled as a rival king in Merv in the second half of the first century CE.[209] There were also territories and provinces directly subject to the great king, which he had administered by his own satraps.[210] The king's power was not unlimited: he had to take into account the divergent interests of members of the Arsacid clan: 'The king stood at the head of the state, but royal power was regarded as the collective property of the Arsacid family.'[211] Because of this, the great kings who followed Sanatruces were often weak, having to fight civil wars or falling victim to assassination. In 224 CE Artabanus IV (r. *ca.* 213–224) would lose a decisive battle against the rebellious king of the province of Fars, Ardashir by name, who then went on to found the Sassanid Empire (224–651).[212]

The Parthian Empire was divided and diverse not only in government but also in culture and religion. While Iranian languages dominated in the east, in the west it was the Semitic language Aramaic, and in the cities Greek. But even in the east, the Parthian elites were anchored in Hellenistic culture, thanks to the Greco-Bactrian influence. Because of this, and in view of the great commercial importance of the relatively autonomous Greek-speaking cities, Parthian silver drachms had Greek inscriptions, and Greek was also used to some extent as a language of official administration. The strength of the Parthian elite's identification with Hellenistic culture is revealed by Mithridates I's description of himself, on his coinage, as 'philhellene', 'friend of the Greeks'. It was only with Vologases I (r. 51–76/79), traditionally accounted responsible for the first codification of the Avesta, the primary collection of sacred texts of Zoroastrianism, that the royal name began to appear on the coinage in Aramaic script. This policy of rejecting the Greek language and Hellenism in favour of promoting the Parthian and even the Achaemenid heritage had already been initiated by Artabanus II (r. 10–36/38), also as a return to their own, oriental values in the context of their growing enmity with Rome, the champion of Hellenistic culture.[213] Parthian culture developed into a synthesis of Hellenistic, Achaemenid, Old Parthian and local elements. Aramaic grew in importance as a language of international communication, and as the language of the Arsacids' external contacts, and it served as the basis for the development of a script for the Middle Iranian Parthian language, the vowel-less, right-to-left, Arsacid Pahlavi.[214]

The Parni's original religion is unknown, but in penetrating the Seleucid Empire they encountered the Greek and Old Iranian pantheons and also Zoroastrian beliefs. In all likelihood, the rulers of Parthia adopted the Zoroastrianism of the day some time after the establishment of the empire. Writing around the beginning of the Christian Era about a trade route through Parthia, the geographer Isidore of Charax mentions the existence there of what one supposes to be a royal fire temple: 'the city of Asaac, in which Arsaces was first proclaimed king; and an everlasting fire is guarded there.'[215] The Nisa ostraca (potsherds with inscriptions) show that the Parthians also used the Zoroastrian calendar alongside their own. Yet the privileged position accorded to Zoroastrianism did not at all prevent the continuing practice of the old religions or the spread of new ones. Particularly in the cities and among the nobility, the Greek gods remained popular, being worshipped in the guise of Old Iranian divinities: Zeus as Ahura Mazda, Apollo as Mithra, Heracles as Verethraghna, and Athena as Nanaia, who had a temple in Parthia.[216] A similar fusion of the gods of one religion with the characteristic visual representations of those of another would also be found among the Sogdians of medieval Central Asia.[217] The south-eastern periphery of the Parthian Empire also witnessed the growth of Buddhism, one of the first translators of Buddhist texts into Chinese being an Indo-Parthian prince called An Shigao (d. 168).[218] Christian communities, too, sprouted up across the whole empire, from Adiabene (northern Iraq) in the west to the Kushans in the east, in western Afghanistan or Bactria.[219]

In the *Parthian Stations* Isidore identifies one of the next halts north-east of the royal fire temple as the city of Parthaunisa. 'Beyond [Asaac] is Parthyena, 25 schoeni [*ca.* 140 kilometres], within which is a valley, and the city of Parthaunisa after 6 schoeni [*ca.* 34 kilometres]; there are royal tombs. But the Greeks call it Nisaea.'[220] While this city is most likely identical with the ruin complex called New Nisa, 18 kilometres west of today's city of Asghabat in southern Turkmenistan, no trace of a necropolis has yet been discovered there. What Soviet archaeologists did find nearby in the 1930s was a cult complex of the late third or early second century BCE, later renamed Mithradatkert in honour of Mithridates I or II.[221] Surrounded by a city wall of rammed earth with rectangular towers, the 28-hectare city of Parthaunisa possessed a citadel and a temple. A kilometre and a half from New Nisa stood the strongly fortified cult complex of Old Nisa, with a number of monumental buildings. Among them are the 'Square Hall', where painted clay statues once stood, the 'Round Temple' with a 'Round Tower', both used for cultic purposes, and finally the 'Large Square Building', also called 'Red Building', in which the archaeologists discovered, in walled-up rooms, an archive of more than 2,700 Parthian ostraca as well as marble statues of Greek origin, valuable silver coins from different lands, a silver mirror with Animal Style decoration and more than 40 ivory rhytons. Tapering down to a figurative finial, these drinking horns show not only Central Asian motifs such as griffins but also Hellenistic ones such as centaurs and Dionysiac scenes. The building served either as a royal treasure house or for the safe keeping of the funerary goods of the Parthian rulers. The already derelict complex was completely destroyed by an earthquake in 454.[222] The strong influence of Hellenistic art on the Mithradatkert complex also finds expression in the absence of strict frontality that characterises post-Hellenistic Parthian sculpture, which also marks the self-representations of the Kushan rulers and even leaves its traces in the Early Buddhist sculpture of Gandhara.[223]

4. Kingdoms of Central Asian Peoples in Afghanistan and the North of the Indian Subcontinent

From the middle of the second to the middle of the first century BCE the Hindu Kush on the south-eastern margin of Central Asia witnessed major migrations by the Saka and the Yuezhi. The first wave of Saka horse nomads to leave the Issyk Kul region around 162 BCE saw some of the expelled Saka move to the western Tarim Basin, especially to the Khotan Oasis, leading to the development of the Khotanese Saka language and culture.[224] As the *Han Shu* reports, a second group crossed the Pamir and the Hindu Kush to settle in Kashmir, where Emperor Wudi sent a number of missions, without success. A military intervention proved equally fruitless.[225] The third group finally settled in Sogdiana and Bactria, from where the Yuezhi again pushed them out around 132 BCE. These Saka made their way to the province of Aria (Herat) and deeper into the Parthian Empire. It was only after the death in battle of two Parthian kings that Mithridates II (r. 123–88/87 BCE) managed to resettle the Saka in Sakastan, today's Sistan, and drive others of them into the Indus Valley, where they clashed with the Indo-Greek kingdoms.

Although the little pre-Kushan kingdoms and the Kushan Empire lay south of the Hindu Kush, they were all established by Central Asian peoples, and through Buddhism and the Gandhara school of art that it inspired they would come to have a decisive influence not only on pre-Islamic Central Asia but also on China, Japan and Korea. A brief account of them will therefore be given here.

4.1 The Indo-Greek Kingdoms

The foundations for the Indo-Greek kingdoms were laid by the Greco-Bactrian king **Demetrius I** (r. *ca*. 195–171/70 BCE), when he conquered the provinces of Arachosia, Drangiana, and Gandhara in the Kabul Valley. This successful extension of the Greco-Bactrian Empire south of the Hindu Kush marked the beginning of the Yavana Era, the Indo-Greek reckoning of time, counted from 186/85 BCE.[226] Apart from a few inscriptions and mentions in chronicles, the history of the Indo-Greek kingdoms, which extended as far as the eastern Punjab, has to be reconstructed from their coinage. Coins of 37 Greek rulers are known altogether, but these do not form a chronological series, since two or three of them were reigning at the same time in small neighbouring kingdoms.[227] Demetrius I was succeeded by his presumed sub-kings, **Agathocles** in Paropamisadae (Kabul Valley) and **Pantaleon** in Arachosia (Kandahar), before **Apollodotus I** (r. ?–165 BCE) brought both areas under his rule, together with western Punjab. Given that they had Indian subjects, these kings began to strike bilingual coins, first in Greek and Brahmi, and a little later in Greek and Kharoshthi.[228] The next Indo-Greek ruler of importance was **Menander I** (r. *ca*. 165/155–130 BCE), who repelled the attack of the Greco-Bactrian king Eucratides I (r. 171/70–145 BCE), consolidating the Indo-Greek rulers' independence from Greco-Bactria. Menander expanded his empire to eastern Punjab, and advanced deep into the Ganges Valley, which formed part of the Sunga Empire; he is said to have destroyed the city of Pataliputra, today's Patna in Bihar, without, however, succeeding in laying claim to the Ganges Valley.[229]

Menander is known above all for his reported conversion to Buddhism. According to the Buddhist tradition of the Pali text *Milindapanha* or 'The Questions of Milinda', King Menander was very knowledgeable in matters of philosophy and an extremely accomplished rhetorician. After government business was done, he enjoyed conversing with philosophers and representatives of different religions, among them Buddhists, but none of his numerous interlocutors was able to answer his questions or meet his arguments. At the conclusion of one debate with the Buddhist abbot Ayupala he is said to have scoffingly exclaimed: 'All India is an empty thing, it is verily like chaff! There is no one, either Samana or Brahma, capable of discussing things with me and dispelling my doubts!'[230] At that time, however, the sage Nâgasena had arrived in Menander's capital Sagala, today's Sialkot, on the Indo-Pakistani border. Menander went to see him and for the first time encountered an interlocutor of sufficient ability, who succeeded in convincing him of the truth of Buddhist teaching. Their days-long discussion ended, so tradition tells, with Menander's request: 'May the venerable Nâgasena accept me as a supporter of the faith, as a true convert from today onwards as long as life shall last!'[231] That Menander really did become a Buddhist is as debatable as the supposed conversion of Kanishka I, king of the Kushans, yet there is much evidence that Buddhism flourished in Menander's realm and that many Greeks joined the Sangha, the Buddhist monastic order, and propagated Buddhist teaching as missionaries. Nonetheless, the legend of Menander's conversion summarises the development of the Early Buddhist art of Gandhara in the form of an allegory according to which Indian thought found a perfect visual expression in Hellenistic forms.

On Menander's death the provinces broke apart, and he would be followed by 20 Greek kings before Hermaios and Archebios, the last Greeks to rule outside the eastern Punjab. Menander's immediate successors were probably **Zoilos I** in Paropamisadae and Menander's widow Queen **Agathokleia** in Gandhara and western Punjab, ruling as regent for her son **Strato I**, still a minor. It is notable that the bilingual coinage of many Greek kings bore on the reverse a Buddhist-sounding legend in Kharoshthi, *Maharajasa dharmikasa*, followed by the name of the monarch, whether Agathokleia, Strato I, Strato II, Zoilos I, Heliocles II, Peukolaos, Theophilos or Archebios. The royal self-description *Maharajasa dharmikasa* means 'great king, follower of the dharma'; that is, of Buddhist teaching – a title very close to that of the great Buddhist king Ashoka (r. 268–234/32 BCE), *Dharmaraja*, the king who follows the teaching. Buddhism seems to have come to occupy so prominent a place in the Greek kingdoms that their rulers portrayed themselves as proponents of its teachings, and some of them may have been Buddhists themselves. It would, however, be wrong to conclude that Buddhism was then dominant, for on the other side of the same coins one finds, as well as relatively infrequent Buddhist symbols such as the eight-spoked wheel or the triratna symbol,[232] such Greek deities as Zeus with his lightning, the armed Athena, or Nike, goddess of victory.[233] In Paropamisadae, the last Greek king, **Hermaios** (r. *ca*. 90–70 BCE), was driven out by

28. Head of a Kushan prince, clay and stucco, Dalverzin Tepe, southern Uzbekistan, 1st–2nd c. CE. The State Museum of History, Tashkent.

the Yuezhi around 70 BCE, while in Arachosia and Gandhara **Archebios** (r. *ca.* 90–80 BCE) had to yield to the Saka ruler Maues around 80 BCE. The very last of the Greek kings, **Strato II** (r. *ca.* 25 BCE–10 CE), was able to hold out with his son and joint ruler **Strato III** in eastern Punjab until around 10 CE, when he was defeated and killed by the Indo-Scythian satrap of Mathura.

4.2 The Indo-Saka Rulers

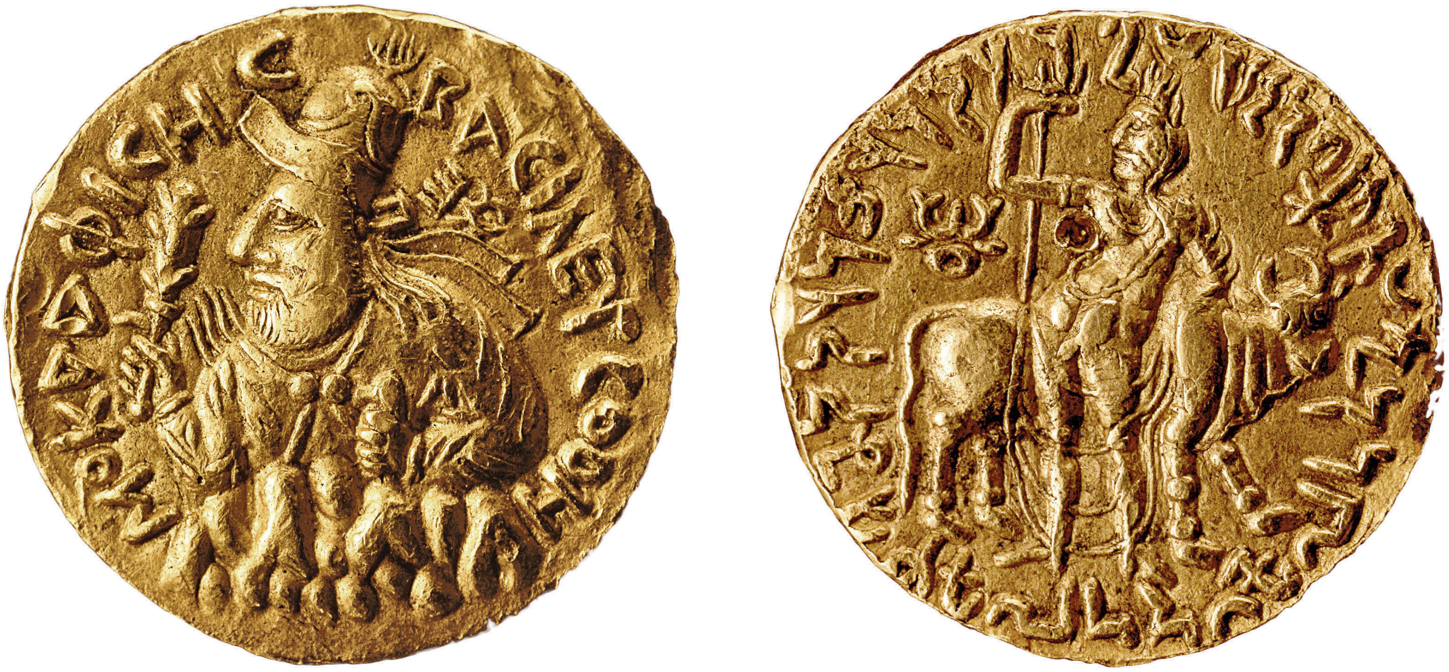
Maues (r. *ca.* 85–60 BCE), the first Indo-Saka king, crossed the Karakorum with his horsemen and joined with Saka from Sistan before conquering Arachosia and Gandhara and minting coins in Taxila. Traces of his passage through the Karakorum are to be found in the many petroglyphs in the Scythian Animal Style that survive in such places as Chilas, Thalpan, Shatial, Gilgit and in Hunza, where later rock engravings and inscriptions by Sogdian traders, and Buddhists and Hindus both monastic and secular are all to be seen. Karl Jettmar rightly called 'the drawings and inscriptions on [today's] Karakorum Highway the visitors' book of the Silk Road'.[234] However, the Greek kings Apollodotos II and Hippostratos regained Taxila not long afterwards, so that the power of the Parthian-named Indo-Saka king **Vonones**, and his brother and co-ruler **Spalahores** was limited to Arachosia. In 57 BCE, during the reign of his successor **Spalagdames**, another Saka group suffered defeat at the hands of Vikramaditya, king of Malava, in Ujjain, west central India, an event said to have been the basis for the introduction of the Vikram Samvat calendar, still used today in India and Nepal.[235] Some authors, however, take the view that the Vikram Era, which starts in 57 BCE, celebrates the accession to power of the Indo-Scythian king **Azes I** (r. 57–*ca.* 30 or 20 BCE) and his reconquest of the western Punjab and Taxila.[236] Azes' rule now extended from Arachosia in the west to Mathura, central India, in the east. Another reckoning of time still in use in India is the Saka Era, introduced by the Saka Western Satraps of Ujjain in 78 CE.[237] Azes I was succeeded by **Azilises** and **Azes II**, then the empire fell apart, to be conquered by a succession of Indo-Parthian rulers. In the east, the 'Northern Satraps of Mathura' later fell to the Kushans, while in the west the 'Western Satraps of Ujjain', descendants of Saka who had migrated from Sistan, enjoyed a certain autonomy until 388.[238] As explained below, the Bimaran Reliquary – one of the earliest Buddhist sculptures and one of the most treasured representations of the Buddha – may have been produced in the age of Azes II (fig. 46).

4.3 The Indo-Parthian Kingdom

Early in the first century CE a Parthian princely family declared itself independent and from its base in Sistan embarked upon the conquest of the Indo-Saka Empire. The first Indo-Parthian king was **Gondophares I** (r. *ca.* 20–46), who extended his rule to eastern Punjab but did not succeed in reducing the satraps of Mathura and Ujjain to subjection. Gondophares is known from the apocryphal *Acts of Thomas*, for he is the king to whom the Apostle travelled just after the Crucifixion and for whom he allegedly worked as carpenter and master builder.[239] Even though the historical truth of this account cannot be confirmed, it is plausible in so far as there existed a busy maritime trade between the Roman Empire and northern India, and artists from the eastern Mediterranean were indeed active there. Gondophares' empire began to fall apart under his successor **Abdagases**, when Kujula Kadphises, the first ruler of the Kushans, robbed the latter first of the Kabul Valley and then Gandhara, Taxila and Kashmir. In eastern Punjab and Sindh, nine Indo-Parthian kings managed to hang on to their ever-decreasing territories until the end of the first century, probably as vassals of the mighty Kushans.[240]

4.4 The Yuezhi and the Kushan Empire

As explained in volume I, the Europids, who migrated into Xinjiang towards the end of the third millennium BCE, were probably speakers of an Indo-European, Proto-Tocharian language with linguistic affinities to Celtic and Italic, and hardly any with later subdivisions of the Indo-Iranian language group. This extinct Proto-Tocharian language can be reconstructed from written documents from the Tarim Basin, dating from the sixth to the ninth century CE, which attest to three different Tocharian languages: Tocharian A, also called Turfanian, was mostly a religious language; Tocharian B, or Kuchean, was a local vernacular, and Tocharian C, or Krorainic, was an older language spoken in the Lop Nor that died out around the fourth century CE.[241] Whether the most probably Europid Yuezhi who originally dwelt west of the Ordos Desert also spoke a proto-Tocharian language remains uncertain, despite many pointers in that direction. The name that in Modern Mandarin is pronounced Yuehzi was in Old Chinese pronounced 'Tokwar' or 'Togwar', very close to 'Tochar-ian'.[242] It is, however, clear that the Τόχαροι (Tocharoi) of Strabo, who 'took Bactria from the Greeks' are identical with the Yuezhi described by Sima Qian.[243] In the fourth century, after the end of the age of



29. Gold double stater of the Kushan ruler Vima Kadphises (r. *ca.* 102–127 CE). Vima Kadphises reformed the coinage of the Kushan Empire and introduced the first gold coinage in India, which was based on the Roman weight standard of the stater. The obverse with the Greek legend 'King Vima Kadphises' shows the ruler holding a club, and with flames rising from his shoulders which indicate his divine right to rule. The reverse portrays the god Oesho, whose features anticipate the representation of the Hindu god Shiva with his trident and his bull, Nandi. The Kharoshthi legend proclaims: 'Of the king of kings, lord of the world, Vima Kadphises the Great, the Saviour.' The Trustees of the British Museum, London.

the Kushans, direct descendants of the Yuezhi, Bactria began to be called 'Tocharistan'.[244]

4.4.1 The 'Long March' of the Yuezhi

The Yuezhi make their first appearance in the historical record in Sima Qian's account in the *Shiji* of their wars against the Xiongnu.[245] After a first victory over their then vassals, the Xiongnu, in 209 BCE, they suffered three heavy defeats at the hands of these same Xiongnu in 208–207, 176 and 162 BCE, after which they broke up into three or four separate groups. The largest, called by Zhang Qian the 'Great Yuezhi', fled westward and took the Ili Valley from the Saka who lived there, while the 'Lesser Yuezhi' went south, seeking refuge among the north Tibetan Qiang on the borders of today's Gansu and Qinghai provinces.[246] A yet smaller third group settled in the Tarim Basin, as might be inferred from Xuanzang's mention of the kingdom of Duohuoluo not far from the ruins of Endere whose Chinese name probably corresponds to 'Tukhara'.[247] It may be that a fourth fraction reached the southern Chinese province of Yunnan, as is suggested by the famous animal combat motifs found on the bronze buckles of the Dian culture that existed there between the second century BCE and the second century CE.[248]

The Greater Yuezhi were driven out of the Ili Valley by the Wusun in 133 or 132 BCE, when they fled south, expelling in their turn the Saka who lived in Sogdiana and Bactria. As Sima Qian reports, the Yuezhi conquered the little principalities of Bactria,[249] plundering a number of cities, such as Aï Khanum, but leaving the agricultural irrigation systems unharmed. By around 80 BCE they held the whole of Bactria. Kangju, however, falling in the north into the Xiongnu sphere of influence and bordering in the south on the Yuezhi, had nominally to recognise the suzerainty of both its neighbours.[250] The Kushans celebrated the Yuezhi victory over the Saka in a sculptural frieze of the second half of the first century CE at their dynastic cult centre of Khalchayan, north of Termez in southern Uzbekistan. Almost life-size figures in painted clay look down from the three walls of the great hall; they represent members of the ruling house, Hellenic and Iranian deities such as a warlike Athena, Heracles, Nike goddess of victory, and a Mithra or Zeus with radiate halo, as well as a group of variously armed horse warriors (fig. 26). These last represent a battle between the victorious mounted bowmen of the Yuezhi and the defeated, heavily armoured Saka.[251] The Khalchayan sculptures represent a crucial link between a Greco-Bactrian art inspired by Hellenistic and Iranian formal conceptions and two later artistic tendencies: on the one hand the monumental frontality of the dynastic art of the Kushans, and on the other the early Gandhara School. The Khalchayan sculptures were also a visual expression of the traditional nomadic life of the Yuezhi. The Yuezhi's adaptation to their new, Bactrian environment is also reflected in their abandonment of their (probably) Proto-Tocharian language in favour of the east Iranian Bactrian language.[252] Bactria thus became the cradle of the later Kushan culture.

4.4.2 The Kushan Empire

Our knowledge of the later history of the Yuezhi and the rise of the Kushan dynasty comes from coins, the *Hou Han Shu*, and a number of inscriptions such as the famous Rabatak inscription in central Afghanistan from the year 132/33, uncovered in 1993 by mujahideen as they were digging a trench. The *Hou Han Shu* reports that 'The Yuezhi moved to Bactria and divided up this kingdom between five xihou [princes]. . . . More than hundred years later, the prince of Guishuang [Kushan], named Qiujuque [Kujula Kadphises], attacked and exterminated the four other xihou. He established himself as king, and his dynasty was called that of the Guishang [Kushan] King. He invaded Anxi [the Indo-Parthian Kingdom], and took the Gaofu [Kabul] region. . . . Qiujuque [Kujula Kadphises] was more than eighty years old when he died. His son Yangozhen [Vima Takto] . . . became king in his place. He defeated Tianzhu [north-western India].'[253] The Rabatak inscriptions confirm Kujula Kadphises as the founder of the dynasty and identify his successors as Vima Takto, Vima Kadphises and Kanishka; kingship descended directly from father to son.[254] We also know of three ancestors of Kujula Kadphises, six Great Kings, and five kings of a rump state in the east of the empire.

Kujula Kadphises' predecessors in Bactria and southern Uzbekistan are known only from coins; one of them is **Saparbizes**, also known as Sapalbizes, whose name, however, has an Indo-Saka ring, and another is **Arseiles**; both ruled in the last two decades of the first millennium BCE.[255] **Heraios** (r. *ca*. 0–30 CE) was the first Kushan prince to describe himself on his coins as 'Ruler of the Kushans';[256] he probably ruled the rich valley of Surkhan Darya in southern Uzbekistan.[257] Heraios was succeeded by **Kujula Kadphises**, perhaps his son (r. *ca*. 30–80 CE), who first conquered the other four Yuezhi princedoms, so founding the Kushan Empire. On the death of the Indo-Parthian king Gondophares in 46 CE he took from the latter's successor the Kabul Valley, Swat, and Gandhara with the region of Peshawar and Taxila, and seized Kashmir from the Indo-Scythians.[258] When the Yuezhi under Kujula Kadphises reached Peshawar, then called Purushapura, later Kanishka's winter capital, their almost 4,000-kilometre 'Long March' from the Ordos Desert via the Issyk Kul, the Oxus and

Kabul came to an end. After these conquests south of the Hindu Kush, Kujula Kadphises and his successor Vima Takto consolidated Kushan rule over northern Bactria.[259]

The coins struck by Kujula Kadphises are characterised by a remarkable diversity, for he adapted them to each of the recently conquered regions: in Bagram (Kabul), coins imitated their Indo-Greek predecessors, in Gandhara the Indo-Parthian, in Kashmir the Indo-Saka, and in Bactria the Greco-Bactrian. In Taxila, however, he anticipated the great reform of the coinage that would be undertaken by his grandson Vima Kadphises, introducing a new coin patterned upon the Roman silver denarius of Emperor Augustus, testimony to a thriving maritime trade with Rome.[260] Also worthy of particular note is a bronze coin attributed to Kujula Kadphises that features Zeus on the obverse, and on the reverse a seated figure with legs crossed and right hand raised, together with the Kharoshthi inscription *dharmathidasa*, which signifies 'steadfast in the teaching'. If the attribution is correct, these coins represent one of the earliest attempts at a canonical figural representation of the Buddha. However, two Kushan rulers minted similar coins a century or so later, Kanishka one with a seated Bodhisattva Maitreya and Huvishka one with a seated self-portrait, and the attribution to Kujula is thus disputed.[261]

Kujula Kadphises was succeeded by **Vima Takto** (r. *ca.* 80–102?),[262] who until the decipherment of the Rabatak inscription was known to us only under his sobriquet 'Soter Megas', the 'Great Saviour'.[263] The exceptionally high number of finds of Vima Takto's coins, from Mathura in central India to the northern reaches of Bactria, suggests that he consolidated the empire north of the Oxus and considerably extended it to the south-east. In 83 or 84 CE Vima Takto succeeded through a marriage alliance in integrating Kangju more closely into his sphere of influence, but Sogdiana, which was experiencing a renewed invasion of nomadic horsemen, probably Alans, and Chorasmia remained beyond the reach of the Kushans' power; the frontier ran most probably near the 'Iron Gates', north of Termez.[264] As already discussed, Vima Takto failed in his attempt in 90 CE to wrest control of the Tarim Basin from the Chinese protector general Ban Chao.[265]

In 120 CE Vima Takto's successor **Vima Kadphises** (r. *ca.* 102–127) also tried to gain a political foothold in the Tarim Basin, and again failed when seven years later the Kushan governor of Kashgar submitted to China and cut his links with the Kushans.[266] Despite this minor setback, the Kushan Empire became immensely rich, as it controlled portions of two of the three most important Silk Roads. One was the land route that ran from Kashgar in the east, through Tashkurgan and the Wakhan Corridor and along the Oxus to the commercial cities of Sogdiana and then Merv. As Strabo records, at the end of the Wakhan, at Aï Khanum at the latest, an alternative presented itself: travelling by boat on the navigable Oxus, through the Uzboy River to the Hyrcanian (Caspian) Sea.[267] The route then continued through the Caucasus to the Black Sea, from where Bosporan or Roman ships would carry the goods.

The second option was the combined land and sea route from Kashgar either via Baktra, Bagram (near Kabul) and Purushapura (Peshawar) or via Gilgit and Taxila to the north-western Indian plains. From there a trade route led south-west along the Indus to the seaport of Barbarikon, not far from today's Karachi, while another led to the port of Barygaza, today's Bharuch, at the mouth of the Narmada river in Gujarat, either by travelling directly south or passing through the rich metropolis of Mathura.[268] Both ports are described as important destinations for the Roman merchant fleet in the *Periplus Maris Erythraei*, a mid-first-century CE guide to commercial navigation composed by an experienced Greco-Egyptian mariner and trader.[269] The Roman merchants of the day knew that silk came from China, being brought either by land through Bactria, or by sea, along the Malabar Coast of south India to Barygaza. 'Beyond this region [of Chrysê – either Burma or Sumatra], by now at the northernmost point, where the sea ends somewhere on the outer fringe, there is a very great inland city called Thina [China] from which silk floss, yarn and cloth are shipped by land via Bactria to Barygaza and via the Ganges River back to Limyrikê [on the coast of Malabar]. It is not easy to get to this Thina.'[270] The Kushan Empire was a hub of international trade; it was, with China, Rome and Iran, one of the four great powers of Eurasia.

The third trade route to the west was described by Ptolemy, who cites the geographer Marinos of Tyre (*ca.* 70–130 CE), who himself had obtained his information from agents of the Macedonian merchant Maes Titianos. This route crossed Parthia from Hierapolis on the Euphrates (east of Aleppo) to Ecbatana (Hamadan), Hecatompylos and Merv, then continued through the Fergana Valley to Osh in south-eastern Kyrgyzstan and the 'Stone Tower' mentioned by Ptolemy. From the Stone Tower, the Irkeshtam Pass or the Derek Davan Pass led one to Kashgar.[271]

As the Kushans' trade balance was in massive surplus, they were flooded with Roman gold denarii. A high point in trade relations between Rome and the Kushan Empire was marked in 107 by the visit to Emperor Trajan (r. 98–117) of an Indian trade delegation which sought to set relationships on a firmer footing, not least in order to circumvent the fiscal trade barrier represented by the Parthians, a real 'Iron Curtain'. The Kushan emissaries could not have chosen a better time for their journey to Rome, as a year

before Trajan had brought the Second Dacian War to a highly successful conclusion, bringing home, according to Dio Cassius, an immense booty of 164 tons of gold. In the negotiations the Kushans are said to have been promised that Rome would increasingly pay in gold.[272] As is shown by archaeological finds, there was indeed a greater influx of Roman gold coins into the Kushan Empire, which allowed Emperor Vima Kadphises to introduce a new gold coin. He had the Roman gold denarii melted and minted coins of his own whose weight standard of eight grams very slightly exceeded that of the Roman *aureus denarius*.[273] Vima also had a gold double dinar and quarter dinar minted. The near parity between the two coinages facilitated commercial exchanges between the Kushan Empire and Rome, and within Central Asia the introduction of the gold standard led to the Kushan coinage being accepted everywhere. At the same time, the gold standard isolated the Parthians, who kept to silver coin.

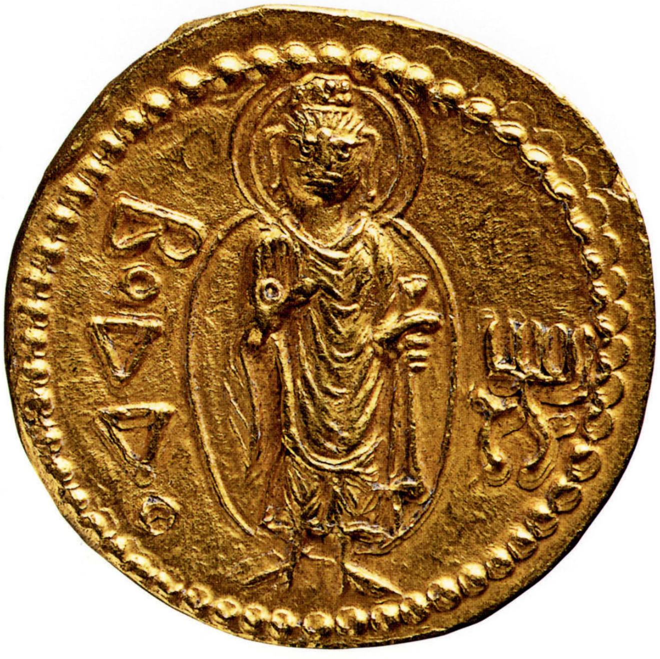
On these gold coins the Emperor appears either riding an elephant, driving a chariot, in bust, or enthroned cross-legged on top of a mountain. From his shoulders spring flames which, according to the then rarely used Iranian model, symbolise *xvarnah*, the vital force and royal splendour of the ruler. This motif is found not only in representations of various Kushan deities but also in figurative representations of the Buddha, namely in depictions of the Great Miracle of Sravasti, when Shakyamuni caused flames to shoot from his shoulders and streams of cold water to flow from his feet. This spectacular motif travelled the Silk Road to the Tarim Basin and on into China.[274] If Marilyn Martin Rhie is right in dating to the second half of the second century CE the famous fire-gilt bronze figure of a meditating Buddha with flaming shoulders in Harvard's Arthur M. Sackler Museum, this would be the oldest canonical statue of the Buddha from China. In facial features, this Buddha, believed to have been produced in China (fig. 30), shows a very striking similarity with the sculptures of rulers at the Kushan cult centre of Khalchayan, suggesting that by the second century CE there were direct contacts between central China and Kushan missionaries and artists.[275] How popular the idea of this miracle still was in the seventh century is shown by Xuanzang's account of his travels, which attributes a similar miracle to the Kushan ruler Kanishka. He is said to have overcome a dangerous dragon by shooting a mighty flame and smoke from his shoulders.[276]

On his bronze coinage, however, Vima Kadphises is shown – like his successor Kanishka on some gold coins – standing behind a small fire altar, performing a sacrifice. He wears a long, heavy kaftan, a sword on a belt, long trousers, and heavy felt shoes: the traditional attire of a nomadic steppe horseman. Behind him stands a tremendous mace, symbol of authority of the early Kushan kings. The reverse of Vima Kadphises' coins features only Oesho, one of the most important of the Kushan titular deities, whose features anticipated the later representations of the Hindu god Shiva. Oesho was a syncretistic deity, probably introduced by the Kushans, blending concepts and attributes of Iranian, Greek, Roman, Indian and local deities. The god had close affinities to the Zoroastrian wind god Vayu, 'who rules the upper regions', and was closely related to the later Sogdian wind god Weshparkar, who was also depicted as Shiva.[277] As mentioned by Abdul Samad, the representations of 'deities on Scythian coins [Indo-Greek, Indo-Saka and Indo-Parthian coins] served as models for the

Kushana engravers'.[278] At the same time several early attributes of Oesho stemmed from the Hellenistic world, for example the trident from representations of Poseidon, the thunderbolt from Zeus and the club, nakedness and animal skin from Heracles. Later coin representations of Oesho borrowed Indic attributes such as the bull, the multiplicity of head and arms, the third eye and the water-pot. So it seems that the iconography of the Hindu god Shiva was 'developed on the basis of the Kushana period Wēś'; that is, Oesho.[279] And when the Hindu gods became more important among the later Kushans, Shiva himself could have been worshipped in the form of Oesho. Vima Kadphises continued the tradition of inscriptions in both Kharoshthi and Greek, while Kanishka later replaced these with inscriptions in the Bactrian language and modified Greek characters.[280]

The Kushan coins offer an outstanding example of the Yuezhi's creative adaptability. Originally a nomadic horse people, they succeeded in preserving their traditional identity and proclaiming it on their coins and in official statuary. The Kushans were masters in using coins not only as currency, but also as a tool to propagate their ideology. They also fostered an urban culture whose economy was based on transcontinental trade and, in Bactria, on irrigated agriculture. Under the Kushans, the irrigation systems were refined and extended – some canals were more than 100 kilometres long – allowing agriculture in Kushan-controlled Central Asia to reach a high level of development. The Kushans' wealth very quickly brought about a marked economic upswing in all of Central Asia, far beyond the borders of the Kushan Empire, in Sogdiana, Chorasmia and the Tarim Basin. The very high numbers of Kushan bronze coins in circulation underline the vitality of the economy at that time. The Kushans' economic flexibility was accompanied by a high degree of religious tolerance: the reverse of their coins feature some 30 deities from the Irano-Zoroastrian, Hellenistic-Roman and Indian belief systems – including Buddhism.[281] The Kushans achieved a unique synthesis of horse-nomad, Greco-Bactrian, Roman, Iranian and Indian cultural elements that found its highest expression in the Buddhist Gandhara school of art.

The accession of the next Kushan emperor, **Kanishka I** (r. 127–151) marked the beginning of the eponymous Kanishka Era. In Buddhist tradition he is honoured as a great patron of the religion, said to have convened the Fourth Buddhist Council of the north Indian Sarvastivada school in Kashmir and to have built an enormous stupa in Peshawar. While Kanishka's involvement in this controversial council is certainly no more than a pious legend, it was in his time that the Sarvastivada school, a forerunner of Mahayana, began to translate the Buddhist texts composed in the Gandhari Prakrit or vernacular and written in Kharoshthi script,



32. Reverse of a gold coin of Kanishka I (r. 127–151 CE) showing the standing Buddha. With his right hand he performs the Abhaya mudra of 'no fear'. His feet are turned outward like the codified posture of a Kushan ruler. On the left the Greek inscription ΒΟΔΔΟ. The Hirayama Collection.

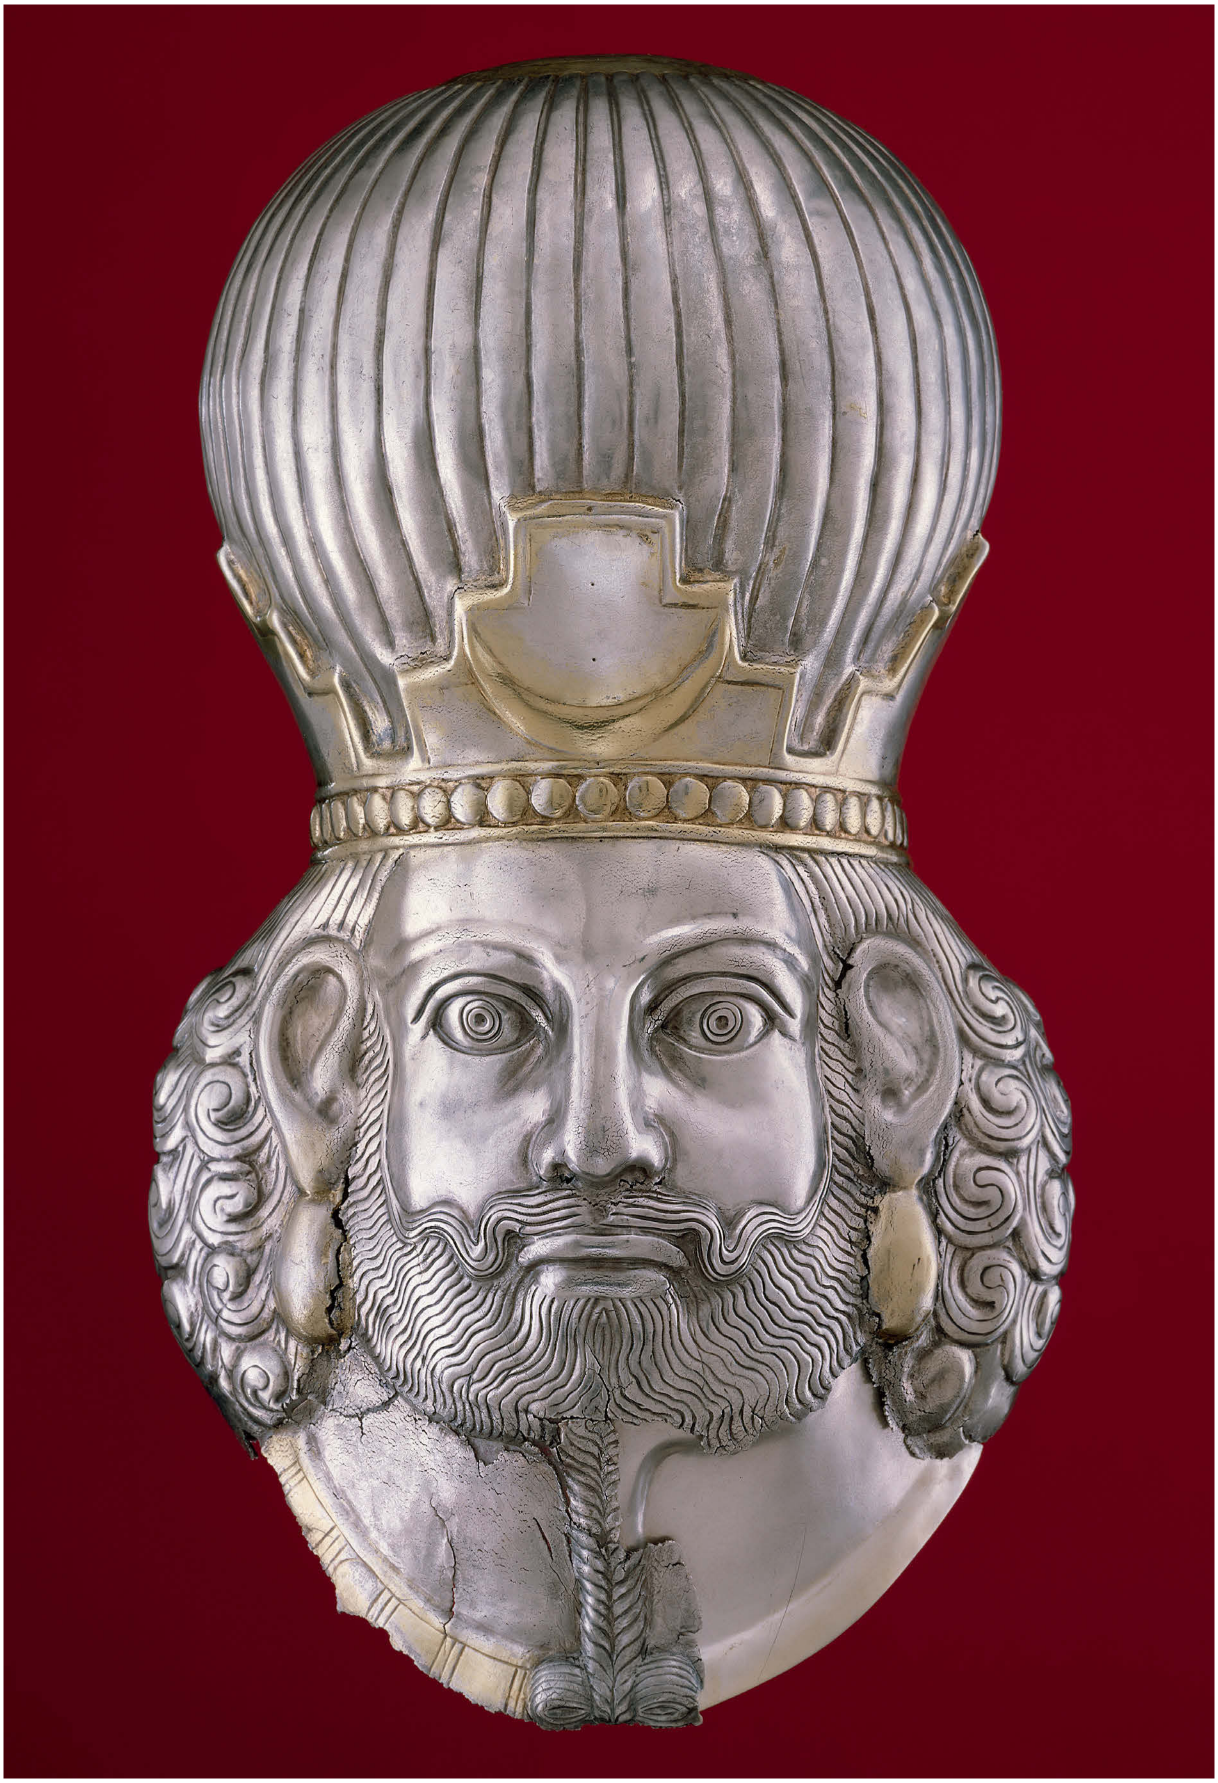
into Sanskrit written in the Brahmi script. As a result, this Buddhist Hybrid Sanskrit written in Brahmi became the favoured Buddhist medium along the Silk Roads of Central Asia, while the Gandhari Prakrit in its Kharoshthi script first came to dominate the administration of the Kushan Empire, before later spreading, via Kushan merchants, to the southern Tarim Basin.[282] But Kanishka was certainly closer to the goddess Nana than to the Buddha, since he announced himself on the inscription of Rabatak as: 'Kanishkha, the Kushan . . . who has obtained the kingship from Nana and from all the gods.'[283]

The second Buddhist tradition mentioned above, the one about the big stupa, seems to have had a basis in fact, as witnessed by the excavations of 1908–1909 in Shah-ji-ki Dheri, a suburb of Peshawar. There the archaeologists under David B. Spooner discovered the base, 87 metres in diameter, of the gigantic stupa that had astonished the pilgrim monks Faxian (sometime after 400) and Xuanzang (sometime after 630).[284] The Muslim polymath al-Biruni (973–1048) also saw it, before its destruction by the Turkic Afghan Mahmud of Ghazni (r. 998–1030).[285] In the ruins Spooner found a gilded copper reliquary, said to have contained three bone fragments of the Buddha Shakyamuni, whose undated Kharoshthi inscription identifies Emperor Kanishka as the founder of the Kanishka *vihara* or monastery (fig. 31). Such reliquaries were not private property but gifts to a monastery that would be set at the heart of a stupa. The little reliquary itself takes the form of such a monument, a reminder that all stupas are in fact gigantic reliquaries.[286] On the lid is a small figure of the Buddha seated on a lotus flower, flanked by the Hindu gods Brahma and Indra, who stand in postures of reverence; the heads of all three figures are surrounded by circular haloes. The vertical rim of the lid is decorated with a frieze of flying geese, symbolising the soul's liberation from the cycle of rebirth. On the body of the reliquary, Kanishka is represented frontally, standing with feet turned outward and set well apart, and framed between the Iranian moon god Mao and sun god Miiro (Mithra); on the sides, two princes or bodhisattvas worship the meditating Buddha.[287] The whole scene is surrounded by a heavy, undulant garland supported by cherubs. This originally Dionysian motif, derived from the garland decoration found on Roman and Hellenistic temple friezes, altars and sarcophagi of the same period, would travel from Gandhara as far as the Tarim Basin, as is evidenced by the murals of Miran. In Buddhism, garlands were among the gifts that believers would bring to a stupa.[288]

Towards the end of his reign Kanishka became the first Kushan emperor to have images on his coins of both of the most important Buddhist cult figures of the time, Buddha Shakyamuni and Bodhisattva Maitreya. But these rare pieces represent only a fraction of the coins he had minted, for images of Iranian, Bactrian and Hellenistic deities such as Oesho, Nana, Miiro and Mao, were far more numerous. The obverse of the 'Buddhist' gold coin shows Kanishka, sacrificing at a fire altar, dressed in a heavy cloak, clearly presented as the follower of a fire cult (fig. 33). The reverse has the Buddha, frontally depicted, with the Greek inscription ΒΟΔΔΟ (fig. 32). He wears a Hellenistic-looking monastic robe and his right hand is raised in the gesture of fearlessness and protection (*abhaya mudra*). Like Kanishka's, his feet are turned outward, his attitude corresponding to that of a ruler as codified in Kushan dynastic art. The Buddha's head is surrounded by a halo, his body by a mandorla – one of the earliest examples of this kind of representation of the Buddha. On a similar series of very well worn copper coins the inscription reads CAKAMANO ΒΟΥΔΟ (Shakyamuni Buddha), and that on a third equally well worn series ΜΗΤΡΑΓΟ ΒΟΥΔΟ (Maitreya Buddha).[289] There Maitreya sits on a throne, suggesting that the image on the coin may have reproduced an existing sculpture.[290] The representation of the Buddha with combined halo and mandorla would soon be adopted in the heart of Central Asia, as at the Kushan-period Kara Tepe cave monastery near Termez in southern Uzbekistan. The mural in question dates from the second to third centuries CE and is one of the oldest surviving wall paintings depicting the Buddha;[291] the representation with combined halo and aureole is a Kushan innovation, reproduced in painting for the first time in Kushan Bactria.[292] Another novelty at Kara Tepe is the halo of tongues of flame that surrounds the entire body of the Buddha,[293] surely connected with the depiction of Vima Kadphises and Kanishka with flames shooting from their shoulders. The epithet BUDDOMAZDO, inscribed near the Kara Tepe Buddha in the fourth or fifth century, related to a later syncretic cult of Buddha and Ahura Mazda that arose after the Central Asian campaigns of the Sassanid Shapur II around 368–378.[294] Since Mazda means 'wise', this epithet could also just represent a Buddhist reverential title implying 'Wise Buddha'.

Under Kanishka's successor **Huvishka** (r. *ca.* 155–187) the Kushan Empire reached its greatest extent, and he consolidated Kushan authority over the semi-autonomous Indo-Saka satrapies of western India.[295] On the other hand, it seems improbable that the Kushan Empire also included the western Tarim Basin, as Staviskij and Litvinsky argue. The Kushans' evident cultural influence in the Tarim Basin can be explained by the advance of Buddhism and perhaps the flight of Kushan administrators to



34. Silver head of a Kushano-Sassanid ruler or a Sassanid king, 4th century CE. The Metropolitan Museum of Art, New York.

Khotan and Shan-shan in the face of Sassanid invasion.[296] The next ruler, **Vasudeva I** (r. 191–229/30) seems to have favoured the Hindu gods: representations of Oesho/Shiva predominate in his coinage, and his own name is that of one of the 24 avatars of the god Vishnu. Towards the end of his reign, Vasudeva, the last of the 'Great Rulers' of the Kushan Empire, was confronted by the Sassanid incursion, and in the last year of his life he sent an embassy to Cao Rui, the Emperor Ming of Wei, northernmost of China's Three Kingdoms, presumably to forge a military alliance against the Sassanids.[297] In 819/20, the Arab historian al-Tabari reported on the Sassanid advance on the Kushan Empire as follows: 'Ardashir gathered an army and attacked Khorasan [north-east Iran and Turkmenistan]. He went from the province of Fars [Central Iran] to Kerman and from there to Sistan, seized this region and turned toward Khorasan, where he took the cities Balkh, Merv, Nishapur and Khorasan.' Later, 'emissaries of the Kushan from Turan [mountainous east and central Baluchistan] and Makran [Gedrosia in southern Iran and Pakistan] offered their submission to King Ardashir'.[298] In fact, Ardashir (r. 224–*ca.* 240), the first of the Sassanid dynasty, attacked the Kushan Empire's north-western provinces and peripheral sphere of influence not long after 224, and by 233 he had conquered the whole of Bactria, initiating the decline of its urban culture.[299]

Faced with Ardashir's military superiority, the western regions of the Kushan Empire recognised Sassanid suzerainty and paid tribute, bringing about the division of the empire. In the rump state remained the rulers of the south-eastern part of the empire: **Kanishka II** (r. *ca.* 230–47), who had lost the western and northern territories to Ardashir, **Vasishka** (r. *ca.* 247–257), **Kanishka III** (r. *ca.* 268) and **Vasudeva II** (r. *ca.* 280–300). Vasudeva II was succeeded on the throne of the declining remnant by **Shaka** (r. ?– mid-4th c.) and a line of other minor potentates, until Hunnish Kidarites from Central Asia invaded north India in the early 440s.[300] We read of the north-western regions of the Kushan Empire that submitted to Ardashir in an inscription on the tower of Ka'ba-ye Zartosht at the Naqsh-e Rustam necropolis north-west of Persepolis, an inscription composed in 261 by Ardashir's son and successor Shapur I (r. *ca.* 240–272). In this he lists not only the territories his father acquired in Margiana, Bactria and Sogdiana, but also 'Hindustan [Sind] and Kushanshahr as far as Peshawar'.[301] Shapur seized the Upper Kabul Valley shortly after his accession from Kanishka II or Vasishka; the whole of Gandhara fell to the Sassanids after 293.[302] The government of the lands that had once belonged to the Kushans was left by the Sassanids to a semi-autonomous vassal king, who bore the title *Kushanshah*. The rule of the eight to ten kings of the **Kushano-Sassanian Dynasty** came to an end in the 360s to 380s, when the Hunnish Chionites drove the Sassanids out of their eastern territories.

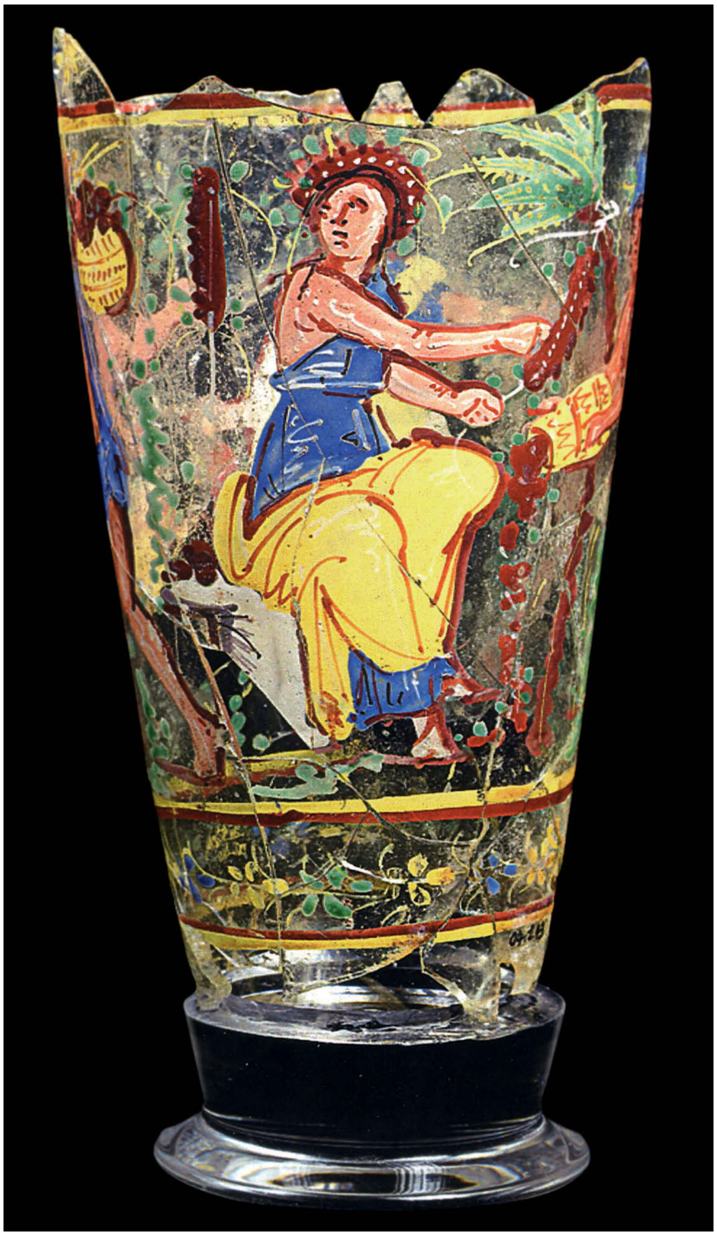
4.4.3 Silk and the Kushan Trade Network

The Kushans opened the most important trade routes of Central Asia, which formed the main section of the transcontinental Silk Road. They controlled the territories between China and the Indian Ocean ports, and secondly, they had the necessary resources in terms of pack animals to be able to carry on the trade efficiently. The Kushans made it possible to circumvent the barrier to trade represented by the Parthians and quickly developed into the biggest distributors of Chinese goods. Sima Qian's pioneering journey to Central Asia and China's conquest of the Western Regions provided the preconditions for the 'opening' of the Silk Road, but it was the mentally and physically mobile Yuezhi-Kushan steppe horsemen and Mediterranean mariners who created the combined land and sea silk routes. These new routes were all the more important to China as Ban Chao's attempt to establish direct contact by sending Gan Ying to Rome had failed; and they also offered a connection to the eastern sea route to China via Sumatra.

The *Periplus Maris Erythraei* reports that the ship's captain Hippalus (*ca.* 1st c. BCE) was the first to discover the direct sea route between the Arabian Peninsula and India, while Pliny (d. 79) says that he discovered the regularity of the monsoon winds,[303] and Strabo notes that around 24 BCE 120 merchant ships made the journey between the Red Sea and India every year.[304] Sailors from Himyar in southern Arabia were in fact the true discoverers of the monsoon winds which made it possible to sail between Arabia and India and back within a year. Between Africa and India the wind blows from the south-west between April and October, and from the north-east between October and April, so the Arabs would sail to India in the spring, and return home at the approach of winter, when the wind changed.[305]

China's most significant exports were silk, lacquerware and bronze products, while the *Hou Han Shu* lists the most important imports as gold and silver products, luminous jade, pearls, African rhinoceros horn, coral, Baltic amber, transparent blown glass from Syria and Egypt – Chinese glass remained opaque until the fourth or fifth century CE – cinnabar, green gemstones, gold-thread embroidery and rugs, fine polychrome silk fabrics with a golden lustre, asbestos clothing and 'a fine cloth which people say is made from the down of water sheep'. The profit margin between India and China was ten times the purchase price.[306] The Kushans also imported pelts and honey from the north, and exported to China spices, linen, lapis lazuli, minerals, dyes, exotic animals, slaves, incense, myrrh and topaz. Central Asian and Chinese buyers paid for Kushan exports to China with silk, which Kushan merchants sold on to Rome.

Of the mysterious fabric made from the 'down of water sheep' that China bought from Rome, a Chinese fifth-century commentator remarked that it was really made from wild silk. While the pupa of the domesticated silkworm *Bombyx mori* is killed by immersion in boiling water before the moth can break out of the cocoon, in wild species of the silkworm, the moth escapes by perforating the cocoon, so breaking in countless places the endless thread it has spun, and the silk obtained is of lower quality. However, the necessity of killing a living creature posed an insurmountable problem to observant Buddhists, leading them to avoid high-quality silk. The Chinese monastic pilgrim Xuanzang thus noted approvingly in the course of his visit in 643 to the Buddhist oasis town of Khotan (in the south-western Tarim Basin): 'From old time till now, this kingdom has possessed silkworms, which nobody is allowed to kill.'[307] But about the down of water sheep the *Hou Han Shu* was right: the material came from a Mediterranean sea creature, the *Pinna nobilis,* or noble pen shell. This bivalve, up to one metre long, attaches itself to the sea bed by a tuft of silky filaments called byssus, and in Antiquity (and indeed until the end of the nineteenth century) these filaments were spun and woven into an extremely fine fabric, known in English as sea silk.[308]



35. **A 12.6-centimetre-high, painted glass goblet depicting a Roman noblewoman harvesting, 1st century CE. From dig II, room 10, Bagram, Afghanistan. National Museum of Afghanistan, Kabul.**

Even more surprising is the fact that in importing 'gold-thread embroidery' from Rome, the Chinese were unknowingly buying back the silk they had sold to the Kushans! Roman customers, and Roman ladies especially, did not like the tightly woven, rather heavy Chinese silk fabrics. So, as Pliny records, the silks were unravelled in the coastal cities of the eastern Mediterranean, such as Sidon, Tyre and Gaza, and the threads were re-woven into much lighter and almost transparent fabrics with new patterns.[309] In the process, gold thread was also incorporated, giving the material a golden sheen. In the third century CE the Chinese became aware that the Romans were making their 'Western silk' from Chinese silk.[310] Later, under the Tang Dynasty (618–907), China unintentionally became a significant importer of foreign silks. As the early Tang emperors wished to weaken the locally based nobility, they created a new layer of aristocracy to which access was gained by success in written state examinations. At the same time, they introduced strict new dress regulations for each rank of the administration and nobility.[311] At the top of the colour hierarchy stood gold and yellow, followed by purple, green and black; particular patterns and motifs were also prescribed for each rank. Those seeking alternatives could find high-quality, colourful silk garments in vivid reds, yellows or greens from Byzantium, which had had its own silk industry since the time of Emperor Justinian I (r. 527–565), from Iran, Khorasan and Sogdiana, all available in Chinese markets. By then, the trade of Central Asia had for a long time been dominated not by the Kushans, but the Sogdians.[312] By the fifth century, the Khorasanis from eastern Iran and the Sogdians were producing exquisite silk garments in

many colours[313] and, outcompeting the Sassanids, were successfully exporting their silks to China, Tibet and Eastern Turkestan. In those last two regions, their silks were also valued as fabric for shrouds. But such silk fabrics adorned with medallions surrounded by pearls were also made from the end of the sixth century in the Tarim Basin and in imperial workshops in Sichuan.[314] Later, the Sogdians found a new and unexpected market in Western Europe. The cult of relics emerging there had cathedrals, churches and religious houses searching for the remains of patron saints and founders, which they then wrapped in finest silk before depositing them in crypts or under altars. As Byzantium could not meet the demand, Central Asian silks, from Sogdiana and especially Bukhara and Samarkand, found their way into the treasuries of Western European churches.[315]

Indicative of the wealth of the mercantile Kushan Empire and its close trade relations with Rome is the so-called 'Bagram Treasure' discovered in 1937 and 1939 by the archaeologists Joseph and Ria Hackin. Some 60 kilometres north of Kabul, Bagram is probably identical with the Alexandria ad Caucasum of Antiquity and Kanishka's summer residence Kapisa. Here the archaeologists discovered, carefully deposited in two walled-up chambers in a Kushan-period building complex, a collection of objects from three different cultural spheres. From India there were ivory carvings that had served as decorative inlays for sofas, stools and caskets,[316] from China lacquerware, and from the eastern Mediterranean around 50 plaster casts, between 10 and 20 centimetres high, of mythological scenes in a pure Hellenistic style, bronze figurines of Greek or Egyptian-Hellenistic deities, and spectacular vessels of blown glass from the Roman-Egyptian city of Alexandria. These are either finely painted drinking vessels depicting fishing, hunting or battle scenes or distinguished Roman ladies, or ichthyomorphic (fish-shaped) perfume flasks. The oldest datable object was a coin of King Hermaios (r. *ca.* 90–70 BCE), the most recent a coin of Vasudeva I (r. 191–229/30 CE). Dated to the first or early second century CE, the objects probably belonged to the collection of a rich merchant or the treasure chamber of a Kushan ruler. The coin of Vasudeva represents the *terminus post quem*, the earliest possible date for the closing of both chambers, making a persuasive case for associating the deposit with the impending conquest and destruction of Bagram by Shapur I in 241 CE.[317]

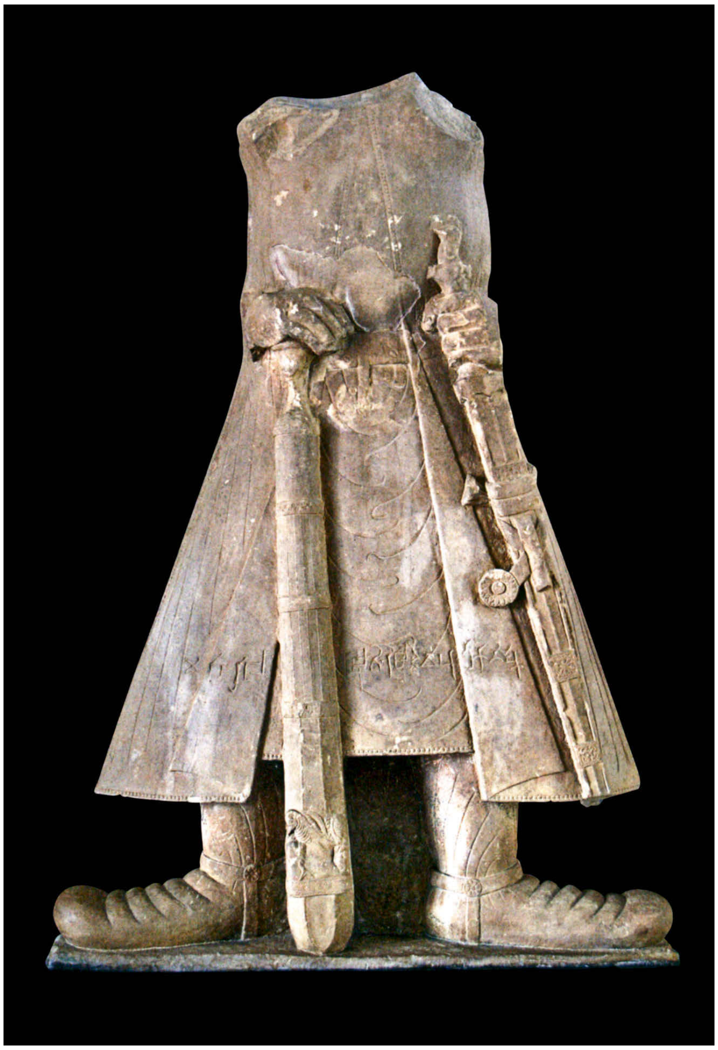
4.4.4 The Kushan Pantheon and its Dynastic Art

The religious beliefs of the Yuezhi before their arrival in Bactria are unknown. There they encountered a Hellenised culture in which Greek settlers and their descendants identified the local gods as Greek ones. They thus understood Ahura Mazda as Zeus, Mithra as Apollo, and Nana as Artemis. Confronted with this range of expressive possibilities, the early Kushans began to adopt them for the representation of their own religious ideas, as can be seen in the Hellenistic and Iranian divinities appearing in the Khalchayan frieze. At the same time, the Yuezhi came into contact with the local Bactrian fire cult, for which evidence from as early as the fourteenth century BCE was found at Jarkutan.[318] The high importance attached to this cult by many Kushan rulers can be seen not only in their coins, where they are shown sacrificing at a fire altar, but also at the dynastic cult centre of Surkh Kotal.[319] This complex of four great man-made terraces in northern Afghanistan was founded by 'Kanishka the Victorious' and renovated and extended under Huvishka in 158. On the highest platform stood two fire temples; the cella of the main temple was surrounded on three sides by an ambulatory, and in niches in the wall surrounding the courtyard stood life-size stone sculptures of Kushan rulers. Highly significant was the Kushan architects' decision to adopt the idea of an ambulatory temple; that is, of a cella surrounded by a walkable corridor, an architectural feature that Boris Litvinsky traces back to Achaemenid and Parthian precursors in Iran.[320]

The square or rectangular ambulatory temple introduced by the Kushans would serve as the basis for both the later massive Hindu temples of south India and the earliest Buddhist temples in Central Asia, first in northern Bactria with the Airtam temple east of Termez, whose foundation inscription dates to 159, and the nearby monastery complex of Kara Tepe, also dating from the second century.[321] The ambulatory temple offered the faithful the possibility of paying respect to the cella and the cult image it contained by a circumambulation, called *pradakhshina*, analogous to the circumambulation of a stupa or a holy mountain such as Mount Kailash. These Kushano-Bactrian innovations very quickly spread to the Tarim Basin, as seen, for example, in Temple 61 at Karadong (4th c.), Temple B and Temple D of the Northern Group at Tumshuk (4th–5th c.), and the early cave temples of Kizil in Xinjiang and Dunhuang in Gansu.

Related to the ambulatory temple are those cave temples in which it is possible to circumambulate a square solid core with cult images carved into it, as seen at Kizil and Dunhuang. Surkh Kotal, Kara Tepe and Airtam were partly destroyed in the aftermath of the third-century Sassanid invasion (or, less probably, in the wars between the Sassanids and the Hunnic Chionites around 368–79), most probably on the instructions of Kartir, the iconoclastic court priest who accompanied Shapur I, who in his inscriptions boasted of himself as the founder of Zoroastrian orthodoxy and persecutor of unbelievers such as Buddhists, Manichaeans, Christians and Jews.[322]

Under Kanishka and Huvishka there developed a syncretic pantheon of at least 33 different deities, similar to the Roman pantheon, and the Bactrian script, which had been introduced by Vima Kadphises, made it possible to replace Greek names for gods with Iranian ones. For many of the Kushan gods of Irano-Bactrian origin, images on coins are the first, and in some cases also the last, anthropomorphic representations to have survived.[323] How far images of emperors and gods used on coins were derived from sculptures in palaces or temples is unknown. The following gods were particularly important:[324] the goddess **Ardoxsho** corresponded either to Ahura Mazda's daughter Ashi, bringer of wisdom and wealth, or the goddess Anahita, who invests with kingship. Later, Ardoxsho would be depicted as Tyche, the Greek goddess of fate and fortune, holding a cornucopia, this figure coming to represent Hariti, Buddhist goddess of fertility. **Oesho** bore similar features as later representations of Shiva, the Hindu god of creation and destruction, since the 'Hindus borrowed Wēś' [Oesho's] attributes to present Śiva in stone sculptures' (figs. 29, 36).[325] Oesho was closely related to the Zoroastrian wind god Vayu and is often shown with a bull, similar to Shiva's mount Nandi, or with his companion, **Ommo** (Uma/Parvati). Very popular, too, were the Iranian moon god **Mao**, pictured carrying a sword and with a sickle moon behind his shoulder, the sun god **Miiro** with radiate nimbus, first represented as Helios and later as Mithra, and **Pharro**, who with flaming shoulders represented *xvarnah*, regal glory. In Gandhara, the couple Pharro and Ardoxsho correspond to the popular Buddhist divine couple of Panshika (Kubera), god of wealth, and fertility goddess Hariti.[326]



37. Sandstone statue of King Kanishka I (r. 127–151) with club, long sword and heavy, outward-turned boots. The Kharoshthi inscription proclaims: 'The great king, king of kings, His Majesty Kanishka.' Museum of Mathura.

Likewise very important was the goddess **Nana**, on whose head is a crescent moon. She is seen standing holding a staff with a horse or stag protome, or drawing an arrow from its quiver, or mounted on a lion. Nana was a complex deity who combined the functions of several different goddesses and who also had an important place in the Sogdian pantheon (fig. 191). She brought together aspects of the Mesopotamian goddesses of fertility and war – Inana and Ishtar respectively – the Zoroastrian goddess of water and fertility, Anahita, and the Greek goddess of the hunt, Artemis. Nana figures prominently on the gold belt from Grave 4 at Tillya Tepe.[327] Towards the end of the second century CE, there began to emerge from the worship of the lion-riding Kushano-Bactrian goddess Nana the cult of the Hindu goddess Durga Simhavahini, one of the most important Hindu goddesses.[328]

Less frequently encountered are coins with **Ooromozdo** (Ahura Mazda), **Mozdooano** mounted on a double-headed horse (also representing Ahura Mazda or a deified first ancestor of the Kushans), and Ahura Mazda's son **Atisho** (Atar) in the form of Hephaistos, Greek god of fire and metallurgy. In the Zoroastrian context he represented fire and served as doorkeeper of Paradise, who admitted or turned away the souls of the dead. Also found are **Lrooaspo** with a horse, responsible for the health of horses; the four-armed god **Manaobago**, the Avestan personification of 'Good Thought', Vohu Manah; the running wind god **Oado** (Avestan Vata), with his cloak floating in the air behind; the victory goddess **Oanindo** in the guise of the Greek Nike; **Oaxsho**, the fish-bearing god of the River Oxus; **Sroshardo**, equivalent to the Zoroastrian god of righteousness and obedience; the Indian war god Skanda under the names of **Skando** and **Orlagno**, who corresponds to Verethraghna, the Iranian god of victory. Much less frequently found, finally, are the Buddhist 'deities' **Boddo** (Buddha), **Sakamanoboudo** (Shakyamuni) and **Metragoboudo** (Maitreya). Equally rare are the Greco-Egyptian god Serapis, under the name **Sarapo**, the goddess **Rishto** who corresponds to the Avestan goddess of justice Arshti (Arshtat) and who was depicted by the Kushans under the traits of the Hellenistic Pallas Athene,[329] and finally the Roman god of war Mars as the armoured **Shaoreoro** as well as **Erakilo**, a naked, bearded Heracles carrying a broad club and wearing a lion's pelt.

Three schools of art flourished under the Kushan Empire: firstly the local, Indian art, secondly the Buddhist Gandhara School that will be discussed in the next chapter, and thirdly the proclamatory official art of the Kushan rulers. The local Indian style was characterised by sensual depictions of human figures, with broad hips, full breasts, plump bodies and rich jewellery. It can be seen in profane, decorative art such as the ivory carvings of the 'Bagram Treasure', as well as in early Buddhist art, as for example the stone archways of Sanchi in north central India, with their rich sculptural decoration. The crucial role of ivory carving in the earliest Buddhist art is shown by an inscription on the stone entrance gate to the hemispherical Great Stupa 1 at Sanchi, built in the first century BCE or CE, which states that local ivory carvers were responsible for one of the great scenes depicted on it.[330] Indian relief sculpture of this kind was not only full of grace and eroticism; the carvers were also interested in detail, and they loved to tell stories. They would often include several scenes within one frame, so as to compose a narrative.

Diametrically opposed to this sensual art was the dynastic conception of art of the Kushans, which is evident in gold coins and the few surviving stone statues (figs. 33, 37). It also represents a clear departure from the lively and expressive early Kushan sculpture of Khalchayan, which sought to achieve a likeness in its representation of rulers. In dynastic art, this gave way to strictly formal principles, as can be seen in the cult centres of Surkh Kotal and Māt, near Mathura,[331] as well as on coins. Figures are normally represented in a static and markedly frontal view, with feet pointing to opposite sides, but on some gold coins the head of the standing ruler is shown in profile. On other gold coins, the emperor is portrayed in bust, with arms, and with his head also in profile (fig. 29). In having themselves depicted in the traditional, heavy clothing suited to a cold climate, the emperors emphasised their rootedness in the cultural heritage of what had earlier been a nomadic horse people. While representations of rulers on the obverse of the gold coins rigorously adhere to these compositional principles, the gods on the reverse were rendered more freely. Some are presented frontally, standing with head in profile, like the emperor; others are shown mounted or in movement. As for the widely circulated bronze coinage, the representations of Vima Kadphises and of Kanishka share the rigid code of the gold coins, while Huvishka is shown seated, or riding an elephant.

Surprisingly, the Kushan rulers are never pictured in a scene of battle, or of triumph, with defeated enemies, evidently wishing to represent their unique status by means of a powerful austerity suggestive of the hieratic or even superhuman. The dynastic art of the Kushans which had developed in Bactria was influenced by Parthian sculpture, which, since the politically motivated abandonment of Hellenistic cultural features, was itself characterised by a marked frontality, in contrast to Achaemenid relief sculpture, which favoured the side-view. The Sassanids, on the other hand, combined figures in profile and frontal view in the same scene.

II

Early Buddhism in Central Asia and the Gandhara School

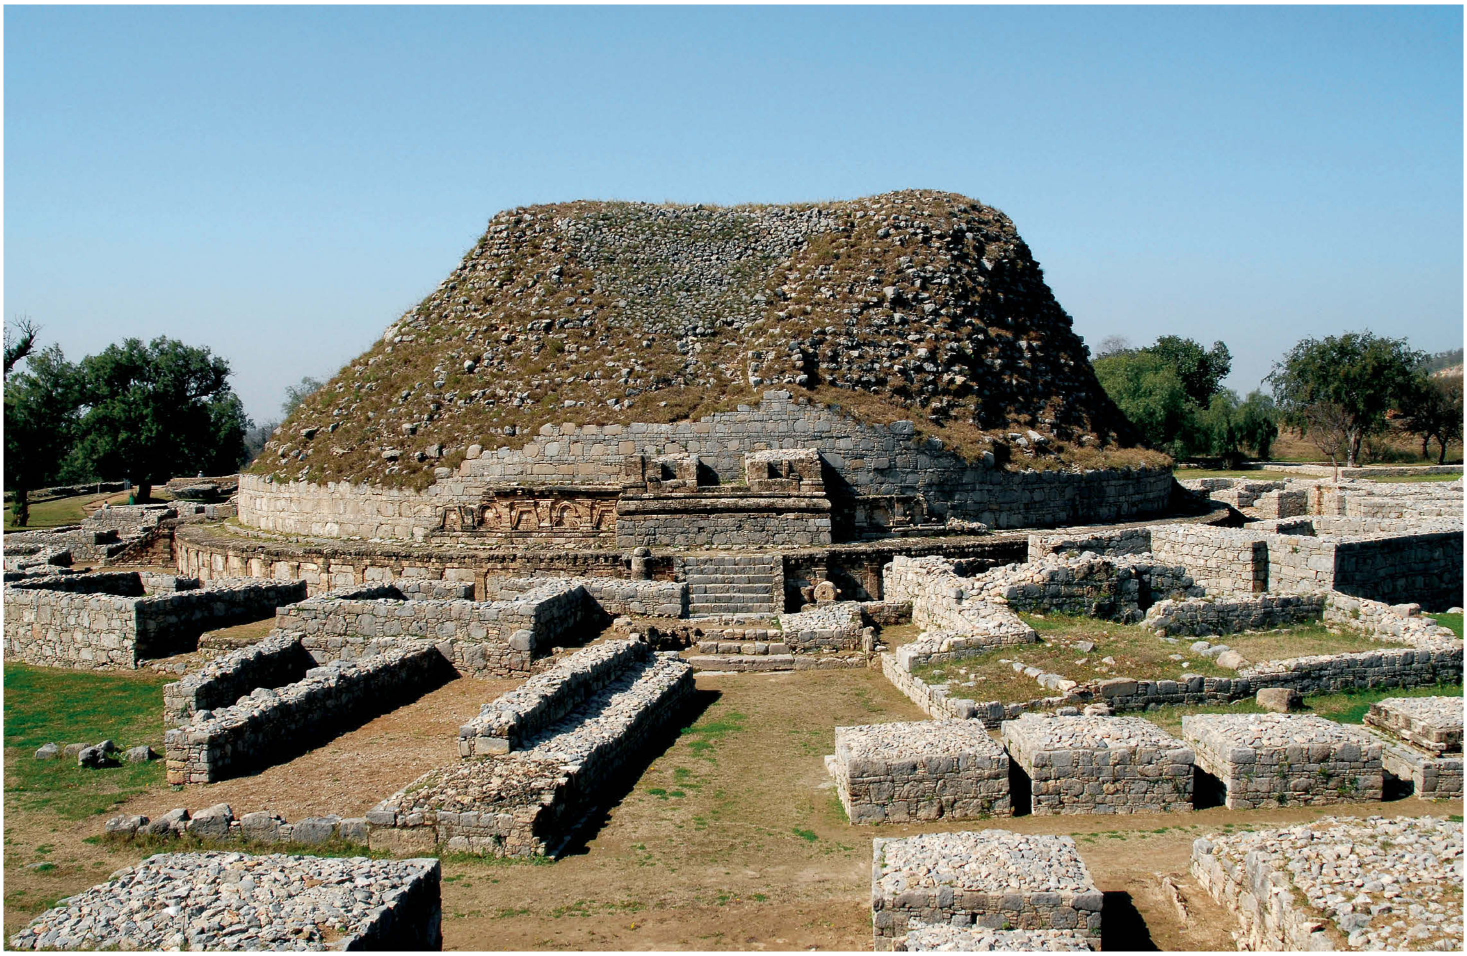
The Gandharan School of art [was] clearly influenced by the naturalism of Classical Greek style. Thus, while these images still convey the inner peace that results from putting the Buddha's doctrine into practice, they also give us an impression of people who walked and talked and slept much as we do. These figures are inspiring because they do not only depict the goal, but also the sense that people like us can achieve it if we try.

HIS HOLINESS THE 14TH DALAI LAMA[1]

1. Indian Buddhism before the Kushans

The teaching of Buddha Shakyamuni (*ca*. 563–483 BCE or 448–368 BCE)[2] developed as an alternative to the paths to salvation then current in India – an alternative accessible to all.[3] It retained, however, the fundamental premise of all redemptive religions; that is, that the world is fundamentally corrupt and life in need of redemption. It also held on to the ideas of karma – the requital of all deeds – and of rebirth. But Shakyamuni extended the concept of karma to include the intention behind an act since he believed that an intention, even if not realised, was karmically effective. He rejected as means to salvation the mortification of the ascetics, the philosophical path of the Upanishads, and the pedantic observance of Vedic rites, with their bloody animal sacrifices. Conceived as guidance for self-redemption, his teaching pointed to the twilight of the gods: the gods of the time were superfluous. As Shakyamuni addressed all humanity without regard to barriers of caste, he laid the foundation for a universal, missionary religion. He outlined his doctrine of redemption in the Four Noble Truths: life is suffering; the origin of suffering is craving for continued existence and sensual pleasure; suffering can be overcome by abandoning the craving; and the way to this is the Noble Eightfold Path. The Buddha's method of salvation makes each person responsible for his or her later lives; the Path involves mental insight, spiritual discipline and right behaviour. The Buddha's teaching was other-worldly in that the goal was not concrete change in this world but the final breaking of the chain of earthly reincarnation. As in all redemptive religions, the value of this-worldly life was reduced to its function within the process of redemption.

Having already experienced many struggles between divergent tendencies, with splits and departures of reformers to north-west India, towards the end of the first century BCE Buddhism saw the emergence of two fundamental innovations: the anthropomorphic representation of the Buddha, and the appearance of



38. The stupa of Dharmarajika in Taxila, Gandhara, Pakistan, still 15 m high today. The stupa dates from the 2nd century BCE, and its monastery was destroyed in the first half of the 6th century CE.

the new schools of thought grouped together under the concept of *Mahayana*. Both ultimately arose from the need for devotion to a personal god, which would greatly facilitate lay people's access to Buddhism. Representatives of Mahayana, the 'Great Vehicle', saw themselves as a development of *Hinayana*, the 'Lesser Vehicle'; a description that adherents of the earlier Buddhism, called Theravada, rejected as demeaning.[4] Hinayana teaching understood itself as a practical guide to individual liberation from the cycle of rebirth, as humans had to find the road to salvation themselves and walk it alone. The narrow path of renunciation could, however, only be followed by monks and nuns who had freed themselves of all worldly ties, and it thus remained closed to laypeople.

The Mahayana movement developed complex philosophical systems, but at the same time emphasised the role of male and female bodhisattvas for the sake of ordinary believers. Though bodhisattvas – whose Sanskrit name means 'enlightened beings' – do indeed strive after enlightenment, they pledge to forego their entry into Nirvana until all living beings are likewise redeemed. Bodhisattvas are kind-hearted and compassionate. They help other living creatures, taking others' sufferings upon themselves and transferring to them their own karmic merits. A broad road to salvation was thus opened up for those men and women who were unwilling or unable to follow the narrow path of monastic renunciation. It was enough to call on the compassionate bodhisattvas for help and to fulfil one's own religious and moral duties to reach at least a paradise, a preparatory stage for Nirvana. In this way Mahayana, which can also be called the 'Buddhism of bodhisattvas', became more accessible to the broader population and developed into a popular religion. While Hinayana also had the concept of the bodhisattva, it was limited to the earlier existences of the historic Buddha, as described in the 547 legends of the jataka, and to the future Buddha Maitreya. Already widespread in Hinayana, this belief in Maitreya, the Buddha to come, provided a bridge to Mahayana ideas about the future, with their many bodhisattvas.

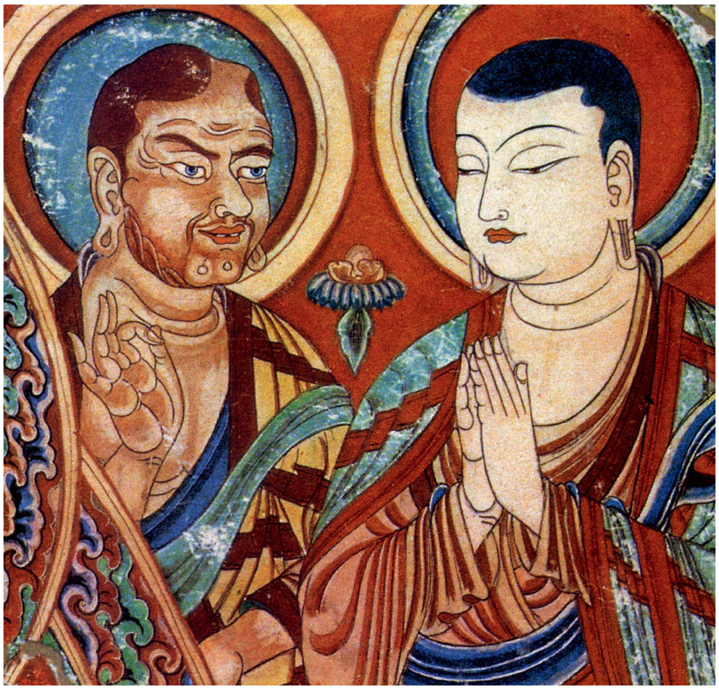
Laypeople were naturally less interested in an enlightenment difficult to comprehend than in rebirth in better circumstances, or quite simply good fortune in one's present life, achievable through the accumulation of merit, by giving to monks, for example, or donating to monasteries for the raising of stupas or statues or the copying of sacred texts, as taught by the Lotus Sutra, translated into Chinese in 286 CE.[5] Another motivation for generous giving was the prospect of transferring merit thus obtained to living or even departed relatives. Thanks to these unabashedly mercantile aspects of Mahayana theology, vast financial resources flowed to the monasteries, promoting a sustained flourishing of Buddhist art over a period of centuries.[6]

2. Diffusion into Central Asia

The first systematic missionary efforts were made by the Indian emperor Ashoka Maurya (r. *ca*. 268–234/32 BCE), who not only sought to govern his empire in accordance with Buddhist principles, but also sent Buddhist missions to Sri Lanka, Kashmir, the Himalayan princedoms and Greco-Bactria, and also to the Seleucids, the Ptolemies of Egypt, and the Antigonids of Greece. We do not know whether these emissaries reached their destinations, but Ashoka did have his Buddhist edicts inscribed at three different sites in the future Kushan Empire: in Kharoshthi script[7] at Manserah and Shabazgarhi in north-west Pakistan, and bilingually in Greek and Aramaic at Kandahar in south-east Afghanistan. A century after Emperor Ashoka, Buddhism enjoyed the respect and support of several Indo-Greek kings from Menander to Archebios, the satraps of Mathura, and the Indo-Saka satraps of Bajaur on Pakistan's north-western border with Afghanistan. Evidence of this favour is afforded by the Indo-Greek coinage already discussed, inscriptions on reliquaries containing relics of the Buddha, such as were dedicated by members of the Indo-Saka satrap dynasty of Bajaur, or the red sandstone capital from Mathura in central India, whose inscription lists those of its ruling satraps who promoted the Buddhist cause. All these Kharoshthi inscriptions date from the first two decades of the first century CE.[8]

A few Buddhist sources report that the Buddha himself, soon after his enlightenment, had chosen two merchants from Balkh in Central Asia as his very first lay disciples and taught them the enshrinement of relics in a stupa. As Xuanzang relates, once initiated into his teaching the merchants asked for an object that they might venerate, whereupon the Buddha gave them some of his own nail clippings and hair and explained to them the form and construction of a stupa in which the relics were to be kept. He took his three garments, *tricivara*, folded first the outer garment, *sangati*, twice and put it on the floor, and on top of it the lower garment *Antaravasaka* and the upper garment *Uttarasangha* in such a way that always a smaller garment came to lie on top of a bigger one. Finally he placed his alms bowl, *patra*, upside down on to the pile of clothes and on top of it all his monk's staff, *khakkhara* – this is how he designed a model for all stupas. And he goes on: 'The two men taking the order, each went to his own town [near Balkh], and then, according to the model which the holy one had prescribed, they prepared to build a monument, and thus was the very first stupa of the Buddhist religion erected.'[9] This legend underlines the important role of Central Asia in the diffusion of Buddhism outside India.

The cosmopolitan attitude of the Kushans and their promotion of trade made it possible for Buddhism, whose teaching was particularly appealing to the class of urban traders, to travel in the footsteps of the trade caravans, first conquering southern Afghanistan before advancing into Central Asia. Already around the end of the first century BCE, in the time of the five Yuezhi princedoms, Buddhist monks and missionaries had reached the Oxus, establishing a small Buddhist monastery at **Termez**, the ancient Tarmita, on the north bank of the river.[10] In the second half of the first century CE, Kujula Kadphises or Vima Takto developed Termez into a heavily fortified commercial metropolis, and the city quickly became a base from which Buddhist missions were sent to Eastern Turkestan and on to China. In Termez there were not only monks; there was also a thriving lay civic community, as is witnessed by the number of city temples with their countless dedicatory inscriptions and even painted portraits of donors.[11] At least one of these temples had Indo-Corinthian capitals, on each of which, amid the acanthus leaves, sits a small Buddha figure in an attitude of meditation.[12]

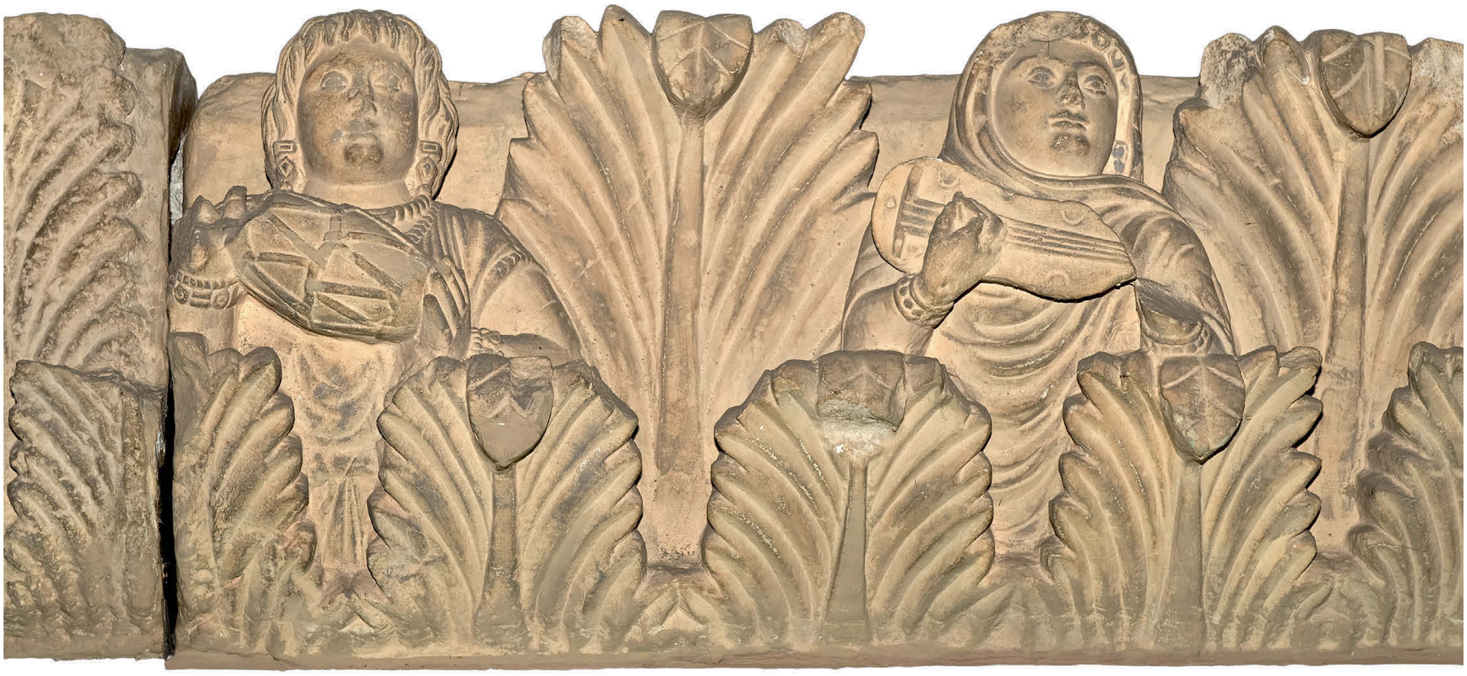


40. A Central Asian Buddhist monk (left) and a Chinese one (right). Pranidhi scene no. 5 (in Le Coq's counting) from cave 9 in Bezeklik, Xinjiang, China, 11th c. No longer extant. Albert von Le Coq, *Chotscho*, 1913, pl. 21.

Among the largest of the monasteries built between the first and third centuries is the great cave complex of **Kara Tepe**, with its several temples and enormous, freestanding stupa. Numerous ostraca inscribed 'Kadevaka Vihara' testify to Kara Tepe's status as a 'royal temple', suggesting that it was an imperial temple of the Kushans.[13] Carved in the living rock, the figure of a seated Buddha with figured halo, surrounded by an aureole painted on the stone, became, as Marylin Martin Rhie observed, the prototype for the late third–fourth century Style I buddhas on the great stupa of Rawak near Khotan in the south-west Tarim Basin.[14] Like many Buddhist cult sites north of the Oxus, the monastery had a tumultuous history. Founded at the time of the Kushans, it suffered during the campaigns of Shapur I or Shapur II and from the third/fourth to the fifth century served as a necropolis where the dead were often buried with a coin in their mouth or hand, a 'Charon's obol'. Around the fifth or sixth century, the site was reconstructed and turned into a Buddhist monastery but the destruction and looting of the city of Termez by Said bin Uthman, the Arab governor of Khorasan, dealt the fatal blow to Buddhism in 676.[15] Not far from Kara Tepe are the enormous stupa of **Zurmala** and the monastery of **Fayaz Tepe**, whose own stupa, renovated in the second or third century, is of cruciform plan. It consists of three rectangular platforms, one upon the other and each smaller than the next, with staircases on each side, on top of which rises a domed, cylindrical structure. This stupa represents a gigantic, walkable, three-dimensional mandala, whose concept derived from Kanishka's stupa at Shah-ji-ki Dheri, and itself served as the model for the Rawak stupa (figs. 111f).[16] The cruciform-shaped stupa with staircases also symbolised Buddha Shakyamuni's 'descent from heaven', his human incarnation.[17]

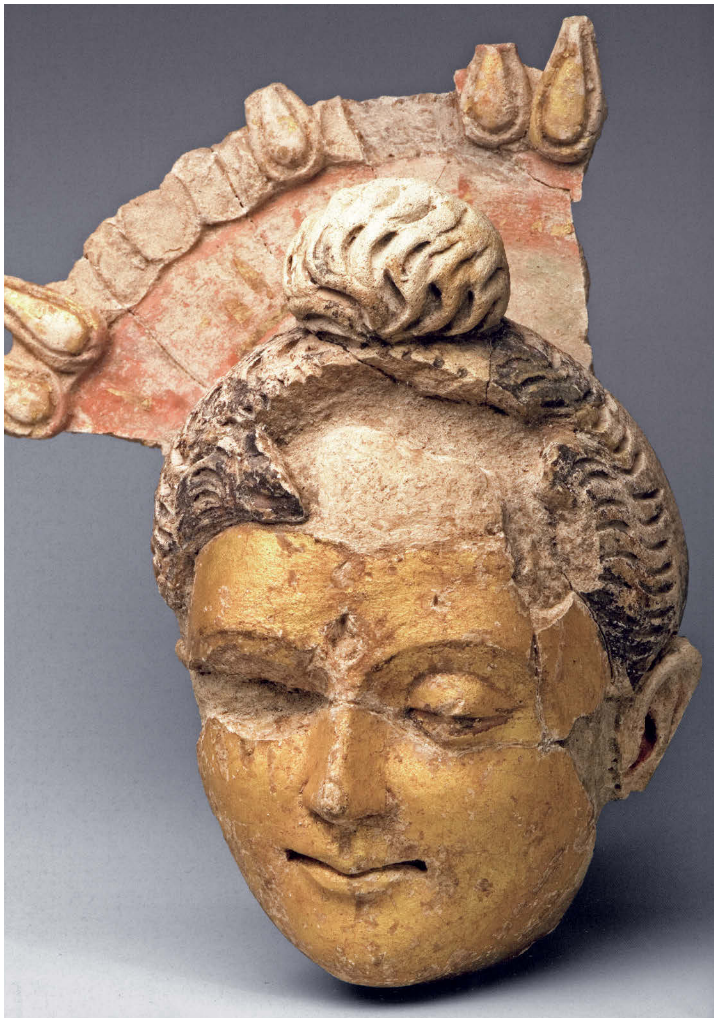
Two other important Buddhist monasteries of the Kushans were discovered near Termez by accident. In 1932, close to a place called **Airtam**, a man fishing on the north bank of the Oxus found eight limestone blocks worked in the classical Gandhara style of the Kushans. The 14 figures set between acanthus leaves represent women musicians and women offering flower garlands to a stupa.[18] In **Dalverzin Tepe** it was a tractor driver who came across some stucco fragments in a field, leading to the discovery by archaeologist Galina Pugachenkova of the heads of many statues once mounted on walls but deliberately destroyed in the fourth century.[19] Dating from the early second century, these statues were made using a technique that would soon spread throughout the Tarim Basin and beyond that to Tibet, Gansu and all of China. A rough form was created by applying clay mixed with straw to a core of wood and straw held together by thick cord. This was covered with damp cloth, then several layers of clay plaster were applied which were finally shaped and painted. As Pugachenkova noted, the cloth 'functioned as a binding element between materials such as clay and gypsum that would otherwise not form a strong bond'.[20] The heads of these figures display another characteristic of Gandharan origin, also found in the Tarim Basin and Gansu. While representations of benefactors and local princes were lively, individualised portraits, those of buddhas and bodhisattvas appear stereotyped and lifeless, having been created by impression from standardised moulds. As such moulds were considered sacred objects, they were kept a long time, and the dating of temples on the basis of the stylistic features of such clay statues alone can be misleading. An art historian might well wonder at finding seemingly older clay figures amid walls, murals and dedicatory inscriptions of more recent date.

Most Buddhists in Termez belonged to the Hinayana Mahasamghika and Sarvastivadin schools,[21] which contributed to the spread of worship of anthropomorphic images of the Buddha.[22] In fact, it was for the most part Sarvastivadin monks who in the late first or early second century CE brought Buddhism to the Tarim Basin, first to Kashgar and Khotan. They came either from Bactria to Kashgar, or directly to Khotan via Gilgit from Kashmir. Although Buddhism in its Hinayana forms did not establish



41. Female musicians between acanthus leaves. Gandhara style, limestone, Airtam, southern Uzbekistan, 2nd c. CE. The State Museum of History, Tashkent.

itself along the Northern Silk Road until the third century,[23] it would remain dominant there for centuries at cult sites such as Tumshuk, Kucha, Turfan and Karashahr. On the Southern Silk Road, on the other hand, in Kashgar, Khotan and the kingdom of Shan-shan, Hinayana Buddhism spread much earlier but by the late third century began to retreat again under the pressure of Mahayana.[24] The more rapid diffusion of Buddhism along the Southern Silk Road reflects the flow of trade at the time. In the first three centuries CE, caravans favoured the southern route, but with the decline of Loulan and Niya in the fourth century trade turned to the northern route, bringing with it the elite of wealthy merchants who were among the most important sponsors of Buddhist religious institutions, which now saw rapid growth in the north. As the orientalist Hans-Joachim Klimkeit has noted, the geography of the trade routes in east Central Asia, and in the Tarim Basin in particular, is marked by the harsh contrast between the flourishing oasis towns and the dead wastes of the desert, where travellers were menaced not only by sandstorms and lack of water but also by ruthless robber bands: 'Thus for the oasis-dweller [and the trader], the situation of the sheltered town and the open, dangerous [deserts] and steppes corresponds to the duality of order and chaos, of life and death.'[25] Given the transience of life, it is understandable that the people of Eastern Turkestan sought consolation in the compassion and protection of buddhas and bodhisattvas.

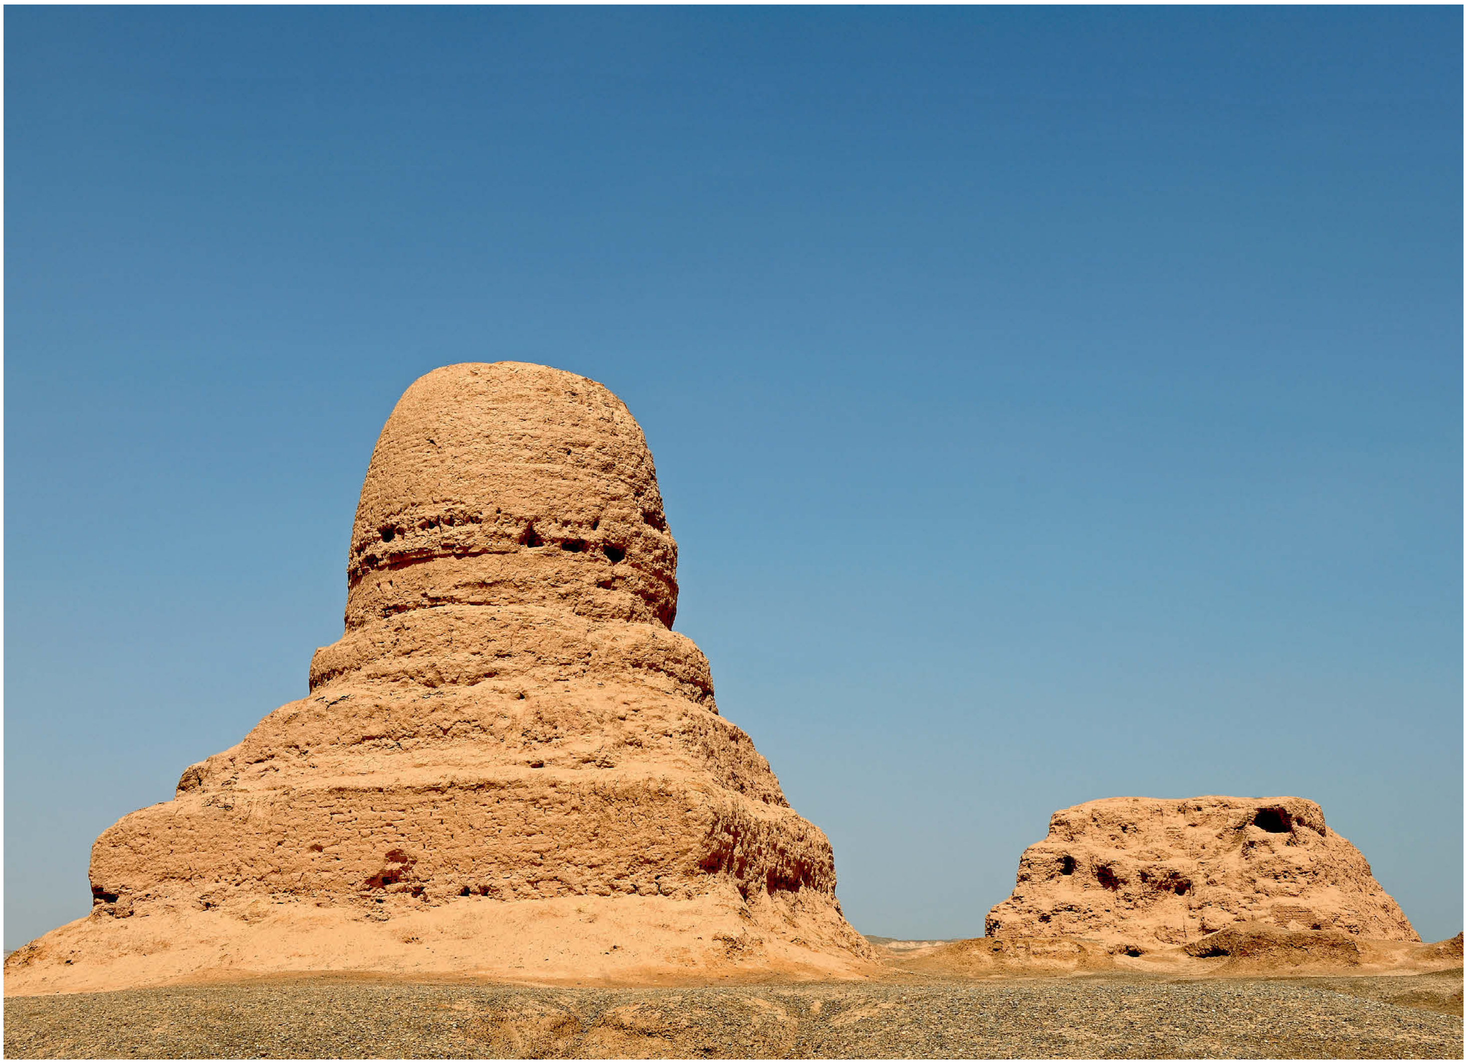


42. **Head of the Buddha. Gilded, unfired clay and stucco. Kara Tepe, southern Uzbekistan, 2nd–3rd c. CE. The State Museum of Oriental Art, Moscow.**

A Kharoshthi stone inscription discovered by the present author at Endere in 1998 shows that by 263 Mahayana had come to enjoy the patronage of King Amgoka (r. 246–277) of Shan-shan, who identifies himself there as *Mahayana Samprastida*, 'who has set forth on the Mahayana'.[26] This is a title very rarely found in Central Asia, otherwise being known only from a third-century inscribed wood tablet found in 1901 by Sir Aurel Stein in the oasis city of Cadota (Niya), part of the kingdom of Shan-shan. There it is the *cozbo* or governor, Samasena, who has this title.[27] The oasis city of Khotan for its part soon developed into a centre of Mahayana Vajrayana Buddhist learning. In the monastic scriptoria there, as later in Turfan, not only were Indian sutras collected and commentaries written on them, but many new, 'apocryphal' sutras were composed. These texts also served as foundation for the development of local forms of Chinese, Tibetan, Tangut, Uyghur and Mongolian Buddhism.[28] Many of the Buddhist manuscripts found in Khotan, elsewhere in Central Asia, and in Dunhuang, are of inestimable value, as the Indian originals no longer exist.

With Buddhism, two scripts in which to write the local languages also came to the Tarim Basin. In the northern oases (except Tumshuk) the slanting type of Central Asian Brahmi was developed for Tocharian A and B, while the upright Central Asian Brahmi, also known as square Brahmi, was used for the Iranian Saka dialects of Khotan, Kashgar and Tumshuk. With the further development of the Saka language, the fifth century CE saw the adoption of a cursive form of Central Asian Brahmi, based on the Gupta Brahmi script.[29] Along the Southern Silk Road and in Shan-shan especially, administration was carried out through the Gandhari Prakrit, an Indian language from Gandhara, which was written in Kharoshthi.

The striking similarity between the facial features of the very early bronze Buddha at Harvard's Sackler Museum (fig. 30) and those of the Kushan rulers at the dynastic cult centre of Khalchayan in southern Uzbekistan suggests the hypothesis that the impulse for the earliest diffusion of the Buddhist faith and



43. The nearly 12-metre-high stupa of Mauri Tim, situated 30 km east of Kashgar, belonged to a large monastery. Late 2nd or early 3rd c. CE. Xinjiang, China.

Buddhist art among the urban circles of Luoyang, then the capital of China, came directly from northern Bactria and not from the Tarim Basin that lay between the two. It would seem that on its way to China Buddhism 'leapt over' Eastern Turkestan,[30] a region which represented no more than a traverse for the trade caravans. This hypothesis is supported by the fact that Central Asian scholars began to translate Buddhist texts into Chinese, in China itself, as early as the second century.

The earliest leading translators came from Central Asia, from areas under the political and cultural hegemony of the Kushans; they were Kushans and Indo-Parthians.[31] Among the most important were the Parthian An Shigao,[32] who translated Sarvastivadin sutras in Luoyang from about 148, his Parthian pupil An Xuan, originally a merchant (from around 181), and the Kushan Lokaksema, who from 167 translated Mahayana scriptures into Chinese. Other Kushan translators with Chinese names were Zhi Yao (*ca*. 185), Zhi Qian (*ca*. 220–252) and Zhi Yueh (*ca*. 230). The development of Chinese Buddhism was further advanced by the work of the Dunhuang-born Kushan Dharmaraksa (230–*ca*. 313), who translated the crucial *Saddharmapundarika* sutra, commonly known as the Lotus Sutra. This important text was written in stages through the first two centuries CE in either northern India or Central Asia, in a Prakrit language, before it was later translated into Sanskrit for prestige reasons.[33] To sum up, it was from Central Asia that China first received Buddhist teaching, Buddhist texts and Buddhist notions of art; as Litvinsky vividly put it, 'Central Asia acted as a gigantic conveyor belt in the diffusion of Buddhism and Indian culture to China and on to Korea and Japan.'[34]

Buddhism received a much less enthusiastic welcome in western and north-western Central Asia than it did in the east, though isolated Buddhist communities were established in Sogdiana, for example in Samarkand, as well as further west,

A Murder Uncovers East Turkestan's Pre-Islamic Past

Until 1890, the Buddhist history of the Tarim Basin remained hidden in sand. A singular competition between scholars of different nations was triggered by the murder of Scottish trader Andrew Dalgleish on the Karakorum Pass in 1888, which led the government of British India to send a Lieutenant Hamilton Bower to catch the culprit.[35] In early March 1890 this officer was in Kucha, where he bought a manuscript in the form of 51 oblong birch-bark leaves bearing Gupta script, stolen by a treasure hunter from a stupa at the nearby cave complex of Kumtura. First deciphered by philologist Rudolf Hoernle in 1891, the 'Bower Manuscript' proved to be a collection of seven medical texts, written in the early sixth century by four Kucha monks.[36] Once published, the translation caused a sensation, indicating as it did that other pre-Islamic treasures awaited discovery in the Tarim Basin.[37] Russian and British scholars were the first to recognise the potential for fresh discoveries, giving the 'Great Game' – the competitive struggle for political influence in Central Asia – a new, scholarly, dimension. The two countries' diplomatic representatives in Kashgar, the Russian consul-general Nicolay F. Petrovsky (in office 1882–1902) and his British counterpart Sir George Macartney (in office 1890–1918), then activated their local networks in order to acquire old manuscripts.

A significantly older Central Asian manuscript than Hamilton Bower's bears a collection of the Buddha's sayings called the *Dhammapada*, originally compiled in the fourth or third century BCE in Pali. The Kharoshthi script of this version in Gandhari Prakrit dates from the first or second century CE. It was discovered in the 1890s in the ruins of the Gosinga monastery near Khotan, in the form of a birch-bark roll originally five metres long. A large part of this was acquired in 1892 by the French explorer Jules Dutreuil de Rhins, and a smaller part by Consul-General Petrovsky.[38] The publication of the manuscript by S.F. Oldenburg in 1897 had an enormous impact, confirming and underlining the conclusion drawn from the Bower Manuscript, that Eastern Turkestan had enjoyed a long Buddhist past.

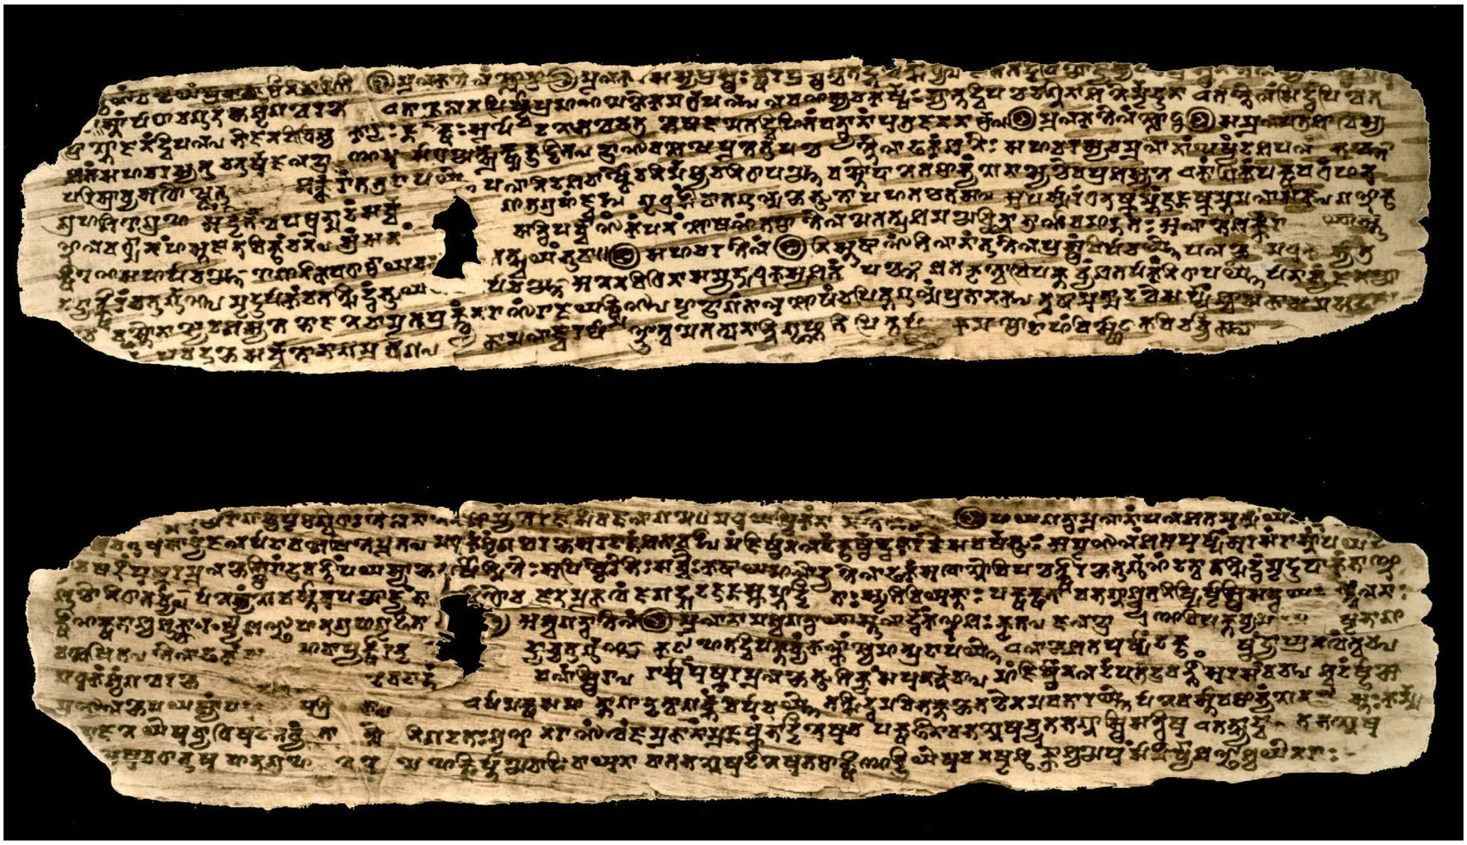
The competition for ancient manuscripts between Petrovsky and Macartney would bear curious fruit, since demand many times exceeded supply. Islam Akhun, a Uyghur from Khotan, seemed to be an exceedingly gifted treasure seeker in the Taklamakan Desert. In 1895 he began to supply both consuls with birch-bark manuscripts, and in 1896 with woodblock prints, many of which ended up in museums in London and St Petersburg. Hoernle and his Russian counterparts were able to decipher the first texts they received, but as more came in, only the Brahmi characters were familiar while the language was unknown, and finally, even the characters were incomprehensible. While Hoernle laboured over his translations and ignored the warnings, in 1898, of the Kashgar-based Swedish missionary Bäcklund and the researcher Deasy,[39] the orientalist Marc Aurel Stein began to suspect that the indecipherable manuscripts were fakes. In 1901, Stein succeeded in questioning Islam Akhun, who after initially defending himself made a full confession. He and his partner Ibrahim Mullah had started by faithfully copying Brahmi texts, before inventing new 'words' to be written in Brahmi and later making up their own scripts. Given the enormous demand, Islam Akhun had opened a workshop where he cut woodblocks and printed 'ancient' texts on local paper bought in the bazaar. He then aged the prints by smoking them and burying them in sand.[40] There was now nothing the museums could do but remove these very costly counterfeits from their collections.

---

at Gyaur Kala in Merv, around the second century CE, where the Chinese officer Du Huan – taken prisoner near Talas in southern Kazakhstan in 751 and transported to Merv – would later come upon two Buddhist monasteries.[41] Faced with state-sponsored orthodox Zoroastrianism, Buddhism found itself in a difficult position. On the one hand, non-Zoroastrian religions in the Sassanid Empire were often the objects of persecution, and on the other, much of Buddhist belief must have been quite foreign to Zoroastrian ways of thought. While Zoroastrianism was based on the ideas of a creator God, a continuous conflict between opposing principles, and finite time, and saw human reproduction as a duty, Buddhism recognised neither creator god nor cosmic struggle, saw time as cyclical, and took monks and nuns – childless and set apart from the world – as its ideal; in addition, the funeral rites of the two religions were fundamentally different.[42]

3. The Art of Gandhara

Humanity stands at the centre of Buddhism in two important respects: its teaching is focused on the believer, and its history is therefore not centred on a divinity, as it is in the Hindu or Semitic religions. In Buddhist art, then, it is the Buddha (as historic teacher or as various aspects of a cosmic buddha), the bodhisattvas, and monks and nuns and lay believers who occupy the foreground; the deities which were subsequently incorporated into Buddhist imagination play a merely secondary role.[43] Before his death, Buddha Shakyamuni identified his teaching as his true successor and leader of the community; and as a visual symbol of his continuing presence, easily understandable to all, he ordered that stupas be built at the four places most important in his life: at his birthplace Lumbini in the north; at Bodhgaya, the place of his



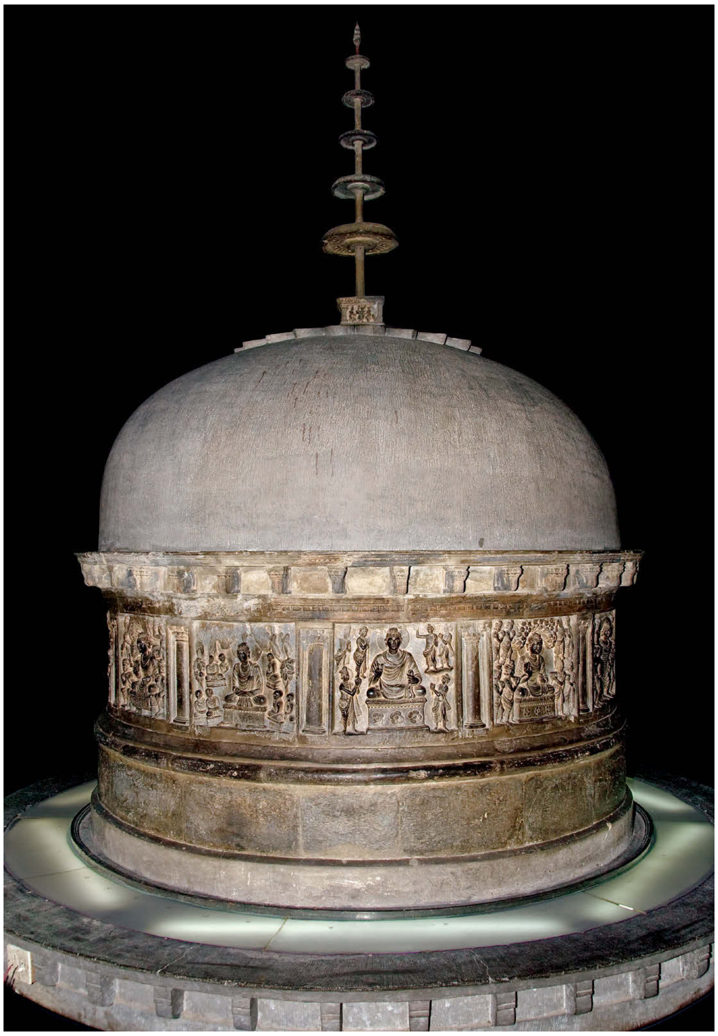
44. The Bower Manuscript, part II, leaf II. The birch-bark manuscript is a collection of medical texts in Buddhist Hybrid Sanskrit and written in the Indic Gupta script in the early 6th c. in Kucha. A.F. Rudolf Hoernle, *The Bower Manuscript*, part II, fasc. I, 1894, pl. XVI.

enlightenment, in the south; at Sarnath, where he first preached, in the south-west; and at Kushingara, the place of his death, in the north.[44] The four stupas marked out a sacred geography, a pilgrimage route which, like the ritual circumambulation of a stupa, had to be performed clockwise.

As the French art historian and ‘father of Gandhara studies’ Alfred Foucher noted in 1905, ‘the ancient stone-carvers of India [were] very industriously engaged in carrying out the strange undertaking of representing the life of the Buddha without Buddha’.[45] Indeed, early Buddhist sculptors avoided depicting the Buddha in human form, preferring symbolic representations. Among these are the four key stages of his life that he had ordered to be commemorated by the construction of stupas, and these symbols also have a further meaning related to the teaching. The lotus flower thus symbolises both the Buddha’s birth and the purity of the Buddha nature; the Peepal Tree, also known as Sacred Fig (*Ficus religiosa*), the Buddha’s enlightenment and the attainability of redemption; the eight-spoked wheel, the Buddha’s first preaching and the *dharma*, the teaching; and the stupa, the Buddha’s death, his presence in the teaching, and Nirvana. Other favoured symbols of this aniconic period (5th–1st c. BCE)[46] were an empty throne, which, like the Sacred Fig, signified the Buddha’s enlightenment; the imprint of a foot with the eight-spoked wheel on the sole, expressing the Buddha’s presence and the effect of his teaching; a horse with saddle but no rider, standing for his renunciation of worldly pleasure; and the lion, representing the unmistakeable power of the Buddha’s message.

Another way of communicating the Buddha’s teaching and his exemplary qualities to mostly illiterate laypeople was found in the figural representation of episodes from his earlier lives, and even earlier (e.g. animal) forms of existence. These were recorded in a collection of 547 stories called the *Jatakas*, tales with a markedly moral lesson. They tell how through countless rebirths the future Buddha Shakyamuni ascends all the rungs of the ladder of knowledge, until at last, as Siddhartha Gautama, he reaches the final level of existence that opens on to enlightenment. In all the jatakas the future Buddha acts in accordance with virtuous moral principles, first as an animal of many different species with human characteristics, later as a woman and as a man.[47] He is always guided by such values as willingness to recognise past faults, contrition, humility, empathy, compassion, and willingness to sacrifice oneself for the sake of all living beings in need of help. Many of these jataka legends were originally pre-Buddhist fables, adapted to Buddhist ends. Stone-carvers used these tales, still popular today, to decorate first the stone gates and balustrades that stood before the stupas, and then the relief panels of stone or stucco mounted on the circular or square base of the stupa itself.

Following the Roman model, the panels represent the life of the Buddha in self-contained episodes in framed fields – unlike the Indian relief art found at Sanchi in Central India, in which many successive events in a number of scenes were all contained within a common frame. The Gandhara panels were set clockwise in chronological order around the structure, so that by circumambulating it believers could 'read' the scenes as a coherent narrative and exposition of teaching. As the anthropomorphic representation of the Buddha became more prevalent in the second century CE, such panels came to retell his whole history. Starting with selected previous existences, they then depicted Shakyamuni's life, from his mother Maya's miraculous conception to his entry into Nirvana; in their ritual circumambulation of the stupa believers could now immerse themselves in the life of the Buddha as represented in sculpture.[48] In an intermediate phase, towards the end of the aniconic period, artists depicted episodes from Shakyamuni's life before his enlightenment in which the Buddha was represented as a prince or an ascetic.[49]

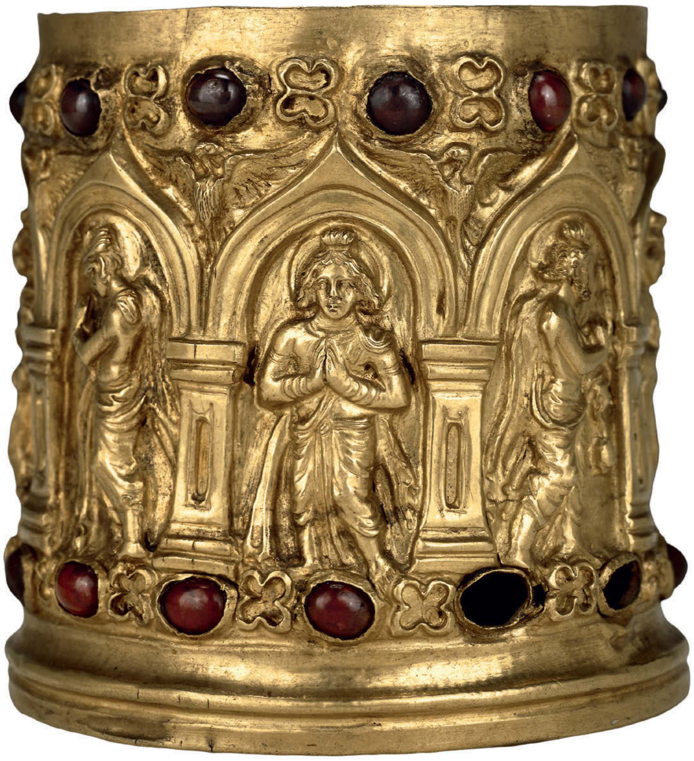


45. The reconstructed stupa from Sikri, Gandhara, with 13 narrative panels, excavated by Harold Deane in 1888, *ca*. 2nd c. CE. Central Museum, Lahore.

Early Buddhist sculpture is very closely related to the secular art of India, as was shown by the comparison with ivory carving mentioned earlier (see p. 58). This closeness reveals itself not only in the sensuous and erotic portrayal of the human body, but also in the drinking and banqueting scenes which were very popular with the Hellenised Indo-Parthians, and are reminiscent of Dionysian fertility rituals. As eroticism and intoxication did not accord with Buddhist principles, the sensuality vanished from stupa panels, and the carouser holding a *kylix*, a broad and shallow drinking cup, became a mannered Buddhist believer with lotus flower in hand.[50]

The need for a figurative representation of the Enlightened One was so strongly felt that a number of texts began to ascribe the first creation of Buddha figures to those close to the Buddha himself, and to show him as approving this. As the monk Faxian has it: 'When the Buddha went up to heaven for ninety days to preach the Faith to his mother, king Prasenajit, longing to see him, caused to be carved from sandal-wood an image of [the] Buddha . . . and placed it where [the] Buddha usually sat. Later on, when [the] Buddha returned to the shrine, the image straightaway quitted the seat and came forth to receive him. [The] Buddha cried out: "Return to your seat: after my disappearance you shall be the model for [those] in search of spiritual truth."'[51]

One of the earliest representations of the Buddha is found on the Bimaran Reliquary, discovered in 1834 at Stupa 2 in Bimaran near Jalalabad by the British explorer James Lewis, known as Charles Masson, a deserter from the East India Company's Bengal Artillery.[52] The 7-centimetre-high gold reliquary was found in a steatite casket, whose Kharoshthi inscription states that the reliquary contained bones of the Buddha. In this casket were also found four coins of the Indo-Saka king Azes II, who ruled in the last decades of the first century BCE. Decorated with almandine garnets, the sides of the reliquary are divided into eight pointed arches, under two of which are Hellenistic-looking Buddha figures, each flanked by Indra and Brahma – a motif typical of Early Gandharan art. The other two niches under the arches are occupied by bodhisattvas or believers shown in postures of prayer. Despite

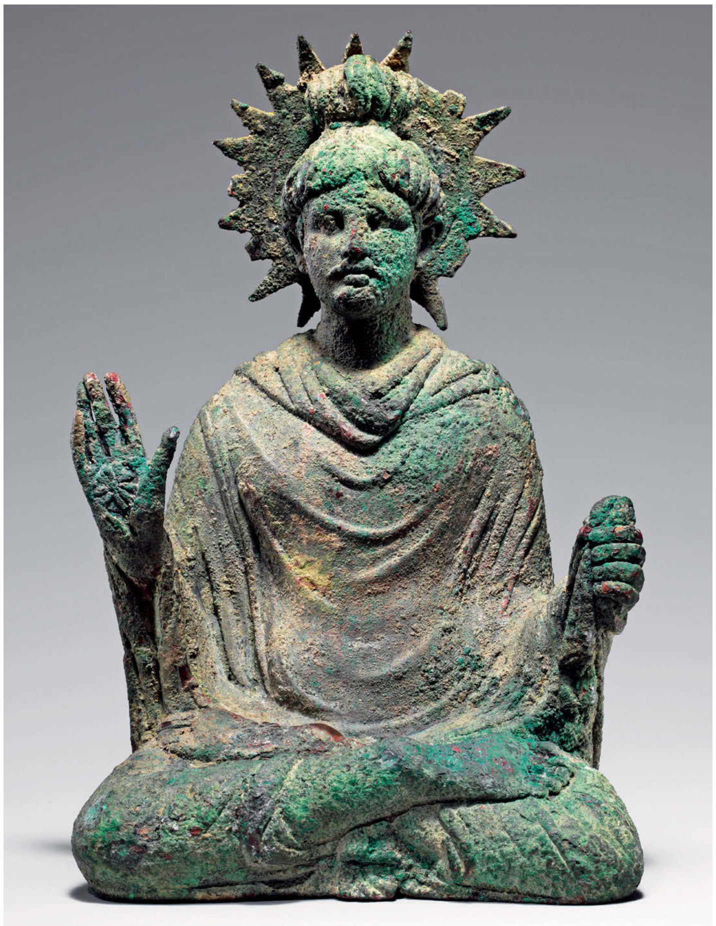


46. The Bimaran Reliquary discovered by Charles Masson in 1834 in Stupa 2 of Bimaran near Jalalabad, south-eastern Afghanistan, 2nd quarter of the 1st century CE. In the centre is a devotee or a bodhisattva with his hands pressed together in the gesture of reverence called Anjali mudra. The Trustees of the British Museum, London.

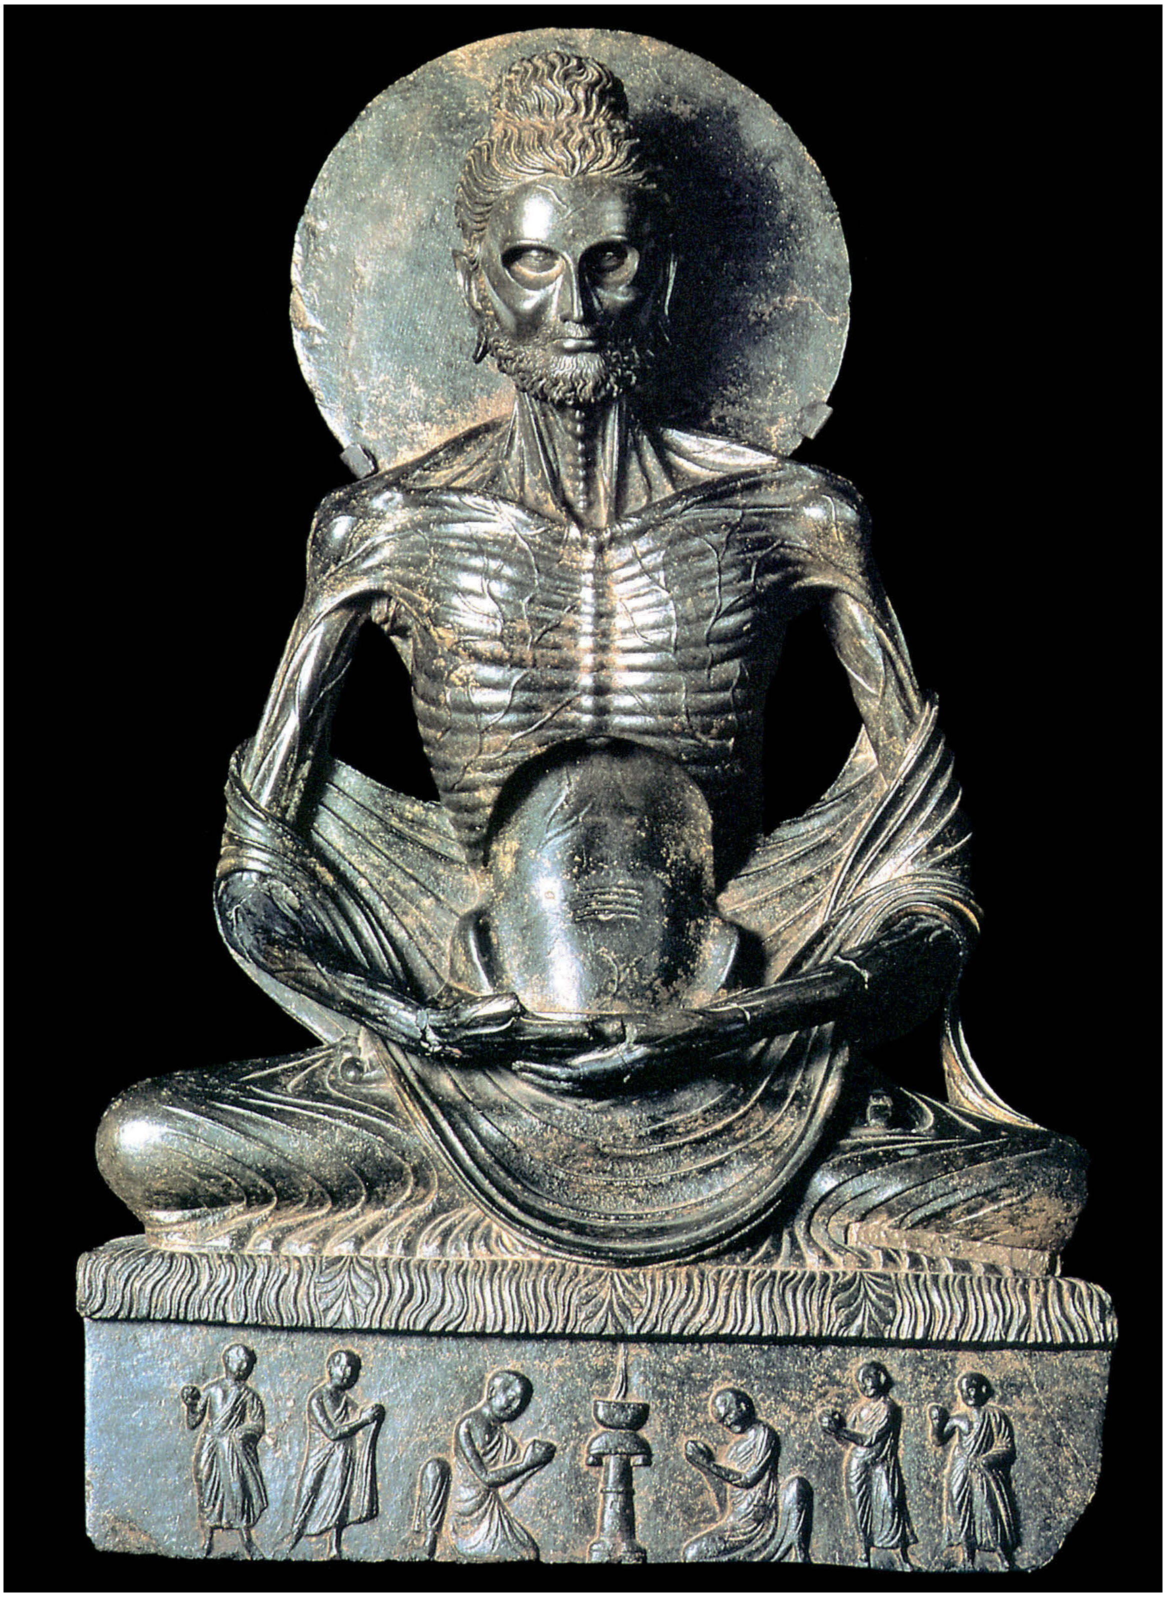
the coins of Azes II, the dating to around the very end of the first century BCE is disputed, as the accomplished form and sophisticated iconography of the figures suggest a chronological scheme of development that would put the earliest beginnings of Gandharan art in the time of the late Indo-Saka or Indo-Greek kings – half a century earlier than generally assumed. From an epigraphical point of view, the Kharoshthi inscription can be dated to around 50 CE,[53] and in the opinion of the present author there are no reasons to date the reliquary any later than 30–50 CE.

The first century CE was a time of experiment for Early Buddhist plastic art, as can be seen in a medallion from Grave 4 at Tillya Tepe[54] and a small bronze figure of a seated Buddha with serrated halo kept at the Metropolitan Museum of Art in New York.[55] Such a halo also characterised the solar deities Helios and Mithra on the gold coins of Kanishka, but it is highly exceptional in the Gandharan tradition of representation of the Buddha and thus may be judged an early experiment.[56] There quickly emerged two different canonical styles of Buddha representation, that of Gandhara in north-western and that of Mathura in north-central India.[57] The Mathura School's red sandstone statues – of which the most famous, in the National Museum in New Delhi, is dated to 159 CE[58] – for the most part show a powerfully built, seated Buddha wearing a close-clinging robe, often with exposed right shoulder; even when they show some signs of Gandharan influence, they are essentially rooted in the formal language of Indian art, more particularly in that of the Amaravati School.

In Gandhara, on the other hand, there emerged a fascinating art that may seem familiar in some ways to Europeans. Hellenistic principles of visual art from Greco-Bactria combine with figural elements from the Roman Empire, Palmyra, Iran and the Kushan Empire to produce a Buddhist iconography intended to give expression to religious beliefs of Indian origin. This unique synthesis blossomed from the first to the late fourth century, initially finding expression in grey, bluish, dark-green or black schist, and from the third century also in the stucco taken over from the Romans. First depicted standing in contrapposto,[59] the Buddha wears sandals, an undergarment, and a monastic robe covering both shoulders



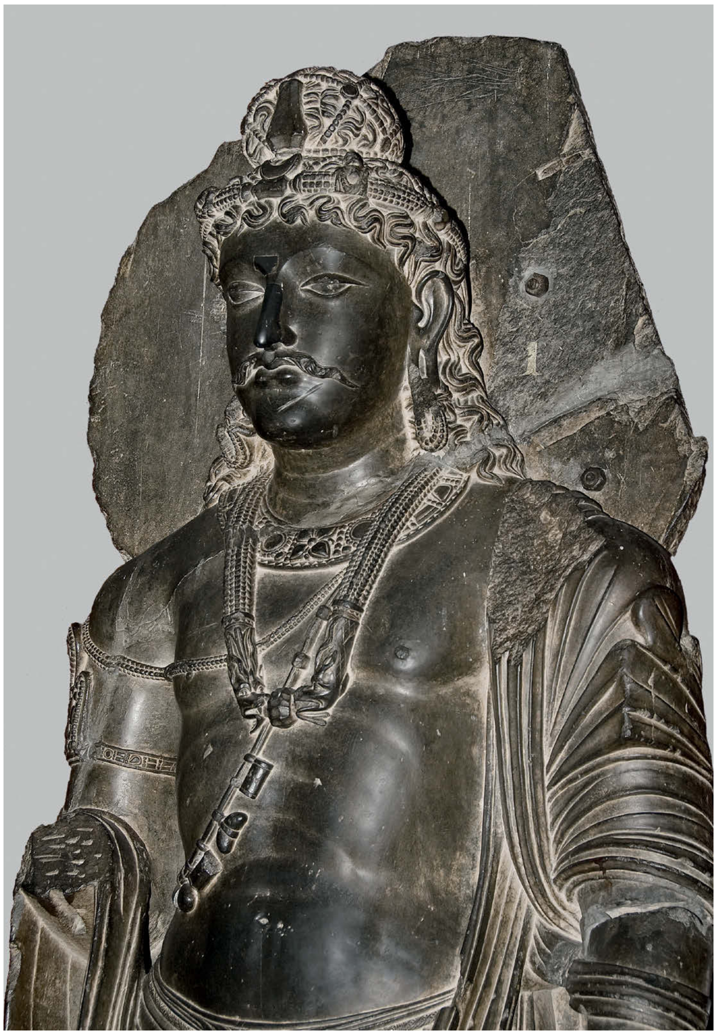
47. Bronze statuette of Buddha Shakyamuni with a serrated halo, Gandhara, 1st to 2nd c. CE. The figure shows influence from Roman imperial portraits and the halo with sharply incised rays also appeared on coins of Kanishka and in Sassanid representations of Mithra. The Metropolitan Museum of Art, New York.



48. Fasting Siddharta, dark grey schist. On the front of the pedestal is a fire altar with three devotees on each side. During this six-year period, Siddharta Gautama practised extreme asceticism, in the hope of learning the truth about human existence. Finally Siddharta realised that the path of extreme mortification was futile and decided to follow the Middle Way between luxury and asceticism. Excavated from the monastery of Sikri, Gandhara, 2nd to 3rd c. CE. Central Museum, Lahore.

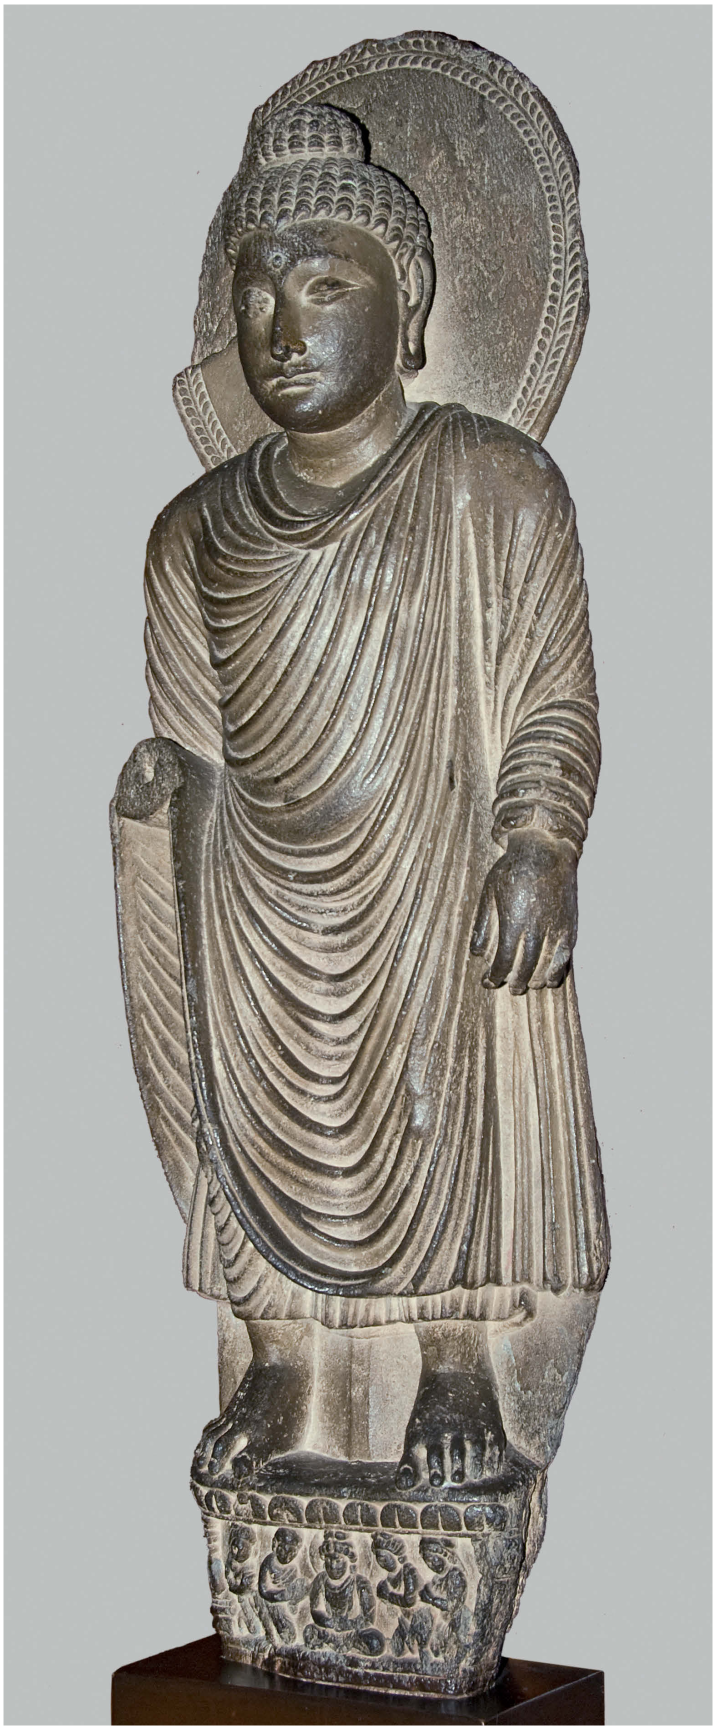
that recalls the Roman toga or the lighter himation of the Greeks. The youthful-looking features resemble a head of Apollo, more especially that of the famous Apollo Belvedere, and the waves or stylised curls of the hair have a Mediterranean feel. The standing Buddha indeed resembles a Roman-Hellenistic god such as Apollo, or a young Roman emperor. Already seen at Khalchayan, the nimbus surrounding the figures of Buddha or bodhisattvas is, however, of Iranian origin.[60] Although the Buddha's dress is entirely different from that of Kushan rulers, early sculptors did borrow from the dynastic art of the latter the out-turned feet, albeit in less emphatic form than is found on Kanishka's gold dinars. At the same time there developed the new sculptural type of the seated Buddha or bodhisattva.

Influenced by a Palmyran sculpture itself much influenced by Parthian art, in the second half of the second century Gandharan representations of the Buddha became more frontal, and the contrapposto less marked. At the same time, the eyes that had at first been large and looking directly at the viewer have become narrower and almond-shaped, half-closed, while the gaze, turned inward, away from the world, was directed at the ground.[61] This was the pattern for an image of the Buddha that would spread to China, Japan and Korea. Common to all Buddha figures is the intention to represent a historical persona in his physical reality but at the same time in a specific spiritual state. As Alfred Foucher pointed out, it is from the shared roots of Gandharan and Gallo-Roman art that a current of early medieval Christian stone



49. Bodhisattva Maitreya in dark grey schist from Takht-i-Bahi, Gandhara, Pakistan, 2nd to 3rd c. CE. The bodhisattva is dressed like a Kushan prince and wears a large necklace, its clasp formed of two wolf-like heads of animals of prey. The necklace is very similar to the golden necklaces of the Saka equestrian warriors and shows that the Kushans preserved elements of their former horse nomad culture. Central Museum, Lahore.

50. The warriors of the demon Mara attack Siddharta Gautama shortly before he attains enlightenment. Grey schist, Gandhara, 2nd to 3rd c. Central Museum, Lahore.

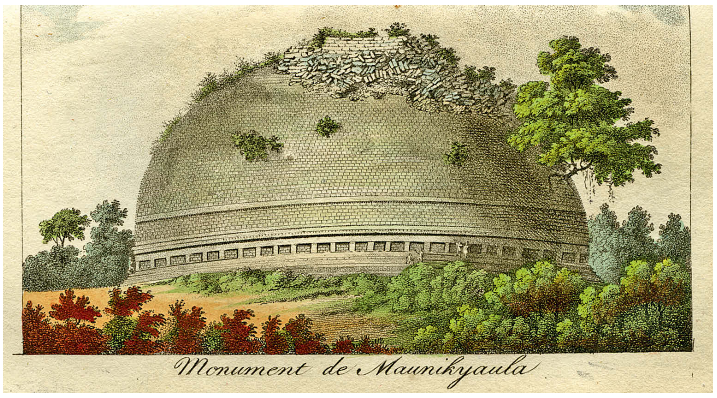


51. Standing Buddha Shakyamuni. Grey schist, Gandhara, 2nd to 3rd c. Central Museum, Lahore.

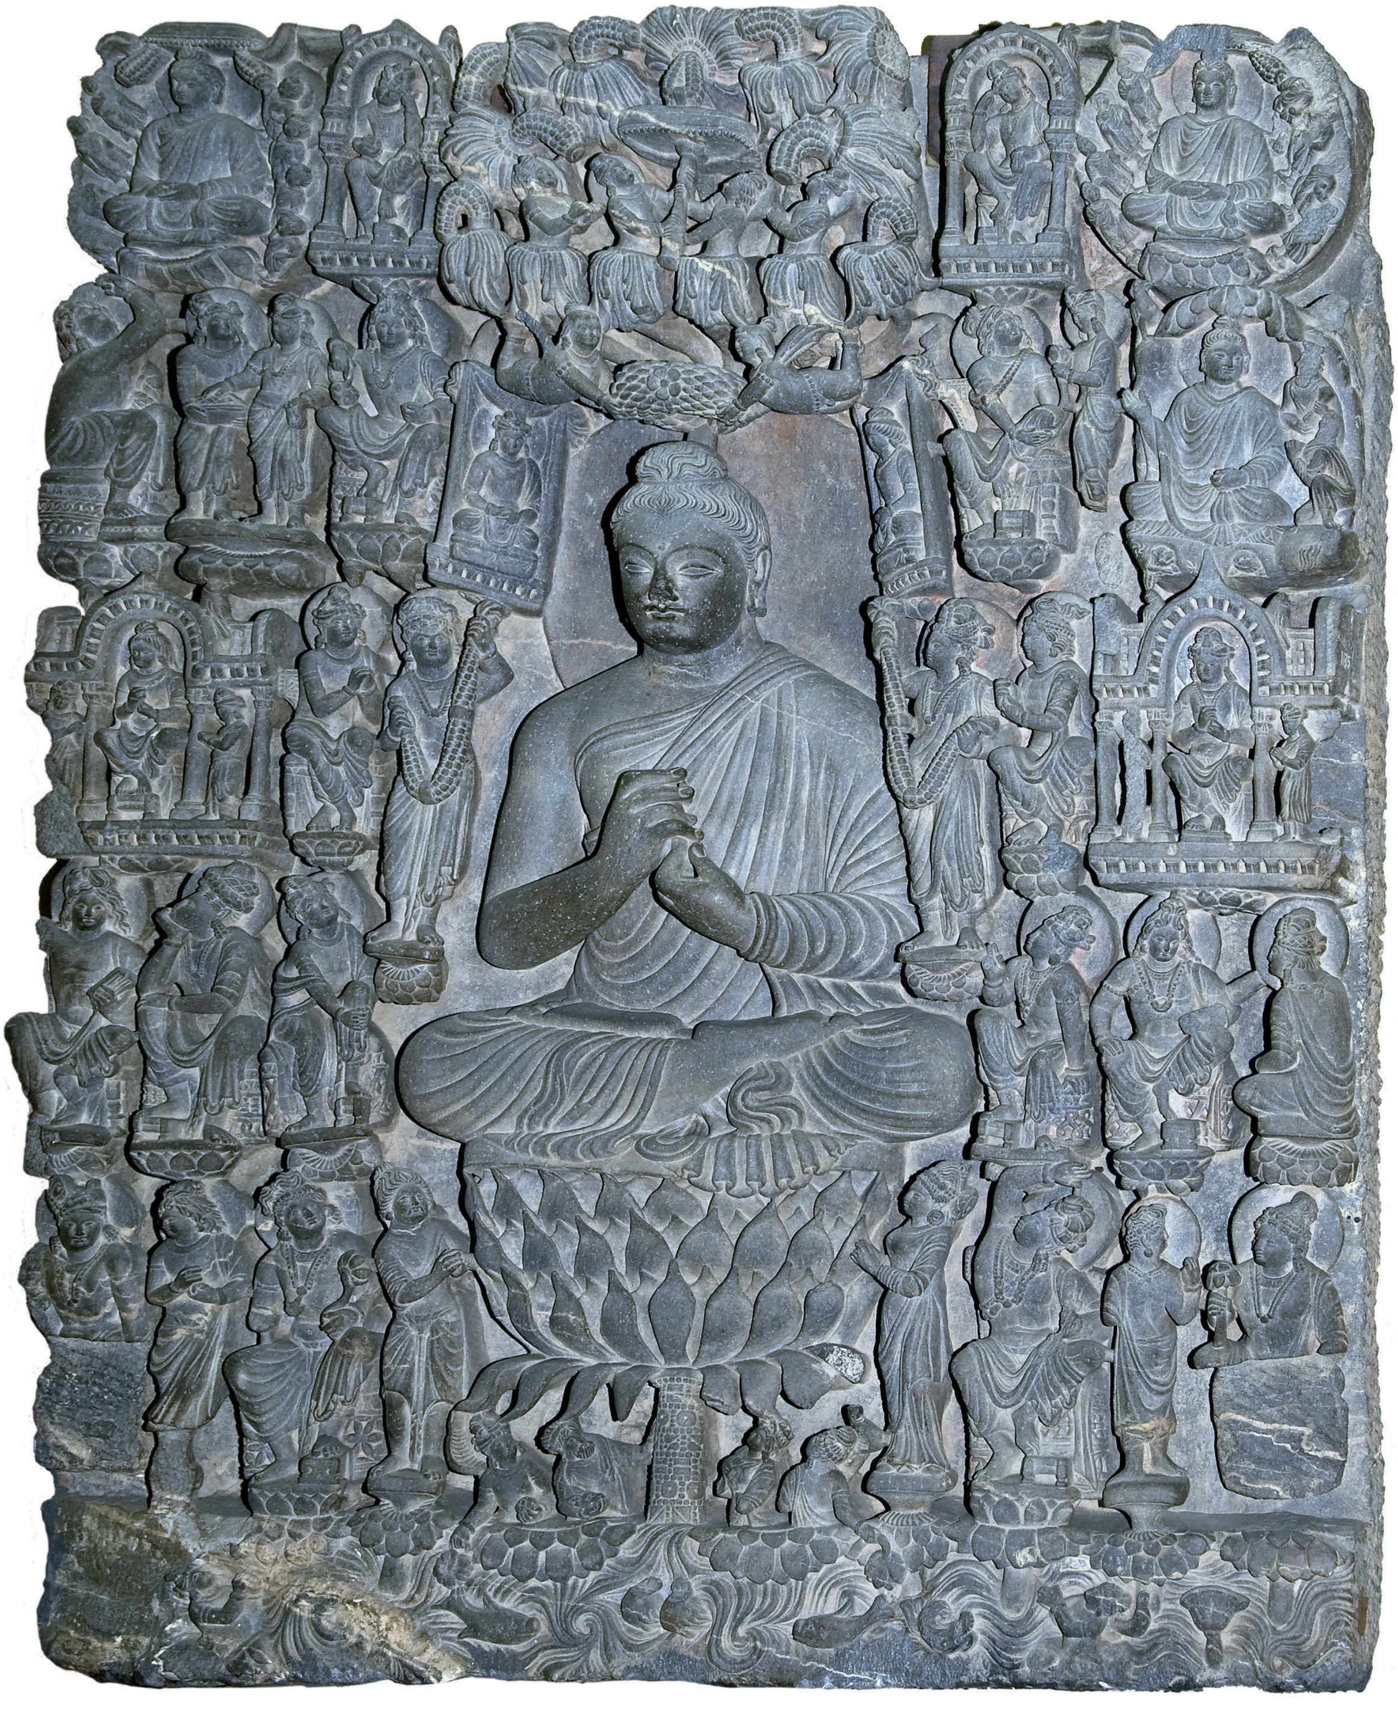
sculpture emerged, and these shared roots make for the seeming familiarity of Gandharan statues to European observers.[62]

While the Kushan art of Gandhara depicted the Buddha as a monk, albeit without the tonsure, it represented the bodhisattvas, for the most part, Shakyamuni before his turn away from the world and the future Buddha Maitreya, as Indian princes of the Kushan Empire (fig. 49). Their youthful heads are adorned with a crown or diadem, their hair is long and slightly wavy; they wear lordly dress that often leaves the breast uncovered, and also fine jewellery of Greco-Roman or Saka origin. Among the latter are torcs whose two terminals take the form of animals, winged putti, or riders, such as have been found in Scytho-Saka graves, from the Crimea in the west to Taxila in the Punjab in the south-east.[63] In the art of Gandhara, other figures deified in Buddhism were shown in Greek form: at Hadda in east Afghanistan the Buddha's bodyguard and protector Vajrapani appears as Heracles or Alexander the Great,[64] the fertility goddess Hariti as Demeter with cornucopia, and her consort Panshika as Mercury.[65] Other examples are the atlantes and caryatids,[66] and tritons and centaurs[67] on the Hadda stupas, together with the garland-bearing cupids or cherubims mentioned earlier.

The influence of Rome made itself felt not just in sculpture but also in the building of stupas. The successor to the Vedic grave mound,[68] the stupa first consisted of a relatively low, circular base from which rose a dome flattened at the top, as for example at Sanchi in Central India, Butkara I in Swat, or Manikyala (fig. 52) near Taxila, all from the third to first centuries BCE. In a second



52. The Buddhist stupa of Manikyala near Rawalpindi, Pakistan. The British envoy Mountstuart Elphinstone (1779–1859) visited the stupa during his diplomatic mission to the Afghan ruler Shah Shuja-ul-Mulk in 1809. Elphinstone's embassy to Kabul was a counter to the French mission of General Gardanne to Persia of 1808, and its aim was to win Shah Shuja as an ally against any invasion of India by Napoleon. The Italian general Ventura, who was in the service of the Sikh ruler Ranjit Singh, was the first to study the stupa in 1830. He discovered that the grand stupa enclosed a second, smaller one, which dated back to King Kanishka I (r. 127–151).[3] Partly coloured copper engraving: Mountstuart Elphinstone, *Tableau du Royaume de Caboul et ses dépendances dans la Perse, la Tartarie et l'Inde* (Paris, 1817), vol. 3, p. 36.



53. Vision of the paradise of a Buddha, probably of Buddha Amitabha's paradise Sukhavati, grey schist. From Mohammed Nari in Charsadda District, north-east of Peshawar, Gandhara, Pakistan, 4th century CE. Central Museum, Lahore.

54. The monastery stupa complex of Guldara, Kabul Province, Afghanistan. Martin Honigberger (1795–1869), personal physician of Ranjit Singh, was the first to study the stupa but without any result. In 1834 Charles Masson also examined it and found inside six gold coins of the Kushan ruler Vima Kadphises (r. *ca.* 102–127) and two of Huvishka (r. 155–187). Contrary to the opinion of G. Fussmann and M. Le Berre, who consider the gold coins of little importance and date the stupa to the 5th–6th c., a dating to the 3rd to early 4th c. is much more plausible.[4]

phase the builders sought to increase the height of both circular base and brick-built dome, which, due to the increased pressure from above, would have endangered the stability of the whole construction and threatened to crack the dome. But thanks to the extensive trade contacts between Rome and the Kushans and their north Indian predecessors, Buddhist architects were able to adopt the principles of construction employed in the mausoleum of the Emperor Augustus, begun in 28 BCE. In this massive building, 84 metres in diameter and 42 metres high, the Roman builders set down a wheel-like masonry structure of five concentric rings with twelve interior radial walls tying these to a central hub.[69] This construction technique diverted the massive load exerted by the enormous dome from the outer wall to the internal structure. Two dozen stupas were constructed in this fashion in north-west India – in the Kushan Empire – and in the south-west.[70] In Gandhara the stupa-builders also adopted another Roman idea: the high, square podium that serves as a base for the cylindrical or rectangular superstructure. To make the stupa accessible, so that the faithful could ritually circumambulate the panels with their episodes of Buddha's life or continuous succession of seated Buddha figures, a staircase, or sometimes four, would lead up to the platform atop the podium.[71]

Before Buddhism crossed the Hindu Kush into Central Asia, it had made its way into Gandhara and eastern Afghanistan along the trade routes, beginning in the third century BCE. The importance of the cult sites that developed there is underlined by the presence of various relics of the Buddha, despite the fact that the region is very far from the area he was active in, and that he never visited it. The area around Hadda, the former Nagarahara in eastern Afghanistan, was particularly rich in relics, miracles accomplished by the Enlightened One, and sites associated with jataka legends.[72] As Faxian and Xuanzang report, a fragment of skull, a tooth, some hair, his monastic robe and his monk's staff were all preserved there, and he had left his shadow in a nearby mountain cave.[73]

In Nagarahara the Bodhisattva Shakyamuni, in an earlier incarnation, is said to have offered flowers in greeting to Dipamkara, his predecessor Buddha, and spread his long hair on the dirty ground as a carpet before him.[74] As Liu Xinru aptly remarks, the religious geography of Gandhara and east Afghanistan developed on the basis of the trade routes.[75]

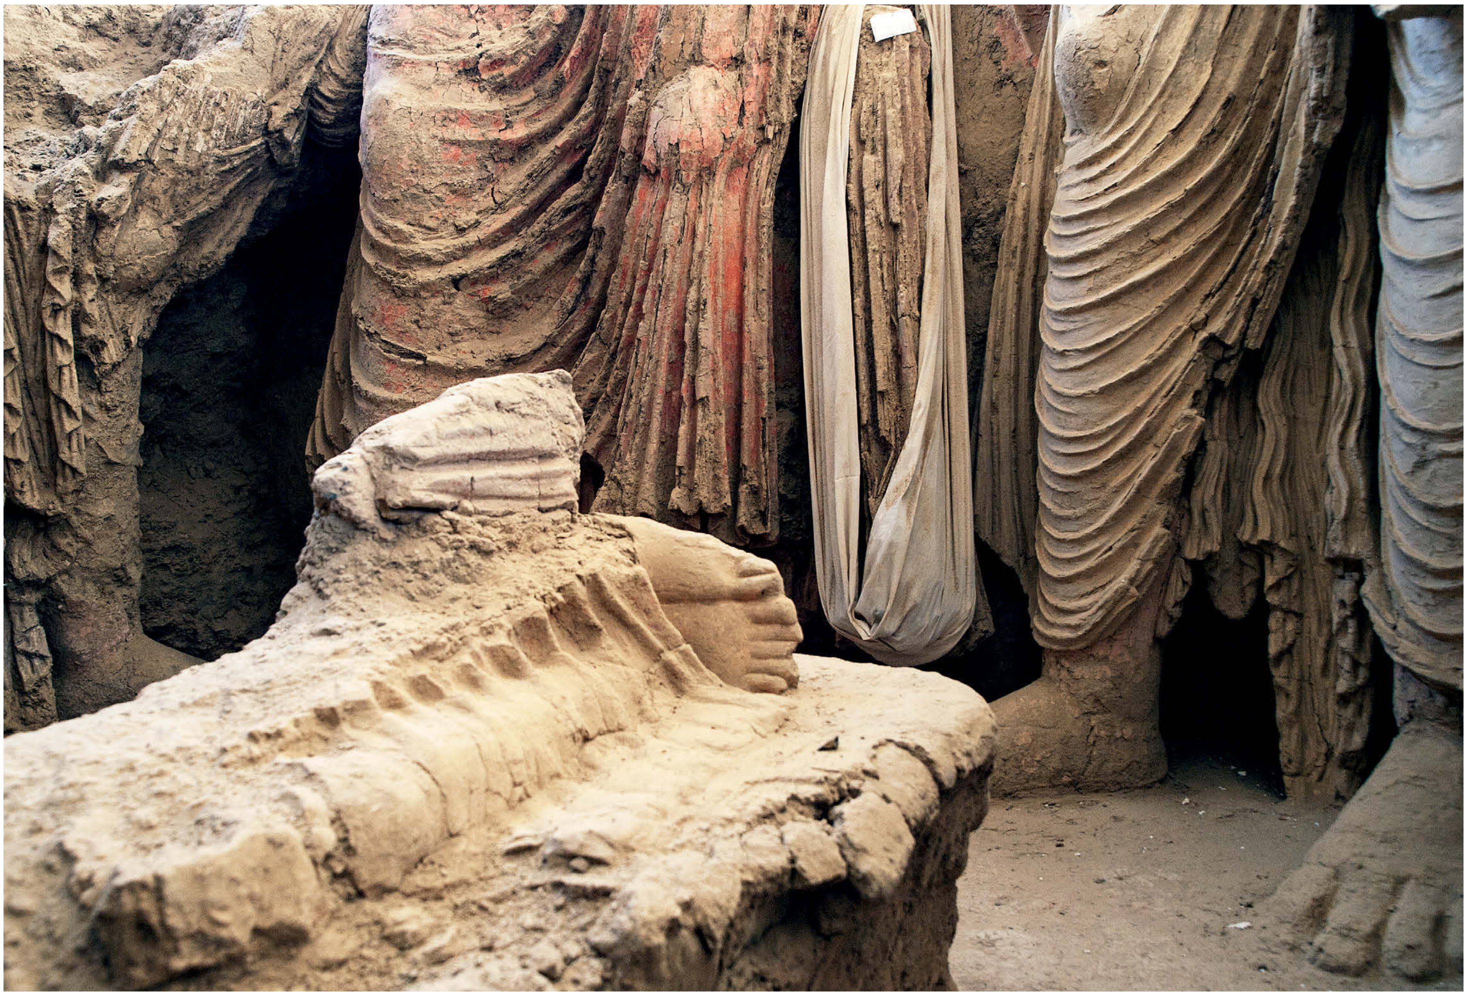
The sculptural process adopted in Dalverzin Tepe in the second century was also extensively used south of the Hindu Kush, not least because of the lack of suitable stone. For small figures, the body would be modelled from local clay, sometimes reinforced by a wooden armature, to which a thin layer of lime stucco would be applied, while the heads were made of lime stucco on a core of clay mixed with quartz sand, animal hair and a little straw. The figure would then be painted, and gilded if need be. Very slightly asymmetrical forms were often preferred in canonical representations of the Buddha, so as to avoid the impression of stereotyped lifelessness.[76] As a taste for monumentality developed in the Gandharan heartland around the fourth century, these more vulnerable materials replaced stone, as for example at Takht-i-Bahi north-east of Peshawar.

Three other important Buddhist cult centres were to be found in the vicinity of Kabul. While the monastery of Khwaja Safa in south Kabul was investigated by Charles Masson in the 1830s, that of Tepe Naranj was first discovered in 2004. Both adorned with large unfired clay figures of the Buddha, these monasteries were active from the late fourth to the mid to late ninth century; their destruction around 869–870 was the work of the Muslim Saffarid warlord Yaqub bin Layth al-Saffar, who sent to the caliph in Baghdad 50 gold and silver statues of the Buddha.[77] Even more spectacular are the discoveries that have recently been made near Mes Aynak, some 40 kilometres south-east of the capital, on the site of the world's second-largest copper ore deposit. The mine was already exploited at the time of the Kushans in the second century CE, which helped the region to gain considerable prosperity. The Buddhist sanctuaries were consciously erected in close proximity to the copper mine.[78] At the time of the *Turk Shahi* (*ca.* 666–*ca.* 843), Turkish rulers, whose capital was first Kapisa, later Kabul, and their successors, the *Hindu Shahi* (*ca.* 843–*ca.* 1026), the copper mine, together with silver mines, made a substantial contribution to the wealth of Gandhara.[79] The archaeologists working there since 2009 have identified some eight complexes, and of these have excavated three monasteries and two stupas of up to nine metres in height. Here the archaeologists found a 3-metre-long and another *ca.* 7.5-metre-long reclining Buddha Shakyamuni and numerous clay figures of buddhas and bodhisattvas, still bearing red paint in parts (fig. 56).[80] Unique, too, are the paintings on the reverse of a stone relief (third–fifth century) and the fifth-to-seventh-century wall paintings, which since the destruction of the Bamiyan paintings by the Taliban are

55. Ruin of the Buddhist monastery of Khilgian, Bamiyan Province, Afghanistan.

among the very few Buddhist murals in Afghanistan to survive in their original context.[81]

In the case of the colossal figures of **Bamiyan** – the Greater Buddha (fig. 58) was 53 metres high, the Lesser Buddha 35 metres[82] – the mass that would make up the statue was first roughly shaped and freed from the rock by carving out the surrounding niche; holes were then drilled in it and wooden pegs driven in, to support a thick layer of clay mixed with straw. In this clay layer the artists modelled the face and the folds of the monastic robe, then covered all with a layer of lime stucco. Finally, both Buddhas were painted in polychrome and the faces gilded.[83] The Lesser Buddha was probably sculpted in the mid-sixth century, the Greater Buddha around 600, when the smaller one was also restored.[84] These two statues executed in Late Gandhara style formed part of a vast Buddhist complex home to thousands of monks and lying on a major trade route. Travelling through on his way to India in 632, Xuanzang very accurately estimated the height of the buddhas as 'about 140 to 150 feet' and '100 feet' respectively, and described an even larger reclining Buddha: 'To the east of the city 12 or 13 li [approx. 5.2 km] there is a convent, in which there is a figure of Buddha lying in a sleeping position, as when he attained Nirvana. The figure is in length about 1000 feet or so.'[85] Probably made of clay and stucco, this 300-metre-long Buddha has long since disappeared, as a result of exposure to the elements. Since the Greater Buddha in the west most probably represents the Buddha of the past, Dipamkara, the Lesser Buddha to its east, Buddha Shakyamuni, and the reclining Buddha further east, Shakyamuni entering Nirvana, the visiting pilgrim walking along the cliff clockwise from left to right would symbolically follow Shakyamuni's spiritual biography: He would first meet his previous incarnation Dipamkara, then the historical Buddha of this age and finally the Buddha having entered nirvana after enlightenment. The splendour of the Buddhist temple complex of Bamiyan is mostly due to its favourable situation on one



56. Clay figures of standing buddhas or bodhisattvas, which were originally 5–6 m high, surround a 7.5-metre-long, reclining figure of Buddha Shakyamuni, who has entered Parinirvana. of the most important trade routes which crossed the Hindu Kush and linked Central Asia with northern India. This route led from Balkh or Kunduz in the north to Khulm and from there southwards via Haibak, Nigar and the pass of Kara Kotal to Bamiyan and from there eastwards via Fondukistan to Kapisa and Kabul.[86] From the first quarter of the seventh century, the little kingdom of Bamiyan was part of the Western Turkic sphere of influence.

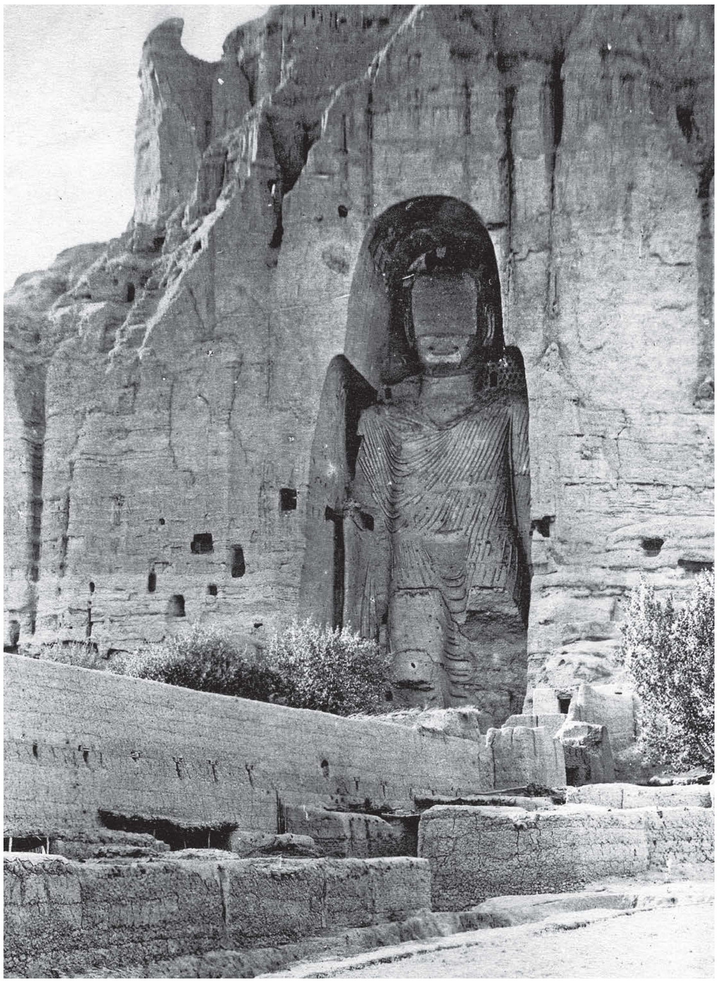
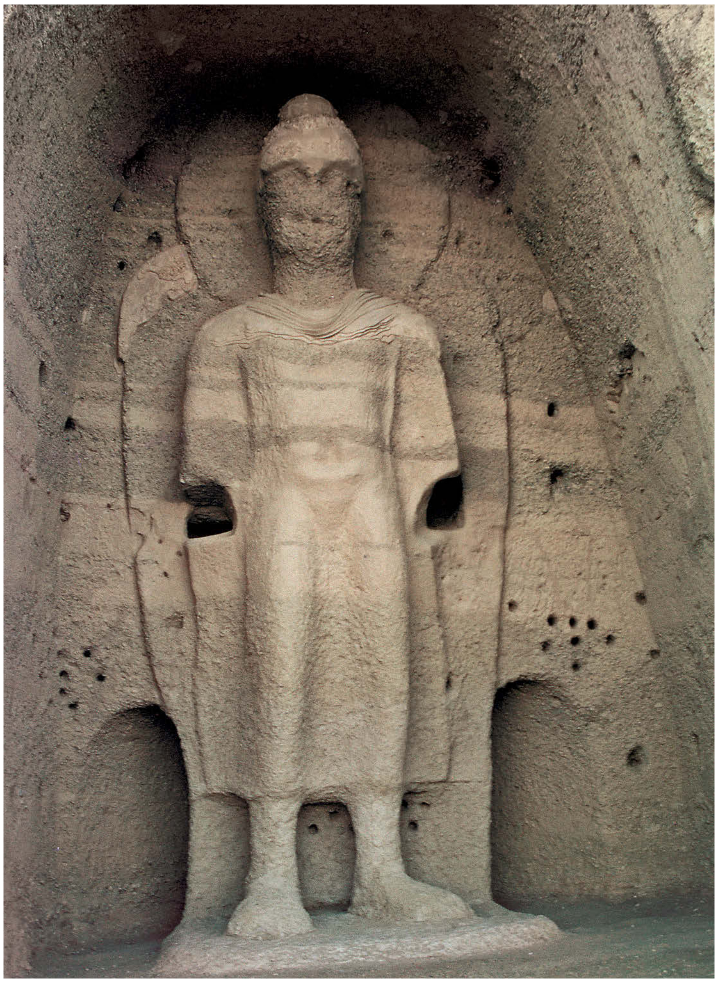
Both buddhas stood in niches, which from a distance appeared as mandorlas. They were flanked by small grottoes linked together by staircases cut in the rock, enabling pilgrims to ritually circumambulate the colossal figures even through the cliffs, climbing up on one side and descending on the other, just as they would walk around a stupa. In 1824, recounting his visit to Bamiyan, the English explorer and traveller William Moorcroft described this unique form of *pradakhshina*: 'On either side of the figures are numerous caves excavated in the rock, usually with vaulted roofs. [There are] staircases ascending to a gallery behind the neck of the statue, while other galleries run off from their sides, right and left, into the rock. The flight of steps on the side of the smaller [statue] was tolerably entire and led to the head of the figure.' Moorcroft was one of the first to realise that these gigantic statues were Buddhist figures, and that the smaller represented Shakyamuni.[87] Before Moorcroft, in 1815, the Scottish diplomat Mountstuart Elphinstone had already correctly concluded from the descriptions of locals that 'The idols and caves of Baumeeaun appear to establish that the inhabitants of that country [the Afghans] were at one time worshippers of Boodh.'[88] After Moorcroft and Trebeck, the Scotsman Sir Alexander Burns in 1832 was the next visitor to Bamiyan; he described the paintings in the niches and was the first to publish a drawing of the statues from his own observation.[89] Burns was followed by Charles Masson and Dr James Gérard in 1833, and the Orientalist Johann Martin Honigberger, of Transylvania, in 1834, as we learn from Carl Ritter's highly informative 1838 monograph on the monuments of Indo-Bactria.[90] Another famous, but involuntary visitor to Bamiyan was Lieutenant Vincent Eyre, who was taken prisoner during the disgraceful British retreat from Kabul in January 1842. When Generals William Nott and George Pollock counterattacked, the British hostages were moved to Bamiyan where they arrived on 3 September. In contrast with his learned predecessors, Eyre interpreted the colossi as a regal couple: 'The first figure we passed was that of a female, 120 feet high; the body covered with a clever representation of the drapery. [. . .] About 400 yards further on, in the same cliff, stands the male figure, about 160 feet high.'[91]

57. Head of a Buddha statue from the monastery of Gol Hamid, Mes Aynak, Kabul Province, Afghanistan, 4th–7th c.

The two uppermost niches above the buddha statues had painted decoration, that over the Lesser Buddha in a style suggestive of the Sassanid Iranian, that over the Greater Buddha in the Indian Gupta style. As the paintings in both are dated to the sixth to seventh centuries, it appears that two very different artistic groups were active during the same period.[92] Both used the same technique found throughout Central Asia: on to the raw surface they applied a layer of clay mixed with plant fibre up to 4 centimetres thick, to which was added a coat of calcined lime plaster or gypsum. Lapis lazuli was used for ultramarine blue, ochre for yellow, copper silicate for green, chalk for white and lead oxide for red, the latter becoming dark brown to black with further oxidation.[93] In the niche of the Lesser Buddha is a motif recalling the Greco-Roman world, the image of a sun god. Carrying spear and long sword, the divinity stands in a quadriga drawn by winged horses, a helmeted female divinity with sword or bow and shield on either side, of whom the left one probably represents under the traits of Pallas Athena Arshtat, the female personification of the Avestan principle of justice.[94] Over each of these warrior goddesses floats a haloed hybrid creature with a bird's body and a human head, its mouth covered by a *padam*, the protective veil that prevents the pollution of the sacred fire by human breath, an



58. The 53-metre-high Great Buddha of Bamiyan probably represents the Buddha of the Past, Dipamkara, and was carved out of the rock around the year 600. On the orders of the Taliban leadership the figure was blown up in March 2001. Photo: A. and Y. Godard, J. Hackin, *Les Antiquités Bouddhiques de Bamiyan* (Paris, 1928), pl. IX.

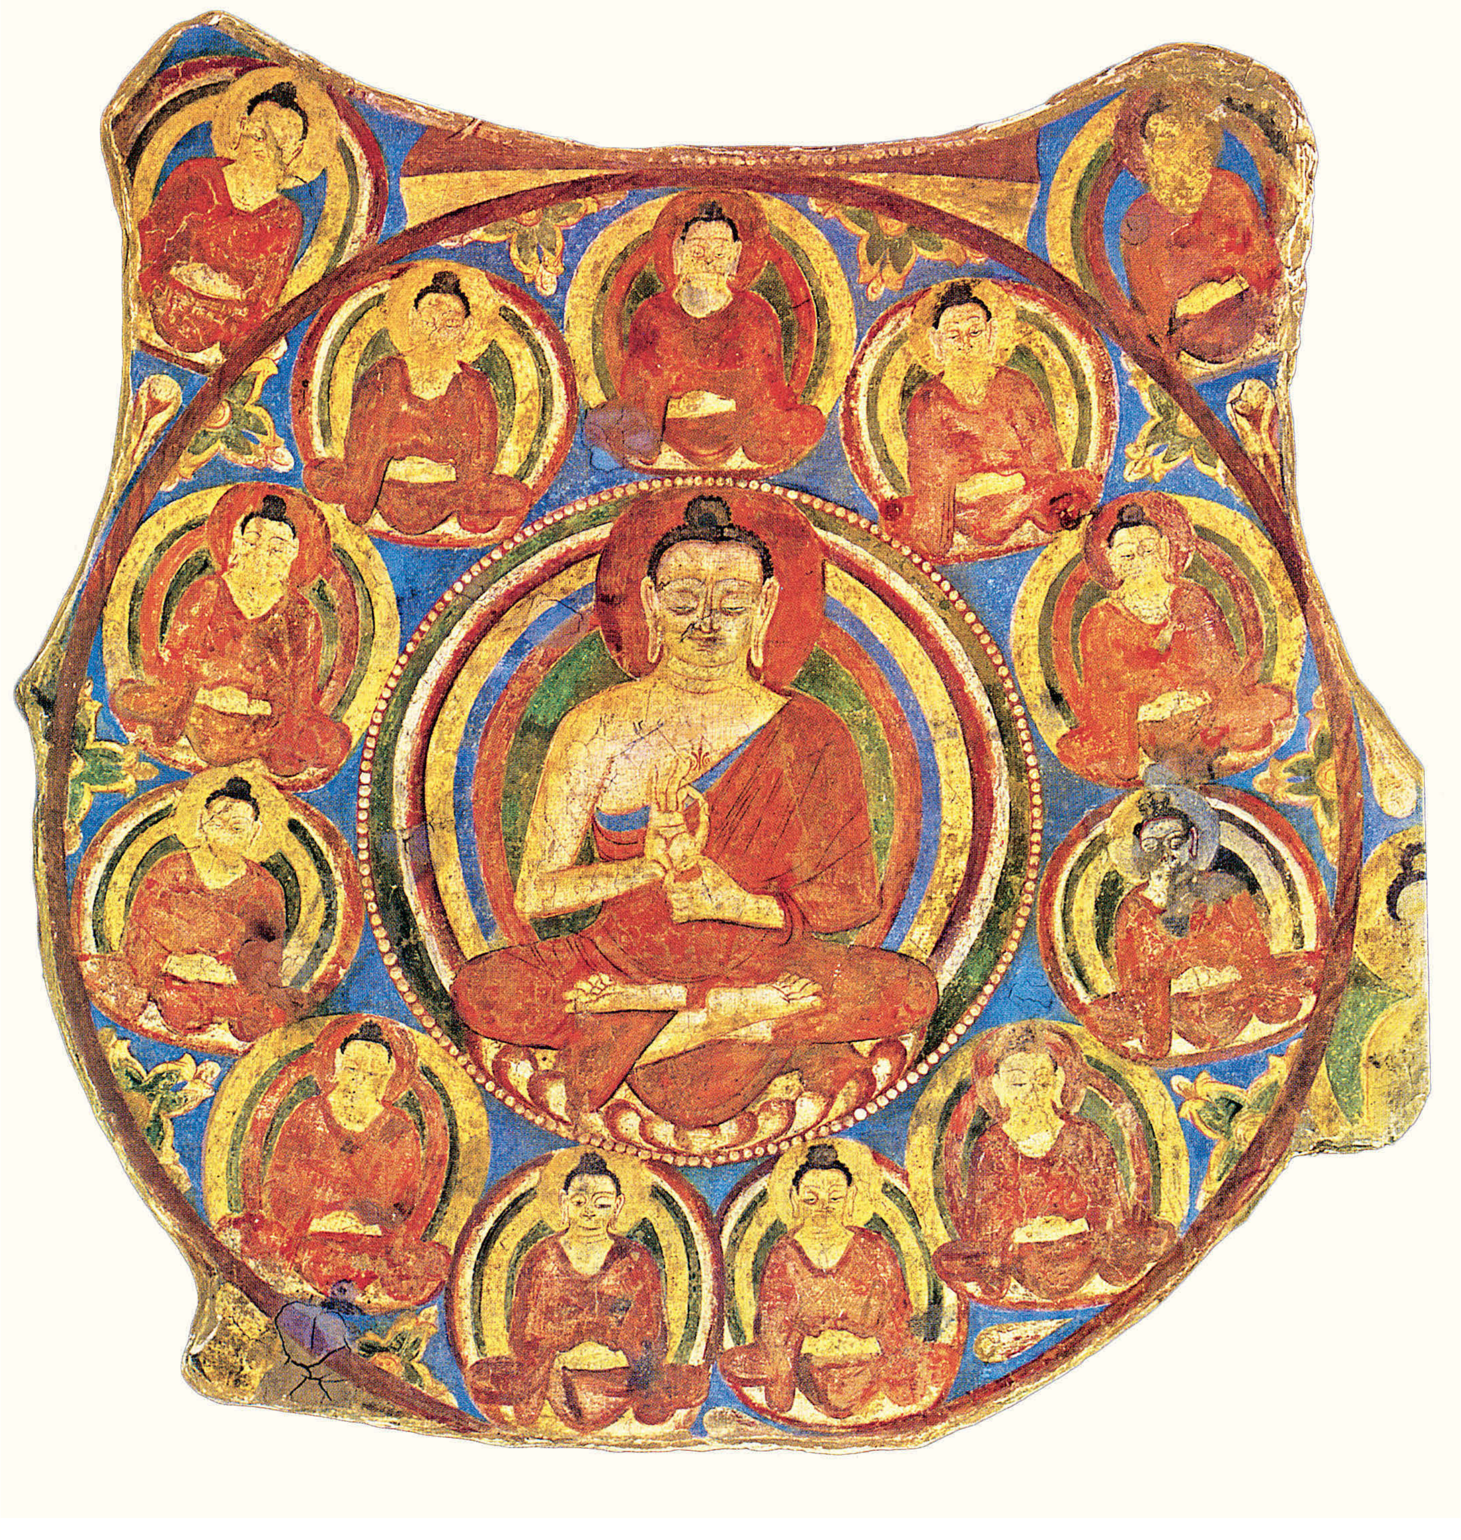


59. The 7-metre-high Buddha of Kakrak from the 6th/7th c. stood in a rock niche a few kilometres south-east of Bamiyan, Afghanistan. After the feet of the stone figure had been destroyed in 1996, the Taliban blew up the remainder in 2001.

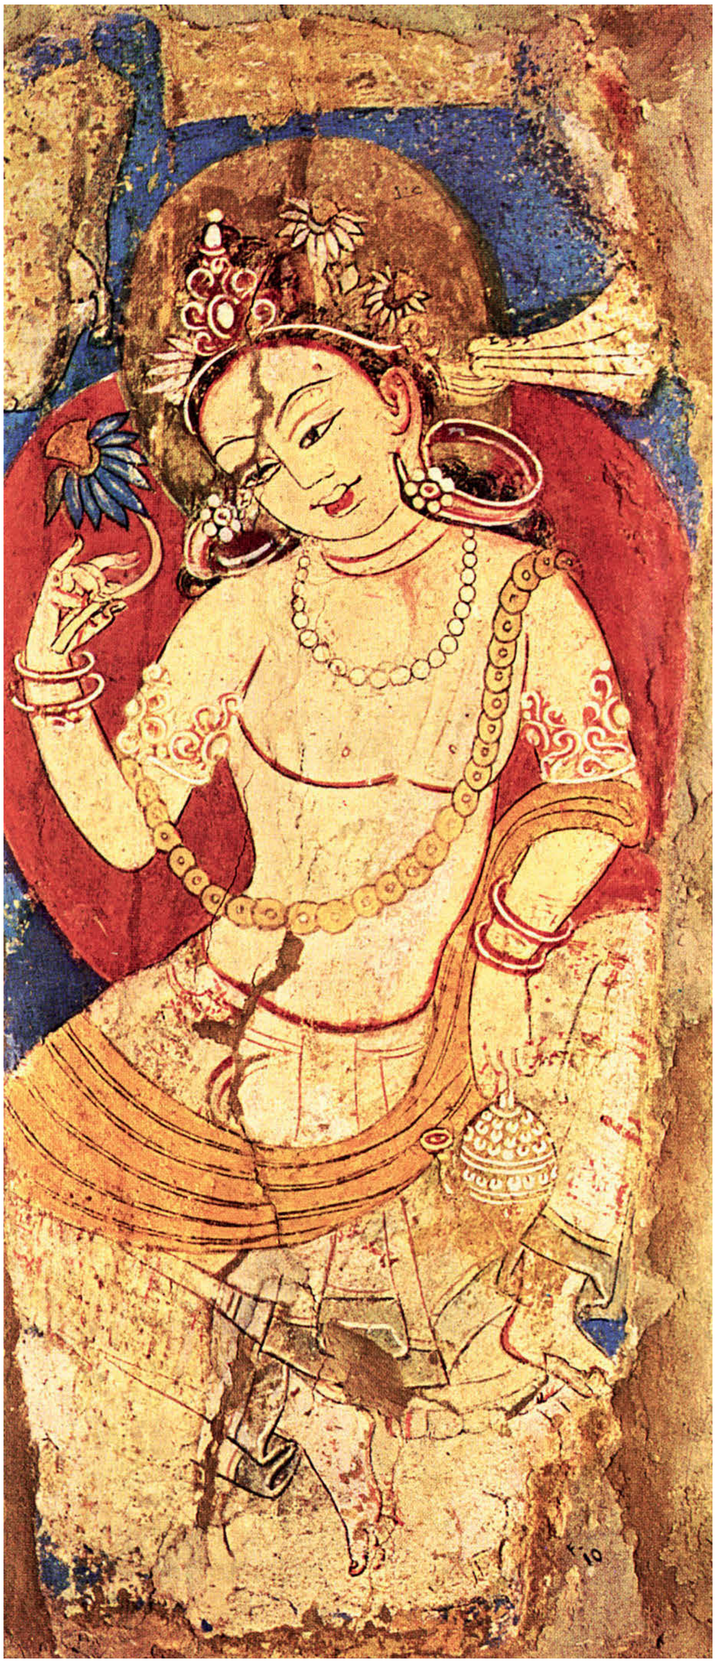
unambiguously Zoroastrian reference.[95] These human-bird hybrids belong to the retinue of the god Sraosha, who leads the righteous across the Chinvat Bridge to Paradise; the other two guardians of the bridge are Mithra and Rashnu.[96] The dreaded Chinvat Bridge became a broad road for the virtuous, but narrowed to a razor's edge for the sinner so that he would tumble down into hell.[97] The motif of the sun god travelling through the sky in a quadriga – which in Bamiyan's Sassanid context most probably represents Mithra – is found again, several times, in the Buddhist wall paintings of Kizil and of Kumtura near Kucha. In a Buddhist context, the sun god may also represent the future ideal universal ruler Cakravartin.

Also typical of Iranian-Sassanid painting are the long ribbons that in Bamiyan and its environs are attached to the crowns of certain buddhas, just as one finds in depictions of Sassanid great kings, and the pearl roundels encircling either boars' heads or birds holding strings of pearls in their beaks. These birds represent the raven Varagan that seeks light in the ocean in the form of a pearl, and allude to the legitimation of the king, while the boar's head symbolises the Iranian war god.[98] Both motifs are also found in the patterns of the Sogdian silks of Eastern Turkestan. This Iranian influence was the consequence of the Sassanids entering an alliance with the Turkic Khaganate between 557 and 563, to break up the Hephthalite Empire, and southern Bactria coming under Sassanid suzerainty. Whether the Hinayana monks[99] of Bamiyan knew that their sanctuary was adorned with the emblem of an Iranian war god we do not know. What we do know is that a pioneering synthesis of Indian and Iranian art developed in Bamiyan, a synthesis that simultaneously flourished on Xinjiang's Northern Silk Road.

Markedly Indian-looking paintings and clay sculptures incorporating isolated Iranian motifs such as floating sashes were



60. Wall painting in the dome of a cave temple in the Buddhist cave complex of Kakrak, Bamiyan Province, Afghanistan. In the mandala-shaped arrangement from the 6th/8th c. eleven meditating buddhas, seated in a circle, surround the larger, central buddha, whose hands perform the Dharmacakra mudra of teaching. The scene probably represents the cosmic Buddha Vairocana with his own emanations and is one of the earliest visualisations of esoteric Buddhism. National Museum of Afghanistan, Kabul.



61. Wall painting from the monastery of Fondukistan, Parvan Province, Afghanistan. National Museum of Afghanistan, Kabul.

produced not only in the upper niche of Bamiyan's Great Buddha[100] but also in **Fondukistan**, north-west of Kabul. Dating from the seventh to the eighth centuries, the post-Gupta paintings there survived countless invasions, having been walled up for their protection, most likely in the ninth century. The painted and sculpted figures are characterised by fluid lines, sinuous posture, affected hand gestures, and mysterious smiles; they give the impression of a unique combination of erotic, dreamy sensuality and other-worldly serenity.[101] As Benjamin Rowland acutely remarks: 'What we have is a culmination of the kind of Mannerism already suggested in the Bamiyan bodhisattvas, and only a step removed from the half-erotic, half-mystical conception of religious beings in the art of Tibet and Nepal.'[102] Remarkable, too, are the paintings of the moon and sun gods, who both wear the same Sassanid-inspired court dress and Iranian long swords as the fifth- to sixth-century 'Tocharian princes' in Cave 8 at Kizil near Kucha.[103] These two styles that predominate at Bamiyan also characterise the Buddhist art of the Tarim Basin. While Gandharan art established itself along the Southern Silk Road, as instanced by the sculpture of Rawak and the paintings of Miran, Iranian stylistic features at first dominated on the Northern Silk Road, best exemplified by the cave paintings of Kizil.

Bamiyan began to decline in the second half of the eighth century with the enforced Islamisation of some of the local princes.[104] Statues and monasteries suffered many depredations, first under the Saffarid Yaqub bin Layth in 869–870 and then the Turkic general Alp Tigin and the Ghaznavid leader Sabuktigin in the late tenth century, before Genghis Khan in 1222 razed the wealthy city of Bamiyan to the ground. The two colossal Buddhas survived all this, as they did the artillery fire of Moghul Emperor Aurangzeb in 1646 and of Persian conqueror Nadir Shah (r. 1736–1747), only to be blown up by the Taliban regime on 12 March 2001.[105]

III

The Migration of Hunnic Peoples to Northern China, Central Asia and Eastern Europe

The last emperor [Huai Di of the Western Jin dynasty], so they say, fled from Sry [Luoyang] (in 311 AD*) because of the famine and fire was set to his palace and to the city, and the palace was burnt and the city [destroyed]. Sry [Luoyang] is no more, 'nkp' [Ye] is no more! Moreover . . . by the Huns [Xwn], . . . and by them . . . 'xwmt'n [Chang'an], if indeed they held (?) it (?). And, sirs, we do not know, whether the remaining Chinese were able to expel the Huns [from] 'xwmt'n [Chang'an], from China . . . .*

The Sogdian Merchant **NANAI-VANDAK** in a letter of June/July 313 to 'the noble lord Varzakk' in Samarkand.[1]

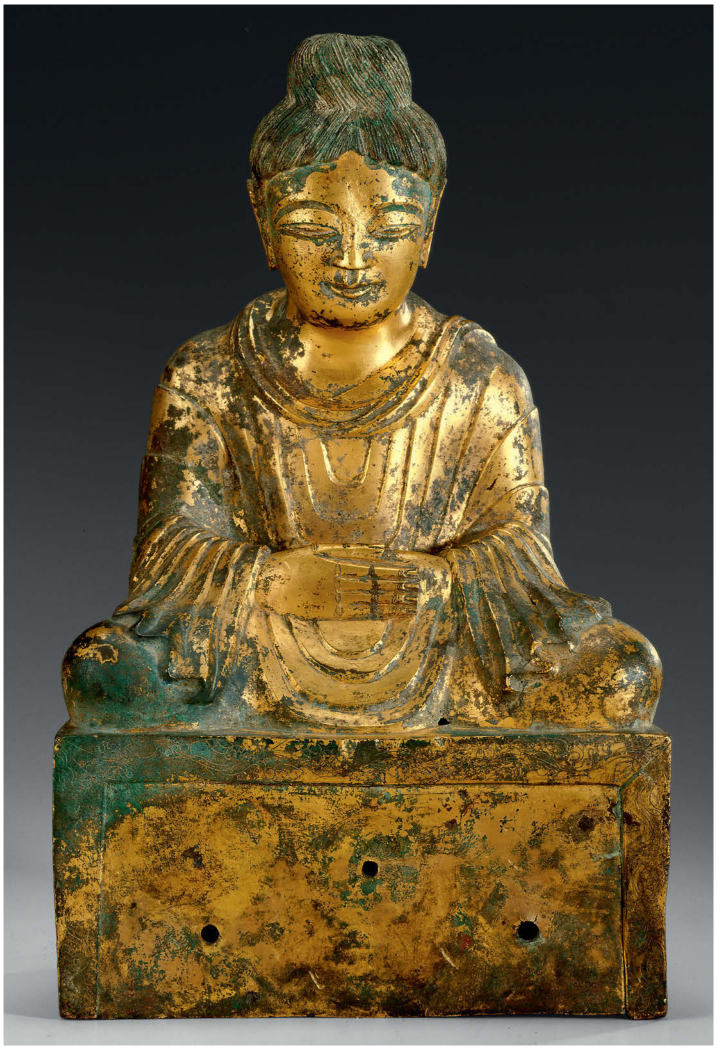
'Sogdian Ancient Letter II' was discovered unopened by Sir Aurel Stein in 1907, at watchtower T.xii.a, some 90 kilometres west of Dunhuang.[2] The letter was written by a Sogdian commercial agent in Jincheng (Lanzhou) or Dunhuang to his partner or superior in Samarkand. Dated the month of Taghmich, in the summer of 313, this letter, like the other five ancient letters found with it, is highly revealing in several respects. Not only is it one of the oldest surviving Sogdian documents,[3] but it shows that the Sogdians maintained a trade network with local agencies and a regular international postal service in China and East Turkestan. The letter tells of the destruction of the then Chinese capital Luoyang in 311 and that of Ye in 307, as well as the chaos into which the Western Jin dynasty had fallen (265–316), which would initiate in northern China the highly unstable period of the 'Sixteen Kingdoms of the Five Barbarian Peoples'.[4] And finally, the letter unambiguously refers to the invading Xiongnu – who in 316 also destroyed the second capital, Chang'an – as *Xwn*; that is, as Huns, thus bringing to an end a decades-long debate.[5]

The French sinologist and orientalist Joseph de Guignes (1721–1800) had already suggested in 1756 that the Huns were descendants of the Xiongnu,[6] and there is indeed a striking phonetic similarity between the 'Hunyu', 'Huna' and 'Hunxie' of the Chinese sources, the 'Khounoi' of Ptolemy, the 'Khounni' of Byzantine historian Theophylact Simocatta and the *Xwn* in Sogdian Ancient Letter II.[7] Archaeological finds have also confirmed to some degree the idea of a connection between the Huns of eastern Europe and those of Central Asia and the Xiongnu. The Altaic horse nomads who in the fourth and fifth centuries set off toward the Volga nomads, and eastern Europe in the west, and Eastern Turkestan, Sogdiana, Bactria and Afghanistan in the south, were the linguistic, cultural and political heirs of the Xiongnu. Within the Altaic language family, the western tribes spoke Turkic and the eastern proto-Mongolian languages. The direct descendants of the Xiongnu were the Southern Xiongnu, who lived on the Ordos Plateau (today's Inner Mongolia), and in Shanxi and Shaanxi. Between 304 and 316 they laid low the Western Jin, and their clans would establish four short-lived kingdoms in China. The peoples or leading clans more or less closely related to the Xiongnu were known in the west as Huns; in east Central Asia they were the Huns, the Chionites, the Kidarites, and possibly also the Hephthalites. The migration of these Altaic peoples led to the displacement of most Iranian-speaking nomads, the Tajiks excepted, from Central Asia.

1. Mongolia and North-West China: the 'Barbarian' Kingdoms of the Xiongnu, the Xianbei and the Rouran, supporters of Buddhism

The fourth century saw war break out again between the Xiongnu and China, though circumstances and strategies had changed since the time of the Han dynasties.[8] Then, the foreign policy strategy of the politically highly organised Xiongnu was aimed at control of the northern trade routes and the exaction of the largest possible tribute from China, either by raiding or through extortionate treaties, but never the actual occupation of Chinese territory. China's emperors, for their part, sought by various means to secure their northern borders. When China was weak and governed by Confucian bureaucrats, who were ill-disposed toward the military and the merchant classes, it bought its freedom by the payment of vast tribute. If, however, generals and merchants enjoyed the confidence of a strong emperor, China would adopt a package of offensive strategies, extending outward its northern and north-western frontiers, securing control of the trade routes, depriving the Xiongnu of important suppliers of foodstuffs and craft products, seeking alliances with other 'barbarians', and finally taking the war to the enemy's heartland. In the early fourth century, on the other hand, China faced horse nomad peoples who possessed military strength but were poorly organised, among them the Southern Xiongnu and the originally Manchurian Xianbei. At the same time, the Xiongnu elite had become strongly sinified, and so were interested not just in pillage and exacting tribute but also in taking power within China itself. Despite this the Xiongnu remained aware of their own distinctive identity and their steppe-nomad traditions. China, for its part, was not only militarily weak but found itself rocked by the 'Rebellion of the Eight Princes' (291–307), a struggle for the imperial throne among nobles of the Jin dynasty. The warring princes were no longer 'using barbarians against barbarians' but now sought alliances with them to make war on other Chinese. With the northern frontier now left defenceless, this war laid the foundations for the period called *Wuhu Luanhua*, whose name means 'The Five Barbarians brought disorder to China'.[9]

Living at the Chinese court, the chiefs of the five tribes of the Xiongnu were familiar with the domestic political situation and knew the weaknesses of the Western Jin. One of them, Liu Yuan (r. 304–310), a descendant of Huchuquan, the last southern chanyu, who had been deposed in 215 by the Chinese chancellor Cao Cao, took advantage of the Rebellion of the Eight Princes to break with the Western Jin, declaring independence and taking the title of 'Great Chanyu'. Liu Yuan's rebellion marked the beginning of the turbulent 'Sixteen Kingdoms' period, which would be brought to an end only with the unification of northern China (except Western Xinjiang) under the Northern Wei dynasty, members of the Tuoba clan of the Xianbei people.[10] The Chinese now paid the price for having settled non-Chinese Xiongnu, Di and Qiang in their own heartland near Chang'an several times since the first century BCE. Fourteen of these 16 unstable petty states, some of them hardly more than a roving army, were founded by the 'Five Barbarians'. These were the Xiongnu themselves, the related Jie tribe, the originally Manchurian Xianbei, the Di from north-west China, and the proto-Tibetan Qiang; only two of these ephemeral states were founded by Han Chinese.[11]



62. Seated gilt bronze Buddha made in China and dated by its inscription to the year 338 CE, Dynasty of Later Zhao, Honan Province, China. Asian Art Museum, San Francisco.

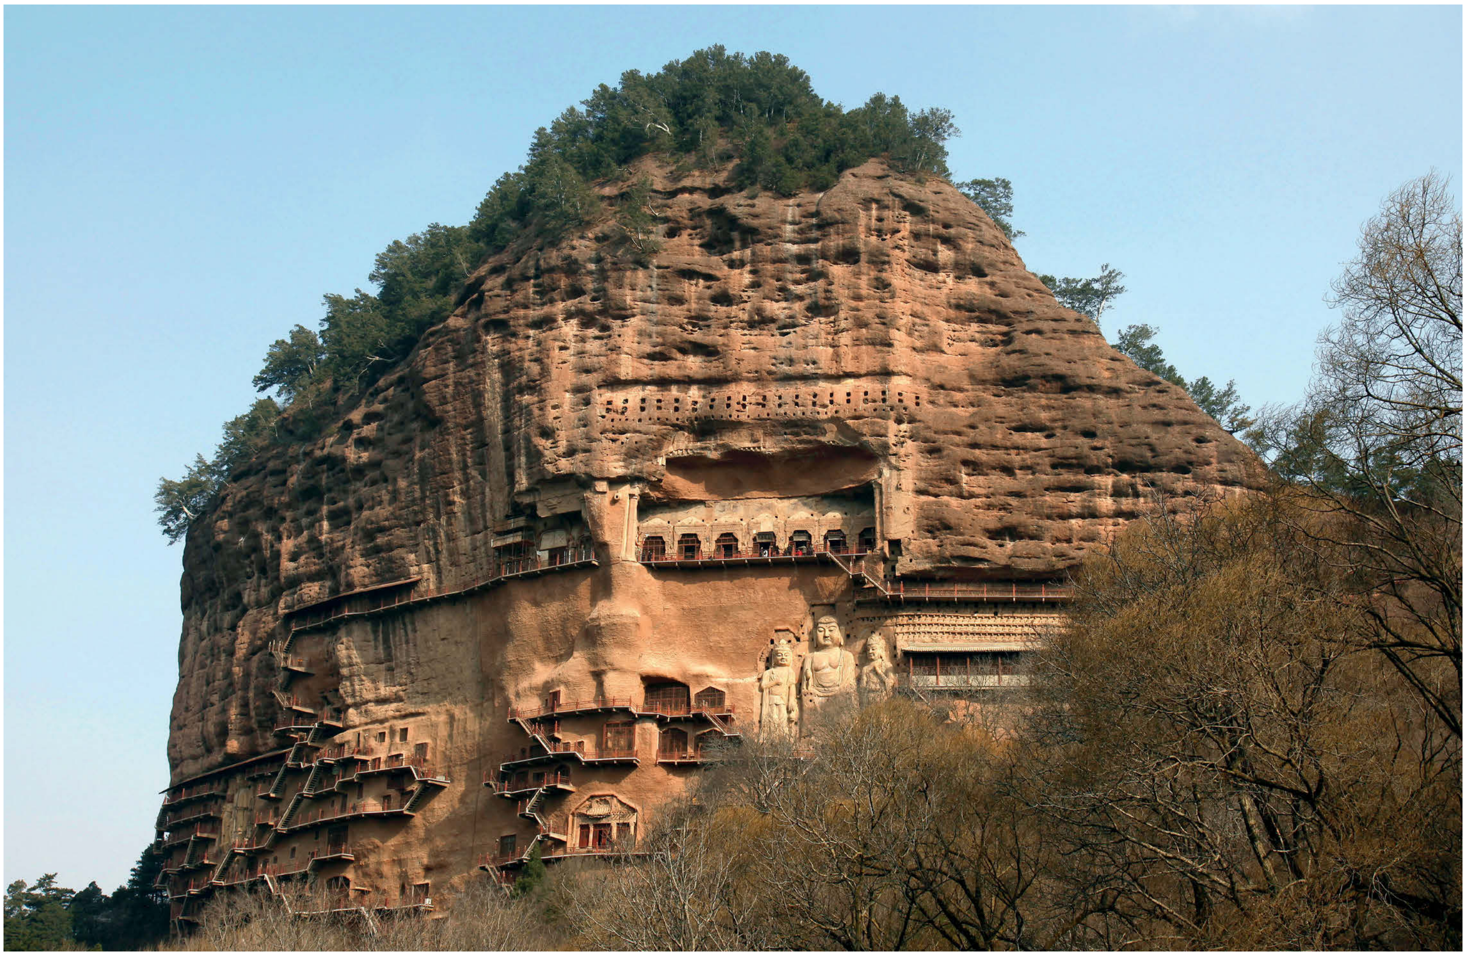
1.1 The Four Xiongnu States and the Emergence of Early Buddhist Art in North-West China

The short-lived dynasty that Liu Yuan founded would be called **Han Zhao**[12] (304–329). Its military success was in no small part due to General Shile (274–333), a member of the Jie tribe, ancestrally related to the Xiongnu. While successful military commanders, Shile and his nephew Shihu (295–349) were also notorious for their excessive cruelty. The Han Zhao dynasty had the two Chinese capitals Luoyang and Chang'an put to the torch once they had been looted; Shile had 100,000 Chinese massacred in 310 alone,[13] and like Genghis Khan's general Subotai 900 years later, was happy, given the extensive devastation, to have northern China reduced to pastureland, 'since this was so much better for the Xiongnu horses'.[14] In 319, General Shile broke away and founded the **Later Zhao** dynasty (319–351), his 'state' hardly more than a roving army that didn't so much govern urban settlements as plunder them mercilessly. In 329, Shile annexed Han Zhao, then died four years later, whereupon Shihu seized power in a coup d'état. When Shihu died in 349, a war of succession broke out and the dynasty collapsed two years later. After almost half a century of pillage and destruction, northern China's trade with Central Asia had come to a standstill[15] and extensive areas had been ruined; the Xiongnu had bled their once wealthy victim dry. Since an important part of the wealthy elite fled to southern China where the 'Six Southern Dynasties' of Jiankang (Nanjing) ruled, some of the Chinese trade in luxury goods was transferred to the sea routes. The hubs for Chinese exports and 'Persian' imports were in the harbours of India and Sri Lanka.[16]

It is a paradox of history that Buddhism had the cruel Xiongnu generals and the bellicose Tuoba to thank for its rapid diffusion north of the Yangtse. Its foundations were laid by Fotudeng (*ca.* 232?–348), a Hinayana monk of Central Asian origins, probably from Kucha.[17] He is said to have reached Luoyang at the advanced age of 78, and to have witnessed its destruction. Fotudeng was not only a charismatic preacher but was also said to have had powers of clairvoyance. He realised that Buddhism might greatly appeal to the afflicted population if he could stop the foreign warlords from butchering innocent civilians. So he joined General Shile and served him as a military adviser, predicting the outcome of upcoming battles and at the same time exerting a moderating influence upon him. He also succeeded in gaining Shihu's confidence. The decisive breakthrough came when a minister named Wang Tu warned Emperor Shihu that no Chinese emperor could tolerate the dissemination of the Buddha's teaching, for the latter was a 'foreign god'. But Wang Tu's advice achieved the opposite of what the minister had intended. Shihu thought of his own Xiongnu origins and delivered the following edict: 'Tu's argument is that Buddha is a deity of foreign lands and is not one whom it is proper for the emperor and the Chinese to worship. We were born out of the marches, and though We are unworthy We have complied with Our appointed destiny and govern the Chinese as their prince . . . Buddha being a barbarian god is the very one we should worship . . . As for I [*sic*], the Chao, and the myriad barbarians, if there are those who abandon their unauthorised worship and take pleasure in worshipping Buddha, We hereby permit all of them to become adherents.'[18] Shihu deliberately chose a non-Chinese religion, a faith that addressed all peoples.

Fotudeng also managed to found 893 temples, formulate a basic monastic rule, and promote Buddhist sculpture, as the earliest-dated gilt Buddha in China suggests. This 39-centimetre-high figure of a seated Buddha (fig. 62) from the Later Zhao territory dates from 338; the realistic representation and beatific expression of the meditating Buddha would be characteristic of early Chinese Buddha figures.[19] Daoan (*ca.* 312–385), Fotudeng's most famous disciple, and Kumarajiva (344–413) from Kucha in Xinjiang continued Fotudeng's efforts to develop a distinctively Chinese Buddhism, at the same time helping Mahayana along its way to dominance.

The third Xiongnu state, called **Da Xia** (407–431), was founded in the Ordos region by Liu Bobo (381–425), who in 413 took the name of Helian Bobo. He built the highly fortified city of Tongwangcheng, which remained the capital of Xia even after the capture of Chang'an. Helian Bobo exceeded even Shihe and Shilu in cruelty, ordering the killing of thousands of skilled craftsmen who had worked on the building of his new capital, so as to ensure that they could never repeat their achievement elsewhere.[20] Scarcely a quarter of a century after its founding, Da Xia fell to the Northern Wei. The fourth Xiongnu state in China would be that of the **Northern Liang** (397–439, 460 in Gaochang) in today's Gansu province, where the Xiongnu general Juqu Mengxun (r. 401–433) seized power in a coup against the state's founder, the Chinese Duan Ye.[21] After successfully defending his little state for

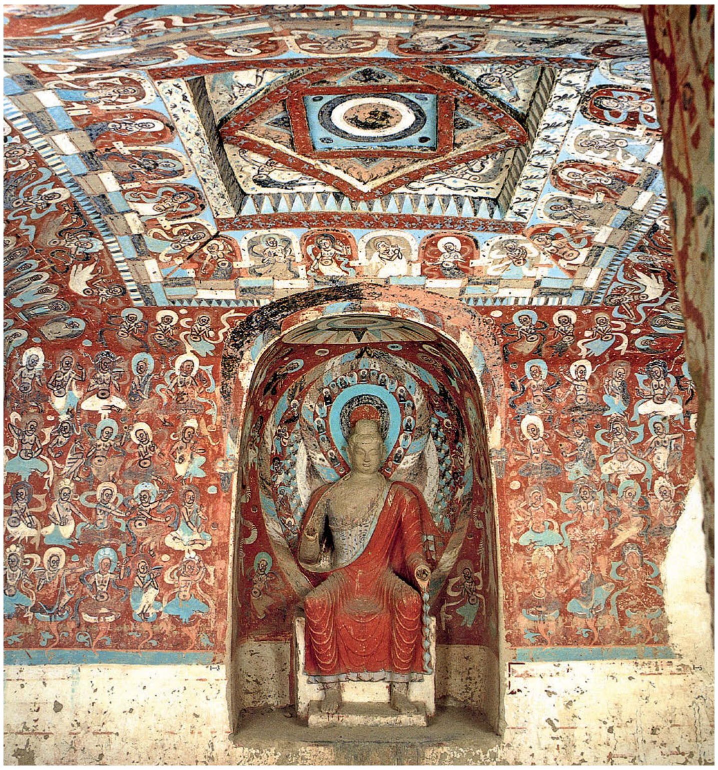


63. Around the mid-5th c., Buddhist monks began to cut caves into Mount Maiji Shan and to decorate them with stone and clay figures as well as wall paintings. Gansu Province, China.

more than 20 years, in 426 Juqu Mengxun had to recognise the overlordship of Taiwudi, the increasingly powerful emperor of the Northern Wei. When in 439 Taiwudi attacked again, capturing the Northern Liang capital of Guzang, not far from Wuwei in Gansu, Juqu Mengxun's son and successor Juqu Mujian (r. 433–439) had no option but to capitulate.

His younger brothers Juqu Wuhui and Juqu Anzhou succeeded in escaping west, first to Dunhuang, where in the winter of 441–42 they were encircled by Northern Wei troops. The Xiongnu then broke out, crossing the Kum Tagh desert south of the Lop Nor and escaping toward Shan-shan. Shan-shan's king Bilong had already fled to Calmadana (Chümo) on the Southern Silk Road during the war, leaving the kingdom's defence to his son.[22] When the Xiongnu failed to establish control over Shan-shan and were threatened with invasion by the Northern Wei, they turned to the north around 444, capturing the city of Gaochang in the Turfan Basin from the warlord Hei Shuang. Northern Wei forces on the trail of the fleeing Xiongnu then conquered Shan-shan in 445,[23] thus putting an end to the political fragmentation of northern China and reviving the terrestrial trade route. When Juqu Wuhui died in 444, his brother Juqu Anzhou succeeded him at the head of the small rump state of Northern Liang. Around 450, Juqu Anzhou captured the hostile neighbouring city of Jiaohe (Yarkhoto), west of today's city of Turfan, and made Gaochang (also called Kocho and Karakhoja) the capital of the united oases of Turfan.[24] Although Juqu Anzhou strove to maintain peaceful relations with the powerful nomad empire of Rouran to the north, the latter attacked Gaochang in 460, killing Juqu Anzhou and establishing the Han Chinese Kan Bozhou as a vassal king.[25]

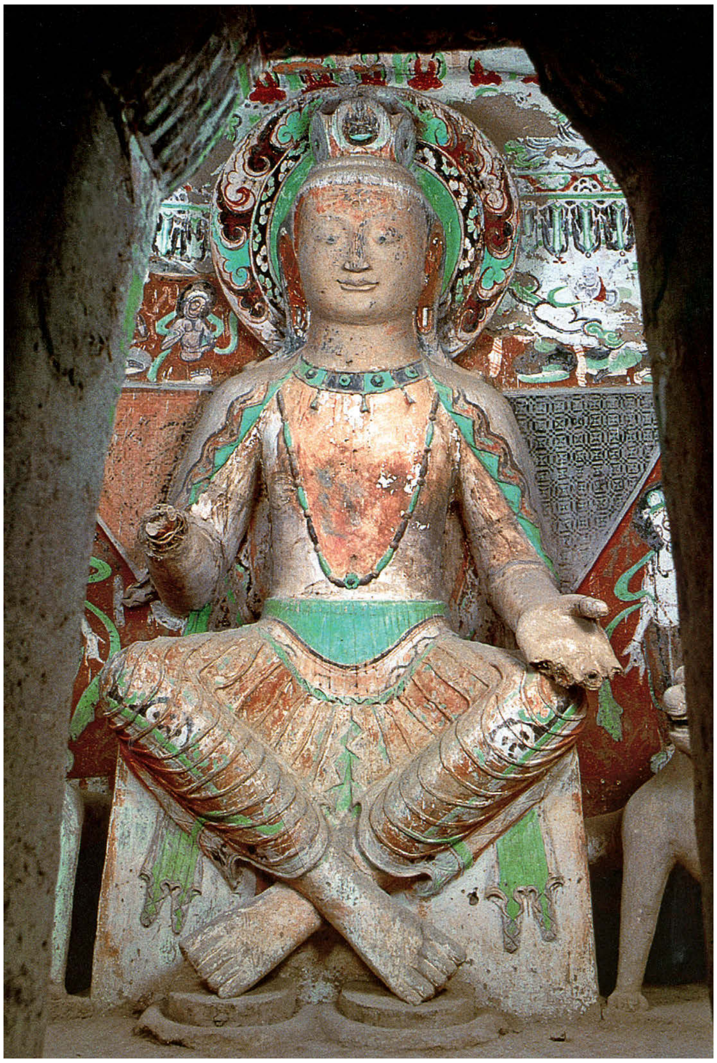
Like the Later Zhao, the Northern Liang supported Buddhism on pragmatic grounds. The rulers valued the clairvoyancy and supposed magical powers of Buddhist masters and promoted the veneration of the apparently all-powerful 'god' named Buddha and his omnipresent bodhisattvas. Hailing from India or Kashmir, the monk Dharmakshema (385–433) came to occupy in relation to Juqu Mengxun a position comparable to Fotudeng's under the Later Zhao. Dharmakshema left home for Central Asia, living in Kucha and Shan-shan before settling in Shazhou (Dunhuang). When Juqu Mengxun captured Dunhuang in 420 or 421, he took Dharmakshema to the capital Guzang, where the latter translated into Chinese the *Nirvana Sutra* especially revered by the Sarvastivadin monks of Xinjiang. Together with the *Dirghagama Sutra* this sutra inspired the design of early Buddhist grottoes at Kizil and in Gansu as circumambulatories with a central pillar.[26]



64. Cave 272, Mogao Caves, Northern Liang dynasty (397–439), Gansu Province, China. In the main niche, the future Buddha Maitreya is depicted in the typical 'European' sitting position, on a raised seat, with his feet resting on the floor; his head is a late replacement which was made too small. The Buddha is surrounded by celestial musicians, dancers and adorants; the *zaojing*-type ceiling, with an ornamental caisson inset at the crown, emulates the architectural structure of ancient Chinese buildings.

Thanks to royal support, there were five centres of translation in the little kingdom of Northern Liang alone.[27] Buddhism quickly found a following among the impoverished wider population, which was hardly interested in a hard-to-earn redemption in some mysterious Nirvana, being concerned rather with gaining entry to the paradise of Maitreya or Amitabha, as it was described in the newly translated sutras. Dharmakshema's fame as a soothsayer, however, became so great that Taiwudi, the mighty king of the Northern Wei, himself a Daoist, demanded that Juqu Mengxun hand him over. As the latter let the matter drag on, Taiwudi threatened war in late 432, whereupon Juqu Mengxun had Dharmakshema killed, to prevent him ever using his magical powers against his old master in the service of the new.[28]

While the small Xiongnu kingdom of the Northern Liang in north-west China remained politically insignificant, it did play a prominent role in the development of China's Early Buddhist sculpture. In holding the Hexi Corridor in Central Gansu it controlled an essential sector of the Silk Road; in the west, Gansu bordered on the Tarim Basin, where Buddhism had already gained



65. Cave 275, Mogao Caves, Northern Liang dynasty (397–439), Gansu Province, China. The 3.34-metre-high Buddha of the Future, Maitreya, sits on his throne with crossed legs.

a foothold in the late first to early second centuries CE, while in the east it gave on to central China and the Northern Wei. The geographical position of the Northern Liang and their interest in Buddhism meant that Gansu served as a bridge in the transmission of Buddhist art from Central Asia to China. Juqu Mengxun supported the foundation of Buddhist cave monasteries, carved out of the red sandstone of the Qilian Mountains. Among the most important of the cave monasteries established by the Northern Liang are the grottoes of Mati Si, Tianti Shan, Wenshu Shan and Jianti Si;[29] almost simultaneously, or a very little later, the neighbouring Xianbei-ruled kingdom of Western Qin (385–431) saw the development of the imposing Buddhist cave monasteries of Bingling Si and Maiji Shan (fig. 63).[30] All these institutions were situated near military garrisons established on the Silk Road.[31] As can be seen in the caves of Mati Si, the artists adopted the plan of the circumambulatory temple with central pillar from Kizil or the older cave temples of Airtam and Kara Tepe near Termez.[32] The early Kizil caves also influenced the distinctive Buddhist imagery of the Northern Liang, which sets the Buddha Shakyamuni and the future Buddha Maitreya in the foreground, surrounding them with flying heavenly beings called *apsaras* (Chinese: *feitian*). Apsaras, bodhisattvas and benefactors are all surrounded by airy, floating bands or ribbons that recall images of the Kushan wind god Oado and his billowing cloak.

The most valuable legacy of the Northern Liang is the oldest surviving Buddhist cave complex at Mogao, 25 kilometres south-east of Dunhuang in furthest Western Gansu. The 492 caves that now survive are only some of the more than 1,000 caves that were cut into a sandstone cliff two kilometres long and 17 metres in average height.[33] The first grotto was made by the monk Yuezhun in 366, during the Former Liang dynasty (320–376), whose state developed from a commandery of the Chinese Western Jin. The earliest caves have collapsed, and the oldest well-preserved grottoes, nos. 268, 272 and 275 (figs. 64f), date from the time of the Northern Liang, after they had conquered Dunhuang in 420 or 421.[34] Like those in Cave 169 at Bingling Si (dated to 420), the Buddha statues in these three grottoes display characteristics of the Late Gandhara School, such as the cheery, composed faces, the half-closed, almond-shaped eyes, the pronounced *ushnisha* (the cranial protuberance) and naturalistic anatomy.[35] The Northern Liang left another, unintended legacy to Buddhist art on their defeat by the Northern Wei in 439, when the latter deported some 100,000 households to their capital Pingcheng (today's Datong), where 20 years later the Emperor Wengchengdi (r. 452–465) would embark upon the construction of a gigantic Buddhist cave temple at Yungang. These prisoners of war and craftsmen and artists later deported from Gansu would be employed to construct these grottoes.[36]

1.2 The Northern Wei and the Yungang Grottoes

The loose, proto-Mongolian-speaking **Xianbei tribal confederation** (89–235) originated in eastern Mongolia and Manchuria. In the late first century CE they had played a key role in the defeat of the Northern Xiongnu and had incorporated some 200,000 of their warriors into their own federation. The combined Xianbei-Xiongnu federation controlled much of Mongolia, and after victories over the remaining Xiongnu and the Wusun, they became the strongest power in north-east Central Asia. The architect of this success was Tanshihui (r. 156–180), who ruled over almost as large a territory as had Chanyu Modu, and who in 177 defeated two invading Chinese armies. Unlike Modu, Tanshihui failed to strengthen his 'empire' by establishing governmental structures and enacting a body of laws. And rather than doing as Modu did and concluding advantageous treaties with China, he preferred to conduct annual raids to the south. As de Crespigny says, 'His state was a pirate kingdom, never matching the organization of the former Xiongnu'.[37] His death was immediately followed by a struggle for succession, and when a leader called Kebineng seemed to have succeeded in reuniting the different clans, Emperor Wei Mingdi had him murdered in 235. The confederation broke up into several tribal groups, the most important of which were the Murong, the Shiwei and probably the Khitan in the east, the Tabgach (Tuoba) in the centre, and the Rouran (Juan Juan) in the west.[38]

While the Xiongnu were responsible for four of the Sixteen Kingdoms, the Xianbei founded six, as well as the powerful Northern Wei Empire. These were the four Yan dynasties in the east, the Southern Liang in south Gansu and north-east Qinghai, and the Western Qin in south-east Gansu, while the Northern Wei dynasty (386–534) played a vital role in the revival of international trade, the further development of Buddhism, and the history of China more generally.[39] This was the first time that Buddhism had enjoyed the support of a strong and stable dynasty, one that reinforced the religion's visual presence through huge cave temples and stone sculptures. The ruling house of the Northern Wei belonged to the Tabgach clan (Chinese: Tuoba), which spoke a 'Para-Mongolic' language[40] and had earlier founded the principality of Dai (310–376), whose capital Shengle (Shilinggol) was near today's Hohhot in Inner Mongolia. The founder of the dynasty was Tuoba Gui (r. 386–409), nephew of the last prince of Dai. He broke away in 386 from the collapsing Former Qin (351–394), proclaiming himself king (*wang*) and increasing his territories through several wars. In 398 he declared himself emperor, taking the name of Daowudi, unifying weights and measures and moving his capital to Pingcheng in northern Shanxi Province. A year later he inflicted a massive defeat on the Turkic-speaking Gaoche confederation settled around the Gobi Desert and deported tens of thousands of their households to Shanxi.[41]

The early Northern Wei's successes against the great Gaoche and Rouran confederations in the north were based on their intimate knowledge of horse-nomad behaviour. So as not to endanger the traditional martial spirit of their own members, the Northern Wei used two systems of administration: one that applied traditional Chinese principles of administration to conquered Chinese populations, the other governing Xianbei

households in accordance with the traditional law and custom of the steppe. Secondly, they adopted a markedly offensive military strategy and between 391 and 492 regularly attacked the heartland of the Rouran, whose loose empire extended from Manchuria to the Turfan Basin. The consequent destabilisation was each time reinforced by the deportation of thousands of households, literally depopulating the Rouran Empire. Like the administration, the Tabgach army was divided, Chinese forming the infantry, Tabgach the cavalry, itself divided into tribally based light and heavy divisions. Thanks to grave goods in the form of clay figures, called *mingqi*, of heavily armoured horsemen and other archaeological finds, we know that their mounts were protected by horse-armour that included a chamfron, and that the rider, likewise armoured down to the knees, fought with a lance or long composite bow. Thanks to iron stirrups, very likely a Xianbei invention, the mounted bowman could stand in the saddle when shooting. The Northern Wei also contributed to transcontinental trade and diplomatic exchange, as can be concluded from the Byzantine legations which reached Pingcheng in the years 456, 465 and 467.[42]

Emperor Daowudi also supported Buddhism, and established the office of superintendent of monks and nuns, responsible for Buddhist affairs. The first to be appointed was the monk Faguo (in office 396–398), who not only organised the building of the first Buddhist monastery in Pingcheng but also pioneered the argument that the Tuoba emperor was a *Tathagata*, an earthly manifestation of the Buddha. Faguo adopted this bold postulate in order to resolve an acute dilemma. On the one hand, Daowudi wanted the monks to recognise his worldly authority, and on the other, the Buddhist scriptures insisted that a monk should bow to neither parents nor king. Faguo argued that the emperor was 'the Tathagata of the present time. The [monks] should do him all homage . . . I am not bowing before the emperor, I am just paying homage to the Buddha.'[43] Submissively flattering to worldly rulers, this notion would later be adopted by Chinese and Tibetan emperors.[44]

After the death of the second emperor, Mingyuandi (r. 409–423), poisoned by the 'immortality pills' prepared for him by Daoist alchemists, the emperor Taiwudi (r. 423–452) succeeded in taking Chang'an in 430, defeating Da Xia a year later, and conquering Gansu in 439, bringing the Sixteen Kingdoms period to an end. The conquest of Shan-shan in 445, however, brought neither strategic nor economic advantage, as the desiccation of the climate made the crossing of the desert from Dunhuang to Shan-shan increasingly impracticable and led to the depopulation of that kingdom's oasis cities.[45] Taiwudi, though, was a Daoist, who in 442, as part of his sinification policy, had made Daoism the state religion. The growing wealth of Buddhist institutions therefore annoyed him, and when three years later evidence came to light that monasteries in Chang'an were involved in rebellion he took drastic measures, issuing an edict in 446 that 'All stupas, paintings, and foreign sutras are to be beaten down and burned utterly; the *sramanas* without distinction of age are to be executed'.[46]

The fifth Tuoba emperor, Wengchengdi (r. 452–465) was a Buddhist; he repealed the edict and initiated one of the most splendid of all China's Buddhist works of art. In 460 he appointed as superintendent the monk Tanyao, who decided that the revitalisation of Buddhism required an indestructible visual symbol, and after Taiwudi's destruction of works in wood and metal he opted for a less vulnerable material, stone. He thus recommended to the emperor that five great cave temples be carved out of the rock at Yungang. Like the grottoes of Kizil and Gansu, the cave temples of Yungang are charged with symbolic meaning. In accessing the caves through a dark, narrow passage, the faithful leave the earthly world and all its faults to enter a mysterious space. At the end of the ever-darkening corridor they came to the great Buddha figure, giving the journey the character of a cathartic rebirth. The five earliest caves, Caves 16–20, are presided over by gigantic figures of Shakyamuni or Maitreya, as much as 17 metres high. It is said that these five stone Buddhas have the features of the first five Tuoba emperors, the complex thus serving also the cult of the ancestors, while the faithful who venerated the Buddha simultaneously paid homage to the five emperors. Caves 1 and 2 and 5 to 13 belong to the second phase of construction, which lasted from 470 to 494 (fig. 68). There, colossal Buddhas have in some cases given way to smaller figures, and in certain caves one finds instead, as at Kizil and Mati Si, a central pillar, square in cross-section, connecting floor to ceiling like the world tree that symbolically connects earth and heaven. On each side of the pillar is a large niche with a Buddha figure carved out of the rock; the walls are decorated with reliefs showing scenes from the life of the Buddha.

The second phase of construction came to an end in 494, when Emperor Xiaowendi (r. 471–499) moved the capital to Luoyang. He did this so that the centre of his empire should lie closer to the geographical centre of China, planning for a conquest of southern China that never in fact took place. In Luoyang the Tuoba continued the construction of cave temples in the grand style that had already been begun at Longmen Shiku, a project that the Tang dynasty (618–907) would bring to glorious fruition. The sinification of Tuoba society and culture begun by Xiaowendi led to the emergence of a distinct, somewhat mannered-seeming sculptural style that found expression in an elongation of form, especially that of the head, a transfigured, inward-turned expression of the face, and a diminution of corporeality. This new Chinese style

appears both at Longmen and in the later grottoes at Yungang, as also at Maiji Shan, whose Cave 133 has ethereal-looking heavenly beings with billowing robes floating through space.[47] However, the forced sinification of the Xianbei population alienated the armies stationed in the north, who not only lost their privileges but were threatened in their identity. With the year 523 began a period of rebellion and palace intrigue that would end in the splitting of the empire into Eastern Wei (534–550) and Western Wei (535–557).

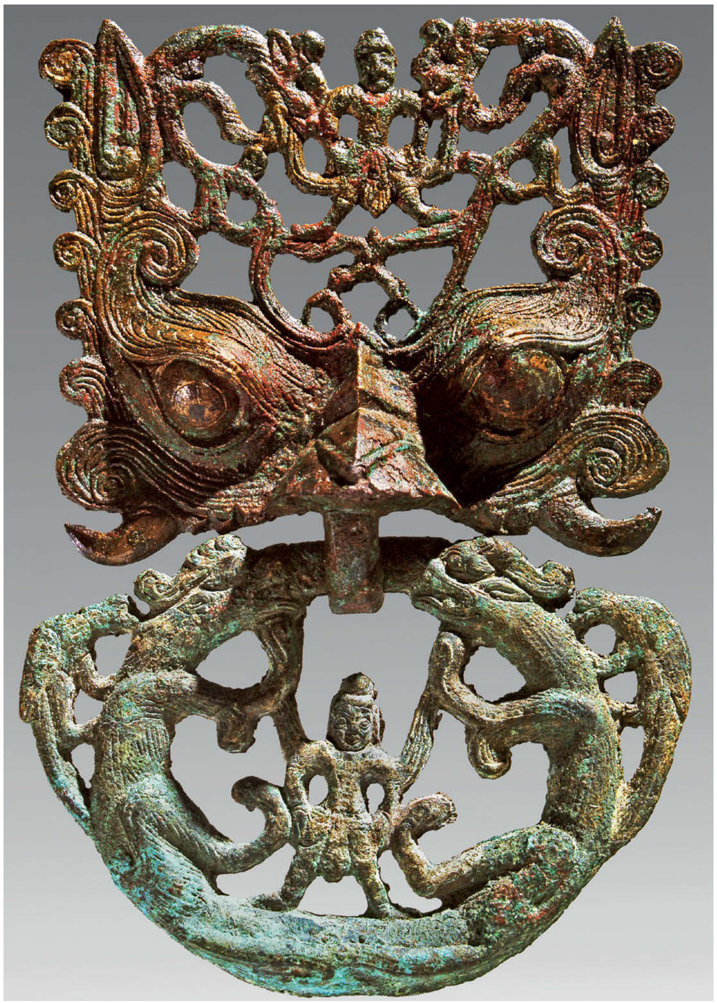
Under the Northern Wei there developed not only an official Buddhist art but also fascinating hybrid forms that combined symbolically significant features from Buddhism, from China, and from the older steppe culture. Among these are the two-part bronze knockers called *pushou* that were affixed to tomb doors or coffins (fig 70). The upper part consists of a frontally represented zoomorphic mask, called a *taotie*, in which, in these specific types of bronze pieces, the newborn Buddha Shakyamuni can be seen between the upward-pointing ears, subduing two symmetrically arranged dragons. From the muzzle of the animal mask hangs the knocker ring, a pair of dragons worked into a circle, again tamed by the newborn Shakyamuni, who has flames flaring from his shoulders. On the back of each dragon stands a feathered beast of prey. Known in China since the third millennium BCE, the *taotie* mask represents a wild and dangerous being that will confer protection when properly venerated. The motif of 'lord of animals' had been known in east Central Asia since the Bronze Age and the representation of the newborn Buddha as the lord of the dragons conveys a double meaning: according to Buddhist tradition, rain divinities in the form of dragons poured auspicious water over the newborn child, while in the Chinese Daoist context the little Buddha can be understood as the dragon tamer Huang Long Shi, bringer of good fortune. As Annette Juliano notes, 'In China, the *taotie*, coupled with the images of the dragon and the Infant Buddha immortal, would give this *pushou* extraordinary power to protect the deceased in the tomb on the journey to immortality'.[48]

We may note in conclusion that it was the Xiongnu and Xianbei from the eastern steppes of Central Asia who in the second quarter of the first millennium CE helped Buddhism achieve a breakthrough in northern China and at the same time laid the foundations for the development under the Liang and Northern Wei of a synthesis of Indo-Hellenistic and Chinese notions of art.

1.3 The Rouran and Gaoche

The Rouran had formed part of the combined Xianbei-Xiongnu confederation that broke up in 235.[49] While the forebears of the Northern Wei and the dynasties of some of the petty states of northern China moved to the south, there emerged from the Xianbei and Xiongnu who had remained in Mongolia the tribal confederation of the **Rouran**, whose name derives from that of tribal father Ruru or Ruirui.[50] The name Juan Juan was given to them by the Tuoba emperor Taiwudi, a derogatory pun meaning 'wriggling worms'.[51] The confederation is said to have been first brought together by the semi-legendary Muyilu (r. *ca.* 306–316), though it was Shelun (r. 394–410) who broke away from the Tabgach in 392 and who in 402 proclaimed himself khagan of the **Rouran Empire** (402–555).[52] At the same time he succeeded in gaining control over the **Gaoche** federation, which had suffered a devastating defeat at the hands of the Tuoba emperor Daowudi three years earlier.[53] Just as Chanyu Modu had done, Shelun organised all arms-bearing men into units of 100 and 1,000 and promulgated a strict code of military discipline.[54]

Though Rouran territory extended from Manchuria to Turfan, and sometimes even as far as Khotan, they never succeeded in really subduing the Gaoche, whose name means 'high carts'.[55] The Northern Wei either played Rouran and Gaoche against each other, by supporting the Gaoche, or simultaneously attacked both confederations, as they did in 429, when Emperor Daowudi captured and brought back with him 300,000 Rouran and a million head of livestock.[56] Despite such reverses, the Rouran – whose later khagans were possibly Buddhist[57] – conducted an expansionary foreign policy, displacing the Wusun in the early fifth century.[58] The wars of that period in east Central Asia made their effects felt even in distant Byzantium. Under pressure from the Rouran, some Tiele, members of the Gaoche confederation, moved west, driving the Sabirs out of southern Siberia, who in their turn expelled several Old-Turkic-speaking Oghur tribes from Kazakhstan. From there the Oghurs travelled west, together with a number of Tiele tribes, crossing the Volga in the mid-fifth century, a mere century after the Huns, to occupy the Caspian-Pontic steppes. Around 463 the Byzantine historian Priscus (*ca.* 410/20–74) reported that Oghuric tribes had occupied the Pontic steppe and were seeking diplomatic contacts with Constantinople. The Byzantines granted the request of the most dangerous-seeming Oghurs, seeking to convert these nomadic Central Asian warriors and integrate them 'into the Christian Commonwealth of which the Byzantine emperor considered himself the head'.[59]



70. Bronze door knocker base (*pushou*), which was fixed to the entrance gate of a tomb or to a coffin. In the upper half, the young Shakyamuni tames a fearsome monster called *taotie*, in the lower half a pair of dragons. This *pushou* had a strong protective function. Northern Wei dynasty (386–534), excavated in 1981 in Leizumiao, Ningxia, China; Guyuan Municipal Museum, Ningxia.

Two serious defeats by the Northern Wei in 449 and 458 saw the Rouran lose people and livestock in the south-east. To compensate for these losses they attacked to the south-west, conquering Gaochang in 460, eliminating the Northern Liang elite that remained there and installing a vassal king. At the same time, they resettled the Ashina Turks from the area around Turfan to the Altai, where they had to work for them as ironsmiths.[60] In 471 they gained control of the important oasis city of Khotan,[61] and perhaps also the kingdom of Shan-shan, which had been depopulated since the mid-fifth century.[62] Yet the Rouran were unable to enjoy their new conquests for long, for in 491 the Gaoche toppled the Kan ruling house that the Rouran had installed in Turfan. After a period of turmoil, the non-Chinese[63] and probably Turkic **House of Qu** established itself in Gaochang (501–640), which managed for 139 years to maintain a degree of autonomy, despite the permanent threat of the northern steppe nomads and the pressures to recognise the suzerainty of Gaoche, Rouran and Western Turks in turn. Although Turfan was then politically independent of China, the increasingly wealthy Chinese displaced the old Tocharian elite, and the Tocharian A language faded away.[64]

Under the Rouran khagan Doulun (r. 485–492) the **Uyghur** chief Ay Uzhru (r. *ca.* 487–508; Chinese, Abuzhiluo), a member of the Yaghlaqar clan, left the Rouran federation to make for the west. The Uyghurs then consisted of around 100,000 tents ('households') and ten tribes, the largest of them led by the Yaghlaqar. As the Uyghurs represented by far the largest of the nine tribes of the Tiele confederation,[65] the Rouran lost the majority of their Turkic-speaking nomads with Ay Uzhru's departure, leading to Doulun losing his legitimacy as khagan and being deposed in a coup.[66] Under khagan Anagui (519, 521–552) the Rouran flourished again, not least because the last, weak rulers of the Northern Wei needed their services to defeat domestic revolts.[67] Anagui's arrogance, however, led to the defeat of the Rouran at the hands of the rising Ashina Turks (Chinese: Tujue). The latter's leader Bumin (d. 552)[68] first sought diplomatic relations with the Western Wei (535–557), whose all-powerful General Yuwen Tai (in power 535–556) sent him the Sogdian Anahita (or Nanai) Banda (Chinese: An Nuopantuo) as his ambassador in 545.[69] When a year later the Gaoche were planning a new rebellion, Bumin attacked them at

▶ **71.** Subterranean street in the city of Jiaohe, Turfan Oasis, Xinjiang, China. The Turfan Depression lies at an average of 80 m below sea level and has an extreme continental and arid climate with strong winds. To protect the inhabitants from the unbearable summer heat and the icy winter winds, many streets were cut 2 to 5 m into the ground. At the same time the one- to two-storey houses and the workshops were also dug deep into the ground. The buildings often had two entrances, the upper one from the city level and a lower one from the subterranean street.

Anagui's behest and defeated them. As thanks he asked for a Rouran princess as a wife, to whom Anagui made this scathing reply: 'You are our slaves, our smiths; how do you presume to make such a request?'[70] Seeking his revenge, Bumin allied himself with the Western Wei, gathered his forces and in 552 inflicted on Anagui a crushing defeat, upon which the latter took his own life. Over the next three years the Ashina defeated and hunted down four different Rouran khagans, and when the last khagan, Yanluchen, and 3,000 faithful followers found refuge with the Western Wei,[71] he demanded that they be handed over to him. For fear that the Turks might attack, Yuwen Tai delivered up the refugees to the Tujue, who slaughtered them. The Rouran steppe empire had ceased to exist.[72] Shortly thereafter, in around 557 or 558, the Avars or Varchonites made their appearance on the Pontic steppe, as reported by the Byzantine historian Menander, with the Western Turks at their heels.[73] These Varchonites were defeated Rouran and Hephthalite tribes, fleeing before the Turks, which later led to the development of intensive contacts between Constantinople and the Western Turks.[74]

2. Hunnic Peoples of Central Asia

Around the mid-fourth century, Hunnic peoples invaded the southern half of Central Asia, creating five significant political entities which spread as far as northern India. They were the Chionites, the Kidarites, the Alkhan, the Nezak and the Hephthalites north of the Hindu Kush. It remains controversial whether these Hunnic state-like entities came out of a single, vast migration over time, or whether there were several separate waves of immigration.[75]

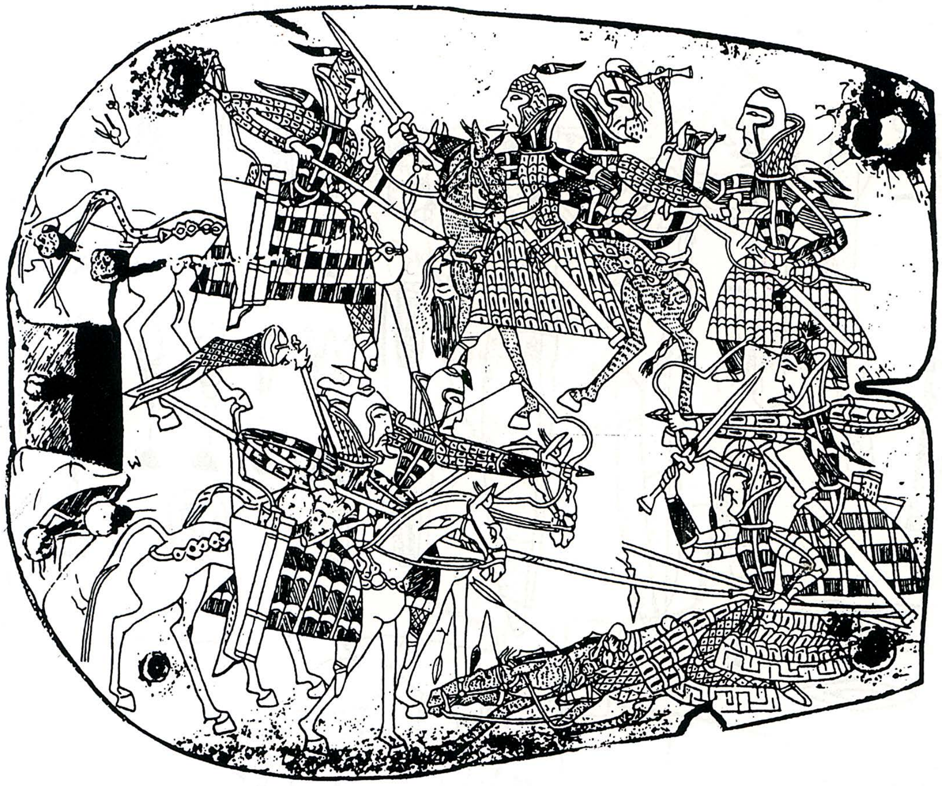
2.1 The Chionites

The first written account of the incursion of Hunnic tribes into the heart of Central Asia comes from the Greek-born Roman military officer and historian Ammianus Marcellinus (*ca.* 330–*ca.* 395), who reports that in the winter of 356/57 Constantinople's arch-enemy Shah Shapur II (r. 309–379) drove off attacks by Hunnic **Chionites** (*ca.* 350–*ca.* 441) on the eastern reaches of the Sassanid Empire.[76] Since the days of Shapur I, Sogdiana had been ruled by vassal kings under Sassanid suzerainty, who inscribed the title *Kushanshah* on their coins but also had to tolerate the pretensions to independence of large landowners, as witnessed by the latter's strongly fortified strongholds. The Chionites – the Persian *Xyon* and Sogdian *Xwn*[77] – were presumably related to the horse nomads who, according to the Chinese chronicle *Wei Shu*, left their homeland in the Altai for the south around 360.[78] In any event, Hunnic tribes arrived in Sogdiana and Bactria around the middle of the fourth century, apparently under pressure from the expanding Xianbei, where they wrestled for supremacy.

Shapur's campaign ended in a double victory, for he not only succeeded in repelling the Chionites but even gained them as allies in his war with Byzantium. Ammianus Marcellinus witnessed how in 359 at the siege of Amida (Diyarbakir, in south-east Turkey) the Chionites under their king Grumbates advanced upon the walls of the city, and how a bolt from a Roman crossbow killed the king's son, whose body was cremated.[79] The custom of cremation makes it clear that the Chionites could not have been an Iranian people. But this participation in Shapur II's offensive against the Eastern Roman Empire did not prevent the Chionites from continuing their wars of conquest in the east of the Sassanid Empire, which for a long time forced the Shah to shift his court to Merv.[80] In the time of Kushanshah Varahran II (r. *ca.* 350–after 360) the Chionites[81] took Balkh, which they made their capital. According to Armenian sources, Shah Shapur II was defeated twice by the Chionites of Balkh, in 368 and between 374 and 378.[82]

While in the north of the contested areas a clear balance of forces was relatively quickly established – the Sassanids retaining control over Merv while the Chionites (or the Kidarites) prevailed in Sogdiana – in Bactria the Sassanids put up a tenacious resistance, leading to decades of war that would have devastating consequences for the region. The Buddhist monasteries in Termez were ravaged and destroyed by Shapur's troops in 368–370, irrigation schemes were neglected, the area under cultivation shrank markedly, and the cities suffered pillage and fire, which brought about an abrupt economic contraction and the depopulation of Bactria. Sogdiana, on the other hand, experienced under the late Chionites and the Kidarites – the equally Hunnic successors of the Chionites – an economic boom, a real 'Sogdian renaissance', that saw the fortification of Samarkand,[83] the growth of Bukhara, and the establishment or reconstruction of the cities and settlements of Paykend south-west of Bukhara, of Varakhshah, Uch Kulakh and Vardana north of Bukhara, Kushaniya east of it, and Panjikant east of Samarkand. The rapid construction of urban fortifications by the Kidarites in Sogdiana was intended to defend against not only the Sassanids to the west but also a new threat from the south. For another horse-nomad people, the Hephthalites, had appeared there, driving the Kidarites out of Bactria from around 456.[84] Also in the very early fifth century the Chionites and Kidarites began the construction of a 'long wall' system around the oasis of Bukhara, which was strengthened with fortresses and watchtowers and would ultimately reach a total length of *ca.* 400 kilometres. Possibly this wall system had a secondary, ecological purpose, namely to prevent sand from encroaching upon the agricultural zones. This intensive building activity marked the beginning of the Early Middle Ages (fourth/fifth–eighth century) in Sogdiana.

73. Ruins of the fortress of Kala-i Kahkaha on the northern bank of the river Panj, which here forms the border between Tajikistan and Afghanistan. Like the neighbouring Zamr-i Atish Parast,[5] this fort stood on an important trade route, which linked the Tarim Basin with Sogdiana via Badakhshan. The fort also controlled a bridge over the Panj. The Russian archaeologist A.N. Bernstam found Hephthalite and early Sogdian ceramics in the fort and therefore dated its construction to the 4th to 5th c.[6] Gorno-Badakhshan Province, Tajikistan.



74. Drawing on one of the delicately carved Orlat bone plates from the later 4th c. CE. The eight heavily armoured warriors illustrate a battle between different Hunnic confederations, which probably took place in Sogdiana.[7] Jangar Ya Ilyasov, Dmitriy V. Rusanov, *A Study of the Bone Plates of Orlat* (Kamakura, 1997/98), p. 146.

2.2 The Kidarites

Around 390, gold coins bearing the name and title Kidara Kushanshah were starting to appear in Tocharistan and northern Gandhara.[85] It is very likely that a leader named Kidara was the founder of the dynasty of the **Kidarites** who were probably descended from the Chionites. The Kidarites first drove the existing Chionite rulers out of Bactria in the late 420s, then descended upon Merv, where they were beaten off by Vahram V (r. 421–438).[86] They then turned southward and conquered Gandhara. According to La Vaissière, Kidara left one of his sons in Gandhara while he crossed the Hindu Kush again before conquering Sogdiana not long after 440.[87] At the same time, the Kidarites invaded the Punjab, forcing the Gupta king Kumaragupta I (r. 413–455) to recognise their suzerainty.[88] But the new Kidarite empire was to enjoy no peace, as by 456 the Hephthalites had already appeared in their rear. The latter allied themselves with the Sassanid ruler Peroz I (r. 457–484) and that same year or one year later sent an embassy to China.[89] As the Byzantine historian Priscus (*ca.* 410/20–*ca.* 474) reports, Peroz defeated the Kidarites in 467/68 and occupied their capital Balkh. 'An embassy arrived [to the Byzantines of Emperor Leo I] from the Persians which announced that they had crushed the Kidarite Huns and had taken their city of Balaam.'[90] But the Sassanid rule over Bactria was short-lived, for in 474 Shah Peroz suffered a severe defeat against the Hephthalites, and ten years later, in another war against them, lost his life so that Bactria fell into the hands of Hephthalites. As early as 479 perhaps, and by 509 at the latest, the Hephthalites had extended their power over Sogdiana as well, as from then on Hephthalites would head the many embassies from that country to the Northern Wei capital of Luoyang, actually merchant expeditions in diplomatic guise.[91]

The intra-Hunnic power struggles in Sogdiana and Bactria may have found expression in the incised decoration of the fourth-century bone plaques famously discovered in 1982 in a kurgan at Orlat, 50 kilometres north of Samarkand. On the second plaque, which formed part of a belt, two groups of heavily armoured riders and foot soldiers represent a battle between nomad warriors, probably depicting the struggle between a Chionite king of Samarkand and other Hunnic warrior groups.[92] The special significance of the decoration of the presumably Chionite or Kidarite Orlat plaques lies in its unmistakeable similarity to the Sogdian wall painting that emerged in the fourth to fifth centuries to reach its apogee in the seventh and eighth; a painting exemplified in the murals that decorated the private houses of wealthy city dwellers, such as those of Panjikant, which show heroic epics, cavalry battles, and single combats.[93]

2.3 The Central Asian Hephthalites

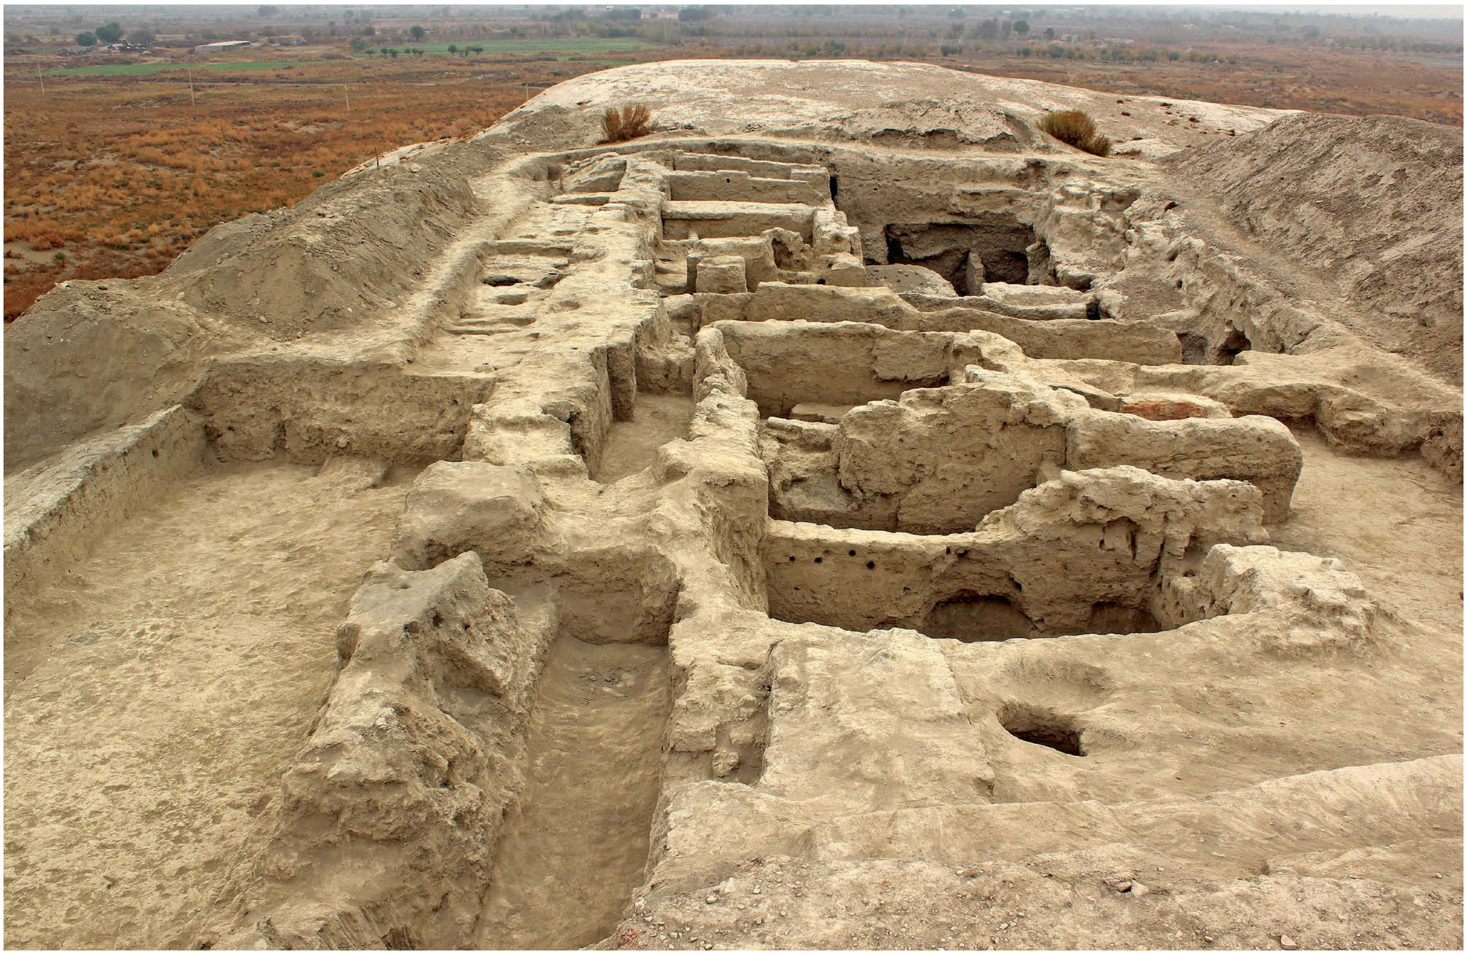
The geographical and linguistic origins of the Central Asian **Hephthalites** (*ca.* 450–*ca.* 560) are disputed.[94] They probably came from the Altai[95] or from the Syr Darya (Jaxartes) Delta.[96] Having arrived in Bactria, the Hephthalites, whose confederation was most likely made up of Altaic Gaoche and Hunnic groups together with Indo-European tribes, adopted the Eastern Iranian language Bactrian as their own.[97] To the north-east, the Hephthalites were allied with the Rouran, but they successfully extended their territory westward and eastward. The Islamic historian al-Tabari (839–923) tells us that the Hephthalites helped the Sassanid prince Peroz I (r. 457–484) regain his throne from his younger brother Yazdegerd II.[98] But when Peroz launched military offensives against them to halt their slow encroachment on Eastern Iran, he suffered three serious defeats. Peroz was twice taken prisoner by the Hephthalites and made to pay enormous ransoms; on the second occasion, in 474, he also had to leave his son Kavadh as hostage against full payment of the money. Al-Tabari reports that upon his release at a column marking the border[99] he had to swear before the Hephthalite king, who bore the Sogdian name of Akhshunwar,[100] that he would never again go beyond it. To protect his north-eastern frontier against the Hephthalite threat, Peroz began the construction of the Great Wall of Gorgan, which ran more than 195 kilometres from a place near today's city of Gomishan at the south-eastern corner of the Caspian Sea to the eastern outliers of the Elburz range. A moat at least five metres deep lay on the northward side of the defensive wall of burnt brick, which was reinforced by more than 30 forts set at regular intervals. Behind stood further strongholds with sizeable garrisons that in an emergency could be quickly sent to defend the wall. Peroz's successors Kavadh I and Khosrau I continued the construction of the wall, which would remain manned at least until the mid-seventh century.[101]

Ten years after his second capture, Peroz decided to avenge his earlier humiliation by embarking on a new offensive and led a 100,000-strong army to the border column that he had sworn never again to pass. Warned against breaking his oath by the highest Zoroastrian clergy, Peroz had the column placed on a cart, says al-Tabari, and commanded that it be pulled into Hephthalite territory by elephants: 'I am bound by oath not to pass beyond the column. Draw it therefore before me, that I and my army may follow it, and the oath be not broken.'[102] The Hephthalite Akhshunwar attempted unsuccessfully to halt Peroz before Balkh, and then laid a trap for him near Herat, digging a great number of pits that were then covered over. When Peroz attacked, many of the Sassanid horsemen fell into these pits, breaking up their formation; Peroz was killed, together with most of his soldiers, and the survivors were enslaved.[103] The Sassanids had to pay costly reparations and the Hephthalites were able to meddle more than ever in Iranian affairs. The Sassanids also lost control over Merv, which then enabled the construction of two Buddhist stupas there.[104] When Peroz's son Kavadh I (r. 488–496, 498–531) rebelled against his uncle Balash (r. 484–488), he was helped to the throne by a Hephthalite army. And when in 496 the Sassanid nobility rose up against him on account of his sympathy for the Mazdakites, a radical, even revolutionary religious movement among whose tenets were community of goods and of women, he again turned to the Hephthalites, finding refuge with them. When two years later a Hephthalite army returned him to the throne, the Sassanid Empire became tributary to the Central Asian Hephthalites, a vassal status that was only thrown off with the formation of the Sassanid-Turkic alliance that between 557 and 563 would bring the Hephthalite Empire to an end.[105] In the last two decades of the fifth century and the early years of the sixth, the Hephthalites extended their dominion to the north and east, conquering Sogdiana, the Pamirs, Kashgar, Khotan, Kucha, Turfan and Karashahr.[106]

Horse nomads by origin, the Hephthalites continued the urbanisation policy of their Kidarite predecessors, investing Sassanid tribute payments in expanding the cities and promoting trade and agriculture; a side effect of this was that Sassanid silver coins with Hephthalite counterstamps became one of the most common means of payment in Central Asia.[107] The Hephthalites were notably active in the Bukhara Oasis, where they established or expanded the city of Vardana (fig. 75). According to the central Asian historian Narshakhi, himself from Bukhara (*ca.* 899–959), the village of Vardana was allegedly founded by an otherwise unknown Sassanid prince named Shapur.[108] On the basis of the many finds of pottery, the two Uzbek archaeologists Adylov and Mirzaahmedov suppose that the small commercial town of Vardana was founded at the latest by the time Kavadh took refuge with the Hephthalites in the late fifth century. A re-analysis of the above-mentioned pottery suggests a foundation of the earliest architecture into the period of the Sogdian renaissance of the fourth to fifth centuries CE, which was also triggered by the economic success of Sogdian traders.[109] As Vardana lay on the northern edge of the Bukhara Oasis, on the road to the steppe, the town was from the fifth or sixth century onward strongly fortified, as evidenced by the excavations.[110] The rulers of Vardana, called the Vardan Khudahs, rivalled Bukhara's Bukhar Khudahs; in the years 689–709 the Vardan Khudah Khunuk – a prince of Turkic origin – even ruled both Vardana and Bukhara; he was one of the most dogged adversaries of the Muslim warlord Qutayba.[111]

Discovered in autumn 2012 by the Society for the Exploration of EurAsia, a chalcedony seal amulet with a highly stylised, engraved figure of either Gayomard or the god Sesen, establishes another link between Vardana and Sassanid culture. In one of the Zoroastrian creation myths, Gayomard was the first mortal man, created by Ahura Mazda, a man with some animal attributes, who at the renewal of the world would be the first to be resurrected. Given this symbolic significance for mortals, Gayomard was probably particularly popular on amulets.[112] However, following a linguistic study by Martin Schwartz, an interpretation of this stylised 'figure with the sticks' as the east Mediterranean god Sesen seems more likely. Sesen was venerated as a deity protecting pregnant women and newborn children. Silvia Pozzi, head archaeologist at Vardana, believes that 'it would be more prudent to identify [the figure] with a demoniac antagonist of this divinity, rather than with the god himself. The existence of a complementary aspect of Sesen seems to be confirmed by the names of Sasan and Sasan Marg, carved on the famous amulet from the Metropolitan Museum of New York.'[113] As Rika Gyselen demonstrated, the Sassanid amulets often did not feature a benevolent deity, but its maleficent counterpart in order to conjure it.[114]

Narshakhi describes in florid prose the end of Hephthalite dominion in Central Asia. According to him the last Hephthalite king, Abruhi, was a tyrannical ruler, prompting many nobles and wealthy merchants to flee northward, founding the city of Jamukat in southern Kazakhstan. This area, however, belonged to the recently established first Turkic Empire that had overthrown the Rouran and in doing so had considerably weakened the position of the Hephthalites who had been their allies.[115] When Yabghu Ishtemi (r. 552/53–575), who governed the western half of that empire, received reports of the unrest among the Hephthalites, he struck an alliance with the Sassanid king Khosrau I Anushirvan (r. 531–579), who around 560 inflicted a heavy defeat on Abruhi at the Battle of Bukhara. 'When Shir-i Kishva [Ishtemi] came to

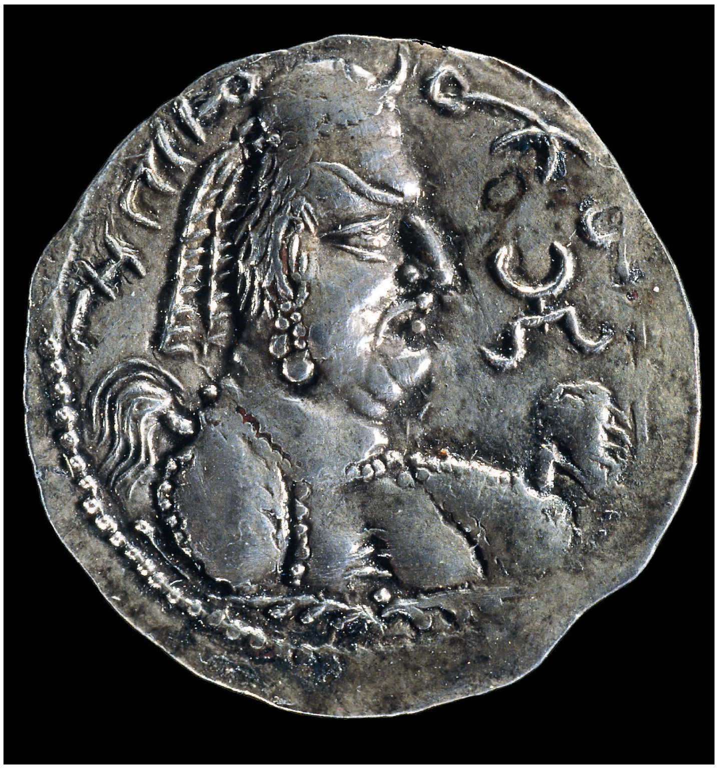


75. The excavation of the citadel of the city of Vardana, north-east of the Bukhara Oasis, Uzbekistan. The strongly fortified citadel was probably founded in the 5th c. during the Hephthalite period or even earlier, in the 4th century. Depicted here is what is presumed to be the palace of Khunuk Vardan Khudah (r. before 689–709), who offered stubborn resistance to the invading Arabs.

Bukhara, he seized Abruhi in Paykend and imprisoned him. He ordered a large sack filled with bees and then confined Abruhi in that sack until he died.'[116] Abruhi's regional capital of Paykend was turned into a 'free merchant city', the Oxus for a time forming the frontier between the two victorious powers, Sogdiana on the northern side of the river falling into the Turkic zone of influence, Tocharistan to its south into the Sassanid one.

Although the Hephthalite empire collapsed after the battle of Bukhara, the Hephthalites did manage to take advantage of the tensions, economic in origin, that rapidly emerged between the two victors. They established many semi-independent kingdoms and principalities that paid tribute to the one or the other, depending on the military situation. North of the Oxus there were two such principalities, Kuttal in south-west Tajikistan and Chaganiyan in the Zerafshan Valley, between Samarkand and Termez, which formed buffer states between the victorious powers. But when the Hephthalites, who had fled to Chaganiyan, chose Faganish as their ruler, the Sassanid king Khosrau I crossed the Oxus and laid both states under tribute. The Hephthalites of Tocharistan and Khotan then took advantage of Khosrau's death in 579 to rebel, but this attempt to resurrect a Hephthalite Empire in Central Asia was nipped in the bud by the Turks. The Turks then crossed the Oxus, expelling the Sassanids from the whole of Tocharistan. When they reached Herat in 588 or 589, the Sassanid general Vahram Chobin lured them into a trap, inflicting heavy losses on a numerically much superior enemy. According to al-Tabari, the general himself killed the Turkic commander with a well-aimed arrow before turning north to take Paykend.[117] The little principality of Chaganiyan, however, managed to stand its ground, as may be gathered from a Sogdian inscription from the Afrasiab palace in Samarkand. Incorporated into the palace murals created between 648 and 651, the inscription tells how Varkhuman, King of Samarkand, received the ambassador of Turantash, ruler of Chaganiyan.[118]

When the Sassanids planned a new campaign during the first quarter of the seventh century, the Turks intervened. In 616–17 a Western Turk army attacked the Sassanids, driving deep into Iranian territory to reach Isfahan and Rayy, south of Tehran. Yet for some unknown reason the Turkic khagan recalled his victorious army, and the Armenian-born Sassanid general Bagratuni went on to defeat the Hephthalite king, a Turkic vassal who had his residence in the region of Balkh. Only around 625 were the Western Turks able to take control of the whole of Tocharistan and Kabulistan, and some of the petty princedoms of Gandhara passed to Western Turk nobles.[119]



76. Silver dinar of the Hunnic king Khingila (r. 430/40–490) from the Alkhan dynasty, which ruled over Kabulistan and Gandhara. The coin was found in a Buddhist stupa near Hadda south of Jalalabad, Nangarhar Province, Afghanistan. The Trustees of the British Museum, London.

2.4 The Alkhan

Around the end of the fourth century, coins bearing the tribal name αλχανο (alkhano) written in Bactrian, produced with modified Sassanid coinage dies, appeared in the valley of Kabul south of the Hindu Kush.[120] At the beginning of the fifth century, the Alkhan introduced a new, independent type of coin. The bust of a Sassanid king which had been on the earlier coins was replaced by portraits of their own rulers, which are characterised by high, artificially deformed skulls. The custom of artificially forcing the skull upwards in early childhood was widespread among the elites of Hunnic tribes. It can be concluded from numismatic research that the Hunnic Alkhan gradually drove the Kidarites out of Gandhara during the extraordinarily long reign of their ruler **Khingila** (r. 430/40–90). The Kidarites retreated to Uddiyana (Swat) where they prevailed until *ca.* 477. Khingila did not rule on his own, though, for mintings of the Alkhan with the names Mehama, Javukha (Zabocho) and Aduman suggest that he had to share the power with them, or that the last three were sub-kings.[121] In the second half of the fifth century the Alkhan penetrated further into the north-west of the Indian subcontinent.

77. Excavation in the western sector of the palace complex of Kazakly Yatkan, the first capital of Chorasmia, Uzbekistan, 1st c. CE.

Although King Skandagupta (r. 455–467) managed to stop their advance into the Punjab in exhausting wars, the Hunnic king **Toramana** (r. *ca.* 490–515) succeeded around 510 in conquering north-west India as far as Malwa, which is situated about 550 kilometres south of New Delhi.[122]

Toramana was succeeded by his son **Mihirakula** (r. 515–540), who between 528 and 532 suffered a crushing defeat by the king of Malwa, Yasodharman. This defeat brought an end to Hunnic rule in northern India. The clan of the Alkhan retreated to Kabulistan where they forced a dynastic alliance on to the Nezak who ruled there.[123] Unlike the Hephthalites north of the Hindu Kush, who were relatively tolerant of other religions, the later Alkhan, who were seen as followers of the Hindu god Shiva, entered history as cruel destroyers of cities and Buddhist monasteries. The Chinese Buddhist pilgrim Song Yun, who visited the Punjab between 519 and 520, mentioned that Gandhara had been devastated and depopulated 'two generations earlier', i.e. around 460. He described the ruler of Swat as a pious Buddhist and Mihirakula as a cruel and godless tyrant.[124]

2.5 The Nezak

As a consequence of the historical defeats of Shah Peroz in 474 and 484, the Sassanids not only lost Bactria to the Hephthalites but also their zone of influence in Zabulistan, which extended from south-west of Kabul to Kandahar. Around the end of the fifth century, a new coin type emerged in Zabulistan, which carried the Middle-Persian inscription 'King of the Nezak', the Nezak perhaps being related to the Alkhan. Their mint probably stood in Ghazni, and in the first quarter of the sixth century the Nezak, who had extended their sphere of influence over Kabulistan, took over a second mint in Kapisa, about 80 kilometres north of Kabul.[125] In the late 530s or early 540s the Alkhan, who had been driven out of northern India, penetrated into Kabulistan where they forced their suzerainty upon the Nezak. This can be seen from the sudden appearance of coins which show the portrait of a king with tower skull and the tamga (an S-shaped identifying mark derived from the cattle-mark) of the Alkhan. After the Turkic-Sassanid victory over the Hephthalites around 560, Zabulistan became part of the Sassanid sphere of influence. In the late sixth century the Alkhan-Nezak succeeded in driving out the Sassanids again, but during the first quarter of the seventh century they came under Western Turkic suzerainty.[126] During the years 665 and 666 two successful Arab attacks on Kabul weakened the position of the last Nezak ruler so much that a Turkic warlord called Barha Tegin was able to overthrow him and found the new dynasty of the Turki Shahis with Kabul as their capital.[127]

3. Pre-Islamic Chorasmia

Although Chorasmia (also known as Khwarezm) on the lower Oxus was, like Sogdiana, in a zone of contention between Sassanids and Hunnic steppe peoples, its history in the early centuries of the millennium is practically unknown. Why this is so is explained by the Muslim polymath al-Biruni (973–1048), author of a lost Chronicle of Chorasmia: the Arab commander Qutayba ibn Muslim 'had [in 712] extinguished and ruined in every possible way all those who knew how to write and read Khwarizmi writing, who knew the history of the country and who had studied their sciences. In consequence these things are involved in so much obscurity, that it is impossible to obtain an accurate knowledge of the history of the country since the time of Islam, not to speak of pre-Muhammadan times.'[128] Angered by the Chorasmians' resistance, Qutayba had irretrievably erased their historical memory in his destruction of manuscripts and slaughter of those who could read and write.

After regaining its political independence from Kangju in the second quarter of the first century CE, Chorasmia maintained a brisk trade with the Kushans, without, however, forming part of their empire.[129] As regards the post-Kushan period, al-Biruni tells of a King Afrigh, supposed to have been a descendant of the legendary Siyavushids, who in 305 founded the new Afrighid dynasty and moved the Chorasmian capital from Toprak Kala to al-Biruni's birthplace Kath.[130] Most of the pre-Islamic sovereigns on al-Biruni's list of 22 kings unfortunately find scant confirmation in numismatic or other archaeological data.[131] Chorasmia's first capital was, however, not Toprak Kala, but Kazakly Yatkan (fig. 77), 15 kilometres to the south-west, whose temple-palace and citadel date from the late third or early second century BCE, and its urban defences from a few decades later. The construction of such city walls and outworks (proteichisma) indicates the presence of some potential threat, and at the turn of the millennium Kazakly was indeed successfully besieged, as evidenced by the extensive traces of fire in the archaeological remains. While the identity of the attackers with the siege engines remains unknown, these can only really have been the Parthians. The city was rebuilt, but the second century saw the centre of power in Chorasmian shift to Toprak Kala. The murals discovered at Kazakly in 2006, around 100 portraits of people and animals that show clear connections with Parthian painting, underscore the importance of this early Chorasmian city (fig. 78).[132]

The transfer of the capital to Toprak Kala occurred at the time when the Kushans were playing a major role in the economics and politics of Central Asia. The Chorasmian rulers demonstrated their independence by countermarking Kushan coins with the S-shaped tamga associated with Siyavush, mythic founder of the dynasty, and from the early third century issuing their own coins with Chorasmian inscriptions.[133] In Toprak Kala the archaeologist Sergei Tolstov discovered not only a great quantity of Chorasmian coins, but also 140 documents of an administrative character, written on wooden tablets or leather sheets.[134] The Chorasmian script was developed from the Aramaic, introduced to Chorasmia by the Achaemenids.[135] Even when Chorasmia enjoyed a lively trade with

the Sassanids, it succeeded for a time in maintaining its independence, for Shapur I's famed inscription at Naqsh-e Rustam makes no mention of it.

Probably built under King Artav in the second century CE, Toprak Kala, like Kazakly Yatkan, was a fortified town some 500 x 300 metres in extent with a citadel (the High Palace) in the north-west, which measured 180 x 180 metres and had three 25-metre-high towers. North of the town was another palace complex, measuring 320 x 300 metres, in whose southern half stood a three-storey temple. The faithful accessed the temple by the southern steps, and in entering the building they passed between two fires that burned in two small cubicles on either side of the vestibule, a form of ritual purification found among many peoples. So, for example, must the Byzantine ambassador Zemarchus have ritually purified himself before his audience with Yabghu Ishtemi of the Western Turks, whom he visited in 569: 'When they [the Turks] had chased away the evil beings, as they supposed, and had led Zemarchus himself through the fire, they thought that by this means they had purified

themselves also.'[136] Travelling in 1245, the papal envoy John of Plano Carpini noted that the Mongolians had the same custom: 'Which purification is in this wise. They kindle two fires, and pitch two javelins into the ground near unto the said fires, binding a cord to the tops of the javelins. And about the cord they tie certain jags of buckram, under which cord, and between which fires, men, beasts and tabernacles do pass.'[137]

As well as smaller painted chapels, the High Palace in the citadel had several splendid ceremonial halls, the most impressive of which was the so-called Hall of Kings. Along three walls ran long platforms divided into 23 or 24 walled bays in total, each occupied by a more than life-size clay figure, flanked by two female figures and one male; on the fourth wall were three alcoves with figures in low relief. The central figure in the middle (throne) alcove most probably represented a woman holding a child. Sergei Tolstov, the first archaeologist to excavate Toprak Kala, in 1945–50, interpreted the large clay sculptures as representations of kingly ancestors,[138] though Yuri Rapoport, who worked there in the 1970s, believed

them to be a depiction of the Chorasmian pantheon. He related the 26 or 27 figures and reliefs to the Chorasmian version of the Zoroastrian solar calendar, which had 12 months of 30 days each and five intercalary days. Every day of the month was dedicated to a divinity or personification of a religious concept, called by al-Biruni the 'angel of the day', Ahura Mazda presiding over four days. Rapoport therefore interpreted the 26 or 27 main figures as the 27 divinities of the month, the place of honour being occupied by the ancient Iranian goddess of the waters, Aredvi Sura Anahita, accompanied by the infant Apam Napat, whose name means 'grandson of waters'. Anahita was flanked by Adur, fire, to whom the ninth day was dedicated, and by the sun, Xwar, celebrated on the eleventh day.[139] As Rapoport surmised, both the High Palace and the extramural lower palace served as dynastic cult sites, but his hypothesis that the Chorasmians, like the later Khazars, had a form of dual rulership, with a sacred king residing in the High Palace and a war king who held the real power living in the other, remains just that. In any case, the two palace complexes were simultaneously abandoned in the late third or early fourth century, the High Palace being converted into an ordinary citadel, which might accord with al-Biruni's mention of a change of capitals.[140]

Although the extent of Sassanid or Hunnic political influence over Chorasmia after the end of the third century is unclear, there is evidence of significant social upheaval: the construction of mighty noble strongholds and fortified villages proliferated, cities such as Toprak Kala gradually lost their populations,[141] transregional irrigation systems suffered from lack of maintenance, the minting of money stagnated, and monumental, anthropomorphic representations of deities disappeared: all clues to a breakdown of centralised royal power and the rise of mutually hostile petty princedoms.[142] As a final result, the Chorasmians, like the Sogdians, were unable to put up a coherent defence against the invading Arabs, going down to defeat despite their martial prowess.

The most important religion in Chorasmia was Mazdaism, a Zoroastrianism of Central Asian stamp in which deities such as Anahita, Mithra, the fire god Adur, the wind god Vayu and the water god Vakhsh (Oxus) were held in high veneration alongside Ahura Mazda.[143] Soviet scholars correctly distinguished Mazdaism, the Central Asian form of an uncodified Zoroastrianism, from Zoroastrianism as defined by the Sassanid high priest Kartir.[144] The Chorasmians, too, departed from the Zoroastrian 'orthodoxy' of the Sassanids in not definitively abandoning the bodies of their dead to the vultures of the *dakhmas* or 'towers of silence', (fig. 83) but afterwards conserving the bones in ossuaries, on which were painted scenes of lamentation, an exhibition of grief equally unorthodox.[145] In this ritual lamentation an important role was played by the myth of the young hero Siyavush, supposed founder of the city of Bukhara and ancestor of the Chorasmian kings, who according to legend was killed by his father-in-law, only later to return to life. As Tolstov notes, the parallels between Siyavush and the Egyptian vegetation god Osiris are unmistakeable. This myth was also current in Bukhara itself, for, as Narshakhi reports, the Mazdaites of that city broke their clay statuettes of divinities every year to replace them with new ones, in commemoration of the death and resurrection of Siyavush.[146] While Buddhism hardly established itself in Chorasmia, there were several Christian communities. Among them were Byzantine-Orthodox Melkites and also members of the Assyrian Church of the East, the so-called Nestorians. The Nestorian presence is evidenced by the ossuaries bearing the Maltese cross they favoured, which were found at the necropolis of Mizdahkhan in western Chorasmia.[147]

4. The Huns of Eastern Europe

In the third quarter of the fourth century, Altaic horse nomads pressed forward to the Volga, their leading clans representing the western branch of the linguistic and cultural heirs of the Xiongnu. Referred to as Huns by Late Roman historians, these tribes formed a heterogeneous people that combined Mongolid and Europid characteristics. Their language is unknown, though their names

81. The fort of Guldursun Kala, Chorasmia, Uzbekistan, which was founded in the Middle Ages and much enlarged in the 12th c. It covered an area of 300 x 250 m, and its huge round towers were originally 15 m high; thanks to their size they could offer protection to thousands of people in the case of war. The storming of the city by the Mongols around 1221 gave birth to a notable legend: When the Kalmuks, the westernmost group of the Mongols, had besieged the city, which was then known as Gulistan, for many months, both besieged and besiegers were starving. The governor of Gulistan came up with a cunning plan: he had the city's best bull fattened up and then let it graze outside the city walls. When the Kalmuks saw the fat bull, they concluded that the city must still have ample food reserves, and they decided to abandon the siege. But the beautiful daughter of the governor, called Guldursun, had fallen in love with the young leader of the Kalmuks and wanted to prevent him from leaving. She sent him a secret message telling him that the city was about to capitulate because its citizens were starving. The Kalmuks immediately redoubled their assault, and the city surrendered. The victors set the city on fire, massacred the besieged or sold them into slavery. But Guldursun's treason did not pay off: When she stood expectantly before the Kalmuk prince, he told her: 'You have betrayed your tribe, your city and your own father because of a stranger – how quickly would you betray me if you fell in love with another? Guards, seize her and tie her arms and legs to two horses which you drive apart with whips. Thus she will never commit treason again.'[8]

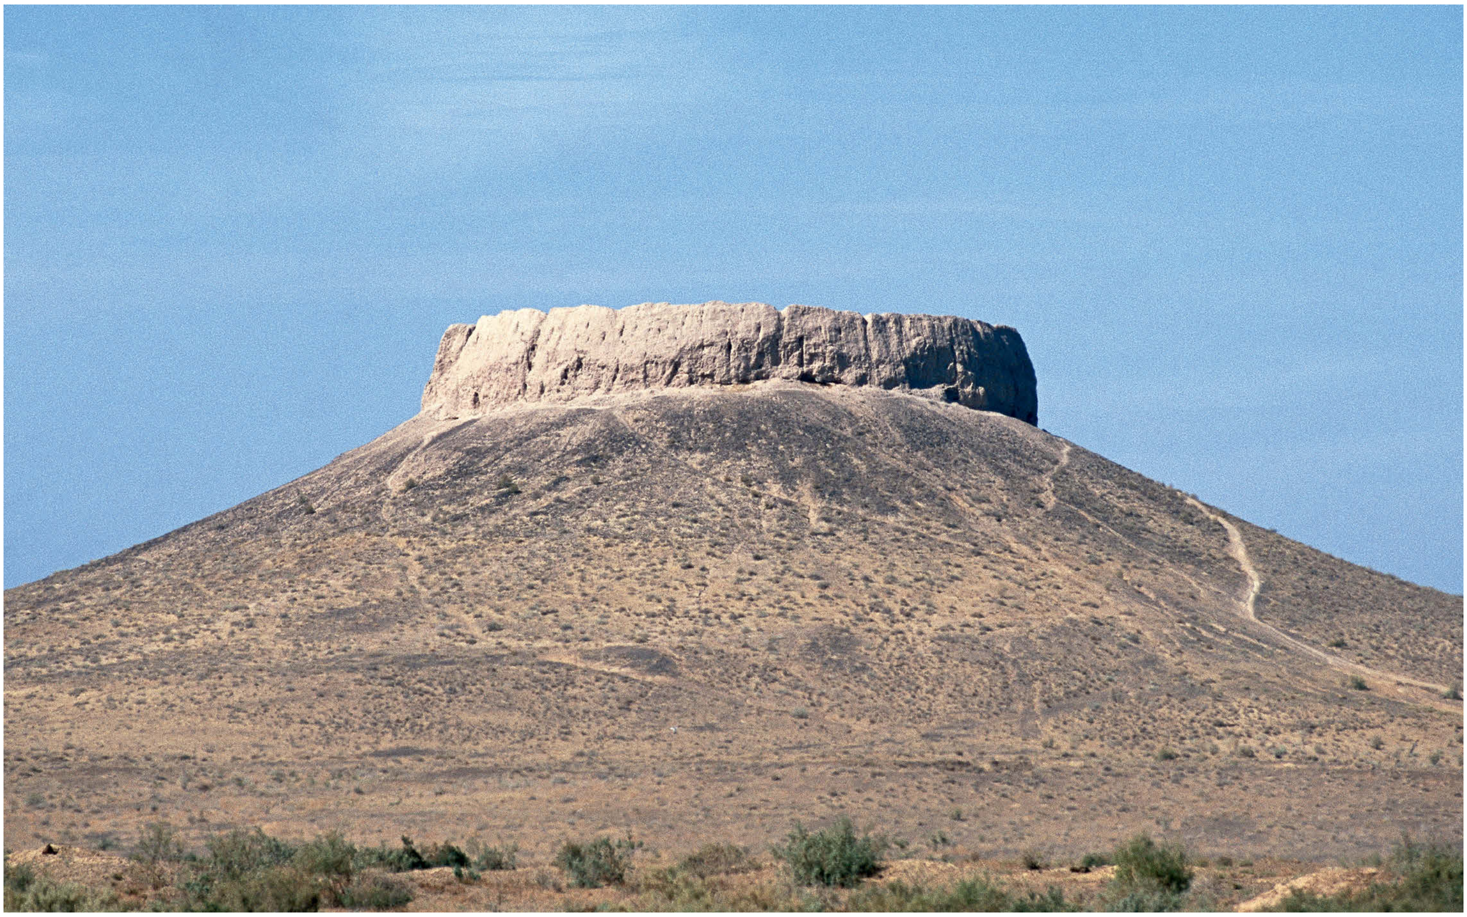
feature both Turkic and Iranian elements, with Germanic entering the mix with later victories over Germanic peoples.[148] Unlike the equally Altaic Chionites who took part in Shapur II's attack on Amida in 359, the Huns arrived not as an army on specific military business but as waves of population groups, in such a way that a Central Asian people came to play a key role in European history for a period of almost a century. On the other hand, it was no coincidence that within two decades Hunnic warriors crossed the Syr Darya in the south and reached the Oxus, while in the north they appeared at the Volga. It is likely that both groups had left their native pastures in the Altai to escape military pressure from the Xianbei.

In the early 370s the Huns defeated the Alans who lived on the Don, thanks not least to their superior weaponry.[149] The Huns were mounted archers, equipped with a 120-centimetre-long, asymmetrical, recurved bow with glued bone reinforcements, and their heavy, iron-pointed arrows penetrated even the Alan scale-armour. Although the Hun bow was clearly superior to that of the Sarmatian cataphracts, it did not prevail in western and central Europe, as it was vulnerable to wet weather. The wooden Hun saddle with its high pommel and cantle offered riders a safe and secure seat.[150] Some of the defeated Alans fled to the Caucasus, while others joined the Hun king **Balamber** (r. *ca.* 375/76–?) as auxiliary troops, so making their way west. In 375–76 Balamber then defeated Ermanaric, king of the Ostrogothic Greuthungi, whose homeland lay north-west of the Black Sea. Unable to halt the Hunno-Alan advance, Ermanaric killed himself in despair; his successor Vithimir fell in battle after three defeats.[151] Some of the defeated Greuthungi escaped to the lands of the Visigothic Thervingi, whose king Athanaric sought to resist the Huns. After a first defeat on the Dniester, Athanaric lost most of the Thervingi, who begged asylum of the Roman Empire.[152] Rome's agreement to allow the fleeing Thervingi on to its territory proved to be a catastrophic error. The Roman administration was overwhelmed by the problems of integrating these armed tribesmen, so that the latter soon rebelled. In 378 the Thervingi and their Alan allies inflicted a crushing defeat on Rome at the Battle of Adrianople,

82. The name of the fortified city Kirk Kiz means 'forty maidens' and refers to the legend according to which a young female warrior gathered forty virgins around her to fight against the advancing Kalmuks (Mongols). The 260 x 240 m city, which was founded in the 4th or 3rd c. BCE, was inhabited until the 8th c. when it was abandoned because of lack of water.



83. The Zoroastrian 'Tower of Silence', called *dakhma*, in Chilpyk, Chorasmia, Uzbekistan. Together with the two towers of Yazd in Iran, the *dakhma* of Chilpyk is one of the rare extant Towers of Silence of the mountain crest type. Other *dakhma* were actual towers, but in Chilpyk the *dakhma* consists of a circular mudbrick wall built right around the crest of a mountain, where the dead were left to the vultures. The *dakhma* of Chilpyk has a diameter of 80 m and possessed a room for an eternal fire, whose function was to protect the dead from demons.[9] Numerous petroglyphs from the Bronze Age show that the hill already had a cultic function more than 3,000 years ago.

at which Emperor Valens (r. 364–378) and all his senior officers were killed.[153] With their attacks on the Greuthungi and Thervingi the Huns had set into motion the first phase of the Migration Period, pushing before them like a wave the peoples who stood in their way, with those peoples in their turn displacing others.

The appearance of the Hun horse warriors inspired fear and terror in their European contemporaries, as witnessed by the account of Ammianus Marcellinus: 'The people of the Huns . . . are quite abnormally savage. [. . .] They have squat bodies, strong limbs, and thick necks, and are so prodigiously ugly and bent that they might be two-legged animals. . . . They have no buildings to shelter them, but avoid anything of that kind as carefully as we avoid living in the neighbourhood of tombs. [. . .] They are ill-fitted to fight on foot, and remain glued to their horses, hardy but ugly beasts. [. . .] Buying and selling, eating or drinking, are all done by day or night on horseback, and they even bow forward over their beasts' narrow necks to enjoy a deep and dreamy sleep. When they need to debate some important matter they conduct their conference in the same posture.'[154] Like the Huns, the Göktürks of the sixth to eighth centuries conducted important negotiations on horseback.

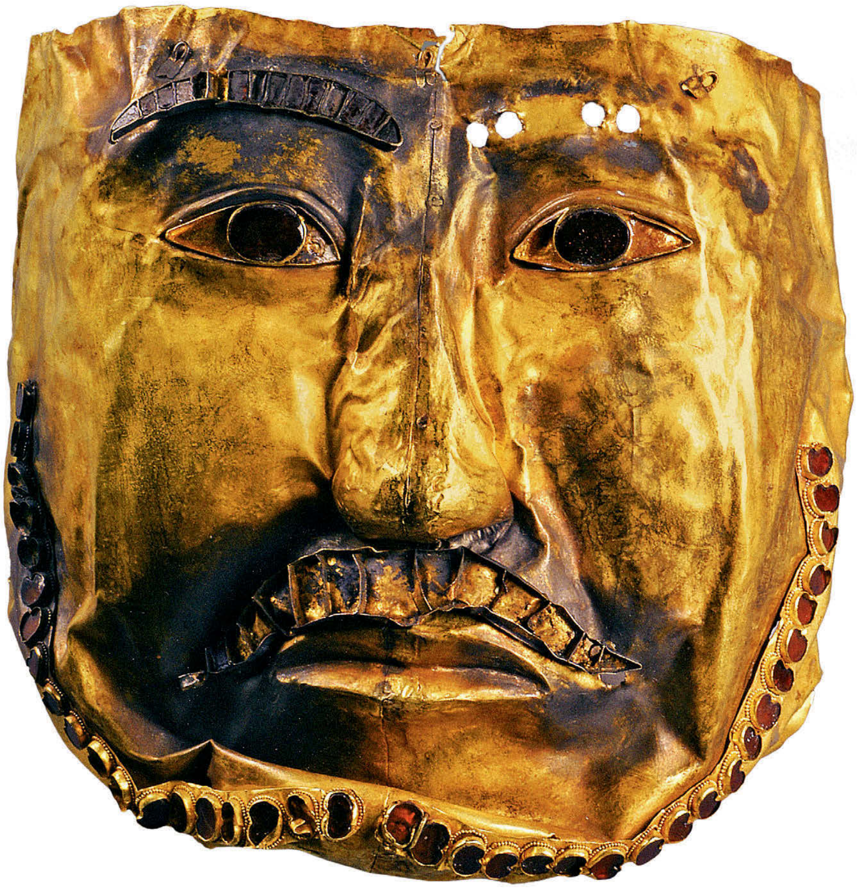
After their victories over the Greuthungi and Thervingi, the Huns consolidated their conquests. The civil war of 394 between the Eastern Roman emperor Theodosius I and the Western emperor Eugenius, which would conclude with the permanent division of the empire a year later, offered the Huns in 395 the opportunity to cross the now unguarded border on the lower Danube and plunder Moesia. Shortly thereafter Hunnic bands under **Basikh** and **Koursikh** crossed the Caucasus and laid waste to Syria, part of Anatolia, and Mesopotamia, where their foray was brought to a halt only before the gates of the Sassanid capital of Ctesiphon; it was after this that the two Hunnic leaders made their first contacts with the Western Roman Empire.[155] The next Hunnic leader whose name is known to us was **Uldin** (r. *ca.* 399–*ca.* 410), who first attacked the Gothic mercenary leader Gaina, a fanatical Arian, and sent the latter's head to the emperor Arcadius on 3 January 401, as a welcome New Year gift. With this victory Uldin established himself as the sole leader of all the 'barbarians' north of the lower Danube, as the Visigothic king Alaric escaped to north-west Italy to threaten Emperor Honorius. Uldin now set the Hunnic strategy with regard to the two Roman empires, a strategy that would govern Hunnic policy until Attila's abortive western campaign of 451–452: while the Huns would ally themselves with Rome and make their troops available against payment, they would exact ever higher tribute from Byzantium by military means. This friendship toward Rome and enmity toward Byzantium would prevent the two empires banding together against the Huns until 452.

Thanks to Uldin's strategy of friendship with Rome, the Roman general Stilicho was able with the Huns' help first to repel Alaric's Visigoths and then in 406 to defeat the invading Gothic king Radagaisus. On 31 December 406, however, the pressure of Hunnic expansion saw Alans, Vandals and Suebi cross the frozen Rhine near Mainz, Stilicho having withdrawn troops from that riverine frontier to fight Radagaisus, so leaving it undefended and thus initiating the second phase of the Migration Period, viewed by the Romans as a barbarian invasion. Uldin's attempt in 408 and 409 to exact annual tribute by attacking Constantinople failed miserably, though it did prompt praetorian prefect Anthemius to embark upon the construction of the 20-kilometre-long Theodosian Walls, named after Emperor Theodosius II (r. 408–450), then a minor, for whom the prefect acted more or less as regent. Completed in 413, and rebuilt and strengthened after an earthquake in 447, the walls withstood all land attacks for 1,000 years.[156] It would appear that Uldin's failure seriously weakened his position, for his name then disappears from the records. The years 412–413 indeed bring mention of a King **Kharaton**, mollified with rich gifts by a Byzantine embassy held responsible for the killing of a sub-king called **Donatus**.[157]

The Huns reappear in the historical record with Attila's uncle, King **Rua** (Rugila, r. *ca.* 422–434/5), who plundered Thrace in 422, exacting from the Eastern Empire an annual tribute of 350 pounds of gold (approx. 114 kg).[158] He ruled together with his brother **Octar** until 430, when the latter was killed in an unsuccessful war against the Burgundian kingdom on the Rhine, leaving him sole ruler over the Balkan Huns.[159] Two years later, he strengthened the relationship with Rome when he offered hospitality to Flavius Aetius (390–454) – a senior general stripped of his post in a power struggle, who in his youth had lived at Hunnic courts as a hostage – and then in 433 put an army at his disposal, allowing him to regain in Rome the power that he had lost. In thanks, Aetius granted the Hunnic kings **Bleda** (r. 434/5–444/5) and **Attila** (r. as sub-king 434/5–444/5, high king 444/5–453) the provinces of Valeria and Pannonia Prima. High king Bleda and sub-king Attila were brothers, the sons of Mundzuk, brother of kings Rua and Octar. The Huns soon hurried again to Aetius' aid when he was unable, despite his victory in 435, to hold at bay the southward advance of the Burgundians. In 436 or 437, helped by a strong Hunnic army, Aetius inflicted a devastating defeat on the Burgundian king Gundahar, who had his capital at Worms or Mainz, and resettled the few surviving Burgundians on the Saône in Savoy and the Rhône in western Switzerland. The destruction of the Burgundian kingdom on the Rhine provides the historic kernel of the *Song of the Nibelungs*.

Unlike the horse nomad empires of the Xiongnu or the Mongols under Genghis Khan, the 'Hun Empire' of Bleda and Attila enjoyed neither administrative structure nor national unity, remaining a 'mobile warrior coalition'[160] whose leaders had to satisfy a growing but unstable following with ever-richer booty. Power among the Huns depended on a vicious circle, in that every increase in power won by military victory necessitated even greater success and ever greater plunder. Ultimately, the Hun-led warrior coalition was doubly parasitic: the elite refused to engage in any form of economic activity in the way of production or trade, and it limited itself to the exploitation of vassals and the blackmailing of their Byzantine neighbours. Both Bleda and Attila would fall victim to this drive to ever greater gain. Although Bleda had in 441–442 inflicted telling defeats on the Eastern Empire, imposing a disadvantageous treaty on Constantinople in 443, the very next year the object of his exactions refused to pay the tribute due. It was probably this economic failure that gave Attila the pretext to kill his brother in late 444 or early 445 and make himself sole ruler of the Huns.

Attila was now under pressure not only to extract the payments agreed to in 443 from the Eastern Empire but to increase the tribute payable. When Constantinople was shaken by an enormous earthquake on 27 January 447 and parts of the Theodosian Walls collapsed, Attila decided to attack the city, already prey to hunger and epidemic, but having now incorporated bands of Germanic foot soldiers into his army, he could advance only slowly on the defenceless capital. The inclusion of these Germanic tribes negated the intrinsic advantage enjoyed by equestrian warriors – their speed of movement – so that it took the Byzantines only two months to rebuild the city walls and even reinforce these with an outer breastwork. Unable to seriously threaten Constantinople, Attila looted and destroyed dozens of cities already strongly affected by the earthquake, forcing Emperor Theodosius to accept harsh Hunnic peace conditions. Yet Attila's calculations did not pay off, for this weak emperor, much influenced by his eunuchs and his sister



84. Golden funeral mask decorated with garnets from Boma, Xinjiang, China. This male mask made of gold foil, discovered in a tumulus in the valley of the Tekes, a tributary of the Ili, in the extreme north-west of Xinjiang, shows a conspicuous similarity to golden cloisonné jewellery from Europe and the Near East from the 5th c. As argued by Alexander Koch, the mask and the grave find of a so-called 'Hunnic cauldron' near Urumqi have a 'pre-Turkic period connection' to 'horse nomad Hunnic groups of the 5th c.'. Perhaps these Hunnic tribes, which lived in the north-west of Xinjiang, had migrated back to Central Asia, in the 450s and 460s, after the destruction of their eastern European empire, and had settled north of the Tian Shan.[10] Ili Kazak Prefecture Museum, Yining.

Pulcheria, would die in 450, and his successor Marcian (r. 450–457), raised to the throne by the Alan-born Roman magister militum (general) Aspar, immediately refused any payment of tribute and made preparations for war.[161]

Marcian's decision would lead to Attila's downfall, for the latter desperately needed the Byzantine tribute to be able to provide the rich gifts that ensured the loyalty of his heterogeneous army. The nearby Balkans had been bled dry and could hardly offer any more booty, Constantinople with its strengthened defences could be neither besieged nor stormed by Attila's troops, and the wealthy provinces of the Near East lay beyond his grasp. When Rome itself stopped its subsidy, Attila decided to attack his earlier ally, invading Gaul in 451. As Attila's horsemen were supporting the Armenians against the Sassanids in the Caucasus, the invading force mostly consisted of slow-moving Germanic foot soldiers. But Attila's siege of Aurelianum (Orléans) gave Aetius enough time to strike up an alliance with the Visigoths of King Theodoric I (r. 418–451) and so be able to relieve the city, leaving Attila to make a slow retreat. It was on the *Campi Catalauni* near Châlons-sur-Marne or Troyes in eastern France (opinion is divided on the exact location) that in June 451 the Battle of the Catalaunian Plains took place, which brought heavy losses for both sides. Withdrawing much weakened and without having achieved his war aims, Attila was down, but not out. On the winning side, Theodoric had been killed in battle, and the Visigoths abandoned the alliance. Attila's northern Italian campaign of 452 also ended in humiliating failure: while he did succeed in taking the cities of Aquileia and Mediolanum (Milan), Emperor Marcian's successful diversionary attack on the Hunnic heartland north of the lower Danube and the outbreak of disease in the Hunnic army forced a hasty retreat.[162] Attila's two attacks on the Western Empire proved to be strategic errors, as he had overlooked the possibility of the two Roman empires banding together against him and of Marcian's being able to carry the war to Hunnic territory. Attila died in 453, on the night of his wedding to the Burgundian princess Ildico, either poisoned by her or from a haemorrhage of unknown cause.

The description of Attila's funeral by the Roman historian Jordanes (d. after 552) is highly revealing, showing how close Hunnic customs were to the traditions of Turco-Mongolian and Scythian horse peoples: 'Then, as is the custom of that race, they plucked out the hair of their heads and made their faces hideous with deep wounds, that the renowned warrior might be mourned, not by effeminate wailings and tears, but by the blood of men. [. . .] His body was placed in the midst of a plain and lay in state in a silken tent as a sight for men's admiration. The best horsemen of the entire tribe of the Huns rode around in circles, after the manner of circus games [. . .] and told of his deeds in a funeral dirge [. . .] When they had mourned him with such lamentations, a *strava*, as they call it, was celebrated over his tomb with great revelling. [. . .] Then in the secrecy of night they buried his body in the earth. [. . .] They added the arms of foemen won in the fight, trappings of rare worth, sparkling with various gems, and ornaments of all sorts whereby princely state is maintained. And that so great riches might be kept from human curiosity, they slew those appointed to the work – a dreadful pay for their labor; and thus sudden death was the lot of those who buried him as well as of him who was buried.'[163] All the funerary customs mentioned by Jordanes were to be found among other Asiatic horse nomads: the cutting of the face among the Scythians, Saka and Göktürks of the sixth to eighth centuries,[164] the cutting-off of the hair among the Saka of the Altai and the Xiongnu,[165] the circling of the bier on horseback and the funeral feast among the Scythians and ancient Türks,[166] and the killing of the grave diggers among the Scythians and the Mongols.[167] Like Genghis Khan's, Attila's grave remains undiscovered today.[168]

Lacking any state structure and strained by conflict between Attila's three sons, the Hunnic warrior coalition quickly fell apart. **Dengizikh** (d. 469) and **Ernac** (d. after 466) disputed the succession of their elder brother **Ellac** (r. 453–454), claiming a share in power for themselves. Jordanes tells us that 'the sons of Attila [. . .] were clamoring that [. . .] warlike kings with their peoples should be apportioned to them by lot like a family estate'.[169] As a result, many of the Huns' vassals and allies rebelled under the leadership of the Gepid king Ardaricus, who in 454 crushed the remaining Huns at a battle on the river Nedao in Pannonia, killing Ellac. Dengizikh's two attempts in 455/56 and 463/64–66 to expel the Goths, who were occupying Pannonia were a failure, and in 469 he died in battle against the Eastern Roman Empire. Ernac, however, submitted to Constantinople and was charged with the defence of the frontier in Dobruja, south of the Danube delta. With this the Huns ceased to exist as an autonomous federation and were absorbed into the Bulgar, Avar and Khazar confederacies. And after the defeat on the Nedao, other Hunnic groups had fallen back further east, even as far as Central Asia.[170]

Compared with Modu's Xiongnu and Genghis Khan's Mongols, Attila's Huns were no more than ephemeral. The German philosopher G.W.F. Hegel (1770–1831) described them as 'one of those purely Oriental phenomena, which, like a mere storm-torrent, rise to a furious height and bear down everything in their course, but in a brief space are so completely spent, that nothing is seen of them but the traces they have left in the ruins which they have occasioned'.[171] Unlike the Xiongnu, who built a stable empire and compelled China to make many innovations in the military and political fields, or the medieval Mongols, who reconnected Europe and China, the two ends of the Eurasian land mass that had grown far apart, making possible a thriving trade and a significant transfer of technology between East and West, the Huns left no long-lasting trace except in the chronicles of the peoples they afflicted. And unlike Modu and Genghis Khan, Attila neglected to provide people and army with clear structures, failing to establish an administration, introduce a common code of law or secure a predictable flow of tax revenue. Despite all the legends built up about him over more than 12 centuries, Attila was not, in fact, a far-sighted strategic thinker but rather an opportunist with an eye to quick spoils.

IV

The Kingdoms of the Tarim Basin and their Schools of Buddhist Art

An arhat, a Buddhist holy man, was ill treated by the inhabitants [of the rich city of Ho-lao-lo-chia] and refused water, because he had reproved them for their sins. He thereupon cursed the town:

'Seven days hence there will be a rain of sand and earth which will fill this city full, and there will in a brief space be none left alive . . .' [. . .] On the seventh day, in the evening, just after the division of the night, it rained sand and earth, and filled the city. [. . .] The town of Ho-lao-lo-chia [somewhere north-east of Khotan] is now a great sand mound. The kings of the neighbouring countries and persons in power from distant spots have many times wished to excavate the mound and take away the precious things buried there; but as soon as they have arrived at the borders of the place, a furious wind has sprung up, dark clouds have gathered together from the four quarters of heaven, and they have become lost to find their way.

XUANZANG, *SI-YU-KI: BUDDHIST RECORDS OF THE WESTERN WORLD*, *ca.* 643 CE[1]

1. The Archaeological Exploration of the Tarim Basin – An Overview

In his account of his travels, from which the story above is drawn, the Buddhist monk and pilgrim Xuanzang goes on to add that the natural catastrophe called down by the angry arhat had happened a long time before. So the seventh-century inhabitants of Khotan and other oases, where this legend was current in varying forms, did have some idea that in the Taklamakan Desert there were hidden ruins of ancient cities where fertile and prosperous oases had once flourished. In fact, the time between Emperor Han Wudi's opening of the Silk Road in the early first century BCE[2] and the re-conquest of Eastern Turkestan by the Chinese Tang dynasty (618–907) is one of the most exciting periods in the history of the Tarim Basin. The flow of transcontinental trade, which only ever slackened for a brief period in the early fourth century, with the turmoil of war in northern China, made Eastern Turkestan the hub of the gigantic communications network that traversed Central Asia. Here came together not just the indigenous Saka and Tocharians, but also Chinese and Tibetans, descendants of the Xiongnu and representatives of the Turkic peoples, Indians, Sogdians, Bactrians, Parthians, Persians and Byzantines; they brought with them their religious beliefs, such as the sky cult now called 'Tengriism', Daoism, Confucianism, Hinduism, Buddhism, Zoroastrianism, Mazdaism, Manichaeism and Christianity. These religions had their visual expressions in the form of paintings, miniatures and figural representations, and this led to the development of diverse cultures in the oases.

Following the decline of the Eastern Han dynasty in the mid-second century CE, the little states of the Tarim Basin escaped Chinese suzerainty, yielding again to the Chinese claim for hegemony only from 640. They were able intermittently to maintain their independence but often came under pressure from more powerful neighbours such as the Tuyuhun, the Rouran, the Hephthalites and the First Turkic Khaganate. Some of the oasis cities had already begun to depopulate since the fourth century for climatic, demographic and political reasons, and sunk beneath the wandering dunes of the Taklamakan. Already, then, the Tarim Basin must have made a similar impression on the trade caravans as it did on the German archaeologist Albert von Le Coq: 'Eastern Turkestan is like a gigantic bowl filled in the centre with moving sand.'[3] Of the two great east–west routes through Eastern Turkestan, one followed the northern and the other the southern edge of the Taklamakan Desert. Changing climatic and political conditions saw them flourish at different times: while the Southern Silk Road was especially preferred in the first four centuries CE, being beyond the reach of the rapacious nomadic horsemen north of the Tian Shan Mountains, the northern route grew greatly in importance from the fifth century onwards, as the northern horse peoples curtailed their attacks on caravans so as to be able to profit themselves from the unhindered trade, and because sections of the eastern part of the southern route had become impassable.[4] Since Central Asian trade was dominated by Indian merchants during the first centuries CE, but by Sogdians from the fifth century onward, the Buddhist art of the Southern Silk Road shows the influence of Gandhara and the eastern Mediterranean, whereas that of the Northern Silk Road contains elements from Indian and Iranian cultures.

1.1 Early Explorers of the Southern Silk Road

The first treasure hunter and systematic 'excavator' of the old cities buried in the sand was **Mirza Abu Bakr Dughlat** (r. 1465–1514), ruler of the cities of Kashgar, Yarkand and Khotan. As his nephew Mirza Muhammad Haidar recounted, 'he ordered the old cities to be excavated [. . .] by eighteen or twenty prisoners, more or less, secured together by a chain running from one to the other, at their backs, through a collar fastened around the neck of each'.[5] The earliest explorers of the Southern Silk Road were either adventurers such as **Adolf Schlagintweit**, executed as an alleged Chinese spy by Wali Khan, the ruler of Kashgar, in 1857,[6] or they travelled as diplomats, surveyors or spies in the employ of the government of British India, which hoped to establish a buffer zone to hold off the advancing Russians in Eastern Turkestan, and so had urgent need of exact topographical data. The Indian **Abdul Hamid** in 1863 was the first to reach Yarkand, staying there for half a year. In his report he notes that some inhabitants would search for treasure in ruins uncovered by sandstorms at the desert's edge.[7] Hamid was followed in 1865 by the British surveyor **William Johnson**, the first such explorer to reach Khotan, who, a five-day march north-east from there, not far from Chira, visited a ruined city buried under sand where locals would look for silver and gold objects.[8]

Johnson's report aroused the curiosity of the diplomat **Sir Thomas Douglas Forsyth**, who in 1870 and 1873 travelled to Yarkand, where he bought ancient Bactrian and Byzantine coins.

86. The Russian geographer and officer General Nikolay Przhevalsky (1839–1888).

87. The Swedish geographer and explorer Sven Hedin (1865–1952) in 1894 in Kashgar. The Sven Hedin Foundation, Stockholm.

In 1874 his collaborator Kishen Singh acquired a Buddha figurine and a statue of Hanuman there, which possibly came from the ruined city that Johnson had visited.[9] Forsyth's report, published in 1878 in the *Journal of the Royal Geographical Society* bore the programmatic title 'On the Buried Cities in the Shifting Sands of the Great Desert of Gobi'. The place where Kishen Singh's little Buddha figurine was found might be identical with the ruins of Uzun Tati north of Chira, which Sir Aurel Stein identified with Xuanzang's city of Pimo and Marco Polo's Pein.[10] As for Xuanzang's cursed city of Ho-lao-lo-chia [Pinyin: Holaolojia], it may be hypothesised that the most likely match among known ruined cities is either Niya or Karadong, both abandoned more than two centuries before Xuanzang passed through in 644.[11] Even before Forsyth, explorer **George Hayward** and government envoy **Robert Shaw** had visited Yarkand and Kashgar in 1868–69, though they had spent most of their time under house arrest. On his way there, Hayward heard a modified version of the legend reported by Xuanzang, in which a Muslim preacher punished a king, who had broken his word, with a terrible sandstorm. 'Many hundred years ago, all this wilderness was a flourishing province, possessing 160 towns and cities, now entirely overwhelmed with sand and buried.'[12] These various references to the hidden remains of pre-Islamic cultures were largely ignored by European archaeologists, since they were then preoccupied with Greece, Egypt and Mesopotamia, and expeditions to the Tarim Basin were dangerous and politically delicate. Only with the acquisitions of the Bower manuscript in Kucha in 1890, and the Dutreuil de Rhins Manuscript in Khotan in 1892, did the attention of European scholars turn to Turkestan, with Sven Hedin leading the way.

1.2 The Riddle of the Lop Nor Lake – Nikolay Przhevalsky and Sven Hedin

The Russian soldier and geographer **General Nikolay Przhevalsky** (1839–1888) felt a perennial attraction to Chinese Turkestan and Tibet and to Lhasa in particular. After spending two years exploring the Ussuri River in Eastern Siberia in 1867–69, he led four expeditions over several years to Central Asia, though he never reached the Tibetan capital. In early 1877, during his second expedition, he explored the 'new' Lop Nor Lake which was situated on the south-western edge of the Lop Desert and formed of the interconnected lakes Kara Buran and Kara Koshun.[13] Przhevalsky's claim to have discovered the ancient lake of Lop Nor was disputed by the German geographer Ferdinand von Richthofen, as the lake he had discovered lay a degree further south than that on a Chinese map of 1862, a map based on ancient data.[14] Already in early 1878 Richthofen argued: 'This would involve the following, that the [River] Tarim had formerly only one easterly course to the true great Lob-nor, but later at the place where it is now joined by the Ugen-darya, it threw off a branch to the S.E. which became the main river; and that this branch discharged into the once isolated Khas-lake [Kara Koshun], enlarged it and made it the chief reservoir.'[15] It would be left to Sven Hedin to settle the scientific argument in favour of Richthofen. On his fourth expedition to Central Asia, Przhevalsky returned in 1885 to the 'new' Lop Nor, which he found to have shrunk.[16] He died in 1888 on the Issyk Kul Lake, at the start of his fifth expedition, whose leadership would be taken over by **Mikhail Pevtsov,** who continued with **Pyotr Kozlov** the exploration of the Tarim Basin.[17] Further pioneering work was done in 1885–86 by Bombay civil servant **Arthur Carey** and trader **Andrew Dalgleish**, who were the first to follow the Khotan Darya River downstream from Khotan to its confluence with the Yarkand Darya, and then proceed along the Tarim to Abdal on the Kara Buran Lake.[18] Four years after Przhevalsky's second visit to the Kara Koshun Lake, the local inhabitants told the French travellers **Gabriel Bonvalot** and **Prince Henri d'Orléans** that the lake had shrunk even further due to abstraction at Korla upstream, and also spoke to them of hidden ruins.[19]

88. During his river journey on the Tarim in 1899 Sven Hedin worked at an improvised desk. Sven Hedin, *Central Asia and Tibet: Towards the Holy City of Lhasa* (London, 1903), vol. I, p. 83. The Sven Hedin Foundation, Stockholm.

The Swede **Sven Hedin** (1865–1952) was the first to take seriously the seemingly fantastical tales of cities beneath the desert sands, while he hoped at the same time to solve the still unresolved 'Problem of the Lop Nor'. As he observed in his biography, *My Life as an Explorer*, he had already decided to be an explorer at the age of 15: returning from the first voyage through the North East Passage, Nordenskjöld's ship, the *Vega*, 'steamed into the harbour of Stockholm, on April 24, 1880. The entire city was illuminated. Buildings near the water-front were lit up by countless lamps and torches. On the Royal Palace, a star, Vega, shone forth in bright gas-flames; and amid this sea of lights, the famous ship came gliding into the harbour. With my parents, sisters, and brother, I enjoyed a view of the city from the heights on the south side. I was a prey to the greatest excitement. All my life I shall remember that day. From the quays, streets, windows, and roofs, enthusiastic cheers roared like thunder. And I thought, "I, too, would like to return home that way."'[20]

After a short exploration of Kashgar and Sogdiana in the winter of 1890–91,[21] Hedin set off on his first Central Asian expedition, which would last from 1893 to 1897. In Tashkent he received a letter from his professor, Ferdinand von Richthofen, with the charge, 'You, I think, will finally solve the problem of the Lop Nor Lake'.[22] Crossing the border into China, Hedin had to open his luggage, for 'as we later learned, [the Chinese] at the fort believed [that] all my boxes were packed full of Russian soldiers, who in that way were being smuggled across the frontier.'[23] After several failed attempts to conquer the 7,546-metre mountain of Muztagh Ata, he undertook a partial traverse of the Taklamakan Desert in 1895. Lack of water and other planning errors brought the expedition to a disastrous end, costing the life of one of his companions.[24] Undeterred by this fiasco, Hedin penetrated into the deep interior of the desert, north-east of Khotan, in early 1896, accompanied by a treasure hunter familiar with the area, to search for the mysterious ruined cities. Luck was with him, and on 24 January he discovered the city of Dandan Oilik, abandoned in the late eighth or early ninth century, then known to the local inhabitants as

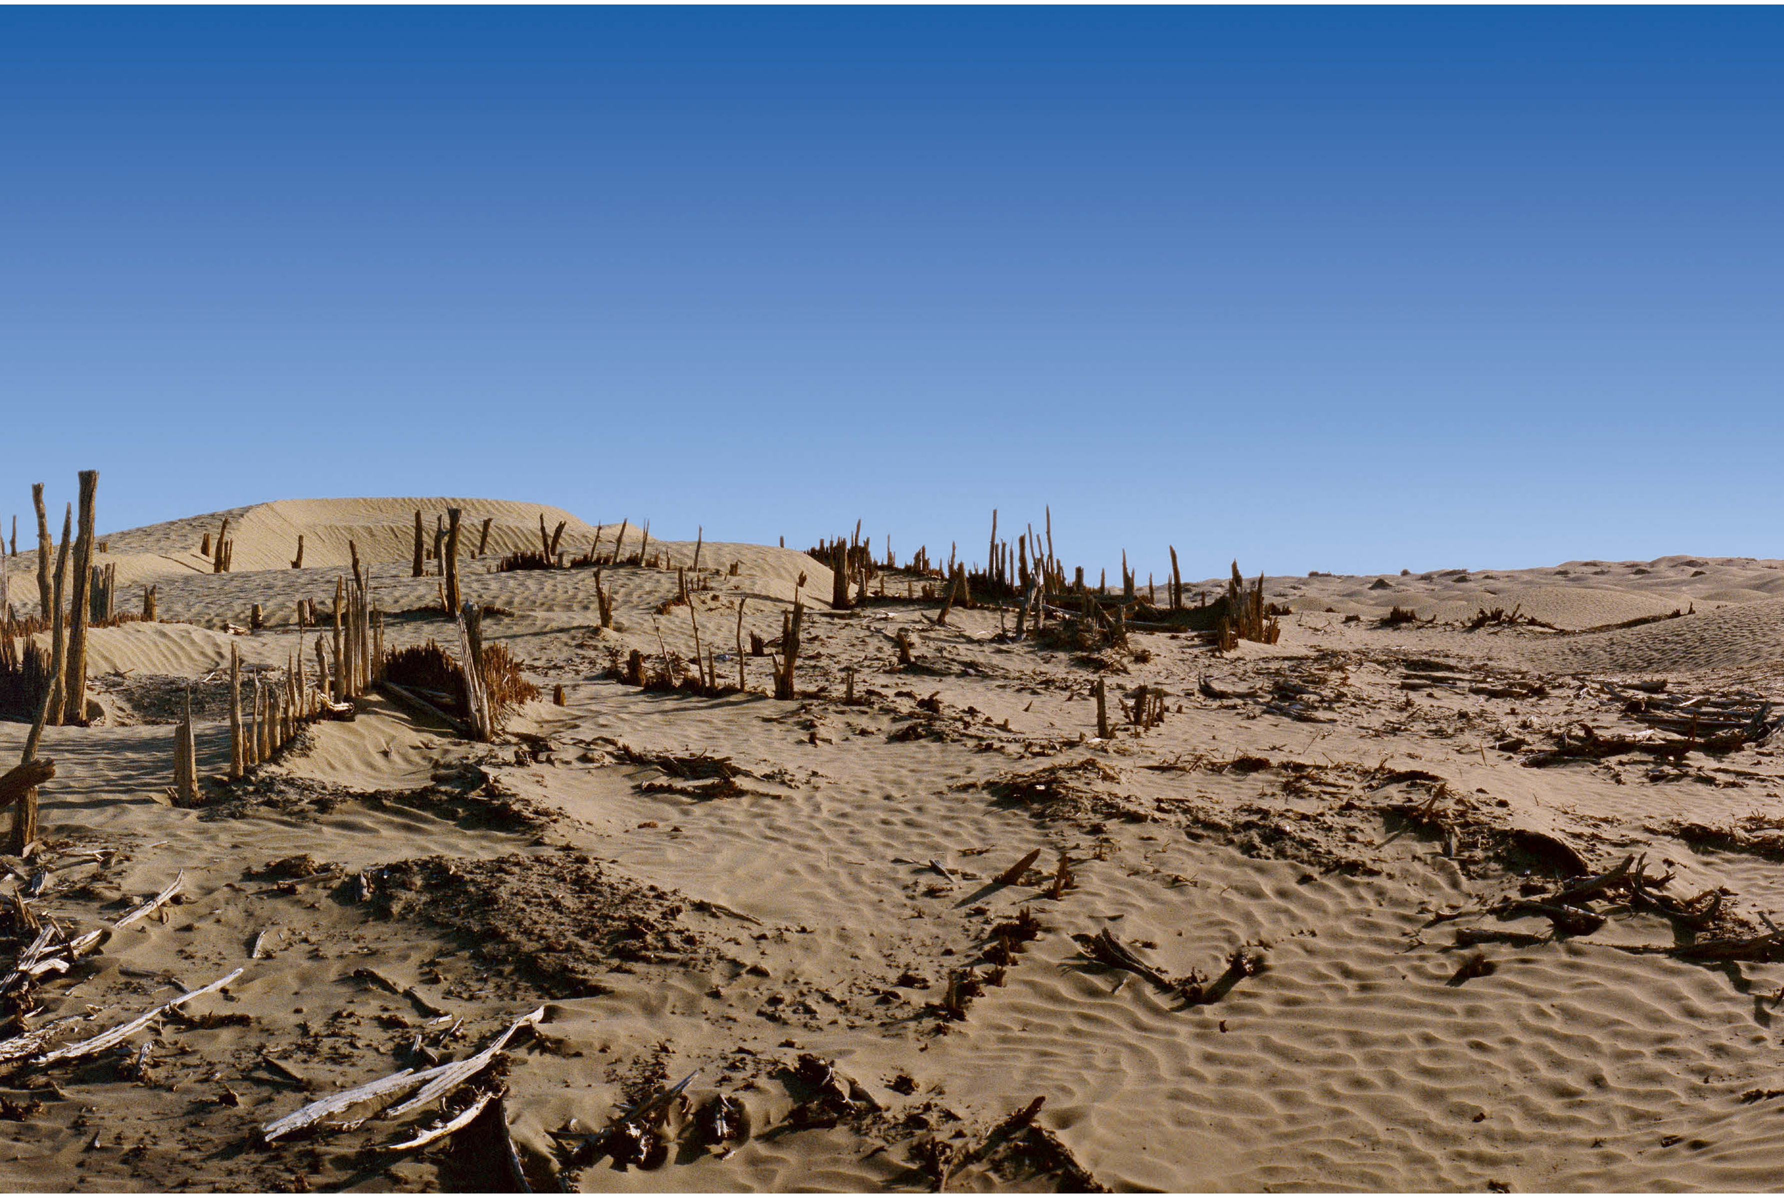
89. Ruin D 8 of the largest monastery of Dandan Oilik, 7th c. until *ca.* 802, Taklamakan Desert, Xinjiang, China.

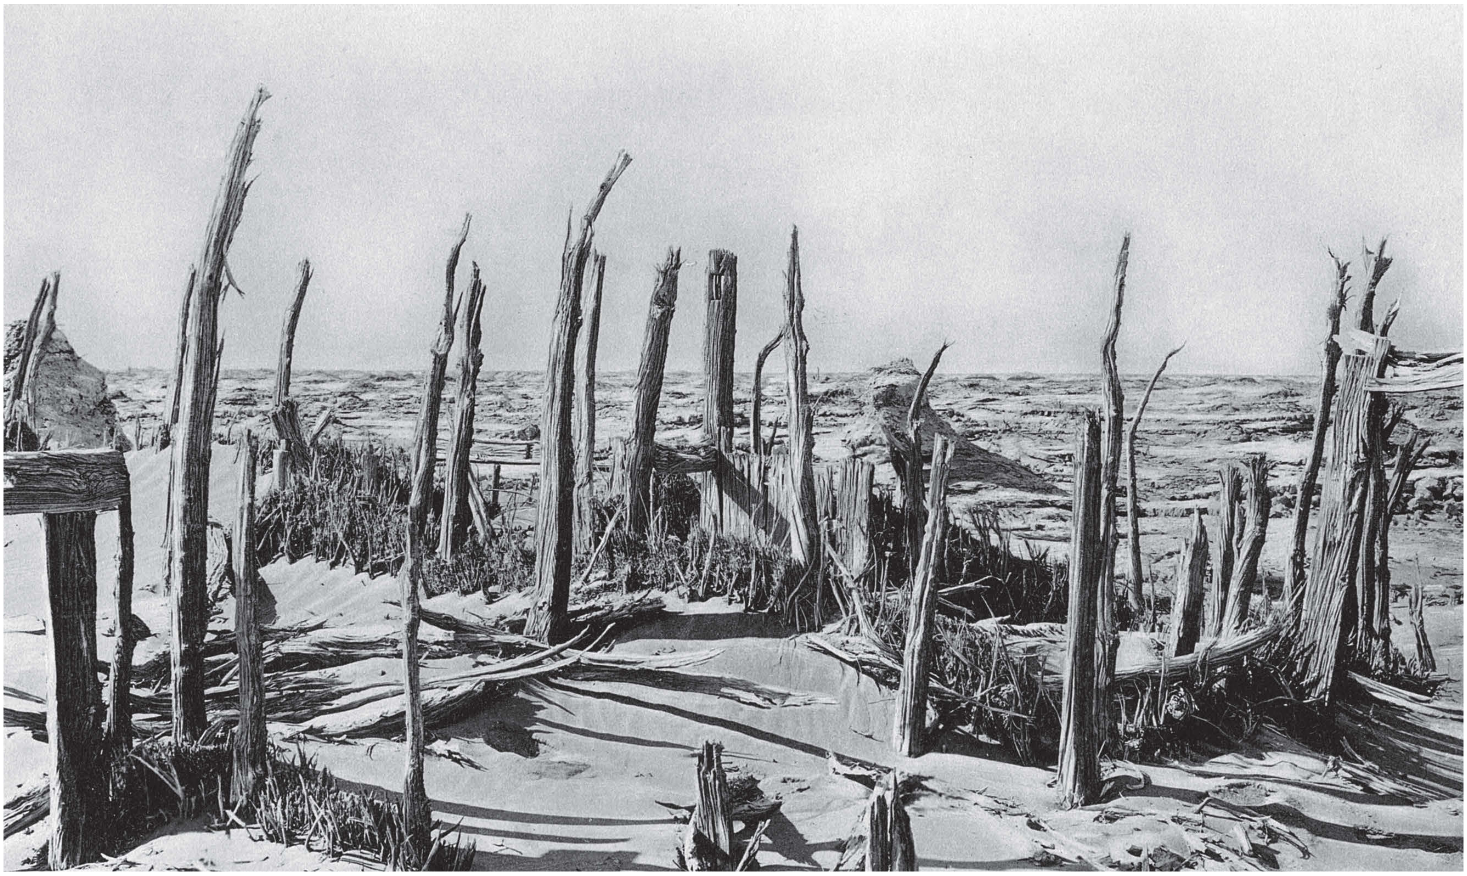
Taklamakan. Hedin was overcome: 'Who could have imagined that in the interior of the dread Desert of Gobi [as the Taklamakan was then called] . . . actual cities slumbered under the sand? [. . .] And yet there stood I amid the wreck and devastation of an ancient people, within whose dwellings none had ever entered save the sand-storm in its days of maddest revelry; there stood I like the prince in the enchanted wood, having awakened to new life the city which had slumbered for a thousand years.'[25] A few days later, on 2 February, he found the ruins of Karadong (fig. 110), whose wall-paintings (fig. 113), like the stucco figures of Dandan Oilik, he correctly identified as Buddhist.[26] As a non-archaeologist, Hedin was rightly proud: 'I consider this one of the most interesting discoveries ever made [in Chinese Turkestan]. No traveller ever expected to find anything here, and it was given to me to discover the traces of Buddhist civilization in a Mohammedan land.'[27] Continuing northward, Hedin narrowly missed the Iron and Bronze Age ruins on the dried-up course of the Keriya Darya.[28]

Hedin then went on to solve the riddle of the Lop Nor. He followed from Korla the course of the Konqe River, which once joined the Tarim River south of today's Yuli.[29] There he came across the dried-up bed of the Konqe Darya, today called the Kuruk Darya, or 'dry river', leading sharply eastward. This Hedin recognised as the old bed of the Tarim, concluding that the ancient Lop Nor Lake must have lain on this prolongation. He surmised that the Kara



Koshun lake, on the other hand, developed much later, in the early eighteenth century, when the Tarim had come to flow southward from Yuli, giving rise to Przhevalsky's 'new' Lop Nor. The old lake had thus changed position after the Tarim, its tributary, changed its course. Von Richthofen was right: Przhevalsky's 'new' Lop Nor was not the same as the ancient lake mentioned in the chronicles of the Han dynasties (202 BCE–9 CE and 23–220 CE) and those of the Western Jin dynasty (260–316), but a more recent body of water. But Przhevalsky had been right in that no other lake existed north of the Kara Koshun in the late nineteenth century.[30] And Hedin identified the cause of the accelerating shrinkage of the Kara Koshun as the development of new lakes south of Tikenlik, as a result of which the Tarim brought significantly less water to the Kara Koshun.[31]

In 1899 Hedin set off on his second Central Asian expedition (1899–1902), intending to settle any remaining doubts regarding his solution to the Lop Nor problem and then push on to the Tibetan capital of Lhasa, which was closed to Europeans. Using a converted ferry boat, he travelled from Lailik, some 70 kilometres north of Yarkand, down the Yarkand Darya and then along the Tarim, until on 7 December 1899 a thick barrier of ice brought his river journey to an end. Hedin then proceeded on foot along the course of the dried-up Kuruk Darya. He arrived at the ruins of Yingpan,[32] which Kozlov had discovered, before finding the traces of the ancient

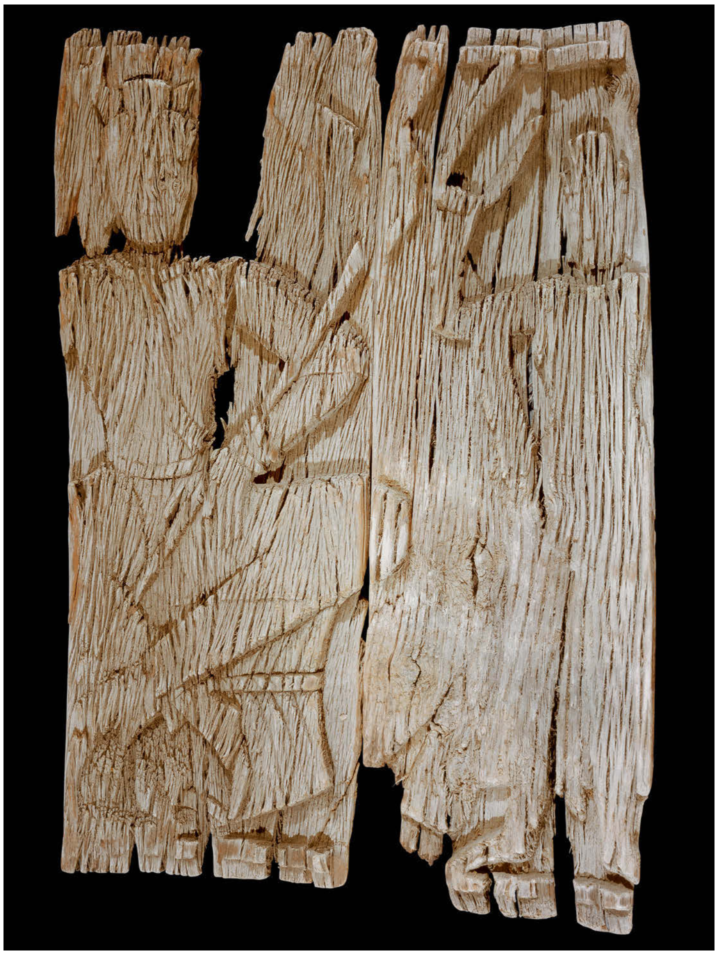


90. House M in Loulan L.A., photo 1901. Sven Hedin, *Scientific Results of a Journey in Central Asia, 1899–1902* (Stockholm, 1905), vol. II, pl. 72. The Sven Hedin Foundation, Stockholm.

Lop Nor Lake not far from the ruined city of Loulan.[33] It was now clear to Hedin that the position of the Lop Nor depended on the course of the Tarim: when this flowed east along the Kuruk Darya, the lake formed north-east of the Lop Desert, and when it flowed south toward Ruoqiang, the lake lay in the south-west, giving the Kara Koshun. Hedin thus described the Lop Nor as a 'wandering lake',[34] declaring in 1903: 'I am convinced that in a few years' time the lake will be found in the locality where it was formerly placed by the Chinese cartographers, and where von Richthofen proved by an ingenious deduction that it must once have been.'[35] Hedin was fortunate enough in 1928 to see with his own eyes the result of the Lop Nor's 'return' to the north, which had taken place in 1921,[36] and then to travel by boat down the Konqe – the now 'wet' Kuruk Darya – to arrive at the lake on 9 May 1934.[37] However, Aurel Stein had shown that in the time of the ancient Lop Nor lake, and thus in the days of the city of Loulan (2nd c. BCE–4th c. CE), part of the Tarim flowed south to join the Cherchen river north of Ruoqiang and so to form a lake in the vicinity of the Kara Koshun.[38]

Having located the ancient lake, Hedin decided to cross the Lop Desert north to south. As early as 28 March 1900 he accidentally came upon the ruins of three houses and an ancient signal tower. Here Hedin found the unique wooden relief of a seated deity with trident (fig. 91). Lost in a sandstorm three days later, his camel driver Ördek discovered the ruins of several houses, 'richly decorated with carved panels. [. . .] The panels were exceptionally well preserved, and had on them flowers and garlands carved in relief.'[39] Short of water, Hedin could not tarry longer, but he did recognise the significance of 'Ördek's city' – which Stein later called 'L.B.' – and returned the next year, discovering not far from L.B. the ancient city of Loulan, Stein's 'L.A.' (figs. 90, 122).[40] There he found not only Buddhist wooden statues, carved wooden friezes[41] and a complete wooden wheel, indicating the use of wooden carts, but also dozens of wood, paper and silk documents, written in Chinese, Kharoshthi Prakrit and Sogdian, which later allowed the reconstruction of Loulan's history.[42] Although Hedin was unable to reach Lhasa, in 1905–08 he undertook a third Central Asian expedition, to Persia and Tibet. Between 1927 and 1935 he led an interdisciplinary and multinational Chinese-Swedish expedition with specialists in archaeology, astronomy, botany, geography, geology, meteorology and zoology from Sweden, Germany and China.[43] They worked in Inner

Mongolia, Gansu and Xinjiang, where civil war was raging and where Hedin and three of his collaborators found themselves caught between the forces of the Chinese governor Sheng Shicai on one side and Muslim rebels under Ma Zhongying on the other. On 5 March 1934, in Korla, they came within a hair's breadth of being shot by the rebels, when Hedin refused to hand over a motor car,[44] then six days later they were fired upon in the course of an abortive attempt at escape.[45] In the summer, the governor Sheng Shicai detained Hedin in the provincial capital of Urumqi.[46] Despite the turmoil of the civil war, Hedin's archaeologist **Folke Bergman** (1902–1946) discovered the spectacular Bronze Age necropolis of Xiaohe in 1934.[47] The final years of Hedin's life, after 1936, were overshadowed by his imprudent intimacy with the leadership of the Nazi regime, and he died, isolated from the outside world, on 26 November 1952.



91. Hedin discovered this extraordinary wooden relief measuring 100 x 70 cm on 28 March 1900 in Loulan L.B. On the left a divine figure seated with crossed legs is holding a trident, on the right stands an accessory figure. The deity is entirely surrounded by a halo. As Folke Bergman has pointed out, the Buddhist pantheon includes several deities with a trident but they appear later than this relief from the 3rd c. CE.[11] Other hypotheses, rejected by Bergman, are representations of Shiva or Poseidon; neither can be excluded. The Sven Hedin Foundation, Stockholm.

1.3 Sir Aurel Stein, Pioneer Archaeologist of the Tarim Basin

While Hedin essentially thought of himself as a geographer and an explorer, the Hungarian-born Briton **Marc Aurel Stein** (1862–1943) was above all an archaeologist. After undergraduate and doctoral studies in Oriental languages, he worked as a professor at various British-Indian universities from 1888. Stein's interest in Central Asian archaeology was sparked by his reading of Arrian's *Campaigns of Alexander* and Xuanzang's *Buddhist Records of the Western World*, and his encounters with Sir Henry Rawlinson, decipherer of the cuneiform Behistun Inscription, and Sir Henry Yule, translator of and commentator upon Marco Polo's travels. The writings of Arrian and Xuanzang convinced Stein that archaeological remains of the Ancient Greeks were to be found in Afghanistan, and traces of pre-Islamic Buddhism in the Tarim Basin. While Stein became the most important archaeologist of the Tarim Basin, the intrigues of French archaeologists, Alfred Foucher most prominent amongst them,[48] meant that Afghanistan would remain closed to him until a week before his death. It was growing doubts about the curious manuscripts which Islam Akhun was providing to Sir George Macartney, the British Consul in Kashgar, and which the orientalist Rudolf Hoernle was endeavouring to translate, and the reading of Hedin's *Through Asia*, published in 1898, that prompted Stein to mount his own expedition.[49]

Stein's first Taklamakan expedition of 1900–01 would be crowned with success. Following in Hedin's footsteps, on his approach to Kashgar Stein made an attempt to conquer the Muztagh Ata, but like Hedin he failed to do so.[50] He then turned towards Khotan and Dandan Oilik, the ruined city which Hedin had discovered in 1896, where between 18 December 1900 and 3 January 1901 he excavated 18 ruin complexes.[51] There Stein worked out for himself the typical ground plans of ancient Buddhist temples and private dwellings, together with their manner of construction and decoration. Still richer finds awaited Stein in Niya, where he was taken by a local treasure hunter. Stein not only identified more than 40 ruins and ruin complexes, but he discovered some 200 wooden tablets and leather documents inscribed in Kharoshthi or Chinese in the refuse tip of an ancient chancery.[52] Most of the tablets consisted of a pair of elongated pieces of wood – in extreme cases reaching two metres in length – inscribed only on the smooth inner sides. These paired tablets were closed together with a sealed cord. Stein was much surprised to find Hellenistic seal impressions on many of these documents which had never been opened: 'It was a delightful surprise when the first intact seal-impression that turned up here presented me an unmistakeable

figure of Pallas Athene carrying aegis and thunderbolt.' Other seals showed Hermes or a seated Eros. Stein thus continues enthusiastically, 'In those [impressions] made from seals of purely classical design we have the most tangible proof as yet furnished how far towards China the use of Western art products had penetrated in the early centuries of our era.'[53] Stein's later finds in Miran and Loulan would show that Hellenistic cultural goods had reached as far as the Lop Nor.

After Niya, Stein carried out excavations in the ruins of the city of Endere, visited by Przhevalsky in 1876.[54] In the principal Buddhist temple he discovered not only stucco figures in the Gandhara style[55] but also countless loose paper manuscripts and a number of painted wooden panels and articles of clothing, left by pilgrims as votive offerings.[56] After a somewhat disappointing excavation at the fortified caravanserai of Karadong,[57] discovered earlier by Hedin, Stein returned to Khotan. There, north-east of the city, he identified the debris field at Uzun Tati as Xuanzang's city of Pimo. Stein's concluding excavation of the great monastery stupa of Rawak represented an archaeological highlight. At the inner and outer perimeter wall, which measured 50 x 45 metres, Stein found 91 life-size, originally red-painted clay statues dating from the late third to the fifth centuries. There had originally been some 360 of these large figures.[58] Excavation of these statues, which were hollow inside, proved difficult, for the inner wood and straw armature upon which the clay was formed had perished, so that the statues threatened to collapse as soon as Stein's workmen had shovelled away the protecting sand. 'In some instances it was necessary to secure the heads, &c., of statues still intact by means of ropes while they were being photographed.'[59] Stein, who often allowed himself to be guided by Xuanzang's descriptions, was particularly pleased to discover on one statue the remains of small sheets of finely beaten gold. 'I could not have wished for a better illustration of the quaint custom which Hsuan-tsang has recorded of the miracle-working Buddha figure of sandal-wood he saw at Pimo. "Those who have any disease, according to the part affected, cover the corresponding place on a statue with gold-leaf, and forthwith they are healed."'[60] It was with a heavy heart that Stein finally had the statues covered again with sand: 'It was a melancholy duty to perform, strangely reminding me of a true burial.'[61] Yet it was all in vain, for when Stein returned to Rawak in 1906 he could only note, aghast, that local treasure seekers had left not a trace of the statues. Of these extraordinary examples of Khotanese sculpture there remain no more than Stein's own photographs.[62] To conclude it all, Stein then finally unmasked Islam Akhun as a sophisticated counterfeiter who had taken in renowned philologists.[63]

Though Stein's second expedition to the Tarim Basin in 1906–08 found itself in direct competition with the Germans Albert Grünwedel and Albert von Le Coq and the Frenchman Paul Pelliot, it resulted in finds even more spectacular than the first, and more than 100 years later their analysis has not yet been completed. After discovering further ancient archives with unopened wooden tablets at Niya,[64] Stein hurried through Endere and Cherchen to Charklik, today's Ruoqiang. On the way, he was obliged, like Hedin, to have his camels' feet attended to: Vash-shahri 'could offer . . . a stout ox-hide from which to prepare fresh soles for those of the camels whose feet had been worn sore by the hard salt-encrusted ground. . . . The new soles, alas, had to be sewn on to the live skin of the poor beasts' foot-pads. . . . it took hours for each of the injured camels to be duly "re-soled", and half-a-dozen men had to hold down the huge writhing patient.'[65] In competition with Le Coq and Pelliot, whose plans were unknown to him, Stein stayed only two days in Miran before hastening on to Loulan, which – thanks to Hedin's precise mapping – he reached on 17 December 1906. That evening he wrote to his friend Percy S. Allen: 'I found the whole site with its known ruins scattered over ten miles, clear of French and Germans and thus the 1,000 mile race from Khotan . . . is won for the present!'[66] He quickly realised that Hedin's 10-metre-high watchtower, which dominated the landscape of ruins, was no tower but a large stupa, like the one in Kashgar.[67] After discovering a quantity of written documents in Chinese and Kharoshthi he returned to Miran, where from

23 January to 11 February 1907 his excavations met with great and surprising success.

His first discoveries in the mighty citadel from the mid-eighth century, built by the Tibetans, were documents written in Tibetan and others in Old Turkic runic script, a reminder of the earlier period of Turkic occupation. He then found in Temple M. III Kharoshthi inscriptions on silk dating from the third to fourth centuries.[68] The real surprise, however, were the impressive third-century wall paintings that Stein discovered inside two small stupa complexes M. III and M. V: 'Yet when the digging there had reached a level of about four feet above the floor and a delicately painted dado of beautiful winged angels began to show on the wall, I felt completely taken by surprise. How could I have expected by the desolate shores of Lop-nor, in the very heart of innermost Asia, to come upon such classical representations of Cherubim! And what had these graceful heads, recalling cherished scenes of Christian imagery, to do here on the walls of what beyond all doubt was a Buddhist sanctuary?'[69] The unmistakeable influence of the eastern Mediterranean or western Asia on the Gandhara-inspired murals was confirmed by a Kharoshthi inscription in Temple M. V which read 'This fresco is [the work] of Tita, who has received 3000 Bhammakas [for it]', leading Stein to comment, 'I can feel no hesitation about recognising in *tita*, which is the painter's name inflected as a genitive, the familiar Western name of Titus'.[70] As he had done six years before at Rawak, Stein sought in vain to protect these unique murals, which he did not trust himself to safely remove. 'The final duty of all, the careful re-burial of the cella was accomplished by February 11. It was a sad business to watch those graceful figures, which had seemed so full of life to my eyes in the desolation of the wintry desert, as they slowly disappeared under the sand debris.'[71] 'It seemed like a true burial of figures still instinct with life.'[72] Stein's efforts were wasted: when he returned to Miran in 1914, more than half the M. V wall paintings had gone. In the winter of 1910–11, Zuicho Tachibana, a Japanese spy disguised as an archaeologist, had made an amateur effort to remove the paintings, and so destroyed them.[73]

Stein's next and most important success was his acquisition of part of the 'hidden library of Dunhuang'. This cache of some forty-five to fifty thousand manuscripts[74] and scroll paintings was discovered in Cave 17 at Mogao near Dunhuang around 1900, by the Daoist priest Wang Daoshi, self-appointed 'guardian' of the complex. These had been sealed up as a precautionary measure not long after 1006, when the Muslim Karakhanids had invaded and ravaged Khotan, whose royal family was related by marriage to that of Dunhuang.[75] The enormous size of the Mogao complex, and the riches it contained, derived from its proximity to the Silk Road, which would truly lose its importance only in the early Ming dynasty (1368–1644). Unlike much Buddhist art in China, the caves survived the persecution and destruction under Emperor Wuzong in 843–845, as Mogao was under Tibetan rule from 759 to 848.[76]

Stein's success must be attributed to his skill in negotiating with Wang and to errors by his rival Le Coq. While Dunhuang had already been visited by the Hungarian geologist Lajos Lóczy in 1879,[77] it was only the rumour of the 'hidden library' that had awoken the interest of Western scholars. In fact, Le Coq should have reached the library first, having first heard of it in summer

1905, almost two years before Stein. As he was planning to set off from Hami to Dunhuang, however, a telegram arrived from Grünwedel, the expedition's leader, instructing him to pick him up on his impending arrival in Kashgar. Le Coq was faced with a choice: either to obey or to ignore Grünwedel's instructions and to ride to Dunhuang, at the risk that the rumour might prove false. He hesitated, tossed a coin . . . and lost. He rode to Kashgar, where he discovered, much to his irritation, that Grünwedel was not expected until almost two months later. Only Stein and Pelliot were left in the field.[78]

It was in Dunhuang, in March 1907, that Stein first heard of the hidden library, but Wang was away, so Stein used the time while waiting to investigate the Han dynasty border fortifications.[79] In his negotiations with Wang, Stein emphasised that in his research he was following in the footsteps of Xuanzang, whom the priest held in such high esteem, and that Xuanzang was indeed his own Chinese patron saint.[80] Wang was convinced 'that I was performing a pious act in rescuing for Western scholarship those relics of ancient Buddhist literature and art which local ignorance would allow to lie here neglected or to be lost in the end'.[81] Stein acquired some 7,000 scroll paintings and complete textual documents, including one of the oldest datable printed books to survive in its entirety, the Chinese Diamond Sutra of 868[82] – as well as 6,000 fragments. The following year, the Frenchman Paul Pelliot acquired almost 15,000 documents, fragments and scroll paintings,[83] and others were later acquired by Kozui of Japan, Oldenburg of Russia, and Stein again in 1914. After Stein and Pelliot, whose exploits are often described as spoliation by the Chinese, the central government ordered that the remaining documents be brought to Beijing, though many disappeared on the way.[84] Stein rounded off this successful expedition with an exploration of Jiayuguan and the Turfan Oasis, where he was unimpressed by German methods of excavation, as witnessed by a letter to Percy S. Allen: 'The places [in the oasis] most likely to yield finds had been reached by this system for which the German language supplies the expressive term of "Raubbau" ['rob-mining' – greedy and careless mining, or over-exploitation].'[85] Even if Stein was no neutral observer, his assessment of the removal of murals from Murtuk and other places, such as Kucha, was entirely understandable: 'Lecoq's & Grünwedel's assistant . . . had ruthlessly hacked the frescoes to the right and left of the pieces they had chosen.'[86] On the way back, Stein stopped again at Karadong,[87] where he was still unable to find the wall paintings Hedin had mentioned, though he did investigate the Tibetan fortress of Mazar Tagh. This almost impregnable citadel stands at the eastern end of a 100-kilometre-long chain of mountains, controlling the most important north–south line of communication through the desert, from Khotan to Aksu along the Khotan Darya. Here Stein discovered in stinking rubbish tips hundreds of Tibetan documents on wood and paper, testifying to the Tibetan military presence between around 798 and 860.[88]

Just as he had in 1906, in the autumn of 1913 Stein approached his third Central Asian expedition (1913–16) via northern Pakistan, following the route of the Korean-born Chinese general Gao Xianzhi. In 747 and 749, the latter had crossed the Wakhan Pamir and the Hindu Kush, in order to drive out the Tibetans, then occupying the strategically important region between the Oxus and Gilgit, an exploit that even surpasses Hannibal's crossing of the Alps.[89] After visiting Niya again, which he called 'my own little Pompeii',[90] and Miran, where he removed a number of wall paintings that had escaped the amateur attentions of Tachibana, in February 1914 he investigated the fortresses L.K. (Haitou) and L.L. and the settlement L.M. (all 1st–4th c. CE) in the middle of the Lop Desert.[91] A year later, Stein's camel driver Afraz Gul reported that he had discovered north-west of L.M. another settlement that Stein labelled L.R., but without ever having seen it.[92] This L.R. (fig. 105) remained a riddle until in December 2007 the present author found the site again and discovered the only ancient watchtower in the interior of the Lop Desert there.[93]

After a short stay in Dunhuang,[94] in May Stein set off north-east for the Etzin Gol (Ejine River), which from the second century BCE had served the Xiongnu as the gateway to north-west China, to investigate the walls, watchtowers and forts put up by the Chinese[95] and the ruined city of Kara Khoto, Marco Polo's Etzina,[96] discovered in 1908 by the Russian **Pyotr Kozlov** (1863–1935). As the German archaeologists had left the Turfan Oasis, Stein then spent the winter of 1914–15 there, carrying out productive excavations at Karakhoja (Gaochang), Toyuk (Le Coq's Toyok or Tuyok), Sirkip, Bezeklik, and especially the necropolis of Astana (3rd–8th centuries).[97] There he found evidence of distinctive funerary customs, such as the covering of the face of the deceased with silk masks with colourful Sassanid patterns, called *fumian*,[98] and grave goods in the form of token "paper money"[99] as well as Byzantine and Sassanian coins and Central Asian copies of the same. 'We found Byzantine gold pieces regularly placed, much in the fashion of the classical obolus, in the mouth of the dead, and Sassanian silver coins over their eyes.'[100] This custom recalled the Ancient Greek habit of placing a coin on the tongue

97. Pranidhi scene no. 14 from cave 9 in Bezeklik (in Le Coq's counting), Xinjiang, China, 11th c. Particularly striking on this wall painting (measuring 360 x 230 cm) are the depictions of the Caucasian, probably Sogdian merchants with their pack animals. No longer extant. Albert von Le Coq, *Chotscho*, 1913, pl. 28.

of the dead, so that they could pay Charon, ferryman of the Styx. But it is also conceivable that it developed independently in the context of Chinese Buddhism.[101] In any event, these few Byzantine gold coins and their Central Asian copies were hardly ever used as means of payment in Eastern Turkestan. In Astana, Stein found several painted earthenware figures of guardian beasts, with the body of a seated dog or leopard, spiky bristles along the back, and the head of a human or a bird of prey (fig. 144).[102] Such guardians protected the dead from the dangerous spirits of the earth, which might be angered by the digging of a grave in their dwelling-place. The same concern saw the dead provided with fictive deeds of sale, testifying to their ownership for all eternity of the land occupied by the grave.[103] Excavations carried out at Astana and Karakhoja since 1959 have provided unexpectedly valuable information about trade and law in the sixth to eighth centuries. The dead were given items such as hats, boots, shoes and belts of paper, and because paper was dear, these were made from old paper documents such as administrative records, private agreements or lists of goods.[104]

On his way back, Stein investigated the early medieval forts along the north bank of the Oxus, in today's southern Tajikistan.[105] At Koh-i-Kwaja, in easternmost Iran, he discovered the ruins of a Buddhist sanctuary with fragmentary paintings of the Sassanid period (224–651).[106] Notable among these were wall paintings of a bearded, aristocratic man, most likely the hero Rustam of Sistan, and of a three-headed male figure. For in 1900 Stein had found in a temple at Dandan Oilik a double-sided, painted votive panel of the sixth/seventh century, on whose front was the three-headed Buddhist tutelary deity Maheshvara or the Sogdian wind god Weshparkar in the guise of the Hindu god Shiva (fig. 114), and on the back Rustam, or the silk god of Khotan.[107] Faced with this striking similarity, Stein was prompted to ask: 'Are we in presence of an import of Central-Asian Buddhist iconography derived from Iranian lore?'[108]

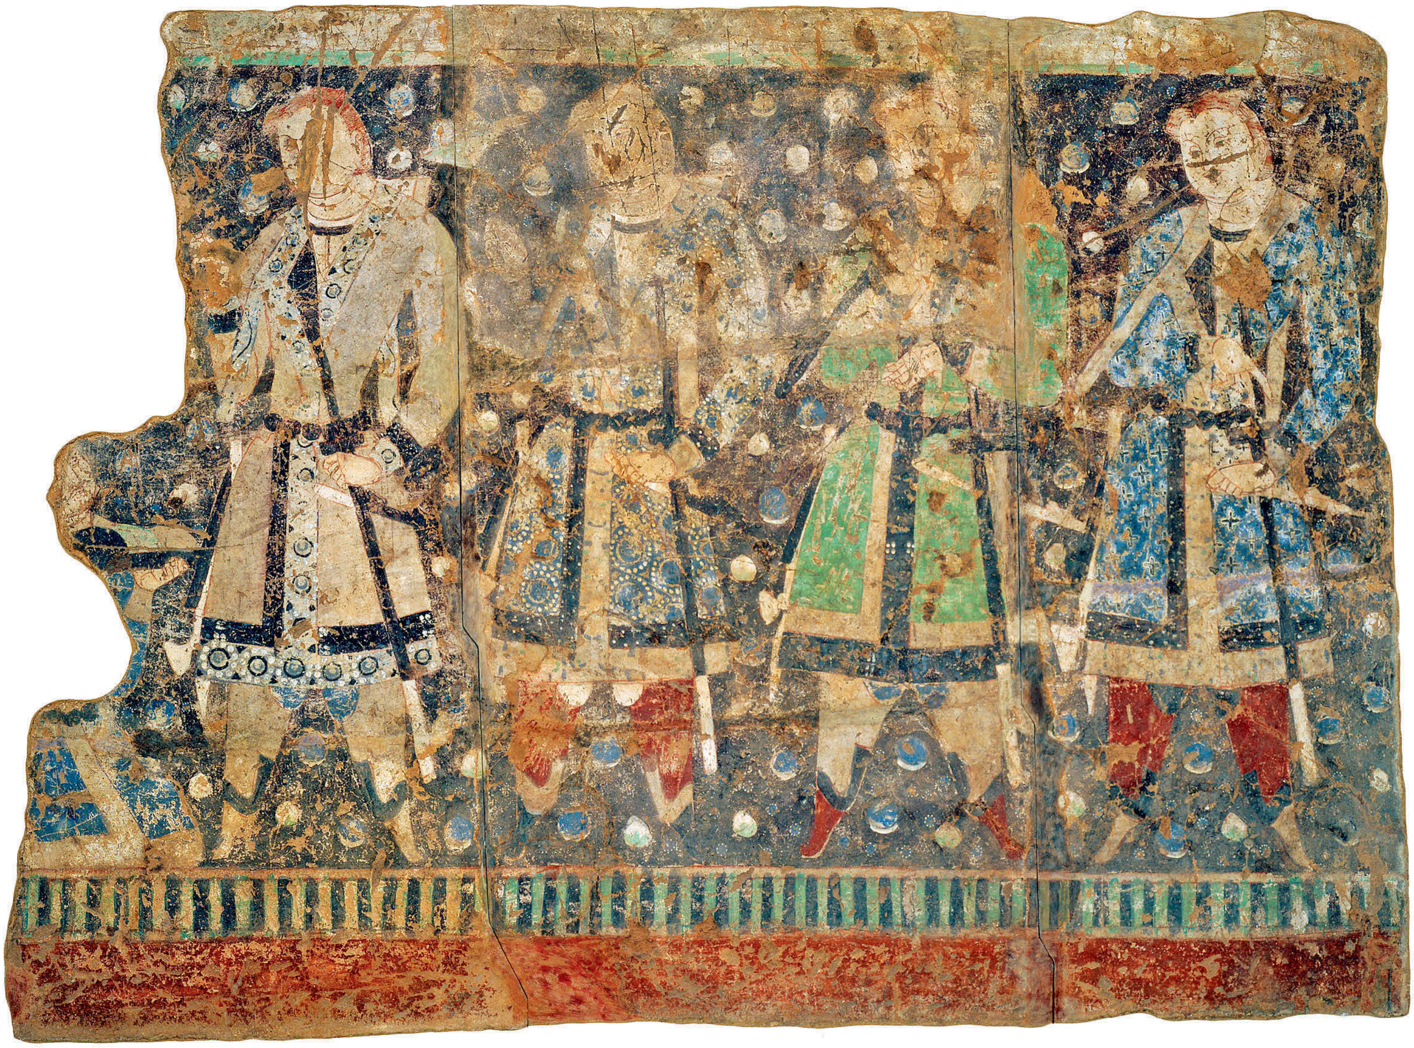
On his fourth Taklamakan expedition of 1930–31, Stein ran out of luck. Foreign expeditions were a thorn in the flesh of the increasingly powerful Chinese nationalists, all the more so in this case as Stein, unlike Hedin, involved no Chinese archaeologists in his undertakings. He was working in Niya again when the order came to stop all excavations. In the years that followed, he undertook four expeditions to Iran, and in 1938 and 1939 two extended campaigns of aerial archaeology in Jordan and Iraq. Invited to Kabul by the American ambassador Engert, he arrived in the city he had so long hoped to visit on 19 October 1943, only to die there a week later.[109]

1.4 The Exploration of the Northern Silk Road

The Swiss-Russian botanist **Albert Regel** (1815–92) was the first to explore the Turfan Oasis, in 1879, and to recognise in Gaochang the Buddhist character of its ancient culture.[110] Proper archaeological investigation of the Northern Silk Road began, however, with the Russian **Dmitri Klementz** (1847–1914), who worked in the Turfan Oasis in 1898, bringing back ancient manuscripts and fragments of paintings to St Petersburg. The results he presented at the 12th International Congress of Orientalists in Rome in 1899 prompted other national institutions to join in the race along the Silk Roads: Stein set off in 1900; the German Grünwedel, and Otani's Japanese expedition, in 1902; and eventually a French expedition under the sinologist **Paul Pelliot** (1878–1945) in 1906. Pelliot's first target east of Kashgar was Tumshuk, where Hedin had indeed seen ruins, but had classified them as Muslim and thus of no interest. But these ruins turned out to be very much worthwhile, for Pelliot discovered two fourth-century Buddhist monasteries with a lot of stucco sculpture dating from the fourth and fifth century.[111] Both had been destroyed and set on fire by Muslim conquerors some time after the tenth century.[112] Pelliot then spent eight months in Kucha, where he found Buddhist manuscripts in hitherto unknown languages, among them Tocharian B, also known as Kuchean,[113] before concluding the expedition in Dunhuang, in the spring of 1908, where he acquired thousands of rare manuscripts from the hidden library of Mogao, among them the Nestorian *Book of Praise*, dated around 780–800.[114]

After British India, Germany had the strongest presence in the archaeological exploration of Eastern Turkestan, a presence focused entirely on the Northern Silk Road. Between 1902 and 1914 it sent four successful expeditions, which returned to Berlin with manuscripts in 17 languages and 24 different scripts.[115] The First Turfan Expedition of 1902–03 was led by the indologist and art historian **Albert Grünwedel** (1856–1935), whose work concentrated on the excavation of Buddhist sanctuaries in Gaochang (Kocho), capital of the Uyghur Empire (*ca.* 866–1209), also known as Idukutshari, and the nearby monastery of Sengim.[116] The enthusiastic response the finds encountered in Berlin led to the organisation of the Second Turfan Expedition of 1904–05. **Albert von Le Coq** (1860–1939) took over as acting leader since Grünwedel was ill. Le Coq was originally a businessman, who had studied ancient oriental languages in his forties and then joined the Indian Department of Berlin's Ethnological Museum as an unpaid volunteer in 1902. He and his assistant Theodor Bartus, who accompanied all four expeditions, were responsible for finds that were scientifically important as well as spectacular. Among the former was the discovery in Tuyok of a rich collection of Nestorian Christian manuscripts of the fifth to ninth centuries, written in Pahlavi, Middle Turkic, Estrangelo,[117] Sogdian and Greek, indicating the hitherto unsuspected importance of the Church of the East in Eastern Turkestan in the second half of the first millennium.[118] Equally spectacular was the discovery of Manichaean manuscripts in Tuyok and Kocho. These finds would prove to be of outstanding importance for scholarship, for the sometimes magnificently illuminated manuscripts represented the earliest original texts of the Manichaeans, whose religion and beliefs had been known only through the writings of their enemies until then.[119] Le Coq quickly saw the similarities between these Uyghur-Manichaean miniatures of the ninth to eleventh centuries and the later miniature painting of Persia.[120]

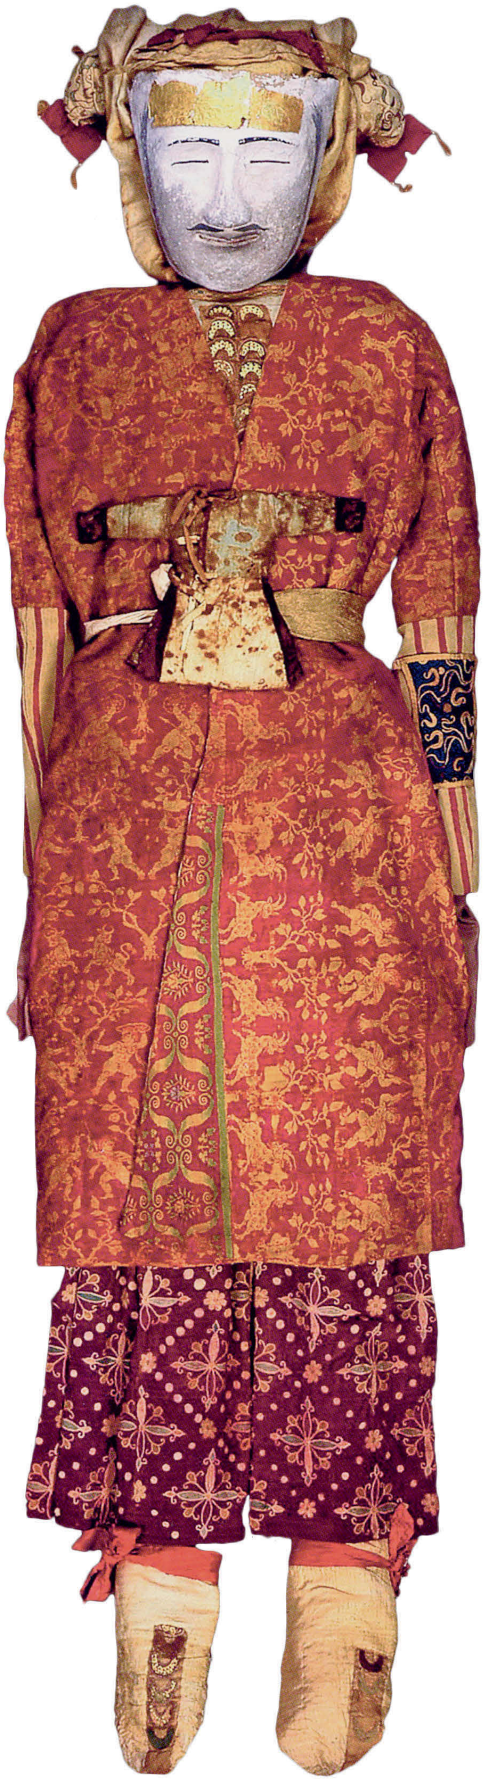
All the greater then was Le Coq's disappointment when the Manichaean library he discovered in the ruins of Shrine K in Gaochang proved to have been irretrievably damaged by water.[121] Even more maddening for Le Coq was the fact that just a year before Klementz's expedition, in 1897, an even more extensive Manichaean library had been deliberately destroyed. In the ruins of a temple pulled down to clear the land for farming, a farmer had discovered 'great cartloads of those manuscripts, ornamented with pictures in gold and colours. But he was afraid . . . of the unholy nature of the writing . . . so he straightway threw the whole library into the river!'[122] Le Coq mentions other reasons for the earlier destruction of Buddhist art, among them the suspicion of Buddhism on the part of Confucian Chinese administrators, the popular notion that wall paintings made good fertiliser, the demand for gold pigment, earthquakes, and certain beliefs about spirits: 'For the belief still exists that painted men and animals, unless their eyes and mouths at least have been destroyed, come



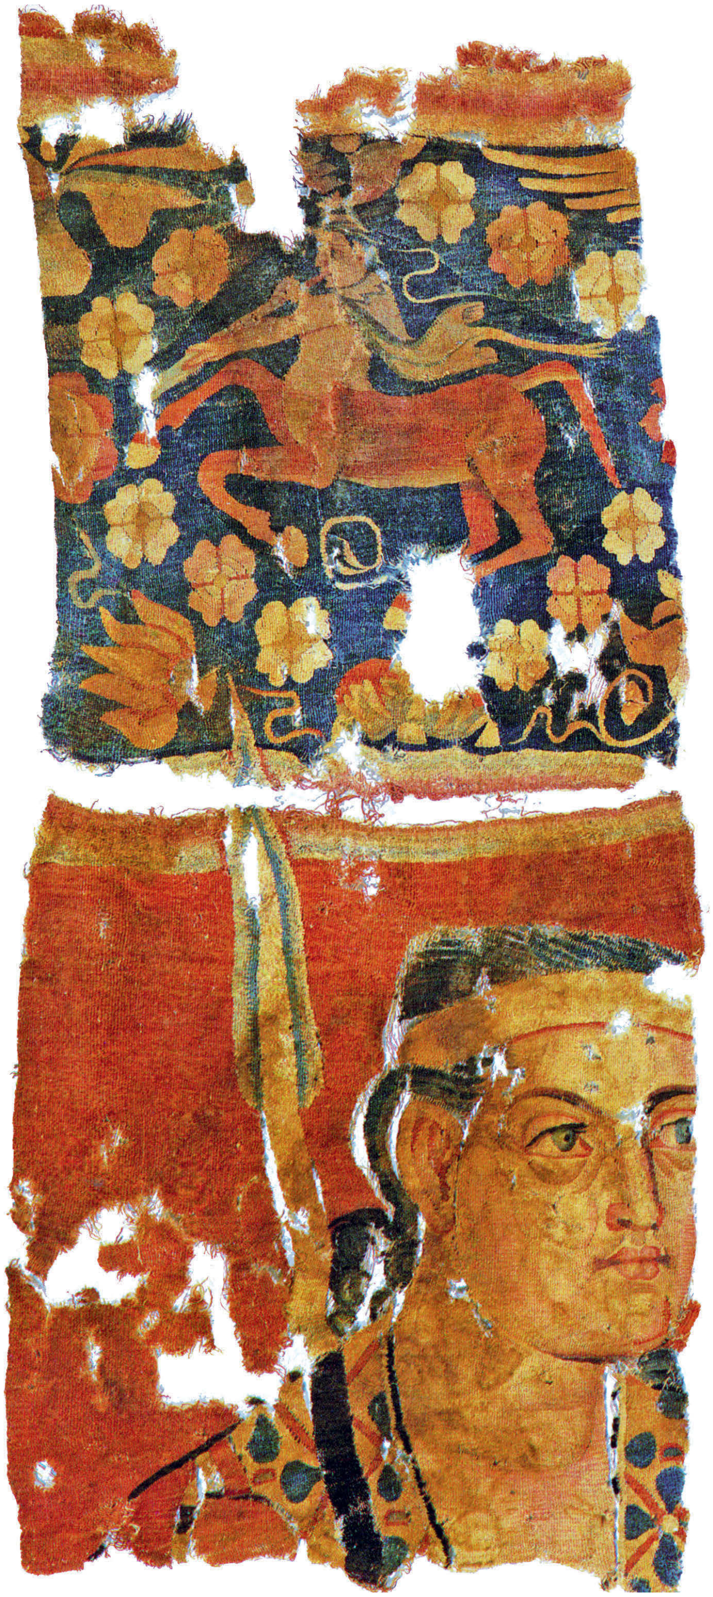
98. Wall painting of local Tocharian princes of Kucha from the 'Cave of the Sixteen Sword Bearers' (cave 8) of Kizil near Kucha, Xinjiang, China, 5th/6th c. The princes carry long, straight Sassanid swords, and their kaftans have Sogdian-Sassanid patterns. Museum für Asiatische Kunst, Berlin.

to life at night, descend from their places, and do all sorts of mischief to men, beasts, and harvests!'[123] In Shrine K, too, Le Coq came across a macabre find: 'On the threshold [to the library lay] the dried-up corpse of a murdered Buddhist monk, his ritual robe all stained with blood.' And as if that were not enough, 'In one of the southern domed buildings, which we named "the corpse hall", we made a horrible discovery . . . came suddenly upon confused heaps of the piled-up corpses of at least a hundred murdered men. Judging from their clothing they were Buddhist monks.'[124] This massacre was most probably perpetrated by the Muslim invader Khizir Khoja Khan in around 1395, when he toppled the Buddhist ruling family and converted Gaochang to Islam by force. At the same Shrine K Le Coq discovered behind a more recent wall a rare Manichaean mural depicting a high-ranking member of the Manichaean elect, or religious, perhaps even the religion's founder Mani (216–*ca*. 276) accompanied by twelve male and nine female elect and a number of laypeople (fig. 252).[125] Together with half the murals brought back from Turfan and Kucha these paintings would be destroyed by seven Allied bombing raids between 23 November 1943 and 15 January 1945.[126]

As unique as these Manichaean paintings were the Nestorian Christian wall paintings discovered at a small temple outside the Gaochang city walls. Like the Manichaean painting of the Elect, these intact Christian frescoes were found hidden behind a wall not quite as old, put up when the temple was converted to another use. Le Coq was impressed by the religious tolerance that seemed to mark the realm of the first Manichaean and later Buddhist Uyghur rulers: 'This pious style of renovation – in our country the old picture would simply have been covered with a coat of colour wash – was used, so it seems, not only when a temple was to be dedicated to another god of the same religion, but also when a Manichaean or Christian Church was to be used for the worship of followers of another [Buddhist] creed.'[127] As the present author



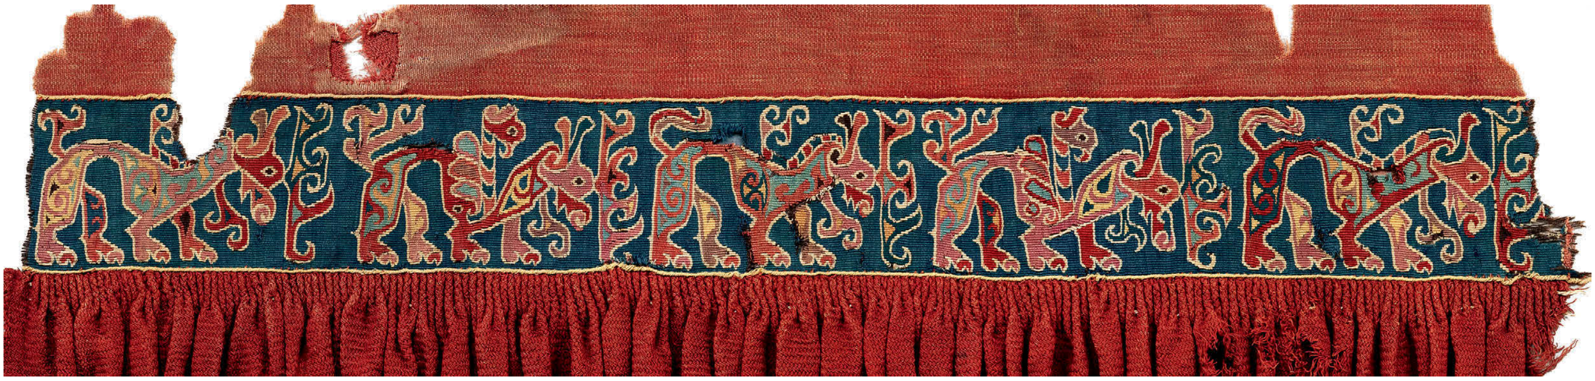
▶ 99. **A mummy, discovered in 1995, probably of a Sogdian merchant from the 4th to 5th c. The man was found in a wooden coffin, which was painted on the outside and covered with a woollen blanket with a lion pattern. On the face of the deceased lay a face mask made of a hemp fibre mass which was painted white, with eyes, eyebrows and moustache painted in black and lips in red; a gold foil covered his forehead. He wore felt boots covered with fine silk, and purple woollen trousers with floral and diamond-shaped patterns. Embroidered on the woollen kaftan are golden, naked putti fighting with short swords, as well as goats and bulls standing in pairs on both sides of pomegranate trees. The deceased was also given two miniature kaftans, one of which lay on his stomach, the other one next to his left hand. The motif of the fighting putti comes from the Roman-Hellenistic world, the one of the paired animals standing around a tree from the Iranian-Sassanid sphere. It is not known whether the kaftan was made in Sogdiana or produced locally under Sogdian instruction. Yingpan, grave 5, Xinjiang, China. Archaeological Institute, Urumqi.**



100. This woollen wall hanging, discovered in Shanpul near Khotan, was originally 4.8 m long and 2.3 m wide and has Hellenistic motifs: at the top a centaur playing the Greek war trumpet salpyx, below a warrior with lance. The wall hanging was made in the 3rd to 1st c. BCE in Greco-Bactria or in the Black Sea region and later cut up into leggings by a Saka warrior of Khotan. Plain weave tapestry, grave 1, cemetery, Shanpul, Xinjiang, China. Uyghur Regional Museum, Urumqi.

has shown elsewhere, this painting does not show Palm Sunday but is rather a depiction of hope in the Resurrection.[128] Such a relatively respectful conversion of a sanctuary for the use of another religion was no exception, as shown by the double-walled Caves 17 and 25 at Bezeklik (in Grünwedel's numbering), among other examples.[129] **Joseph Hackin** (1886–1941), a member of the Citroën Expedition of 1931, was the first to note that the late ninth and the tenth century had seen a period of Manichaean use between two Buddhist periods.[130] Gaochang's Ruin Group α had also served two different religions, first as the seat of the *možak*, the head of the eastern Manichaean church, and then from 1008 as a Buddhist temple. In the double-walled sanctuary Le Coq found many Manichaean manuscripts. The transformation of the seat of the *možak* into a Buddhist shrine marks the latest date by which the royal house would have converted from Manichaeism to Buddhism.[131]

The most spectacular find of the Second Turfan Expedition was Le Coq's discovery of the extraordinarily well-preserved eleventh-century wall paintings at the Bezeklik cave complex in the narrow Murtuk valley. While most cave sanctuaries had long served as shelters for goatherds and shepherds, and their walls were blackened by soot, caves which were more difficult to access, being filled with sand, gave occasion for hope. In Cave 9 Le Coq discovered 15 colourful Buddhist wall paintings, 3.25 to 3.60 metres high, depicting *pranidhi* scenes (fig. 97).[132] These would normally show a legendary episode, in which Buddha Shakyamuni in a former incarnation makes a vow before an earlier buddha, Dipamkara, for example, to become a buddha himself. In the *pranidhi* scenes at Bezeklik, it is the donors of the paintings, monks and laypeople, who vow before the Buddha to strive toward buddhahood. As all people have the seed of the Buddha nature within themselves, all may attain to buddhahood, and the *pranidhi* scenes here thus depict the donor's vow to follow Buddha's teaching.[133] It is a notable feature of these paintings that while the large Buddha figures are somewhat stereotyped, the minor figures are realistically rendered. Among these are the magnificently attired Uyghur ruler of Gaochang, younger goddesses, a demonic-looking Vajrapani – a tutelary deity – armoured warriors, Indian Brahmins, elderly Chinese monks and younger, European-looking red-haired monks, as well as black-haired Iranian and red-haired Europoid traders and caravan masters with their camels, donkeys and horses. These wall paintings give the impression that in the Uyghur kingdom of Gaochang all categories of the population – Turkic Uyghurs, Chinese, Iranians, Tocharians, Europeans and Indians, as well as the upper classes of rulers, warriors, merchants and monks – were united in the Buddhist state religion. Thirteen of the 15 *pranidhi* scenes were well preserved,



101. Fragment of woollen skirt edging with striding mythical creatures in the form of stags or elks. On every second stag sits a bird of prey or the bird forms a part of a mythological creature. Slit weaving, *ca.* 265–40 BCE, probably from Shanpul, Xinjiang, China. Abegg-Stiftung, CH-3132 Riggisberg, inv. no. 5137.

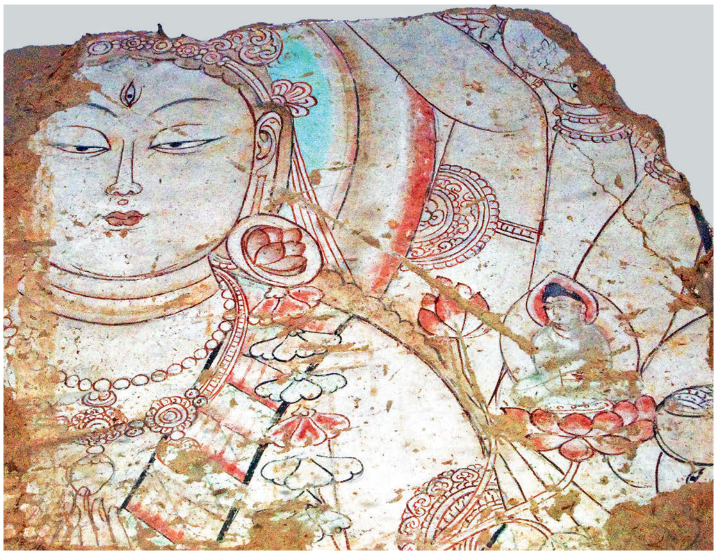
and these Le Coq and Bartus cut out and took back to Berlin. Unfortunately, these wall paintings were built into the walls of the Ethnographical Museum in Berlin, where they fell victim to the bombing of the Second World War, since no care had been taken to remove them to a safer place.[134]

With Grünwedel's belated arrival in late 1905 there began the Third Turfan Expedition of 1905–07, which made its way via Tumshuk to the Kucha Oasis, where the team concentrated on the cave complexes of Kizil and Kumtura. Le Coq was disappointed at having to hand over the leadership of the hitherto successful expedition to Grünwedel, who had neither leadership qualities nor experience of excavations. These he left to Le Coq and Bartus, contenting himself with the preparation of plans and drawings. His rejection of the large-scale removal of wall paintings as barbarism provoked further tensions with Le Coq.[135] In the older caves of the fifth to seventh centuries, Le Coq was surprised at the lack of Chinese stylistic influence: 'There was still not the slightest sign in the painting of an East Asiatic [Chinese] influence. Everything in sculpture and painting alike was Indo-Iranian, following late antique principles.'[136] This Indo-Iranian character was most evident in the representation of donors, as for example in the 'Cave of Sixteen Swordsmen' (today's Cave 8) (fig. 98). Depicted there are local Tocharian princes with short, red-brown hair and nimbus, each wearing a kaftan with a Sassanian-Sogdian pattern and a Sassanian longsword with elongated hilt at the waist.[137] Le Coq also noticed that in painting canonical figures such as buddhas and bodhisattvas, especially their faces, the artists used templates or grids, and followed the written instructions of those who had commissioned them: 'Sometimes, on these [grids] inscriptions were found in Sanskrit or Tocharian which seemed to be directions for the painter, such as "Here Buddha comes, here this or that saint" etc.'[138] In summer of 1906 Le Coq's health deteriorated to such a degree that he decided to return home. Riding alone from Turfan to Kashgar was so unsafe that he felt compelled to share his inn rooms with his horse.[139] Grünwedel and Bartus for their part continued their work into 1907.

Le Coq would lead the Fourth Turfan Expedition of 1913–14, which was intended to continue the work in Kucha and to further explore the Southern Silk Road.[140] After a short dig at Tumshuk the Germans hurried on to Kucha 'to retrieve the important paintings at Kyzil and Kumtura that Prof. Grünwedel had drawn in the course of the 3rd expedition but had neglected to recover'.[141] The danger of working in the Kizil caves was illustrated by the removal of the cupola from the 'Cave with the Ring-Bearing Doves' (today Cave 123), which only two days afterwards collapsed as the result of an earth tremor.[142] While the expedition completed its work in Kumtura and Sim-sim, a planned Fifth Expedition to the Southern Silk Road under the leadership of Albert Tafel was called off on account of the First World War.[143]

1.5 Latest Research

Modern research began with the Chinese archaeologist Huang Wenbi (1893–1966), once a member of Sven Hedin's Chinese-Swedish multi-national expedition, who discovered many wooden documents near Tuyin, east of Loulan, dating from the late first century CE.[144] As research was re-established on a systematic basis following the end of the Cultural Revolution (1966–76), it quickly became clear that the Tarim Basin remained an archaeological Eldorado, where many finds still awaited discovery. Among the most significant finds are the Bronze Age 'Tarim mummies' of Europoid type that Wang Binghua has been unearthing in the northern Lop Desert since 1979, as for example at Gumugou and Towan, and at Zaghunluk near Qiemo.[145] In 2000 Wang Binghua



102. Wall painting of a bodhisattva from a temple in Damagou, 7th–8th c., discovered in 2002. During the Tang dynasty (618–907), the small Buddhist temples of Damagou belonged to the kingdom of Keriya (Yutian). On-site Museum of Damagou, Xinjiang, China.

also succeeded in rediscovering the Bronze Age necropolis of Xiaohe, first found by Folke Bergman in 1934, which would be excavated by Idriss Abdul Ressul between 2002 and 2005.[146] It was in the northern Lop Desert, too, that in 1995 Chinese archaeologists found – during a rescue excavation near Yingpan, 100 kilometres north-west of Xiaohe – the spectacular mummy of a two-metre-high man from the fourth or fifth century CE. This mummy, whose face was covered by a painted death-mask of hemp, was probably a Sogdian trader (fig. 99). The woollen kaftan displayed both Greco-Bactrian and Han Chinese patterns.[147] But the first discovery of a painted tomb in the Tarim Basin, in early 2003, happened by accident, when a research team was following strange tyre tracks some 25 kilometres north-east of Loulan L.A. and came across the freshly robbed third- or fourth-century tomb with two chambers and a 10-metre-long dromos. The painted banqueting scene shows bearded men in Iranian dress, suggesting that the tomb might have been made for Sogdians.[148] Finally, in late 2008, Chinese archaeologists discovered a fortified city of the fourth to fifth century CE near the Bronze Age necropolis of Xiaohe.[149]

In 1995–97, a Sino-Japanese team under Han Xiang and Yasutaka Kojima conducted a systematic survey and excavation of Niya, the ancient minor kingdom of Jingjue. The expedition not only excavated another 60 ruins to add to Stein's 40, but it also discovered a fortress of oval plan with three concentric rampart walls, a Buddhist temple with fragments of a late third- or early fourth-century wall painting and two necropoles of the first to third centuries CE, with a total of 21 mummies, 19 with Europoid facial features. In one grave lay a princely couple wrapped in silk brocade, probably rulers of Jingjue. Finally, the team discovered a presumably Bronze Age site 40 kilometres north of Niya, whose finds mirrored those in the nearby valley of the dried-up Keriya River.[150]

Rescue excavations between 1983 and 1996 brought to light unique woollen textiles at the three cemeteries of Shanpula, east of Khotan. In 1982, heavy rainfall had eroded the earth of the cemetery, immediately attracting grave robbers. The cemeteries held 69 graves and two horse burials dating from the third century BCE to the fourth century CE.[151] In one of three mass graves that yielded the remains of 494 people, many of whom had suffered violent deaths, the archaeologists found a unique woollen wall hanging, originally some 4.8 x 2.31 metres, with Hellenistic motifs: a galloping centaur playing a salpinx – a Greek war trumpet – and a warrior with a Hellenistic-looking face holding a lance (fig. 100). The tapestry was probably produced in Greco-Bactria or in the Black Sea region in the third to first centuries BCE, before coming into the possession of a Saka horseman from the Khotan Oasis, who made it into leggings. The owner would have been killed together with the other dead horsemen in a battle in the first century BCE, probably against attacking Xiongnu.[152] The gaily coloured braids on women's long woollen skirts with their spectacular motifs, however, derive from the Iranian culture of the Saka horsemen. One such braid (*ca.* 265–40 BCE) features pacing stags with mighty antlers, every other of these carrying a bird of prey on its back (fig. 101).[153] On another, mounted falconers pursue winged composite animals with horned and bearded heads

103. In 1994 in Miran the author met Kumran Banyas, who was born in 1886. Kumran, who was born near the Karakoshun lake, which has now disappeared, spoke Uyghur and a dialect related to Tibetan. He had worked for Sven Hedin and Aurel Stein, and in 1914 had helped the latter to pack up wall paintings from Miran in padded boxes.

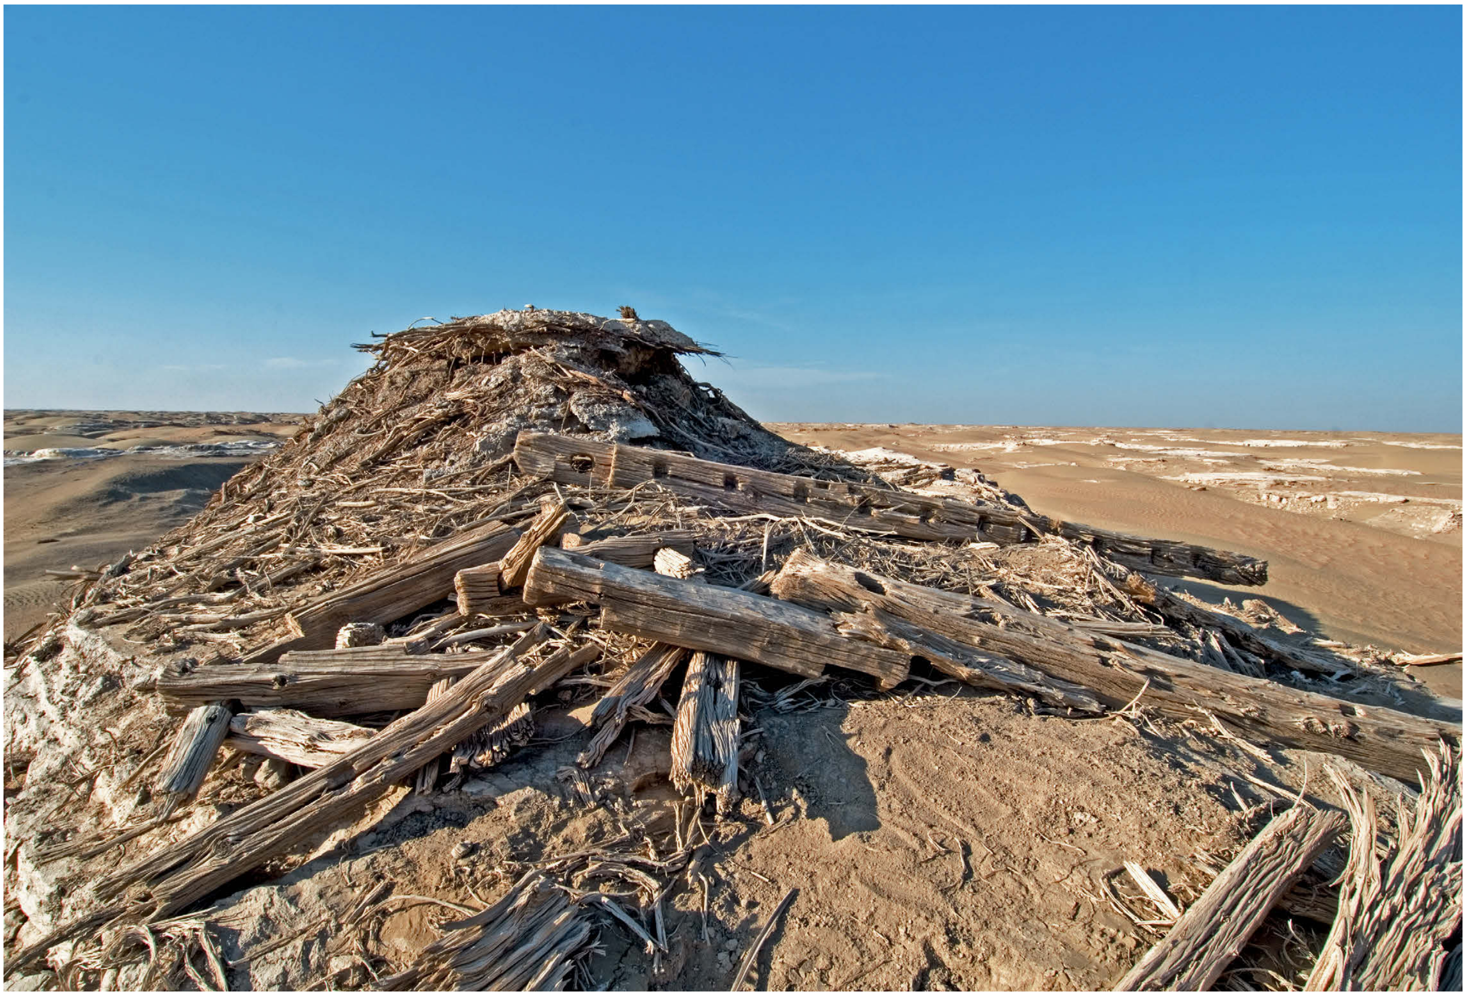
104. Two of the three special desert vehicles used by the author in the Lop Desert in 2007. The team leased Belgian MOL oilfield trucks equipped with Deutz engines. In the foreground is the tank lorry carrying 5,000 litres of diesel.

(*ca*. 8 BCE–234 CE) (fig. 109). This last scene recalls representations of the Iranian god Mithra, accompanied by a raven, pursuing a hybrid creature.[154] In 2008, five knotted wool rugs were found in the vicinity of the Shanpula cemetery when police arrested two treasure hunters and confiscated their booty. The largest of these, produced locally between the late fifth and the early seventh century, measures 256 x 150 centimetres and has more than 30 figures, probably portraying scenes from the life of the Hindu god Krishna.[155]

Important discoveries were made in the lower Keriya Valley in 1994, when the Sino-French Expedition (1991–2005) under Idriss Abdul Ressul and H.P. Francfort (C. Debaine-Francfort from 1995) found the fortified Iron Age city of Jumbulakum (second half of the 1st millennium BCE) together with, by 2001, dozens of intact graves.[156] This afforded the first evidence that settlements existed in the interior of the desert as early as the Iron Age. By then the expedition had also rediscovered the wall paintings in Karadong from the first half of the fourth century, already noted by Hedin, which, along with those of Miran, are the oldest Buddhist paintings in the Tarim Basin.[157]

In 1998 the present author discovered at Dandan Oilik a Buddhist temple (D 13)[158] with hitherto unknown Sogdian-Buddhist wall paintings from the early eighth century which attest that the Sogdians came to represent their own gods, Eastern Iranian in origin, in the guise of Buddhist and Hindu divinities (figs. 116f).[159] The years 2002, 2005 and 2006 saw further excavations carried out at Dandan Oilik by a Sino-Japanese team, bringing to light wall paintings in three other temples. The murals in Temples CD-4 and CD-10 are characterised by a flat, two-dimensional style of painting and motifs very similar to those found by the author at Temple D 13.[160] Other comparable seventh- to eighth-century wall paintings were discovered in 2002 in three small temples at Topulukdong near Damagou (fig. 102), east of Khotan.[161] Also found there were a number of small votive clay tablets called *tsha-tsha*, representing buddhas and bodhisattvas, notably similar to others found at Tholing in Western Tibet.[162]

In 1998 the author discovered at Endere the only known stone inscription in the Central Asian Gandhari language and the Kharoshthi script of the ancient kingdom of Shan-shan. The inscription indicates that in that kingdom Mahayana Buddhism



105. Ruin of the watchtower L.R.i discovered by the author in 2007 in the Lop Desert, Xinjiang, China. Similar to the watchtowers west of Dunhuang, from the 1st to 4th c. CE this tower stood on a 4-metre-high flat-topped elevation, and its lower half consisted of a massive block of pounded earth reinforced with poplar and tamarisk branches. On this platform stood a small building with an entrance door, which was *ca.* 6 m above ground level and accessed by a rope ladder. The body of the tower, which had one or two storeys, consisted of thick mud walls with loopholes, strengthened with wooden beams. From this tower, smoke and fire signals could be sent to the forts L.K. and L.L. or be received from them, since each one was visible from the next.

was officially supported by King Amgoka before 263 CE, a century earlier than previously believed.[163] In the winter of 2007, the author came across the fortresses of Haitou (L.K.) and L.L. (1st–4th c. CE) (figs. 95f, 125) in the Lop Desert, and then, almost 100 years after Stein, he investigated the settlement L.M. and documented for the first time the unknown site L.R. (fig. 105), whose rumoured existence was reported by one of Stein's camel drivers. There the author found the only Han dynasty watchtower in the interior of the desert.[164] Finally, in 2009, he discovered in the dried-up Keriya Darya valley the Iron Age cemetery of Satma Mazar,[165] the fortified Bronze Age settlement of Sebier[166] and the Bronze Age necropolis of Ayala Mazar. These discoveries prove that almost 4,000 years ago a unique culture concerned with fertility rituals extended from the Lop Nor to the centre of the Taklamakan Desert.[167]

2. The Southern Silk Road

2.1 Kashgar and Yarkand

Kashgar and Yarkand were both important trading cities sited below the difficult passes through the Pamir and Karakorum mountains, passes that connected China to the Indian subcontinent. **Kashgar** was additionally of strategic importance, as another trade route led from there via Fergana to Sogdiana, Merv and Iran. This oasis city was a nodal point on the most important trade network between China and Central Asia; China, the Xiongnu and the Kushans thus contended for control of it. Kashgar, the ancient Shule,[168] had belonged to the Chinese sphere of influence from the time of General Li Guangli's expedition to Fergana until the Wang Mang interregnum (9–23 CE), when the oasis fell under Xiongnu influence. Around 74 CE, General Ban Chao again secured China's suzerainty over Kashgar, though in 107 CE the oasis entered a loose vassal relationship with the Kushans, until 20 years later Kashgar's ruler Chenpan broke with the Kushans and submitted to China.[169] With the weakening of the Eastern Han dynasty (25–220 CE), the second half of the second century saw Kashgar regain its independence, but like Khotan, Kucha and Turfan, it came under Hephthalite influence in the last quarter of the fifth century. Following the Western Turks' victory over the Hephthalites, Kashgar became a vassal of theirs in the 560s, until in 658 the oasis finally fell to the Tang dynasty, becoming one of the 'Four Garrisons' of the 'Protectorate-General to Pacify the West'.[170]

Kashgar's brief political connection with the Kushans and the lively Kushan-dominated trade between the Tarim Basin and north India contributed decisively to the dissemination of Buddhism from about 100 CE onwards. Testimony to this early propagation of Buddhism via Sarvastivadin monks are the caves cut into the vertical cliffs at **Sanxian Dong** (early 2nd c.) (fig. 108)[171] ten kilometres north of Kashgar, the oldest Buddhist caves in China, and also, 30 kilometres east of the city, the almost 12-metre-high stupa of **Mauri Tim** (late 2nd–early 3rd c.) which belonged to a large monastery (fig. 43).[172] Like that at Zurmala near Termez, this stupa consists of three superimposed rectangular platforms, each smaller than the one beneath, with a cylindrical structure on top; a similar pattern is found in the stupas of Niya, Endere and Loulan, dating from the late third century onward. Six kilometres south of Mauri Tim stand the clay ruins of a fortified settlement with citadel constructed by the Chinese Tang dynasty (618–907) in the mid-seventh century, when it conquered Kashgar. According to tradition, it was destroyed in the mid-tenth century by the Karakhanid ruler Satuq Bughra Khan, who had recently converted to Islam.[173]

The oasis city of **Yarkand**, ancient Shahe, sought to exploit the weakening of China brought about by Wang Mang's usurpation to establish itself as the leading power in the Tarim Basin. Unlike other city states, Yarkand succeeded in not submitting to the Xiongnu, and was rewarded by China, in 29 CE, with nominal suzerainty over the 'fifty-five kingdoms of the Western Regions'.[174] Over the next 30 years, Yarkand grew into the strongest power in

106. Two merchants in the market place of Kashgar near the Id Kah Mosque, Xinjiang, China.

the area. It first conquered the kingdoms of Xiye (neighbouring Karghalik) and Yumi (Keriya), then in 46 CE Yarkand's king Xian defeated Khotan and Kucha, incorporating them into his realm as vassal states. Though Xian also defeated the king of Shan-shan in the eastern Tarim Basin, the latter preferred to place himself under Xiongnu protection. Yarkand then succeeded in subjugating Fergana, but 60 CE saw a rebellion by Khotan, whose king took Xian prisoner a year later and conquered Yarkand. In 88 CE, after a long resistance, Yarkand had to surrender to Ban Chao.[175] While the city lost political significance, it would remain an important centre of trade until the early twentieth century.

2.2 The Kingdom of Khotan

2.2.1 Origins and History

Unlike Kashgar and Yarkand, which in the first millennium had the character of cities of passage, **Khotan** (called Hetian in Chinese) developed into a solid political power with a strong manufacturing base, and a centre of Buddhist learning that also produced significant art, as witnessed by the ruins of Rawak, Balawaste, Karadong and Dandan Oilik. The population of early Khotan derived from three sources. Significant numbers of nomadic Saka horsemen arrived during the third and second centuries BCE. They raised livestock and brought with them elements of the textile art of the steppes, as witnessed by the fabrics from Shanpula.[176] Communities of Indian and Chinese immigrants and traders formed the urban element. This diverse population structure led to the development of unique hybrid cultural forms. So it was that in the fifth century the Indian Gupta script, a further development of Brahmi also called Late Brahmi script, came to be used in a cursive from to write the Middle Iranian languages of the Saka of Khotan and Tumshuk, the Tumshuk-Saka inventing 12 new signs and incorporating them into the Gupta alphabet.[177] Even more astonishing are the bilingual Sino-Kharoshthi copper and bronze coins of around 30 to 150 CE. On the obverse is a tamga, a tribal identifying mark from the world of the equestrian nomadic pastoralists, together with the value in Chinese characters. The reverse shows a horse or Bactrian camel, similar to those on Indo-Saka coins, surrounded by a Prakrit inscription in Kharoshthi script giving the name and title of the king of Khotan. Given that these coins' weights also matched those of the early Kushan coinage, whose Attic-weight tetradrachm

107. Potter in the old city of Kashgar, Xinjiang, China.

108. Buddhist cave monastery of Sanxian Dong north of Kashgar, Xinjiang, China. Traces of wall paintings can be seen in the interior of this monastery, which was founded in the early 2nd c. CE.

corresponded to the Chinese Han Liang, this bilingual currency was compatible with the north Indian and Chinese monetary system and circulated among both the Indian and the Chinese trading communities.[178] The use of a prakrit written in Kharoshthi script in the administration of Khotan and even of Shan-shan underlines the domination of the Southern Silk Road by the north Indian community during the first four centuries CE.[179]

The Indian and Chinese origins of the urban populations also find themselves reflected in the Tibetan *Annals of Li Yul* – composed in the mid-eighth century and preserved as part of the Tengyur – which list 56 kings.[180] Even though these annals are largely filled with legends, they are nonetheless very revealing. According to the tradition they record, which was older than the annals themselves and already known to Xuanzang in slightly different form,[181] Vaishravana, the Buddhist guardian deity of the north, impregnated the wife of Emperor Ashoka, whereupon a soothsayer prophesied to her husband that the boy would rule even in his lifetime. Angry and worried, Ashoka abandoned the baby, whereupon Vaishravana took him to China and had him adopted as an emperor's son. After some years, the young prince quarrelled with the sons of the Chinese emperor and set off west with a small army. At the same time, a discontented minister left Ashoka's India to look for a new homeland further north. When the Chinese emperor's adoptive son and the minister met, war threatened between the Chinese and the Indian migrants, but Vaishravana intervened to establish peace between them, and the two communities founded Khotan together. On the basis of this tradition, the kings of Khotan traced their ancestry to the god Vaishravana, and honoured him as the patron of the city.[182] The annals date the foundation of Khotan to 234 years after Shakyamuni's entry into Nirvana, and the introduction of Buddhism 165 years later.[183] If one follows the modern, 'short chronology' of Buddha Shakyamuni's life, he died around 368 BCE, giving 134 BCE as the date of the foundation of Khotan and 31 CE as the date of Buddhism's first arrival there. Both of these are plausible as rough approximations. It is significant that this tradition dates the migration of the Indians almost two centuries before the first contact with Buddhism.

109. **Fragment of woollen skirt edging showing hunters and mythical creatures, slit woven, *ca.* 8 BCE–234 CE. A rider accompanied by a hunting falcon is pursuing a winged composite creature with a horned, bearded head. Probably from Shanpul, Xinjiang, China. Abegg-Stiftung, CH-3132 Riggisberg, inv. no. 5138.**

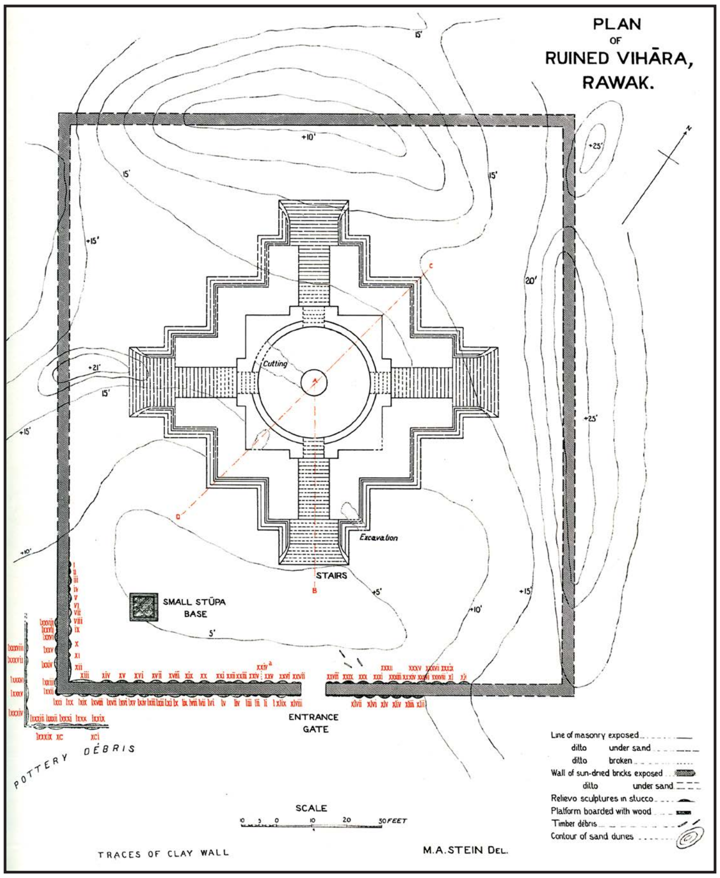
The *Hou Han Shu* reports that in 61 CE Khotan defeated Yarkand to become a regional power, holding 13 small states in subjection, one of them being Jingjue (Niya) on the eastern border of Shan-shan. Yet by 74 CE King Guangde had capitulated to Ban Chao and recognised Chinese suzerainty.[184] In 127, Ban Yong compelled the kingdom to recognise China's supremacy, but in 152 Khotan declared its complete independence, killed the king of neighbouring Jumi (Keriya), and 'Yutian [Khotan] became arrogant'.[185] About a century later, Khotan accepted the nominal suzerainty of China's Western Jin dynasty (265–316).[186] While the following centuries would see Khotan maintain its status as a kingdom, it was several times forced to accept the supremacy of various Central Asian great powers, which generally confirmed local rulers in office as vassals. Among such conquerors were the Tuyuhun under King Muliyan (r. 436–52), originally part of the Xianbei tribal confederation. When the Northern Wei drove them out of their then homeland north of Koko Nor lake (in northern Qinghai and southern Gansu) around 444–445, they withdrew westward to conquer Khotan, whose king they killed. With their conquest of Khotan and advance to Kashgar, the Tuyuhun turned their defeat by the Northern Wei into a triumph, for they now controlled the Southern Silk Road, and the Northern Wei had no option but to withdraw their troops from the Koko Nor region and pay tribute to the Tuyuhun so that they would return to their homelands. The Tuyuhun still retained control of the two trade routes through their kingdom, the one from Xining via Delingha to Dunhuang, the other via Dulan and Golmud to Shan-shan.[187] In Khotan, however, the Tuyuhun came into contact with Buddhism, which Muliyan's successor Shiyin (r. 452–81) introduced into the Koko Nor.[188]

In 471 the Tuyuhun were succeeded by the Rouran, who were followed in turn by the Hephthalites from 502 to 556, after which Khotan had to recognise the suzerainty of the Western Turks, from around 565 to 658 at the latest.[189] Yet Khotan's incorporation into the Chinese Tang dynasty's Protectorate-General to Pacify the West and its investment as one of the Four Garrisons brought no peace. On the contrary: from around 660 until 860 the two great powers of China and Tibet engaged in a fierce war along a more than 3,000-kilometre front, a war they also brought to the Tarim Basin. In 665 Khotan, together with a Chinese army, succeeded in repelling a Tibetan advance, but a decisive defeat by the Tibetans in the Koko Nor in 670 forced China to give up the Four Garrisons to Tibet.[190] During the first four years of Tibetan occupation, Gar Tsennyen Gungston, one of the Gar brothers who had taken over power in Tibet with command of its armies, was governor of Khotan.[191] In 692 the Chinese generals Wang Xiaozhi and Tang Xiujing drove the Tibetans out of the Tarim Basin, and set Fudu Jing (Vijaya Vikrama of the *Annals of Li Yul*) on the throne of Khotan.[192] In 725 the latter's successor Vijaya Dharma III (Chinese, Yuchi Tiao) sought independence from China and an alliance with the Western Turks, whereupon the Chinese Vice-Protector-General Tou Sien had him beheaded.[193]

Although Khotan was a centre of Buddhist learning and its many monasteries had enjoyed royal support, King Vijaya Sihya (Yuchi Kuei, r. *ca.* 737–746/47) expelled the monks from the kingdom. They found refuge in Tibet where they contributed to the development of the earliest style of Tibetan Buddhist art.[194] In 756 Vijaya Sihya's successor Yuchi Sheng (r. 746/47–756) demonstrated his loyalty to China, when he hurried with an army of 5,000 horsemen to help Emperor Suzong (r. 756–762) put down the dangerous An Lushan Rebellion (755–763).[195] In the late eighth century, Tibet increased the pressure on China's north-western flank, capturing Dunhuang in 786/87, Besh Baliq (Beiting) in 791,[196] and Kucha in 795. From Kucha the Tibetan army followed the Khotan Darya south, taking the fortress of Mazar Tagh, which it swiftly enlarged, and conquering Khotan around 798 or 802.[197] In 851 Khotan regained its independence and in 920 again allied itself by marriage with the Chinese ruling family of Dunhuang. After an initial victory in 970 against the invading Karakhanids, Turkic Muslims who now ruled Kashgar, Khotan fell to Yusuf Kadr Khan in 1006, so losing its independence.[198]

With the fall of Khotan the almost thousand-year-old history of Khotanese Buddhism came to an end. Monks of the Mahasamghika and Sarvastivadin schools of Hinayana Buddhism had brought Buddhism to the oasis around the turn of the second century CE, but by the third century they had reluctantly begun to tolerate Mahayana communities, as revealed by the experience of the Chinese scholar-monk Zhu Shixing. He had set off west from China in 260 because he had encountered the irreconcilable contradictions between Hinayana and Mahayana sutras and therefore wished to acquire the original Sanskrit texts. When he purchased a scroll of the *Pancavimsatisahasrika-Prajnaparamita-Sutra* (The 25,000-Line Sutra on the Perfection of Wisdom) and wanted to send it to Luoyang, Hinayana representatives tried to persuade the king of Khotan to confiscate this un-Buddhist 'Brahmin book'. The king had the scroll subjected to divine judgement in the form of a trial by fire, which it survived unscathed.[199] But by 400, when the Chinese pilgrim monk Faxian reached Khotan, which he

110. The fort or fortified caravanserai of Karadong from the 1st to the 5th or 6th c. stood on a former course of the river Keriya Darya. The fort, which measures *ca.* 76 x 67 m, had its only gate on the east side, just like Haitou on the Lop Nor. Xinjiang, China.



111. **Plan of Rawak, drawn in 1901 by Sir Aurel Stein. The archaeologist found the clay statues along the inner and outer surrounding wall; these are indicated with red Roman numerals on the plan. Aurel Stein, *Ancient Khotan* (Oxford, 1907), pl. XL.**

described as a model Buddhist kingdom, Mahayana was clearly dominant: 'The priests [monks] number several tens of thousands, most of them belonging to the Greater Vehicle [Mahayana]. The people live scattered about, and before the door of every house they build small pagodas [stupas].'[200] And there he witnessed an annual procession: 'At a distance of three or four *li* [1 li = 416 m] from the city, a four-wheeled image-car is made, over thirty feet in height, looking like a movable "Hall of Buddha," and adorned with the seven preciosities,[201] with streaming pennants and embroidered canopies. The image of Buddha is placed in the middle of the car, with two attendant Bhôdisatvas and dêvas following behind. These are all beautifully carved in gold and silver and are suspended in the air. When the images are one hundred paces from the city gate, the king takes off his cap of State and puts on new clothes; walking barefoot and holding flowers and incense in his hands, with attendants on each side, he proceeds out of the gate. On meeting the images, he bows his head down to the ground and scatters the flowers and burns the incense.'[202] With this gesture, the king emulated the Bodhisattva Shakyamuni, who in an earlier age had greeted his predecessor Buddha Dipamkara by offering him flowers.

From the fifth century, the king of Khotan also claimed to adhere to the ideal of the *dharmaraja*, a royal defender of Buddha's teaching, as expounded in the *Suvarnabhasottama Sutra*, the Sutra of the Golden Light. By acting in accordance with the principles of dharma, he not only protected his entire country, but fulfilled divine will as a 'godly son'.[203] With this claim, the kings of Khotan sought to legitimate their rule.

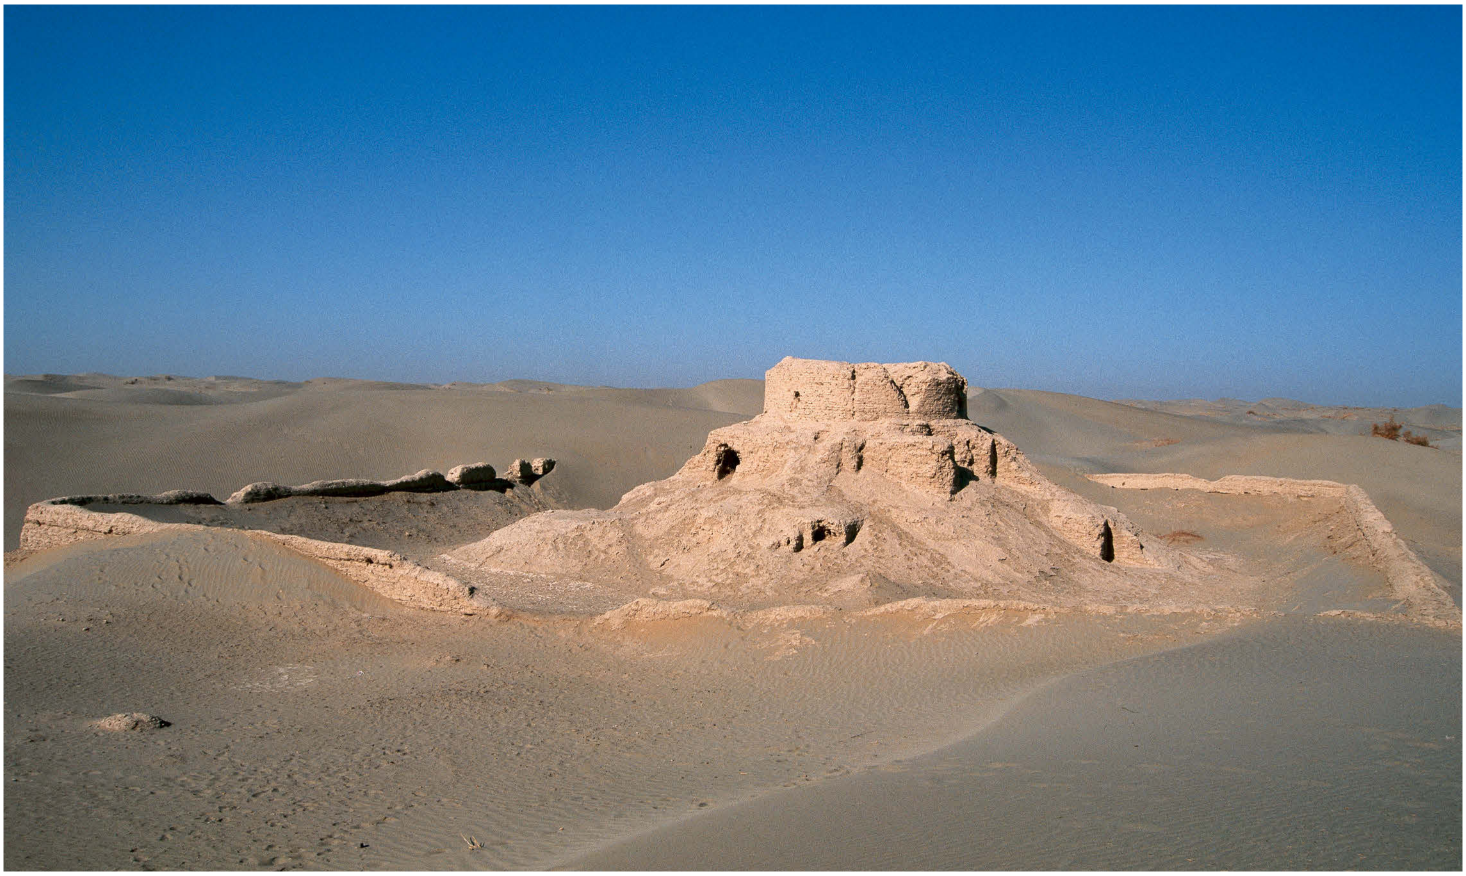
Sutras were not only translated from the Sanskrit in Khotan, but new, apocryphic sutras were composed, which contain invocations of tutelary deities, incantations, and Hindu deities, leading to the development of a 'proto-Tantric' sutra literature.[204] Khotan's importance as an international centre of Buddhist learning was further enhanced from the eighth century onward, as it became a refuge for persecuted monks and scholars, who were fleeing either the Arabs attacking Tocharistan or the anti-Buddhist campaigns of Wuzong in China (843–845) and Langdarma in Tibet (838–842). Like those of Shan-shan and the Northern Silk Road, the Buddhist monasteries of the kingdom of Khotan were knowledgeable not just in spiritual but also in economic affairs. They functioned as caravanserais and warehouses where traders could safely store their goods, and as credit institutions where merchants could borrow money at high interest. For private persons the conditions for obtaining credit were particularly demanding, for – as is revealed by an contract found in Dandan Oilik by Aurel Stein – they had to pay a monthly interest of ten per cent to the monastery providing credit, and also to pledge as security not only their movable goods but their close relatives, such as mother or sister, to be sold as slaves if interest or principal were not paid when due.[205] Monks in Niya might have been 'part-time monks', possessing homes of their own, having wives or slaves, and participating only sporadically in monastery ceremonies.[206] This contravened rules of the time, which prescribed a life of chastity and without possessions, as well as the prohibition on the owning of slaves. Perhaps it was such practices, which allowed well-off families to declare a member to be a bogus monk, so as to escape paying taxes, that moved King Vijaya Sihya to banish Buddhist monks from his land.

2.2.2 Artworks in the Sands

While the ancient capitals of the Khotan Oasis, **Malikawat**[207] (Han dynasties) and **Yotkan**[208] (3rd–11th c.), are no more than rubble today, and in the case of Yotkan, buried under agricultural land and some four metres of silt, in eastern and northern Khotan both religious and secular architecture and artworks still survive, not least because the sites were abandoned long before the conquest of the kingdom by the Turkic Karakhanids and had already fallen into oblivion, slumbering even then under the protective sand. Among them are the mudbrick fortress of **Aksipil**,[209] the temples excavated by Stein of **Balawaste**,[210] **Khadalik**,[211] **Farhad Beg-yailaki**[212] and **Uzun Tati**,[213] as well as the three small, well-preserved seventh-century to eighth-century temples at **Damagou**, whose wall paintings are similar to those of Dandan Oilik and Balawaste.[214]

Most impressive is the monastery stupa of **Rawak** (figs. 111f), 30 kilometres north of Khotan, which is surrounded by a 4-metre high, 50 x 45 metre perimeter wall. This late third- or early fourth-century stupa is cruciform in plan, and its cylinder rests on three superimposed rectangular platforms. Steps lead up to it on each side, so the pilgrim experienced the stupa as a three-dimensional mandala. On the inner and outer faces of the perimeter wall, Stein found 91 life-size, originally red-painted, clay statues, while in 1928 Emil Trinkler and Walter Bosshard found 39 in another sector.[215] As Stein already recognised, the figures were characterised by two different artistic styles. The older Style I was found in very large statues of the standing Buddha, whose harmonious naturalism recalls the styles of Mathura and Gandhara. Also in Style I are four figures of the guardians of the cardinal points and two representations of the cosmological Buddha, who appears endlessly multiplied. The absence of bodhisattvas points to a Hinayana context for this style, thus dating the work to the period of the stupa's construction. In Style II, the clothing of the figures is more elaborate, a certain mannerism is detectable, and bodhisattvas make their appearance (fig. 93). Smaller figures, including seated buddhas, were set between the older large buddhas, and some buddhas have a high, flammiform halo adorned with spirals and small buddha figures. Style II dates from around 350 to 450 CE, falling into the period when Mahayana was dominant. It would also appear that the construction was restored again in the mid-sixth century.[216]

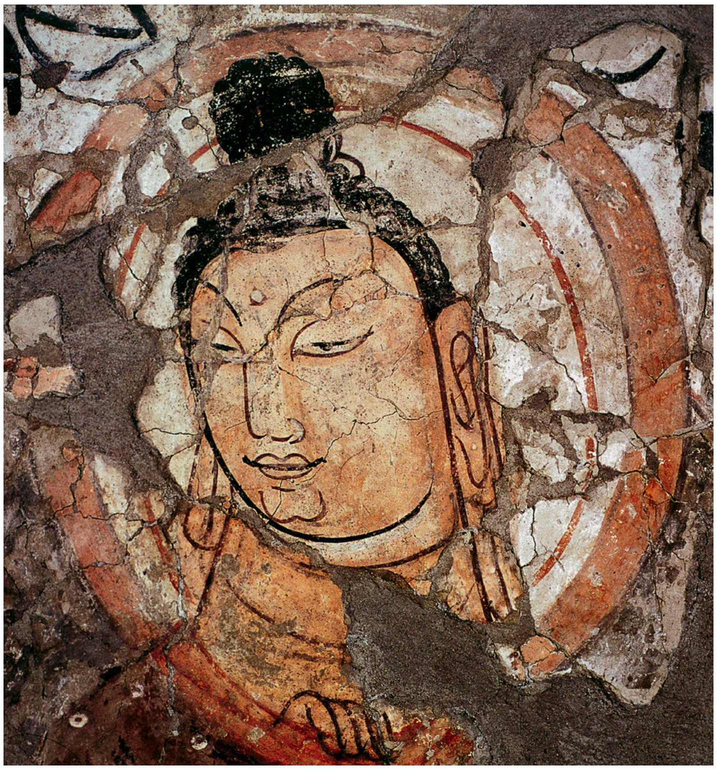
Around 210 kilometres north-east of Khotan stands the fort of **Karadong**, halfway along the north–south cross route from Keriya (Yutian) to Kucha, which followed the Keriya Darya. Although Karadong belonged to the princedom of Yumi (Keriya), culturally it fell under the influence of Khotan, as can be seen in its murals. The Hinayana-period wall paintings in the two two-storey temples feature only standing and seated buddhas (fig. 113). In contrast to the East-Mediterranean/West Asian impression given by the Miran paintings, the faces at Karadong have Indian/Central Asian



112. The monastery stupa of Rawak, north-east of Khotan, Xinjiang, China. The stupa, which was built around 300 CE, was surrounded by a double rectangular wall.

features; they can be dated to the first half of the fourth century.[217] The absence of any Tang dynasty coins suggests that Karadong was abandoned by the sixth century at the latest.

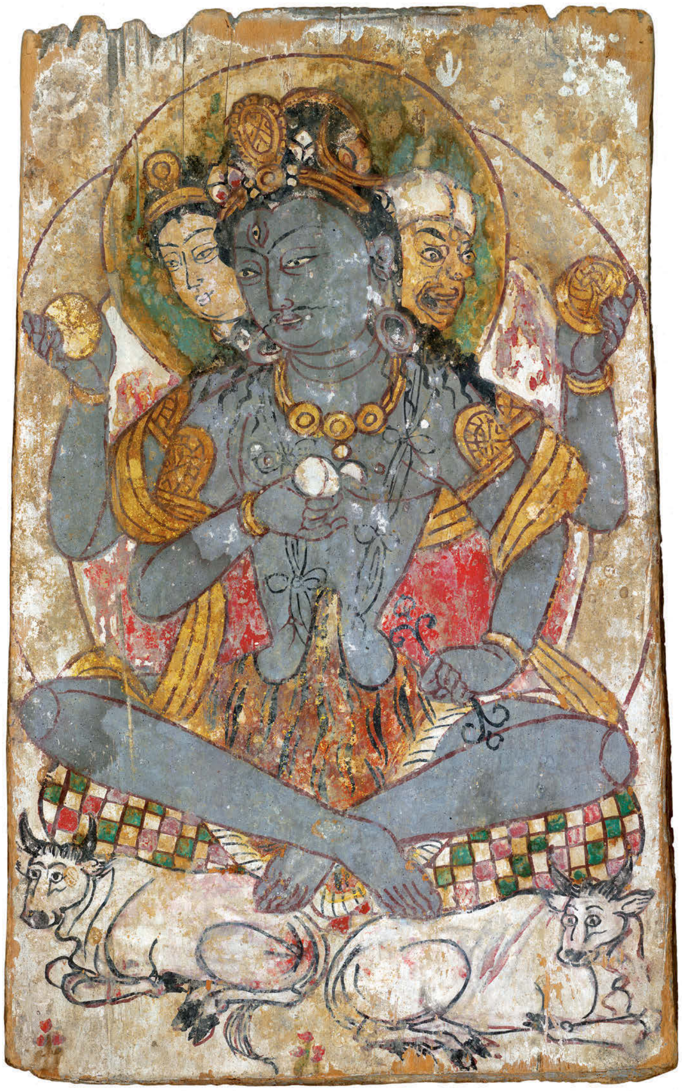
Dandan Oilik, 115 kilometres north-east of Khotan, was truly a city of temples and monasteries, for the majority of excavated buildings once had a religious function, in contrast to Niya, for example, where religious sites represent a tiny minority of the buildings. This oasis city measuring 4.5 square kilometres, whose name in Khotanese was Gayseta and in Chinese Lixie,[218] was probably founded in the late fifth or the sixth century, and it is the only known city of the region that did not lie on an important trade route. Manuscripts show that it formed part of the kingdom of Khotan, and, like the capital itself, by 768 at the latest it had come under pressure from marauding Tibetans, prompting some of the population to quit its isolated location. Dandan was definitively abandoned between 798 and 802, and fell victim to the encroaching sand dunes.[219] Excavations there have produced some unique finds: first, a late eighth-century business letter in Persian, written in a cursive Hebrew script;[220] then a number of sixth- to seventh-century painted wooden votive panels depicting either Vajrayana-Buddhist or Sogdian deities as well as legendary episodes mentioned by the pilgrim monk Xuanzang. On one oblong panel a man looks at a deity with a rat's head, identified by Stein as the Rat King of Khotan, who, according to legend, came to the aid of a Khotanese ruler threatened by a mighty Xiongnu army.[221] When the Khotanese army attacked the enemy camp before daybreak, 'the Xiongnu found that the leather of their armour, and their horses' gear, and their bow strings, and all the fastenings of their clothes, had been gnawed by the rats'.[222] The Xiongnu went down to a crushing defeat. But it is also possible that the votive panel depicts the wolf-headed god Mukhamanda, protector of children, who probably figures elsewhere in the Dandan Oilik wall paintings.[223]

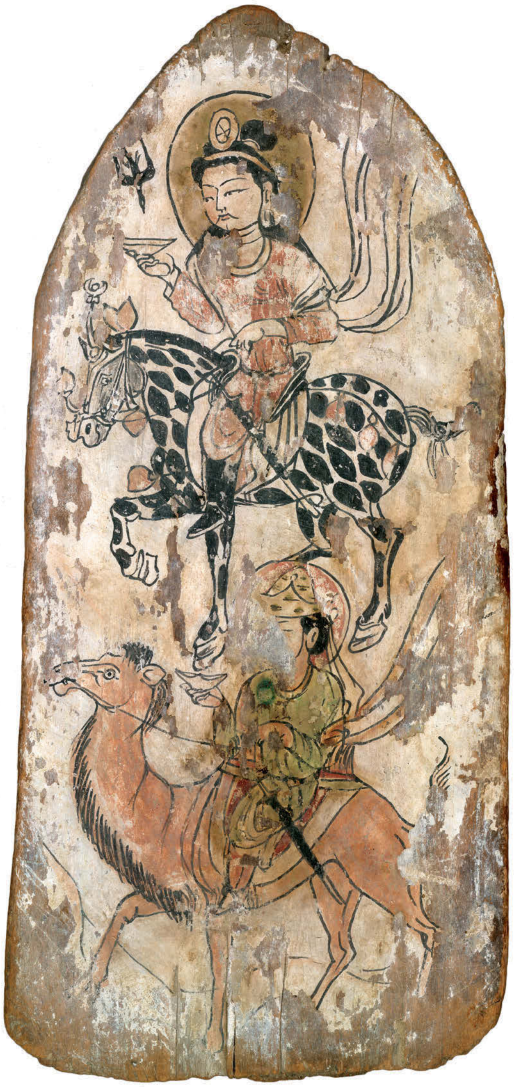


113. As was the case with forts L.K. and L.L., Karadong had a smaller settlement nearby, which contained two small Buddhist temples. Fragment of a painting of a Buddha head, 1st half of 4th c. Uyghur Regional Museum, Urumqi.

A second oblong wooden panel depicts another legend recounted by Xuanzang, which tells how sericulture was introduced to Khotan, when in the third century CE a Chinese princess smuggled silkmoth eggs and mulberry seeds out of China in her headdress (fig. 118).[224] Another panel shows two divine riders, the one below mounted on a camel, while the one above rides a piebald horse and holds a bowl out to a descending raven.[225] The divine camel rider with nimbus – whose image the present author discovered in 1998 as a wall painting in Temple D 13 – represents the Sogdian victory god Vashagn,[226] or Farn, personification of the divine glory,[227] whose image Stein also found at Farhad Beg-yailaki.[228] The rider on the piebald horse, a motif not only frequently found in the wall paintings of Dandan and Damagou[229] but which also appears in Yarkhoto (Jiaohe),[230] may represent the god Vaishravana mounted upon a heavenly horse, whose companion shot down Pekar, tutelary hero of the Uyghurs, when he had taken the form of a bird of prey.[231] Another portrait-format panel has on the front a three-headed, four-armed, ithyphallic god whose skin is painted in blue, seated upon two bulls, and on the back a crowned, seated, bearded man with green cloak and black boots.[232] In 1998 the author found in Dandan's Temple D 13 a wall painting of a practically identical three-headed figure, which at first glance might be taken to represent the Hindu god Shiva with his mount, the bull Nandi, but which in Tantric Vajrayana Buddhism stands for the tutelary deity Maheshvara.[233] Benjamin Rowland remarks that the 'the absorption of Hindu gods into the already Tantric form of Buddhism that flourished in Khotan' is echoed in 'pictorial representations of the *Lankavatara Sutra*, of the Buddha's assuming the form of the members of the Hindu pantheon'.[234]

Similar paintings are known, not only from Balawaste[235] but also from Koh-i-Kwaja (eastern Iran)[236] and more especially from the Sogdian cultural sphere, such as those from Panjikant[237] and Bunjikat,[238] both dating from the eighth century, and also from the stone sarcophagus of the Sogdian notable Wirkak (Chinese name Shi Jun, 493–579 CE), who died as the headman of a Sogdian





▲114. Votive panel from the 6th/7th c. discovered by Sir Aurel Stein in December 1900 in the temple Stein-D VII of Dandan Oilik. The deity which is depicted on the wooden, painted panel, which measures 33 x 20 cm, could be the ithyphallic Hindu god Shiva. But in the particular context of Dandan Oilik it is more likely that he is the Buddhist god Maheshvara (an aspect of Shiva), or more likely still the Sogdian wind god Weshparkar, whom the Sogdians represented in the guise of Shiva. On the reverse the God of Silk of Khotan is depicted. Xinjiang, China. The Trustees of the British Museum, London.

◥115. Painted votive panel with two riders from Stein's Temple D VII in Dandan Oilik, 6th/7th c. The rider on the dappled horse in the upper portion represents the Buddhist god Vaishravana, the Guardian of the Northern Direction, the one on the camel in the lower portion the Sogdian god of victory Vashagn or Farn, the personification of divine glory. community in Chang'an.[239] As the Panjikant painting is inscribed, we know that it represents the Sogdian wind god Weshparkar. The three-headed god of Dandan Oilik is therefore either the Maheshvara venerated in Tantric Buddhism or the Sogdian Weshparkar. An argument in favour of the second possibility is the fact that a notable community of Sogdian traders lived in Dandan, with a 'sabao' at its head. The Chinese word 'sabao' was derived from the Sogdian 'Sartapao' (s'rtp'w), meaning a caravan master. In China, however, 'sabao' was an official title within the administration, denoting the civil and religious leader of a Central Asian or Persian community within a district, the term for the most part appearing in connection with Sogdian communities.[240] The holder of the office was normally a prominent

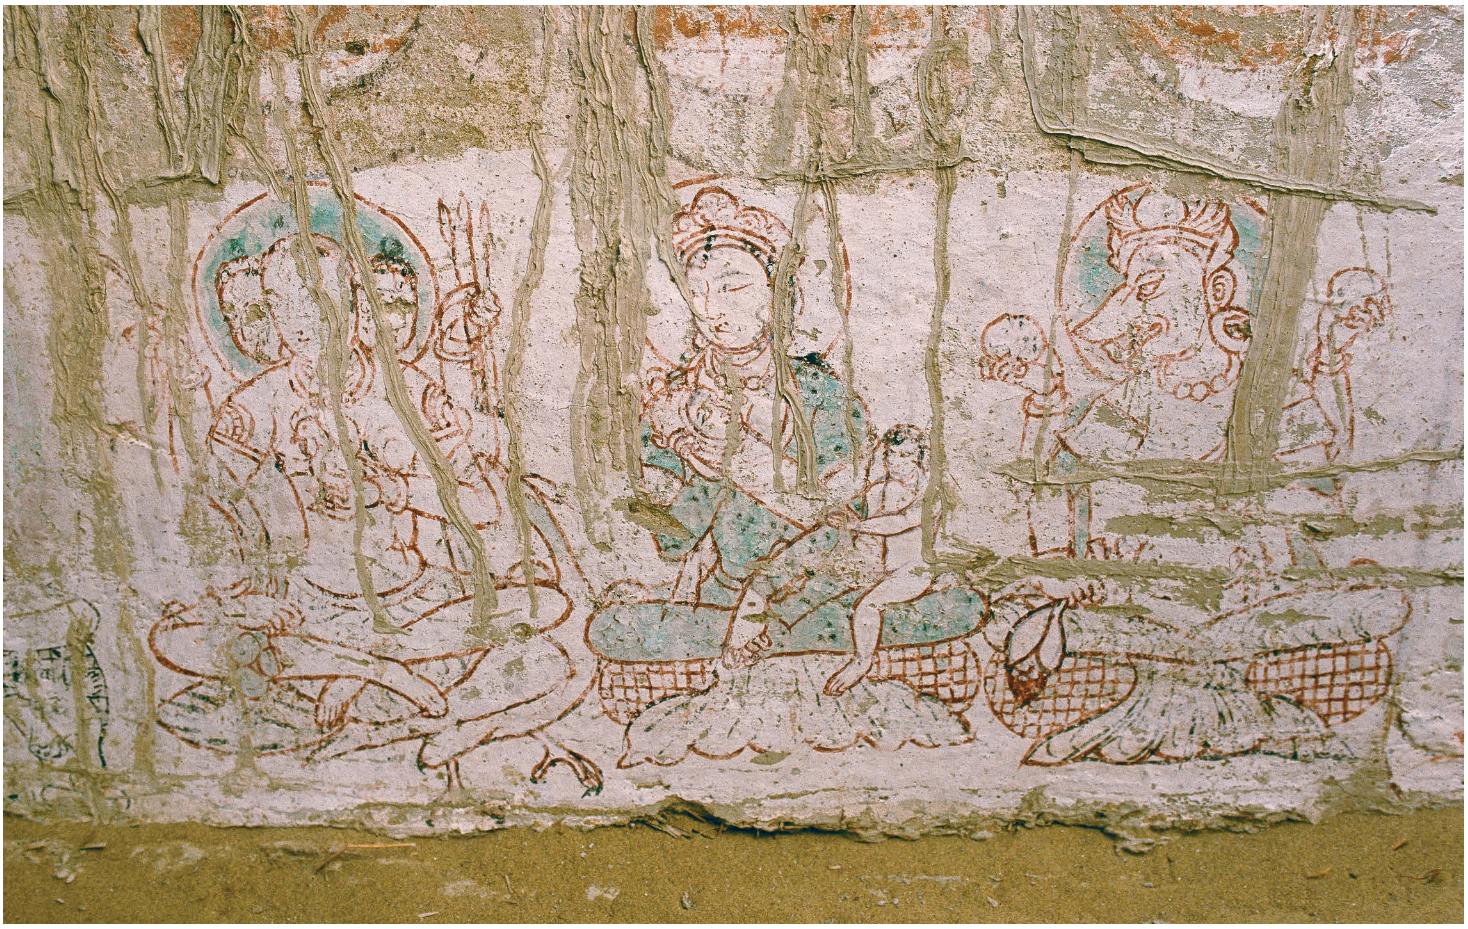
116. Wall painting from the early 8th c., discovered by the author in Temple D 13 of Dandan Oilik, Xinjiang, China. Three Sogdian deities are represented: on the left the wind god Weshparkar in the guise of Shiva, in the middle probably the fertility goddess Nana as Buddhist goddess Hariti, and on the right the god of time Zurvan in the guise of the Hindu god Brahma. Photo from the site, 1998.

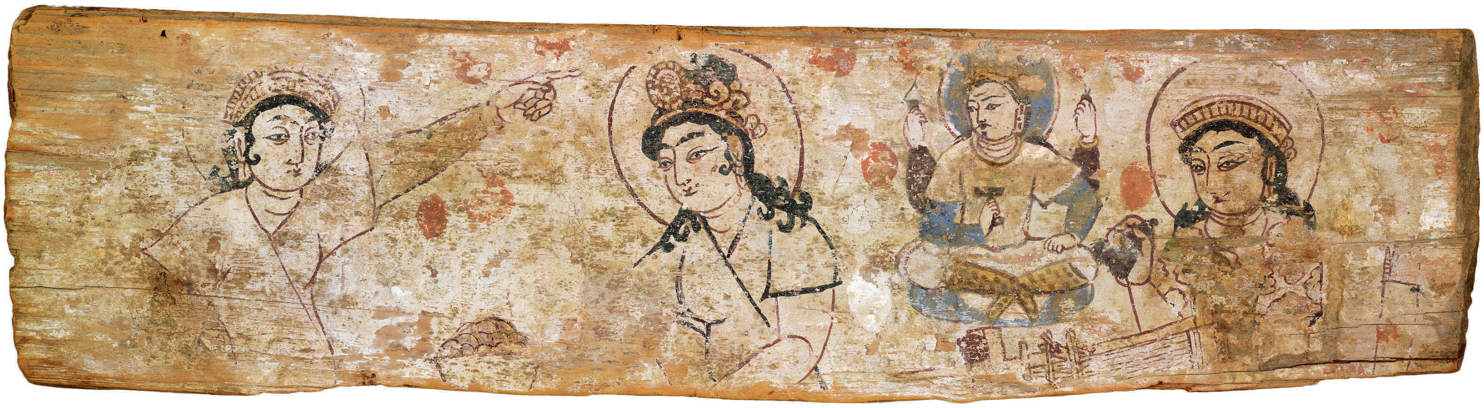
member of the foreign community in question, and so most often a Sogdian. As we know from a number of official documents, there was in Gayseta (Dandan Oilik) a sabao named Sidaka, which indicates the presence of a sizeable Sogdian community.[241] This is not surprising since Sogdian traders used to order the manufacture of textiles against advance payment in Gayseta.[242] And at the Loulan L.B. shrine Hedin found a metre-high carved wooden panel depicting a cross-legged god holding a trident – an attribute of both Shiva and Weshparkar (fig. 91).[243]

Just as once the Parthians had sometimes represented their gods in the forms of Greek deities and the Kushans had adopted models from the Hindu, Greek or Roman pantheons to visualise theirs,[244] so Sogdian Zoroastrians to some extent merged the visual representations of their own divinities with those of deities from Hinduism and Tantric Buddhism – cultures they were in close contact with through trade.[245] If we adopt the Sogdian reading of the three-headed god with bull, the two groups of three seated deities among the paintings of Temple D 13 discovered by the present author may be interpreted as follows:[246] In the first triad (fig. 116), the god on the left is the wind god Weshparkar, and on the right is another three-headed, four-armed god whose upper hands hold the sun and moon. Represented in the guise of the Hindu god Brahma, this latter is most probably a depiction of Zurvan, god of time. Between the two gods sits a goddess who in her arms holds a swaddled child; she represents Hariti, the protectress of children who was converted by the Buddha. In the Sogdian context she is likely to represent the fertility goddess Nana. In the second trio (fig. 117), we again have Hariti/Nana in the middle, with two infants. She must have been popular in Dandan, for Stein found a wooden panel with two images of Hariti in a neighbouring temple.[247] Left of her sits a three-headed god, holding a bow, three arrows and a young cock; next to him stands a peacock. He is either Vashagn, the Sogdian god of war, or the rain god Tishtrya,[248] represented in the guise of the Indian war god Karttikeya, also pictured in Cave 178 at Kizil. On Hariti's right is a four-armed god whose wolf's head bears a crown. This could be the wolf-headed Mukhamanda, both bringer of sorrow and protector of children. In India this divinity is one of the nine *grahas*, supernatural beings whom parents must propitiate. Should the parents entreat the help of a *graha*, it will protect the child from illness; should they ignore it, it will visit a nasty ailment upon the child.[249] The *grahas* are ambivalent divinities and as such are closely associated with Hariti, who before her conversion was a cannibalistic demon who fed on small children.

Two styles of painting were practised in the kingdom of Khotan, whereby the same subjects were rendered in different ways. One incorporated Indian, Sogdian and Sassanian influences to develop a discrete style that would not only influence the Early Buddhist art of Tibet but would also find recognition at the Chinese court. To this style belong paintings from Balawaste, the double-sided votive panel from Dandan with Weshparkar and the Khotanese silk god, and a number of individual paintings from Dandan Oilik. The vigorous outlining of contours brings vividness to the polychrome painting, a revolutionary technique at the time. The names of Khotanese painters working in the Tarim Basin remain unknown, though others left their mark on the central Chinese painting of the seventh and eighth centuries. Some of these, with the Chinese family name Wei Chi, corresponding to the Khotanese Vijaya, were descended from the royal family of Khotan. Around 700, a contemporary critic noted of Wei Chi Isheng that 'His brush-work was tight and strong like bending iron or coiling wire', while his father's was 'free and vigorously expressive'.[250] But the majority of temple paintings and votive panels at Dandan Oilik are characterised by rounded, almost disc-like faces, 'a strictly frontal presentation, highly developed stylization, a flat, almost two-dimensional design', and 'a peculiar technique of drawing on the colours', such that one must speak of a distinctive Dandan Oilik school.[251]



117. The second, probably Sogdian group of divinities in Temple D 13 of Dandan Oilik, early 8th c., Xinjiang, China. On the left the god of war Vashagn or the rain god Tishtrya in the guise of the Indian war god Karttikeya, in the middle Nana/Hariti, and on the right the ambivalent divinity Mukhamanda with a crowned wolf's head, who protects children or makes them ill depending on whether or not she receives offerings from their parents; her Sogdian equivalent is not known. Photo from the site, 1998.



118. This 66-centimetre-long painted wooden votive panel from the 6th/7th c. was discovered by Stein in the small temple D X of Dandan Oilik, Xinjiang, China. It illustrates the legends mentioned by Xuanzang which tell of how Khotan acquired the secret of sericulture. On the left a woman with outstretched arm points towards the headdress of the Chinese princess in which are hidden the eggs of the silk-moth and mulberry seeds. On the right sits the four-armed tutelary god of weavers, on the far right a woman works at a loom. The Trustees of the British Museum, London.

Jade, Silk and Paper

Khotan was renowned not just for its Buddhist monasteries but also for its industry, and especially for the mining and working of jade, sericulture and papermaking. Since it is unchanged by time or wear, jade had been prized as a symbol of immortality in China since around 6000 BCE. The term jade refers to two distinct, monomineralic rocks: jadeite and nephrite. Nephrite, which is particularly hard, was used almost exclusively until the eighteenth century in China, whereas jadeite, which was imported from Burma, became popular only in the nineteenth century.[252] As Chinese nephrite deposits began to run out towards the end of the second millennium BCE, Khotan became China's main supplier. Khotan's enormous nephrite deposits lay in the Kun Lun Mountains, from where two parallel-flowing rivers, the *Yurung Kash* (White Jade) and the *Kara Kash* (Black Jade), ran north into the Tarim Basin. The annual snow and glacier melt brings vast volumes of water down to the plain, and with it nephrite boulders that were easily collected when the torrents had abated. The great importance of jade to China found expression in the name of the fort strategically located on the country's westernmost border, called the *Yumen Guan* or 'Jade Gate'.

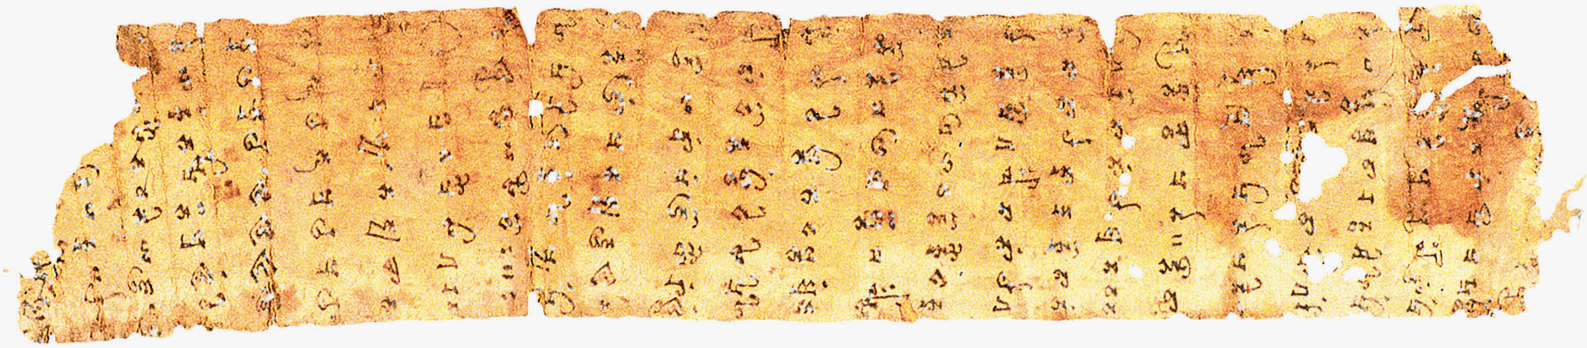
Another important branch of economic activity in Khotan was sericulture. While the production of silk thread and its weaving into fabric had been known in south-east China since the middle of the third millennium BCE, China had succeeded in keeping the process secret for almost 3,000 years. As the *Annals of Li Yul* and Xuanzang report, it was only in the third century CE that Vijaya Jaya, the fourteenth king of Khotan, succeeded in solving the mystery by means of a ruse. The king informed his Chinese bride-to-be, via a messenger, that there was no silk to be had in his kingdom and that she would have to make her own arrangements if she wished to have any. 'The princess, hearing these words, secretly procured the seed of the mulberry and silkworm eggs and concealed them in her headdress.'[253] Larvae of the domesticated silkmoth (*Bombyx mori*) hatched from the eggs, and plantations of mulberry trees could be grown from the seeds to provide leaves for the hungry silkworms. As a devout Buddhist, however, the princess forbade that the cocoons be thrown into boiling water to kill the pupae: 'It is not permitted to kill the silkworm! After the butterfly has gone, [thus breaking the cocoon] then the silk may be twined off.'[254] A third- or fourth-century date for the beginning of Khotanese sericulture is also made plausible by the fact that Aurel Stein discovered in Niya, abandoned towards the end of the fourth century, the traces of a mulberry plantation.[255] It is doubtful, though, that the killing of the pupae was really forbidden, for a burst cocoon yields shorter and therefore inferior threads. The by-products were also used – floss silk in clothes production, and the puparium inside the cocoon to make valuable silk paper. In addition, the excreta of the caterpillars could be used for fertiliser, and the killed pupae fed to livestock or used for the production of oils and soaps.[256]

Yet Khotan was not able to enjoy the monopoly of silk to the west of China for very long, since by the fifth century CE both Sogdiana and Iran had begun producing silk and silk fabrics.[257] Iran's Sassanids, more interested in the export of their own silk than in through transport, successfully blocked trade between Central Asia and Byzantium, prompting the latter to try and circumvent the obstacle, Iran. The historian Procopius reports that shortly after 540 CE, on request of Emperor Justinian (r. 527–565), Nestorian monks brought back silkworm eggs from 'Serindia', so that 'from that time onward silk [was] produced in the lands of the Romans'.[258] When not long afterwards, in winter 568/69, a Sogdian-Turkic embassy reached Byzantium, hoping amongst other things to establish direct trade relations, Justin II proudly showed them his domestic sericulture.[259] There were now five centres of silk production: Central China, the Tarim Basin, Sogdiana, Iran, and to a lesser extent, Byzantium. The secret of silk would reach Western Europe only more than 500 years later, when in 1147 King Roger II of Sicily (r. 1130–54) pillaged such Byzantine-Greek cities as Athens, Thebes and Corinth and while doing so kidnapped silk growers and took them back to Sicily to establish silk production there. Its later spread to mainland Italy would contribute to the economic expansion of that country's city republics.

From the fifth or sixth century CE onward, Khotan also had a thriving paper industry, a craft it adopted from China and still practises today. Paper had been invented in China in the time of the Western Han (202 BCE–9 CE). The oldest surviving paper in the world, dated to between 176 and 141 BCE, was discovered in Fangmatan, Gansu, in 1986, and may represent a small section of a map.[260] There are more than half a dozen known examples of paper from the pre-Christian era, of which that discovered at Xuanquan in 1990 and that found at the Jade Gate in 2006 are inscribed; dating from 8 BCE, this last has 20 legible Chinese characters.[261] Somewhat resembling felt, these early papers have a rough surface and were also used for wrapping. The pulp was made from hemp (*Cannabis sativa*) and similar plant fibres mixed with waste silk. Until recently celebrated as the inventor of paper, the administrator Cai Lun (*ca.* 50–121 CE) didn't so much discover as refine it. To give the paper a smoother and less porous surface, making it easier to write on, he developed the idea of preparing the slurry with bast or inner bark, hemp fibre, textile waste and old fishing nets. This finer pulp more easily entered into suspension, which made it possible to produce a stronger paper with a more consistent distribution of fibre.[262]

In China, at that time, short documents were written on thin strips of bamboo, on wood, or on silk; for books, bamboo strips would be bound together with thread. Bamboo, however, was hard to work, silk was expensive, and wood was unwieldy but easily sanded, which facilitated forgery. Paper was cheap, light, and forgery-proof. As is witnessed by finds of paper from Loulan, it came increasingly into use from the second half of the third century CE, even if wooden tablets were still used for local documents. Only with paper was it possible to satisfy Buddhism's enormous demand for an everyday writing material. The sutras were not just written down and circulated for the instruction of monks; it was also believed to be highly meritorious to have them copied many times and sealed within a statue or a newly constructed stupa. Furthermore, in Vajrayana or Tantric Buddhism extremely concise texts of great protective power, called *dharani*, enjoyed considerable popularity among monks and laypeople alike, not only encouraging the production of paper but also spurring the invention of block printing. The block print process, whose roots may be found in the 5,000-year-old cylinder seals of the Mesopotamians, the clay seals of the Chinese Shang dynasty (17th–11th. c. BCE) and the stone rubbings of the Eastern Han dynasty (25–220 CE), developed in China in the early eighth century CE, from where it rapidly spread to Korea and Japan.[263] The oldest complete and precisely dated Chinese woodblock book is the Diamond Sutra of 868, which Aurel Stein bought in Dunhuang. The sutra was printed on seven sheets of white paper that were pasted together to form a scroll over five metres long. The high quality of the printing indicates the early maturity of a printing industry established in the mid-seventh century.[264] Paper played another important role in Khotan's economy in the form of letters of credit, which in some respects prefigure paper money.[265]

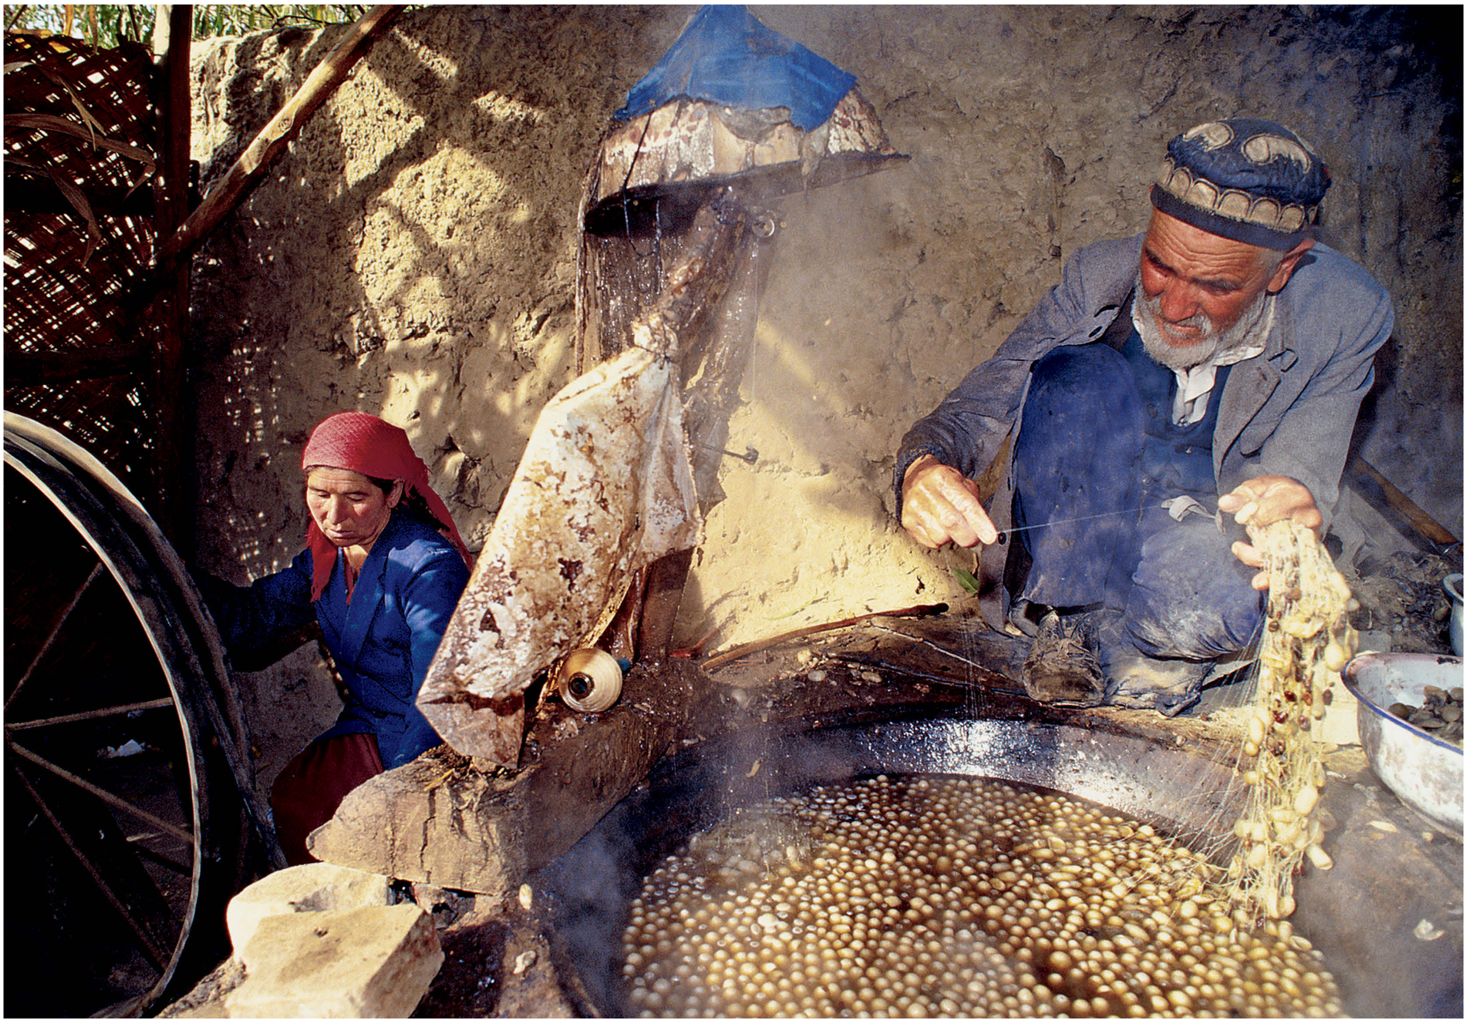
In 1620 Francis Bacon described paper, together with gunpowder and the compass in the form of a floating, magnetised needle, as one of the three inventions that changed the world.[266] When precisely the art of papermaking reached Sogdiana is



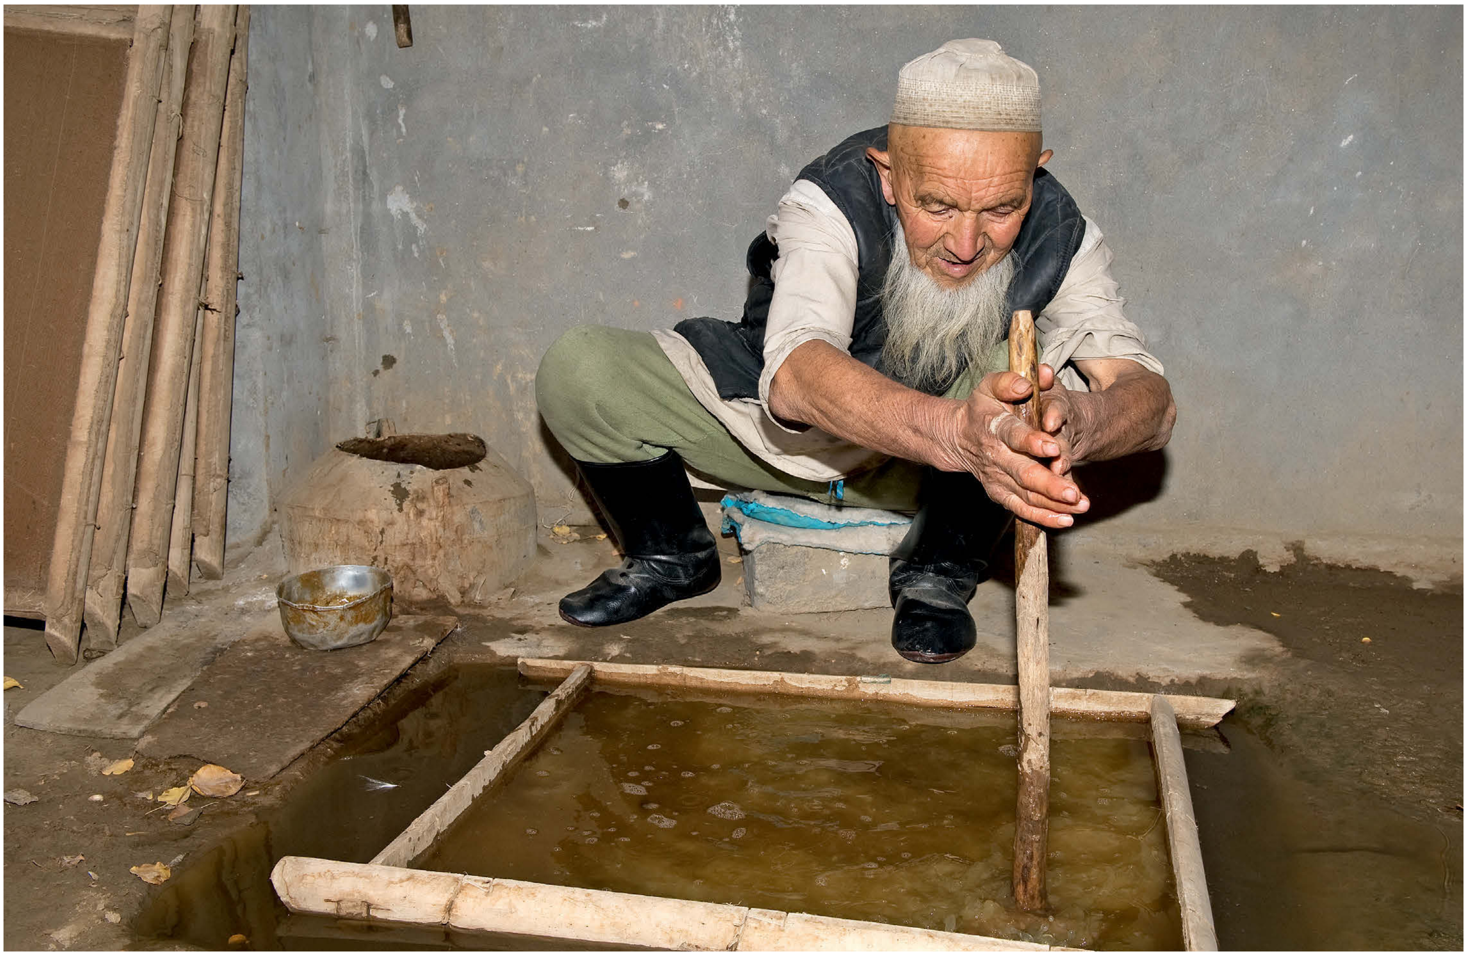
119. This paper document measuring 40 x 8 cm, inscribed on both sides with at least 27 lines of text, was found in 1998 near the ancient rubbish dump D 18 in Dandan Oilik. The document in Middle Khotanese, written in cursive, modified Brahmi script from the 7th/8th c., contains a Buddhist spell against illness and accidents.[12] Archaeological Institute, Urumqi.

disputed. In the early fifteenth century, the Muslim historian al-Tha'alibi cited the Persian geographer Ibn Khordadbeh (*ca.* 820–912) in this regard: 'Among the specialities of Samarkand is paper. The author [Ibn Khordadbeh] of *The Book of Roads and Kingdoms* [now lost] reports that paper reached Samarkand from China through prisoners of war. It was Ziyad bin Salih who captured them [at the Battle of Talas in 751 AD], and there were among them some who could make paper. From then on, papermaking increased and was soon an important article of trade for the inhabitants of Samarkand.'[267] If one credits this report, the Chinese army that Ziyad bin Salih defeated in 751 included papermakers who were taken to Samarkand as prisoners. It should be noted, however, that the author says explicitly that 'from then on, papermaking increased', signifying that paper was already being made in Samarkand. It is likely that Chinese traders had been exporting paper to Samarkand since around 658 or 659, when China established a nominal protectorate over Sogdiana.[268] From Samarkand, papermaking rapidly spread to the Abbasid Empire, whose capital Baghdad saw its first paper mill established in 794.

The tradition of artisan papermaking is still maintained today by a family in Moyu, a suburb of Khotan. Tokhti Beg, a papermaker of the seventh generation, uses the inner bark of the mulberry and produces his paper using the traditional pouring method (fig. 121). Like his predecessors, he pounds the inner bark by hand with a hammer, then boils the resulting mass in a wooden vat. Tokhti Beg produces his 120 x 80 centimetre paper in two qualities: the coarse one is bought by locals to close gaps around their windows in winter, while he sells the fine papers to the local imam for calligraphic purposes.



120. One of the steps in traditional silk production in Khotan, Xinjiang, China. By the time the silkworm has reached a length of *ca.* 70 mm, it has spun very fine and elastic filaments and enclosed itself in a cocoon. The filaments are produced by two salivary glands below the mouth, which secrete a viscous fluid. To prevent the moth from breaking through the cocoon, now weighing 3 g, when it is ready to emerge, which would tear apart the silk thread, the cocoon is immersed in boiling water which kills the pupa and at the same time softens the natural gum coating the filaments and holding them together. The cocoon can now be unravelled. The man in the photo is drawing up the filaments of some 30 silk cocoons, and the woman is winding up the resulting bundles on a reeling wheel.

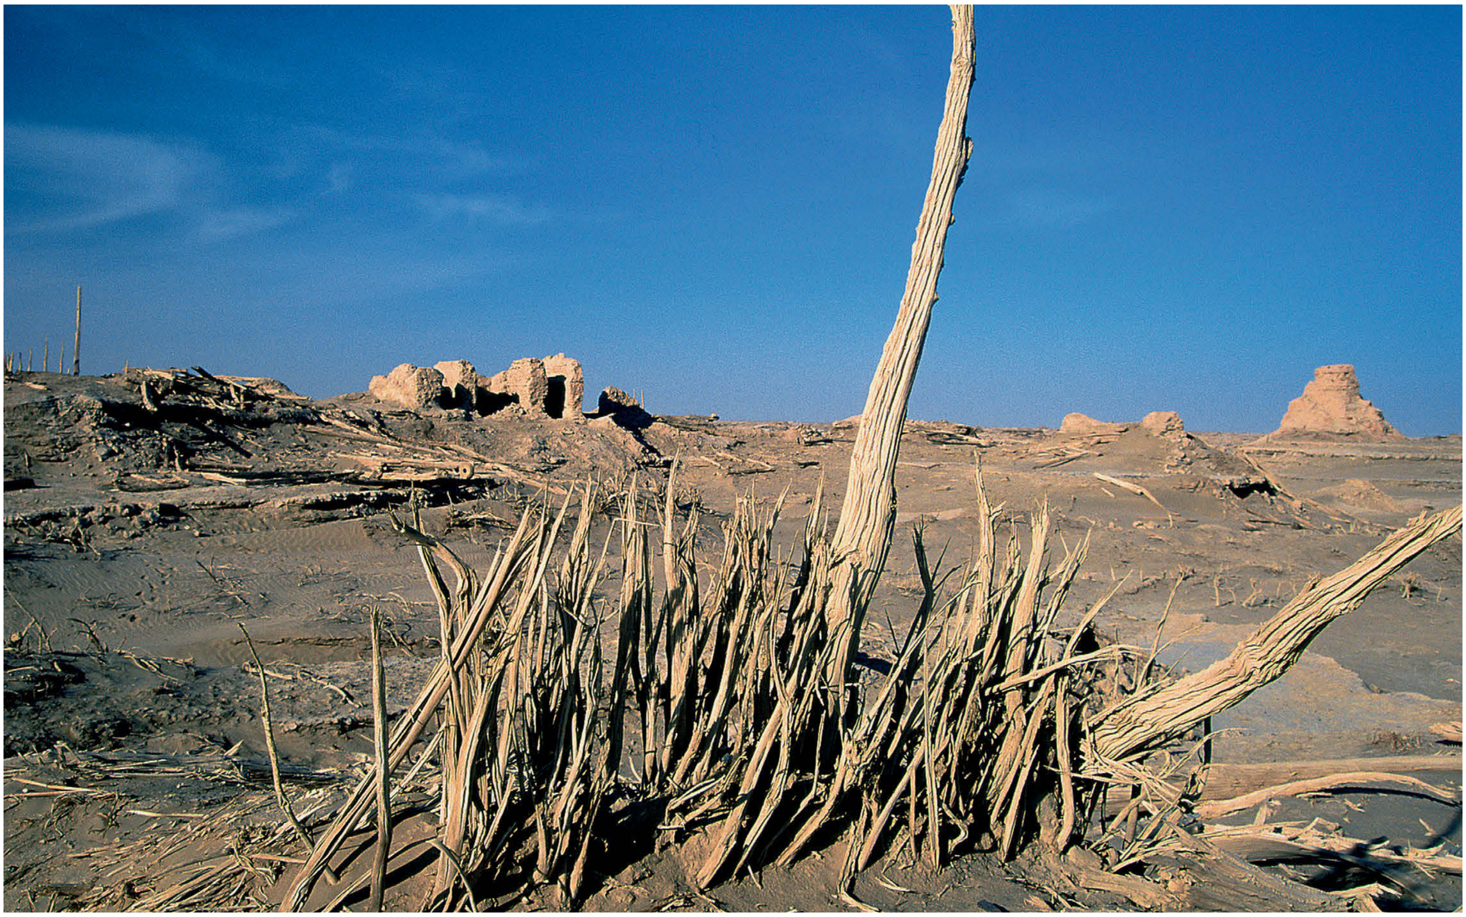


121. **The papermaker Tokhti Beg in Moyu, one of the last papermakers in the Khotan Oasis, produces his sheets of paper using the ancient pouring technique. For the pulp he uses the white innermost bark of the mulberry tree. After peeling off the bark, the fibres are boiled, beaten and suspended in about two litres of water. They are then poured into the frame lying in the water. With the help of a wooden stick Tokhti Beg distributes the pulp evenly over the whole frame, and the fibres cross over to form an interlocked web. Then he lifts the frame out of the water and stands it upright, leaving the paper to dry outdoors in the sun.**

2.3 The Kingdom of Shan-shan

In 175 CE the kingdom of Shan-shan, with its capital at or near today's Ruoqiang, regained the independence it had lost some 50 years earlier under pressure from China's General Ban Yong, though from 222 it had to pay sporadic tribute again to the Chinese Wei dynasty (220–265).[269] During this period, Shan-shan annexed the little kingdom of Cadota (Niya), and thus came to comprise the five princedoms of Kroraina (Loulan, including Miran), Calmadana (Chümo/Qiemo), Saca (Endere), Cadota (Jingjue, Niya) and Nina (today's Minfeng).[270] Shan-shan's ties to China were strengthened under the Western Jin (265–316), following General So Man's establishment of a thousand-man *tuntian* or military colony in Loulan not long after 260.[271] Many written documents, mostly dated from Loulan L.A. between 264 and 330, testify to this increasing contact between Shan-shan and the Western Jin.[272] China's growing influence also found expression in the fact that in the seventeenth year of his reign, in 263, King Amgoka (r. *ca*. 247–285) suddenly adopted an additional – Chinese – title, indicating his entering into a vassal relationship.[273] Equally revealing is a document dated from Loulan L.A. in 330, written in the name of the last emperor of the Western Jin, whose dynasty had fallen in 316! By 324 at the latest the Former Liang dynasty (320–76) had taken possession of the mighty fortress of Haitou (Stein's L.K.),[274] which stood between Loulan L.A. and Shan-shan's capital at Ruoqiang, so it is clear that the Loulan L.A. garrison was entirely cut off from both China and Shan-shan. Not much later, in 335, the Former Liang, with military bases at Haitou, Yumen near Dunhuang, and Gaochang (Turfan), launched an offensive against Shan-shan.

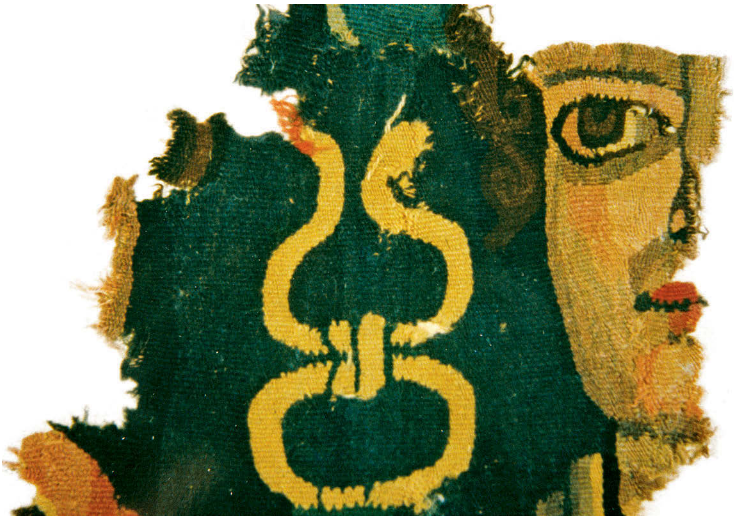
Given its location on the Southern Silk Road, easily reached from Turfan, Shan-shan was always in the sights of its more powerful neighbours. In 381 it had to submit to the Former Qin (351–394), and in 442 it was invaded by the Northern Liang, who



122. The important garrison town of Loulan, in Gandhari Kroraina, which was discovered by Sven Hedin in 1901 and named L.A. by Aurel Stein. In the foreground a former pounded-earth wall, which was reinforced with poplar and tamarisk branches, in the background the brick-built royal palace, and on the right the ten-metre-high Buddhist stupa, which Hedin misinterpreted as a watchtower. Xinjiang, China.

were in flight from the Northern Wei. Incapable of standing his ground and taking refuge at Calmadana (Chümo), King Bilong entrusted his son Zhenta with the defence of his kingdom against the invaders. But when a Northern Wei army approached in 445, King Zhenta capitulated.[275] With the gradual shift of trade to the Northern Silk Road the Shan-shan region declined in importance. The Northern Wei were very soon followed by the Tuyuhun, then by more or less light-handed foreign rule under the Rouran, the Hephthalites and the Western Turks. The seventh century did see a revival of trade on the Southern Silk Road, as is witnessed by the establishment of four new Sogdian cities by a Sogdian chief from Samarkand named Kang Yandian.[276] These four cities built between 627 and 649 in the area between Qiemo, Vash-shari and Charklik are a significant indicator that trade along the Southern Silk Road had grown in importance, not least because a trade route led from Charklik to Lhasa, capital of the rapidly growing kingdom of Tibet.

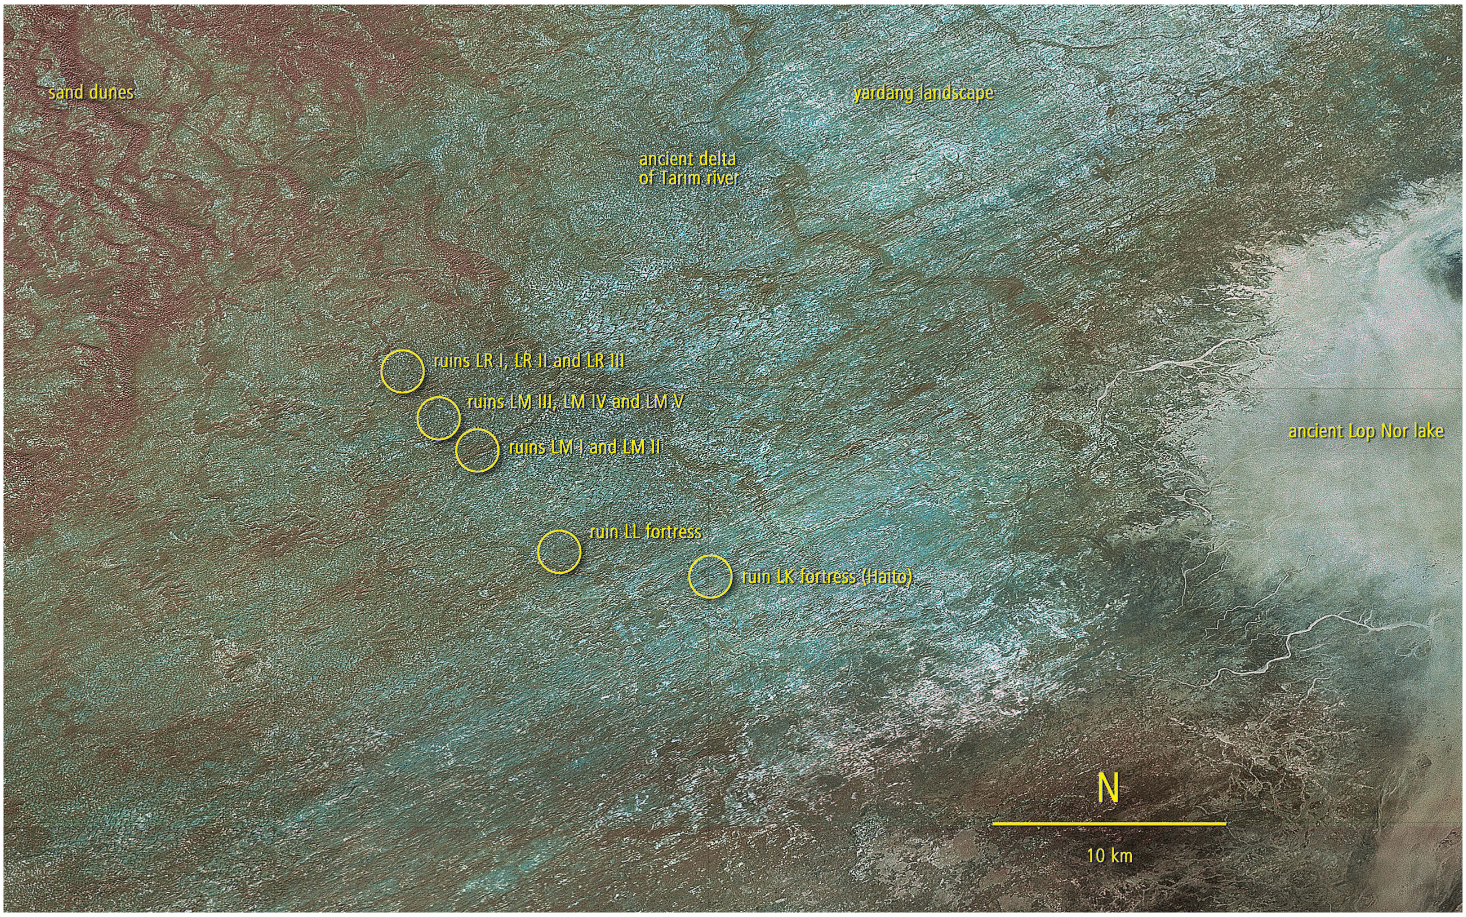
Shan-shan's politically unsettled history under the covetous gaze of both China and the nomadic horsemen of the north also finds



123. Fragment of a woollen shroud from the necropolis L.C. of Loulan, *ca.* 1st–3rd c. CE. Depicted on it is the Greek god Hermes with his staff, the caduceus; in Greek mythology Hermes was also the conductor of souls into the underworld. Xinjiang, China. National Museum New Delhi.

expression in its many fortresses and heavily fortified settlements, such as L.E. in the eastern Lop Nor, its first capital Loulan L.A., the two fortresses L.K. (Haitou) and L.L., Merdek and Miran. First mentioned in 176 BCE, the city of **Loulan**, whose Chinese name is probably a phonetic rendering of the Prakrit name Kroraina,[277] was transformed by General Ban Yong, around 123–24, into a substantial military colony controlling the Southern Silk Road. In the following century, Kroraina developed into an important centre of Buddhism, whose skyline was dominated by a massive stupa of three superimposed square bases surmounted by an octagonal drum. The central Buddhist administration for the whole of Shan-shan was probably located here.[278] Thirteen kilometres north-west of the fortified city there also stood the complex of L.B., with two Buddhist temples. Many architectural elements of carved wood, such as friezes, door lintels and decorated columns, show a significant similarity to comparable objects from Kushan-period Gandhara and Afghanistan.[279] The finds of woollen cloth imported from the eastern Mediterranean, which reminded Stein to some extent of Coptic textiles, underline the fact that Loulan, though politically subordinated to China, was culturally turned to the West. Outstanding among these finds of fabric is the fragment of a shroud with a classical-looking Hermes and caduceus, discovered at the cemetery L.C. (fig. 123).[280] This orientation to both West and East, characteristic not only of Loulan but of Shan-shan as a whole, was also reflected in a dual administrative structure: while the highest administrative and military bodies employed Chinese in their communications, the local authorities used Prakrit written in Kharoshthi script, like the merchants and the Buddhist monks.[281]

Loulan's survival depended on irrigation channels fed by the Konqe Darya, whose delta opened on to the endorheic old Lop Nor Lake. On the north-west coast of the lake stood **Tuyin** (Tuken), which Chinese archaeologists have interpreted as Loulan's harbour and terminus for river-borne traffic along the Konqe Darya.[282] The authorities were aware of the dangers of uncontrolled deforestation, for in the third century they issued the following decrees, drawn up in Kharoshthi: 'Whoever fells a tree with its roots will be fined one horse', and 'It is forbidden to fell trees in their growing period. Offenders will be fined

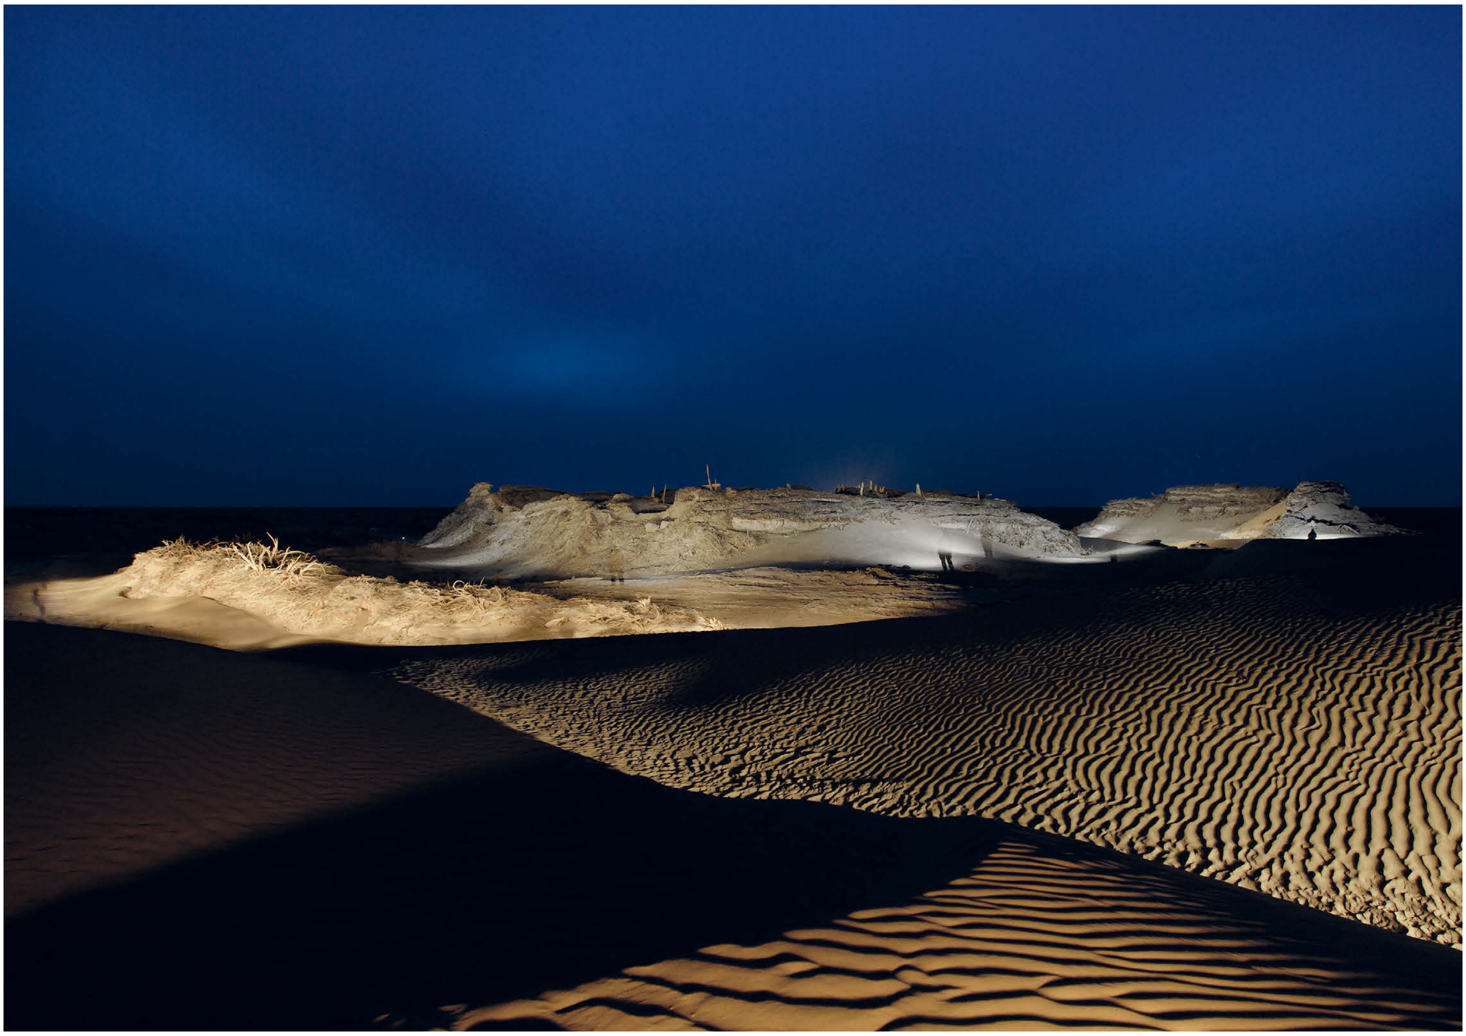


124. Satellite photo of the ruin complex of the forts L.K. and L.L. as well as the settlements L.M. and L.R. in the centre of the Lop Desert. In the upper portion, the former courses of the tributaries of the Tarim and the Kuruk Darya can be clearly seen. The diagonally hatched white areas are *yardangs*, and on the right, compact silt deposits on the bed of the former Lop Nor lake are visible.

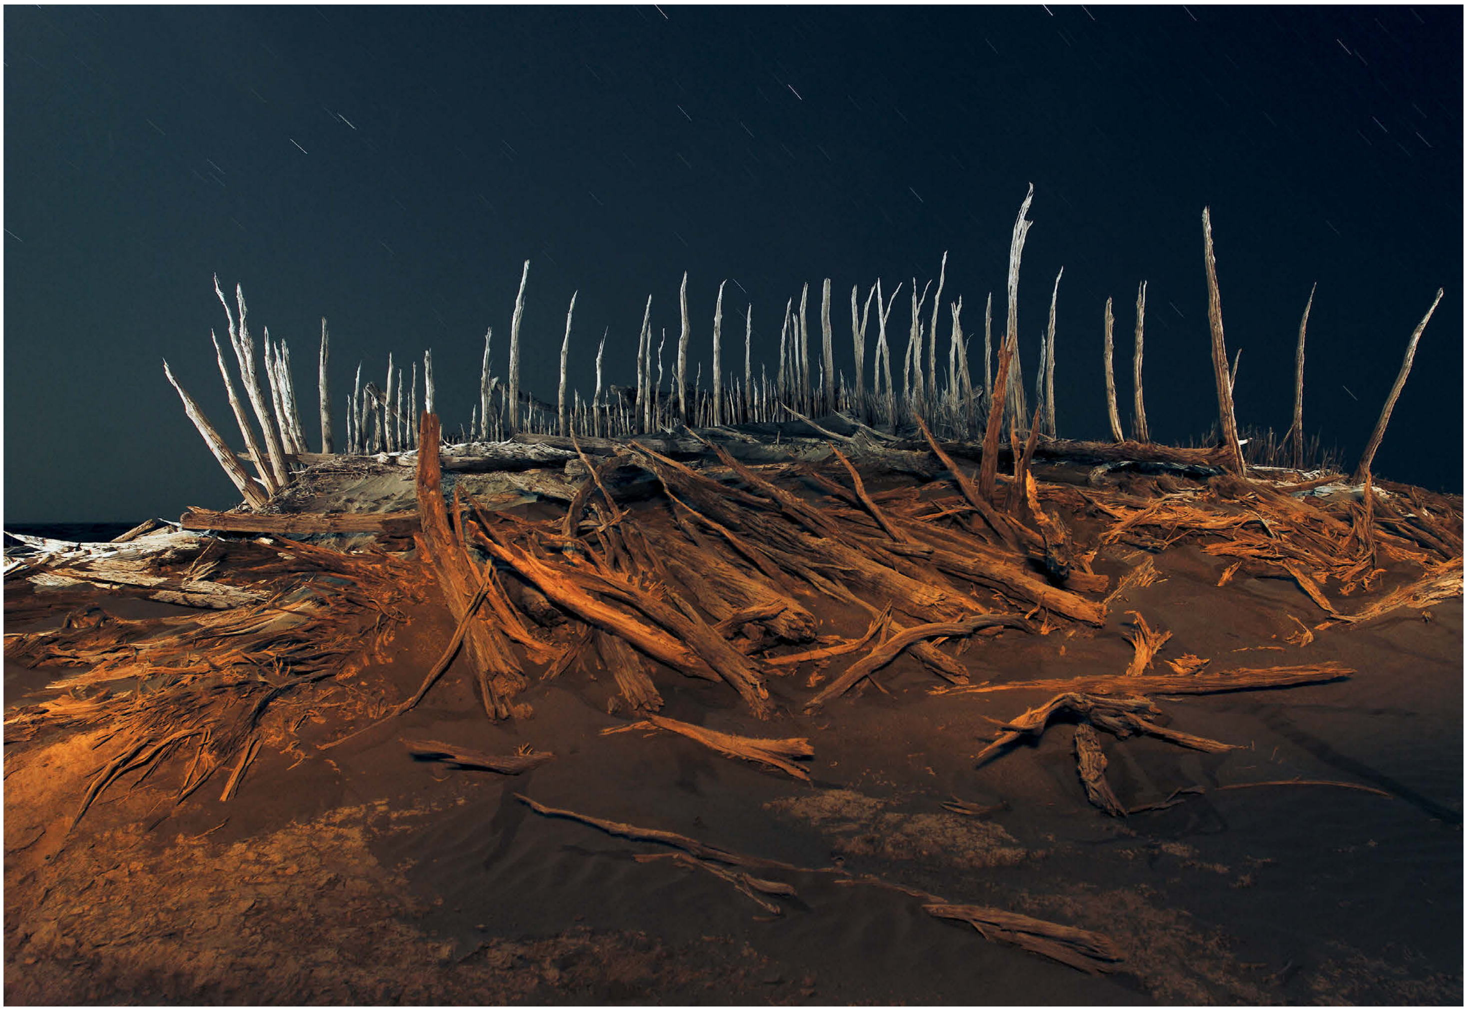
one cow.'[283] Towards the end of the fourth century, however, as an increasing proportion of the Tarim's waters began to flow southward along a different bed, the Konqe Darya ran dry, robbing Loulan of its essential conditions of existence.

Fifty kilometres south-west of Loulan, on the road to Miran, stood the fortresses of **Haitou**, Stein's **L.K.** (figs. 95f), and **L.L.** (fig. 125), together with the settlements **L.M.** and **L.R.** Like the Great Wall west of Dunhuang, the two fortresses were constructed of alternating layers of mudbrick and tamarisk branches, a technique that withstood the fierce sandstorms and continuous wind.[284] Extending over 15 kilometres, this fortress and settlement complex was located in the delta of a south-flowing tributary of the Konqe Darya, its banks covered in thick alluvial forest, whose existence is evidenced today by trees that died some 1,600 years ago. Why the two fortresses L.K. and L.L. should have been built within five kilometres of each other remains a puzzle. Both built in the same period as Loulan L.A., they represent significant garrisons on Shan-shan's eastern flank, lost to the Former Liang by 324 at the latest. The discovery of fragments of Sogdian letters at the fortress L.L. and the settlement L.M. shows that Sogdian merchants stayed there, as they did at L.A.[285] The fact that these four sites were also culturally oriented to the West is evident in the wooden volute capitals in the Ionic style discovered by both Stein and the present author, very similar to the Loulan capitals and those of the Miran pilasters.[286] Shortage of water led to the abandonment of both fortresses, probably in the late fourth century. The fortress of **Yingpan**, on the other hand, standing at the junction of two trade routes – the one from Dunhuang via Loulan to Karashahr and Kucha, and the other coming from Ruoqiang and Merdek – remained manned until the Tang dynasty.[287]

Miran, which was first visited by Przhevalsky in 1876, was settled twice, like Endere.[288] At first, it was an important city of



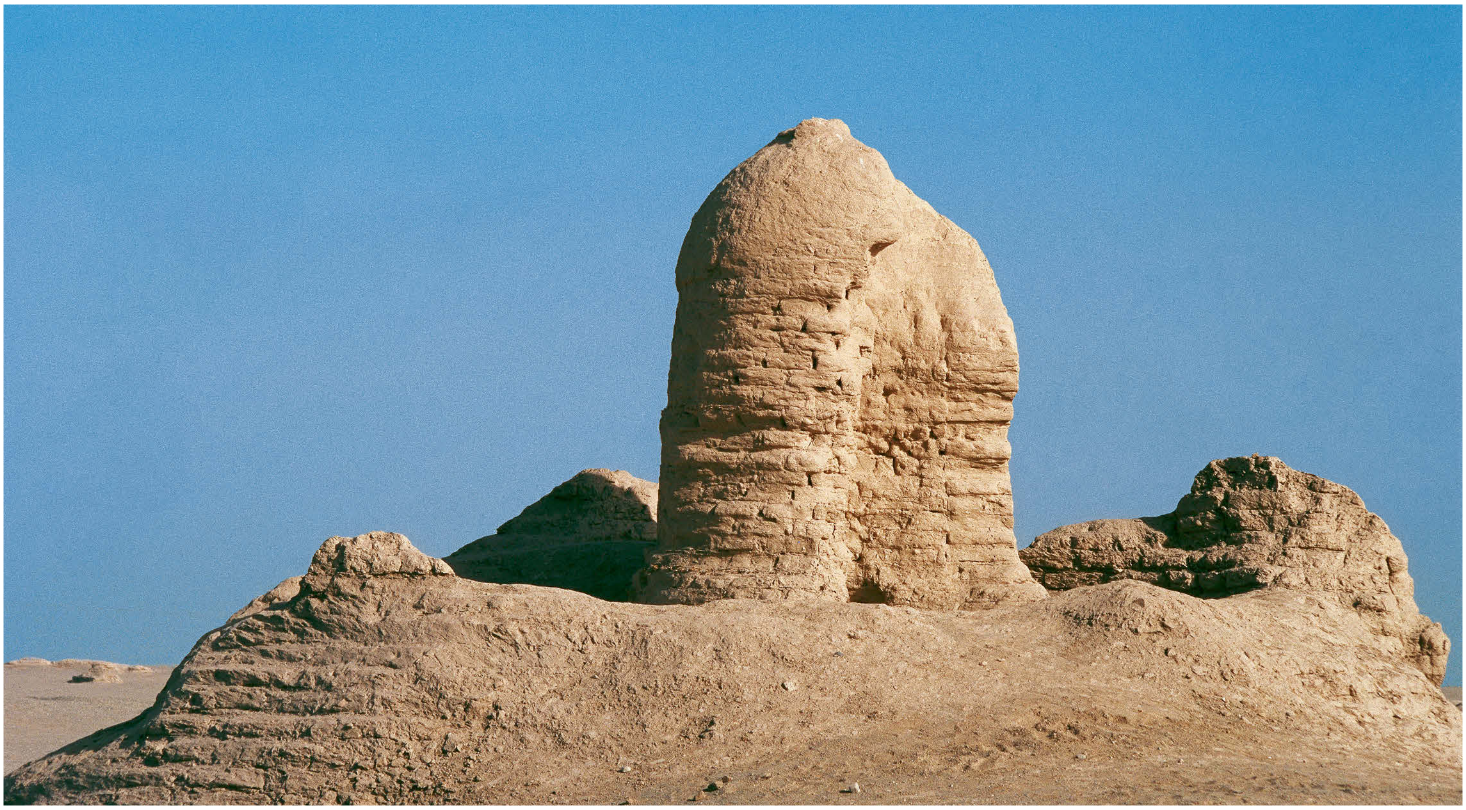
125. The south-east side of the fort L.L., which was abandoned around the end of the 4th c., Lop Desert, Xinjiang, China. The broad gap in the pounded-earth wall on the far right was caused by the wind.



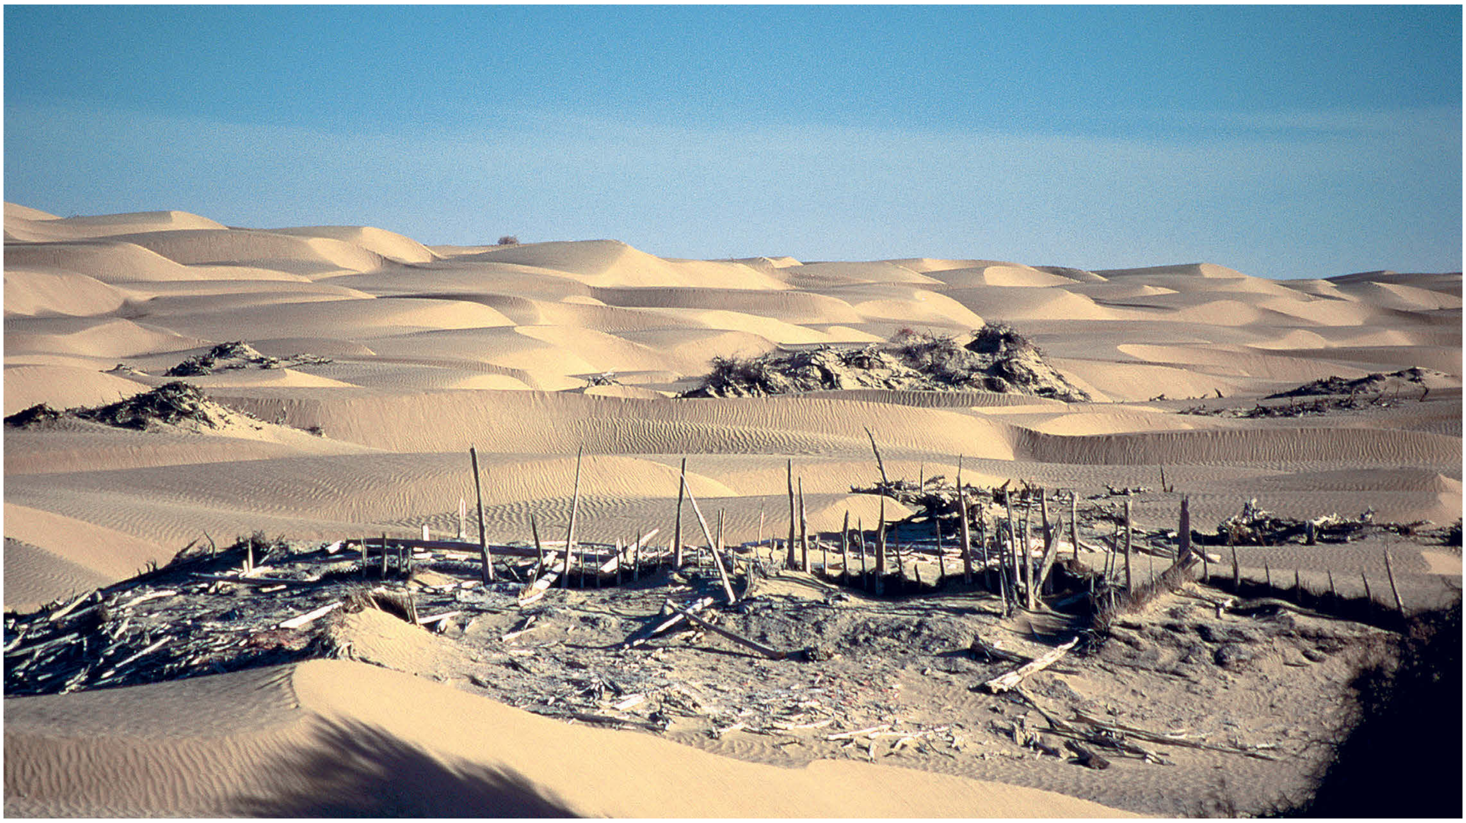
126. The ruin of the large house L.R.iii, Lop Desert, Xinjiang, China. Like the neighbouring settlement L.M. and the forts L.K. and L.L., the small settlement L.R. was abandoned around the end of the 4th c. The house stood on a natural elevation on the shores of a small body of water, as was established in 2007 by the find of dozens of freshwater snails of the species *Radix auricularia* (syn. *R. limnaea*). All that is left of the house are the internal supports made of poplar; those that remained standing were worn down to thin struts by the wind, whereas the ones that fell to the ground early retained their original circumference.

Shan-shan, perhaps even its capital, and a great centre of Buddhism, as evidenced by the dozen or so shrines, stupas and monasteries investigated by Aurel Stein.[289] He made his most outstanding finds at the small stupas M. III (fig. 127) and M. V and the monastery M. II. Each of the two stupas on circular bases stood within a domed rotunda whose inner wall echoed the circularity of the stupa, while the outer wall followed a square plan. On entering, the pilgrim could perform the ritual circumambulation and admire the wall paintings that formed at least three friezes on the inner wall. Amongst other motifs, these featured winged genii (fig. 94) and putti, groups of young men, either naked or dressed in tunics and Phrygian caps and bearing heavy garlands (fig. 129), scenes from the Visvantara-Jataka,[290] and the teaching Buddha with disciples.[291] With their strong eastern Mediterranean influences, these wall paintings of the second half of the third century[292] show a similarity to the art of Gandhara. At monastery M. II, Stein excavated the clay fragments of six colossal seated Buddhas[293] which seem to anticipate the colossal seated Buddha of Cave 20 in Yungang. They date to the first half of the fifth century, but it was not long after this that Miran lost its population, probably as a result of Shan-shan's collapse in 445.

It was the Tibetans who resuscitated Miran when after 756 they pushed forward into the Tarim Basin again, more forcibly this time, building a strong fortress at Miran and imitating the Chinese example by establishing a self-sufficient military colony. Soldiers and their families, traders and administrative officials lived in and around the fortress. This stood at a highly strategic location, at the junction of the routes to Lhasa and those to Dunhuang in the east, Turfan and Besh Baliq in the north, and Khotan and the Pamirs in the west. In the fort of Miran, Stein discovered 61 pieces



127. Stupa M III of Miran, where Sir Aurel Stein discovered in 1907 very well preserved Buddhist wall paintings from the 2nd half of the 3rd c. Xinjiang, China.

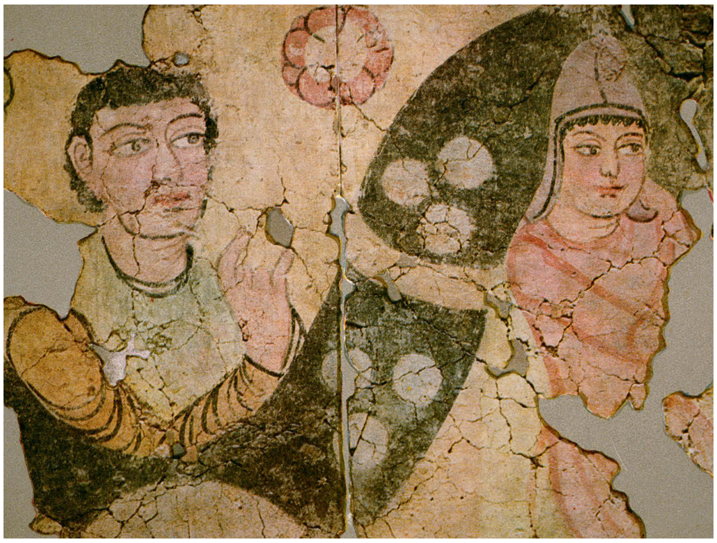


128. The house ruins N I in Niya, where Sir Aurel Stein found the first Kharoshthi wooden documents of Niya. A year earlier, the Uyghur treasure hunter Ibrahim had found several inscribed wooden panels in N I but had thrown them away since he did not know what they were. Another treasure hunter picked them up and sold two of them to one of Stein's camel drivers. As soon as Stein saw the Kharoshthi documents, he hired Ibrahim as guide and was thus taken to the findspot N I of Niya.

of carved and lacquered leather scale of oblong shape from the chest armour of Tibetan soldiers.[294] The body armour used by the medieval Tibetan soldiers 'is called lamellar armour. This type of armour is made up of horizontal rows of small overlapping plates joined by leather lacing. Two features of lamellar armour distinguish it from scale and other types of armour. First, the plates are laced to one another rather than to a lining or other kind of support material, and second, the rows of lamellae always overlap upwards. Lamellar armour was probably in use in Tibet from at least the seventh or eighth century.'[295] Stein also noticed the similarity between the Tibetan body armour and the armour worn by the small stucco figurine he had found at the site of Shorchuk (Mingoï) of Karashahr (fig. 131).[296] The collapse of Tibetan power around 860 then saw the fortress abandoned and left to ruin.[297]

West of Miran stood the two cities of **Calmadana** (Chümo/ Qiemo) and **Tuhuoluo** (Endere), which Xuanzang found abandoned when he travelled through in 644, but which were resettled not long afterwards by the resurgent Chinese.[298] By 660 there was again a garrison in Calmadana, which was renamed Po Xien around 674; arriving there around 1273, Marco Polo described a little town called Cherchen (Qiemo).[299] As at Miran, the first phase of settlement in Tuhuoluo extends from the first to the fifth centuries CE, as testified by a number of stupas (fig. 130) and temples with wall paintings for the most part now lost. After the Chinese drove the Tibetans out of the Tarim Basin in 692, they built a strong fortress in the eastern part of the abandoned city, 110 metres in diameter, whose walls still stand 8 metres high today. After 717, however, the Tibetans renewed their attack on the Four Garrisons, a fact reflected in a Chinese sgraffito at Endere that dates to 719.[300] Scratched into a wall of the commandant's palace there, a Tibetan sgraffito probably dating to after 756 boasts in colourful language of a Tibetan victory over a Chinese army: 'At Phygpag, province of Upper Jomlom, this [Chinese] army was outwitted, and a tiger's meal was obtained [i.e. many were killed]. Eat until you are fat (fig. 241).'[301] Endere would be abandoned at the same time as Miran.

In contrast to the mostly religious buildings at Dandan Oilik, those discovered by archaeologists at **Niya** (Jingjue) were almost exclusively secular. Of the hundred ruins in this city, which extended along part of what is now the dried-up bed of the Niya Darya, 45 kilometres long and on average 5 kilometres wide, a six-metre-high late-third-century stupa and two Buddhist temples were the only religious buildings found.[302] Most of the ruins stand on low silt or loess terraces, indicating that the area was subject to flooding, caused by the snow melt in the Kun Lun Mountains. As in other desert settlements, only specially constructed buildings have stood up to wind and sandstorm. These buildings have poplar wood piles rammed into the ground, between which were laid walls of silt interspersed with tamarisk branches and reeds. Niya had a heterogeneous population of Prakrit-speaking immigrants from the region of Taxila, in today's Pakistani Punjab,[303] Chinese administrative officials,[304] and probably an elite from a background of Saka nomadic horsemen, as may be supposed from the evidence of the princely graves M3 and M8, since both of them contained a Hunnic recurve bow and a combination bow case and double quiver.[305] Revealing in two respects is a wooden tablet Stein discovered in the 'ancient rubbish heap' in room N.xv, a legal document of the third to fourth century, which tells of a man called 'the *vasu* Yonu', from whom a slave was stolen when the north Tibetan Supi tribe raided Calmadana (Qiemo).[306] We learn from this that north Tibetan tribes were already conducting raids into the Tarim Basin by the third or fourth century, and that the robbed slave owner was Greek, or of Greek extraction, since his name is derived from the Sanskrit *Yavana*, the word used in the Kushan Empire for 'Greek'. Greek influence is evident not only in seal impressions showing Pallas Athene or Hermes but in a second-century CE wax-resist-dyed linen fragment showing a naked goddess holding a cornucopia with grapes tumbling out.[307] This is probably either Ardoxsho, the goddess of riches popular among the Kushans, or Hariti, similarly depicted with a cornucopia in Gandhara.[308] Niya was abandoned in the second half of the fourth century, presumably because of shortage of water.



129. The garland motif, painted by an artist called Titus, who probably came from the eastern Mediterranean, goes back to similar decorations of temple friezes, altars and stone sarcophagi from Asia Minor. Miran Stupa M V, Xinjiang, China. Buddhism adopted the Dionysian garland motif as the expression of a gift to a stupa. National Museum New Delhi.

3. The Northern Silk Road

3.1 The Kingdom of Kucha

According to the *Han Shu*, the kingdom of **Kucha** (Qiuchi) was the largest in the Western Regions, with 81,317 inhabitants, including 21,076 who were fit to bear arms.[309] It stood at the other end of the spaced chain of watchtowers that began at Dunhuang. Although the kingdom fell within range of the northern nomadic horsemen, it profited from its location on the Northern Silk Road, and its capital developed into a wealthy centre of trade and culture. Kucha's economic strength was also reflected in the fact that, faced with the threat of regional demonetisation due to the collapse of the Chinese Han dynasty in 220, it began to issue its own coinage. Kucha adopted the form of the Chinese *wuzhu*, a round coin with a square hole, whose name means 'five grains'. Like their Chinese models, Kucha's copper and bronze coins were not hammered but cast in moulds. Three types of small-denomination coins were circulated in large numbers: true copies of Chinese *wuzhu* coins with inscriptions, copies without inscriptions, and bilingual coins with Chinese and Kuchean inscriptions. Produced into the seventh century, Kuchean coins were accepted as means of payment throughout the Tarim Basin. Because of their low value, *wuzhu* coins would be assembled in strings of 100, 500 or 1,000, by passing a cord through the hole. As the coins remained in circulation for

130. The 8-metre-high stupa, the highest in Endere, from the later 3rd c. Xuanzang called the city Tuhuolo and described it as abandoned in 644, but it was rebuilt after 692 and conquered by Tibet around the mid-8th c.

centuries, they are not very useful for the dating of finds. Kucha's wealth, however, was based not only on trade, but on its great success in the raising of horses.[310]

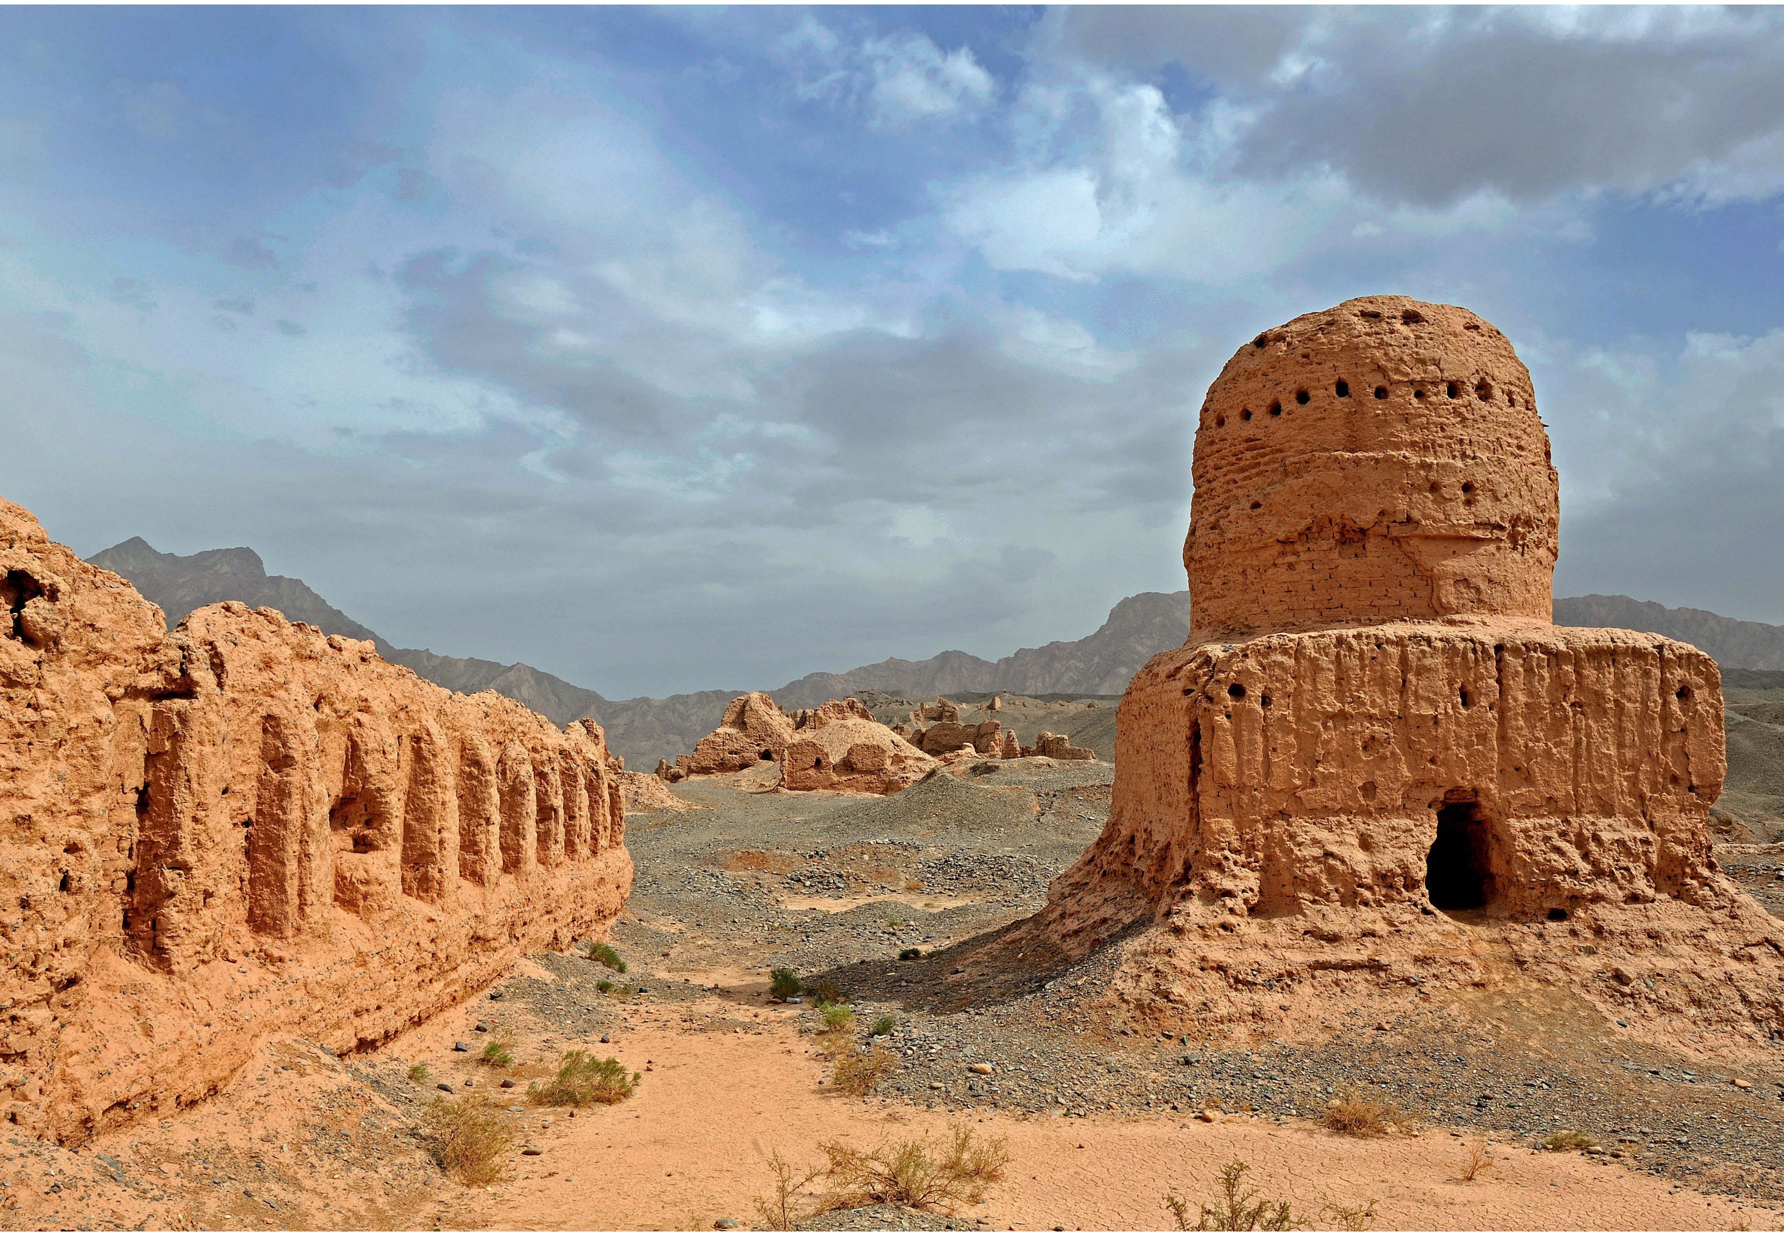
Kucha's wealth attracted envy, all the more as trade in the second half of the fourth century increasingly abandoned the Southern Silk Road for the Northern Silk Road, and Kucha threatened to capture the lion's share for itself. In 381 the kings of Shan-shan and Jushi (Jiaohe, Turfan) begged the powerful Former Qin (351–394) ruler Fu Jian (r. 357–85) to intervene and put Kucha and its ally Karashahr back in their place.[311] Committed to an expansionary foreign policy, Fu Jian sent General Lu Guang, who in 383 conquered Kucha after Karashahr surrendered.[312] Lu Guang's biography tells of Kucha's cavalry that 'they were skilful with arrows and horses and good with short and long spears. Their armour was like chain link; even if one shoots it, [the arrow] cannot go in.'[313] This description of riders in chain mail is confirmed by the wall paintings of Kizil and the clay figures of Karashahr, which show warriors with Sassanian chain mail and lamellar armour (fig. 131). When, however, General Lu Guang heard of the historic defeat that Fu Jian had in the meantime suffered at the hands of the Eastern Jin, he declared independence, founding in Gansu the short-lived dynasty of the Later Liang (386–403).[314]

Among the trophies Lu Guang took with him to Wuwei in Gansu were not only countless horses but also Kucha's most famous inhabitant, the Buddhist scholar and translator Kumarajiva (344–413). The latter's father was a nobleman from Kashmir,

his mother a Kuchean princess. He had first studied Hinayana Sarvastivadin Buddhism in Tibet, before immersing himself in the teachings of the Madhayamaka school in Kashgar[315] and returning as a celebrated Mahayana master to a Kucha, whose inhabitants were mostly followers of Sarvastivadin Hinayana. In Wuwei, Kumarajiva lived virtually in captivity, being freed only 17 years later by Emperor Yao Xing (r. 394–416) of the East Tibetan Later Qin dynasty (384–417), who brought him to Chang'an in 402. There this Kuchean monk, a speaker of Sanskrit, Prakrit and Chinese, undertook an extraordinary labour of translation. In his Chinese translation of more than 300 texts he avoided the earlier Chinese method of paraphrasing Buddhist concepts by using Daoist and Confucian terms, and his clear and comprehensible translations are still standard works today.[316] Kucha quickly recovered from Lu Guang's attack, as shown by the impressive cave paintings at Kizil and the programme of construction at Subashi; but the kingdom was obliged to pay tribute to whatever great power should dominate the Tarim Basin. While the tribute which the steppe empires exacted from Kucha and other city states was often very real, the demands of the Chinese dynasties represented rather a form of lucrative official barter, for the delegations bringing tribute to China would return home with generous imperial gifts. But when Kucha, a vassal of the Western Turkic Khaganate, responded to the threat of the expansion of Tang dynasty China by forming an alliance with rebellious Karashahr around 647, the emperor Taizong was enraged. In 648 he sent an army of Eastern Turkic, Tiele and Tuyuhun warriors, which overcame Karashahr and Kucha, and in 658 Kucha became the seat of the Chinese Protector-General of Anxi.

131. Painted stucco figure of a standing warrior wearing a long tunic of scale armour and a helmet, and armed with a lance and a shield, 6th c. CE. The long scale armour is similar to Sassanid armour and was widespread in Central Asia. Excavated by Aurel Stein in December 1907 at the findspot Shorchuk (also called Ming-oi and Shikshin); Shorchuk was an important religious centre of the Kingdom of Agni (Yanqi Karashahr) south-west of the Turfan Oasis, Xinjiang, China. The Trustees of the British Museum, London.

Buddhism reached Kucha in the early third century, and it rapidly developed into a stronghold of the Sarvastivadin School, the oldest evidence of which is to be found in **Subashi**. This city of monasteries lay just 20 kilometres north-east of today's town, divided by the Kucha river; when Xuanzang visited it in 630, he called the two halves 'East Zhaokuli' and 'West Zhaokuli'.[317] As in Kashgar, he encountered the practice of infant cranial deformation there: 'The children born of common parents have their heads flattened by the pressure of a wooden board.'[318] He was not impressed, though, by Kucha's most famous Buddhist exegete, Moksagupta, his contemporary biographer noting that 'He despised him like dust'.[319] One of the oldest of Subashi's buildings is the South-West Stupa on the Eastern Site (fig. 132), consisting of a three- or four-stepped platform upon which stands a cubic base crowned with a parabolic dome; the form and construction of the stupa recall earlier examples in Swat and Taxila.[320] In West Zhaokuli, the stupa of the principal monastery with its mighty perimeter wall also dates from the early third century; another huge stupa with a square plan with four access ramps, which lead directly to the upper chapel dates to the sixth- to seventh century. Buddhism developed quickly in Kucha, for by the third century it was able to send many learned missionary monks and translators into China;[321] but it remained a bulwark of the Sarvastivadin School, and Xuanzang found Mahayana Buddhism almost unrepresented there.

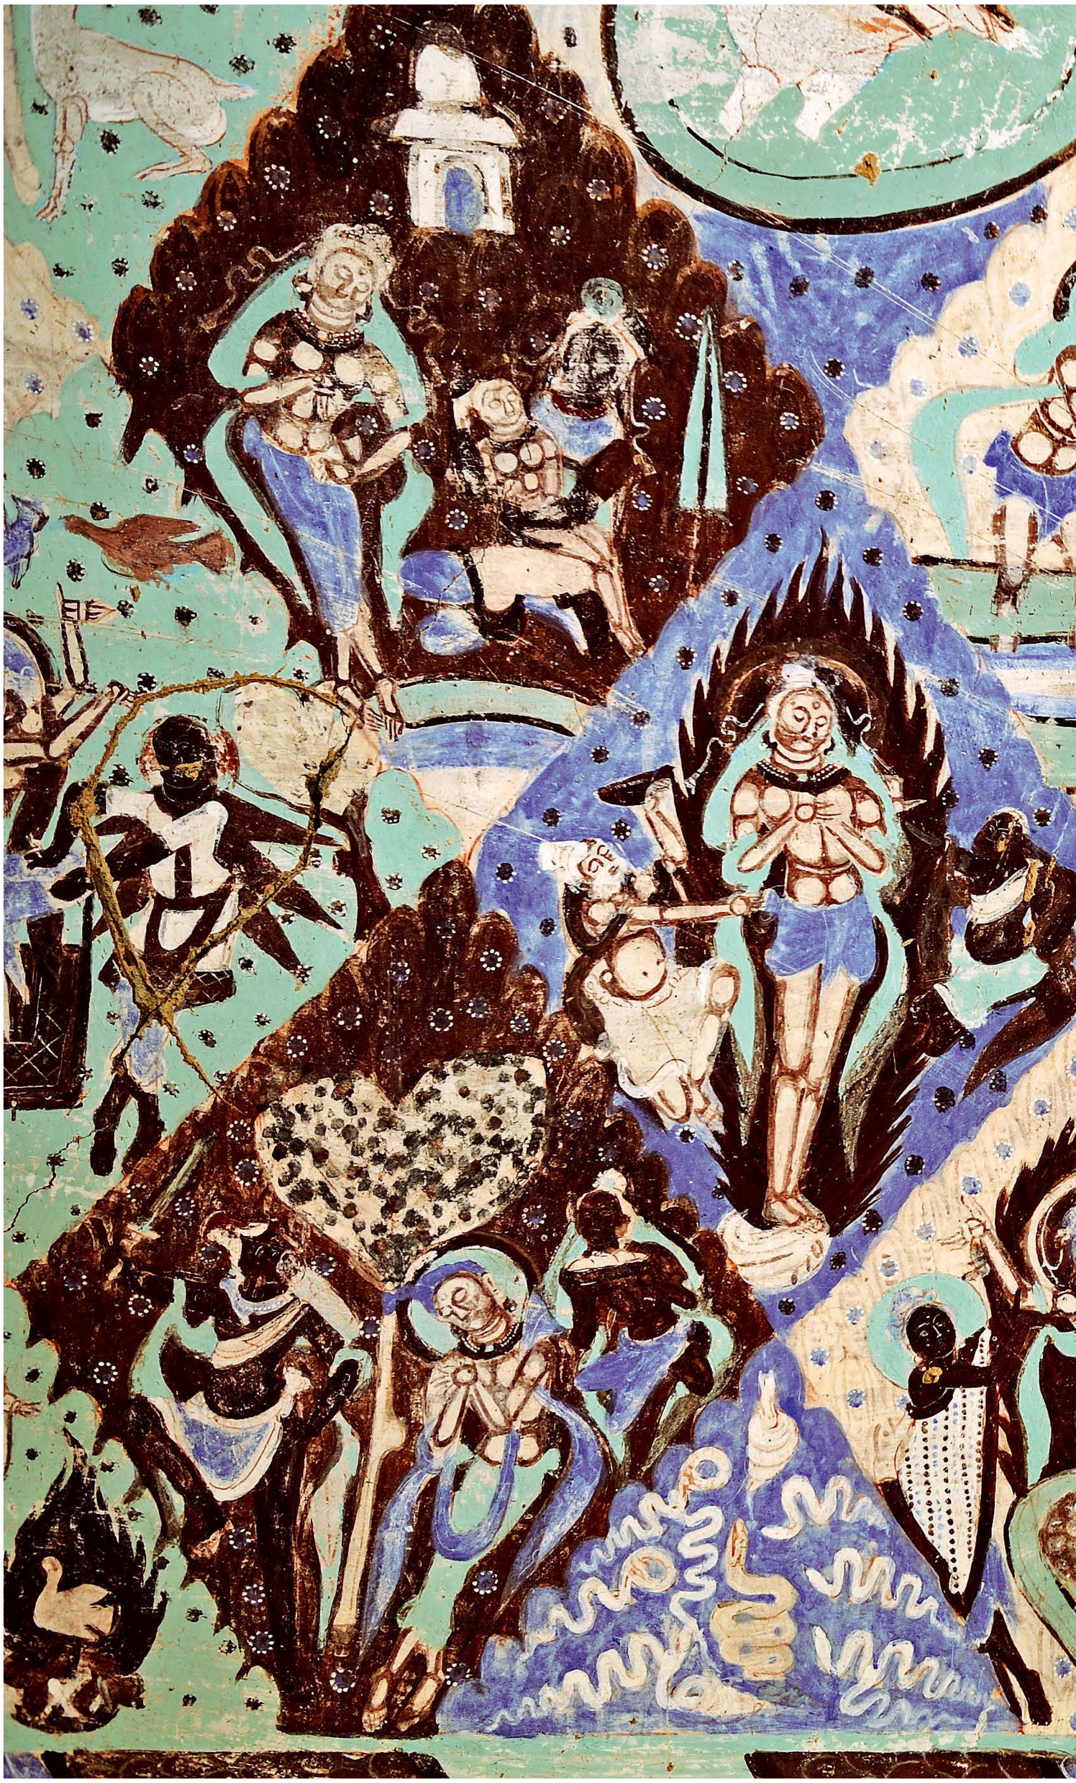


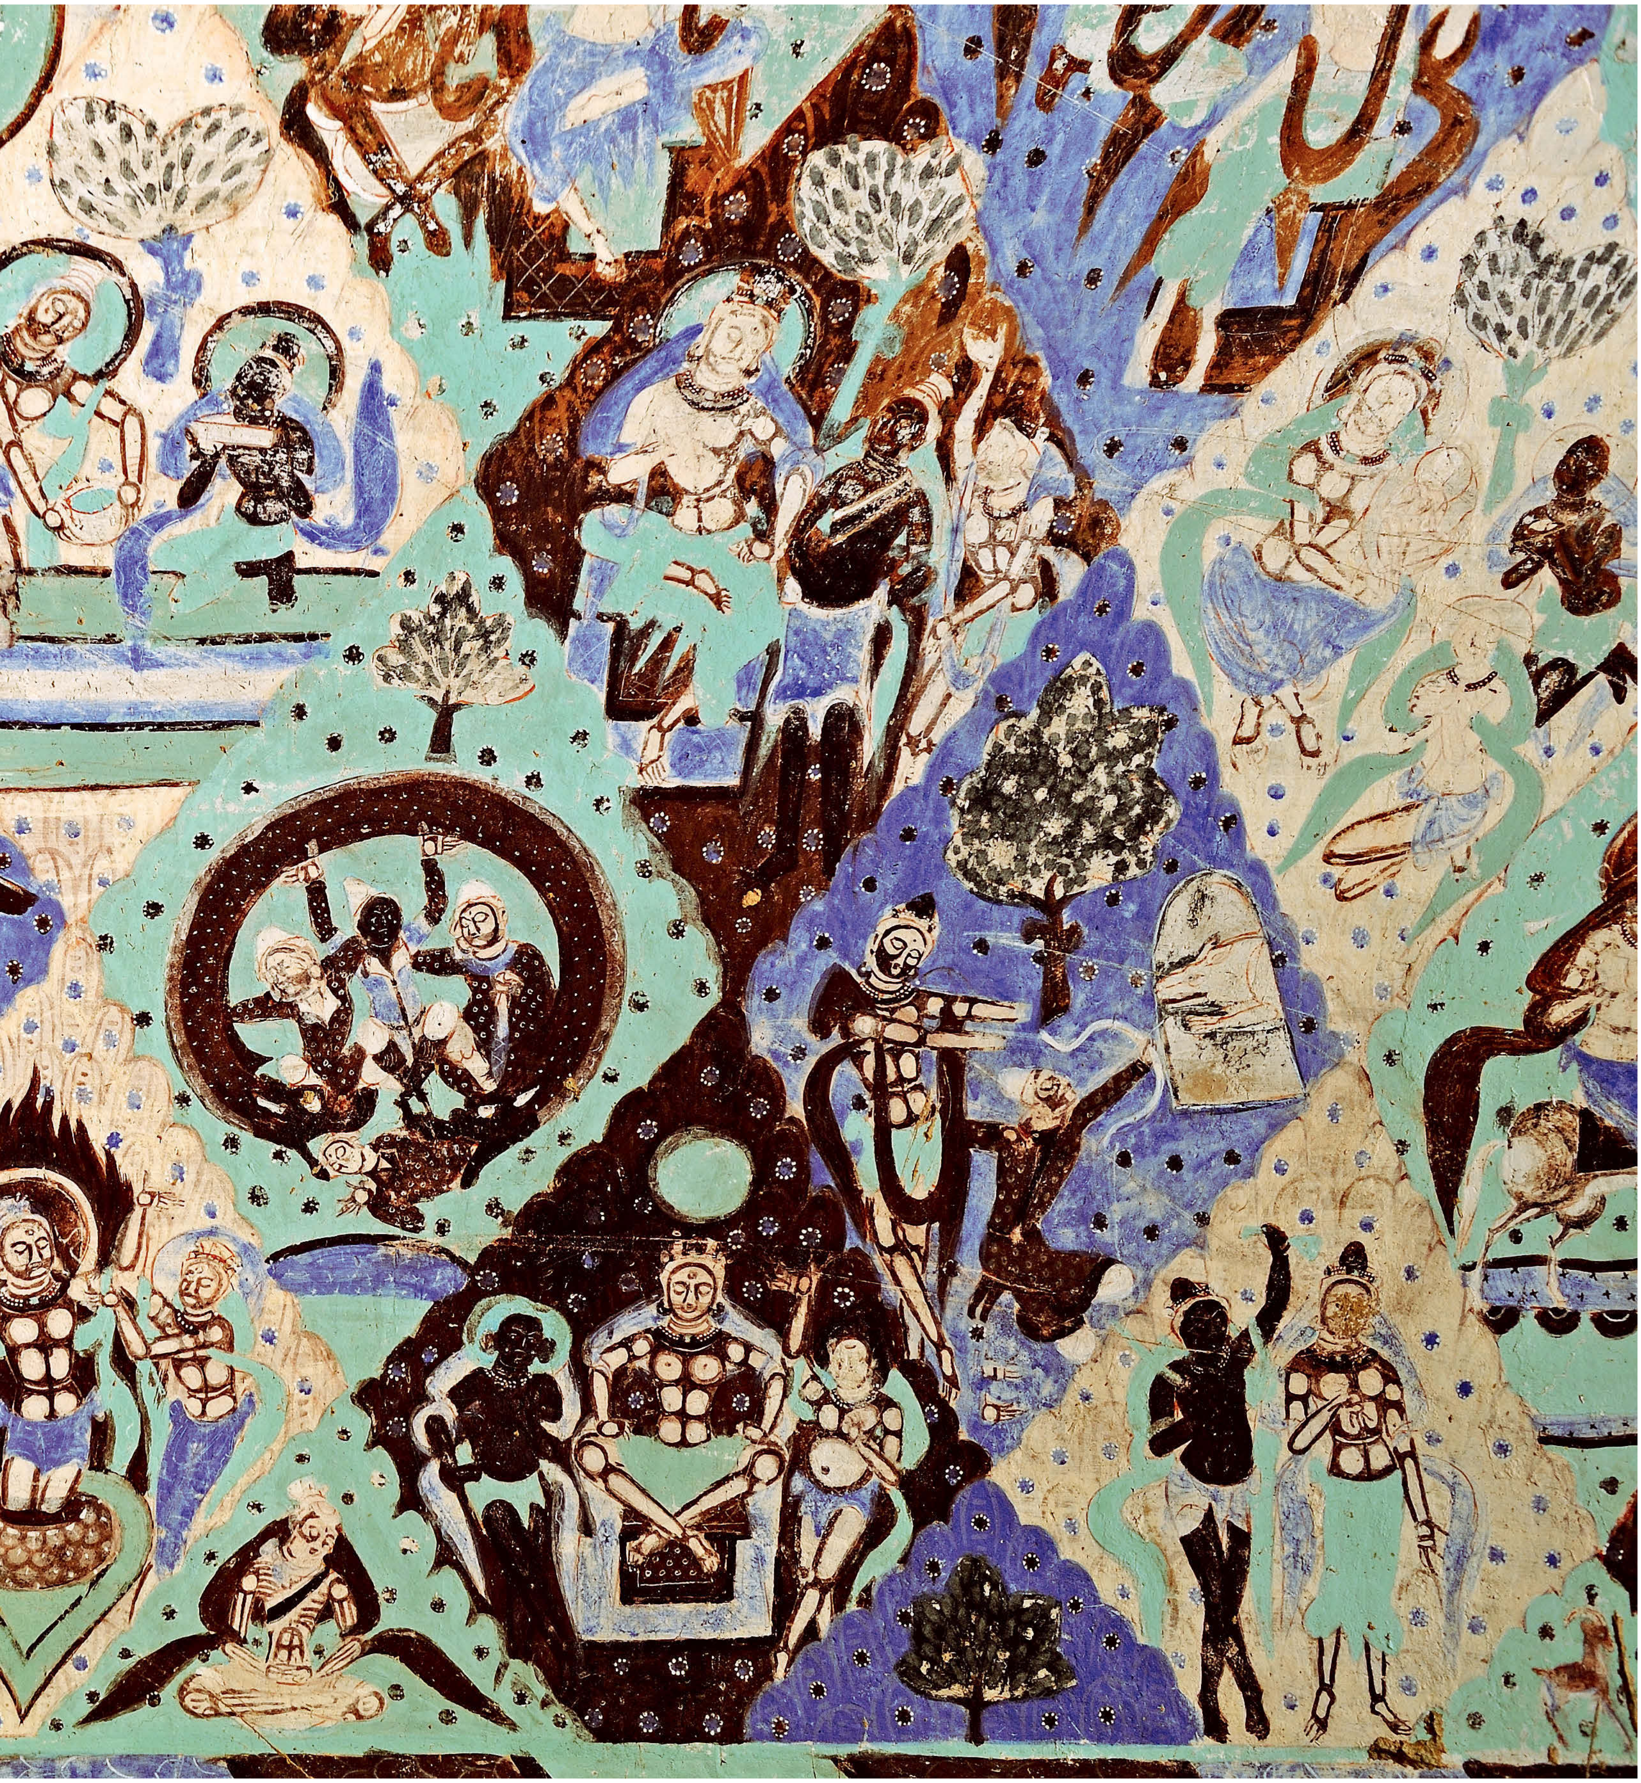
132. The stupa of the eastern Zhaokuli temple of the ancient city of Subashi near Kucha, Xinjiang, China. The stupa, which was built in the 3rd c. CE, consists of about three tiers, now eroded by the wind, a cube-shaped body and a domed, cylindrical structure. The niches on the inside of the western wall once contained statues; in the background another, slightly later stupa is visible.

This Sarvastivadin dominance is reflected in the iconographic programme of the caves at **Kizil**, the largest of Xinjiang's 14 Buddhist cave complexes.[322] Kucha's scholars rejected the notions of a multiplicity of buddhas or of an eternal buddha nature inherent in all beings. They emphasised the historicity of Buddha Shakyamuni and the meaning of his parinirvana, which in exemplary fashion rescinds forever the Law of Cause and Effect through the cessation of all ignorance and all desire for existence. As at the stupa at Gandhara, representations of Shakyamuni's parinirvana were much venerated in the Kuchean Sarvastivadin milieu, being taken, like a relic, as a symbol of the Buddha's presence.[323] In this philosophical context, the *Nirvana Sutra* and the *Dirghagama Sutra* were key to the iconography and the conceptual organisation of the Kizil caves as circumambulatory chapels with central pillar.[324]

On entering the caves, pilgrims first encountered Shakyamuni, Buddha of the present, on the central pillar; walking clockwise along the left-hand wall and left-hand corridor, they would then be taught vivid lessons by the jataka and avadana tales depicted there; and then on the back wall of the cave they would

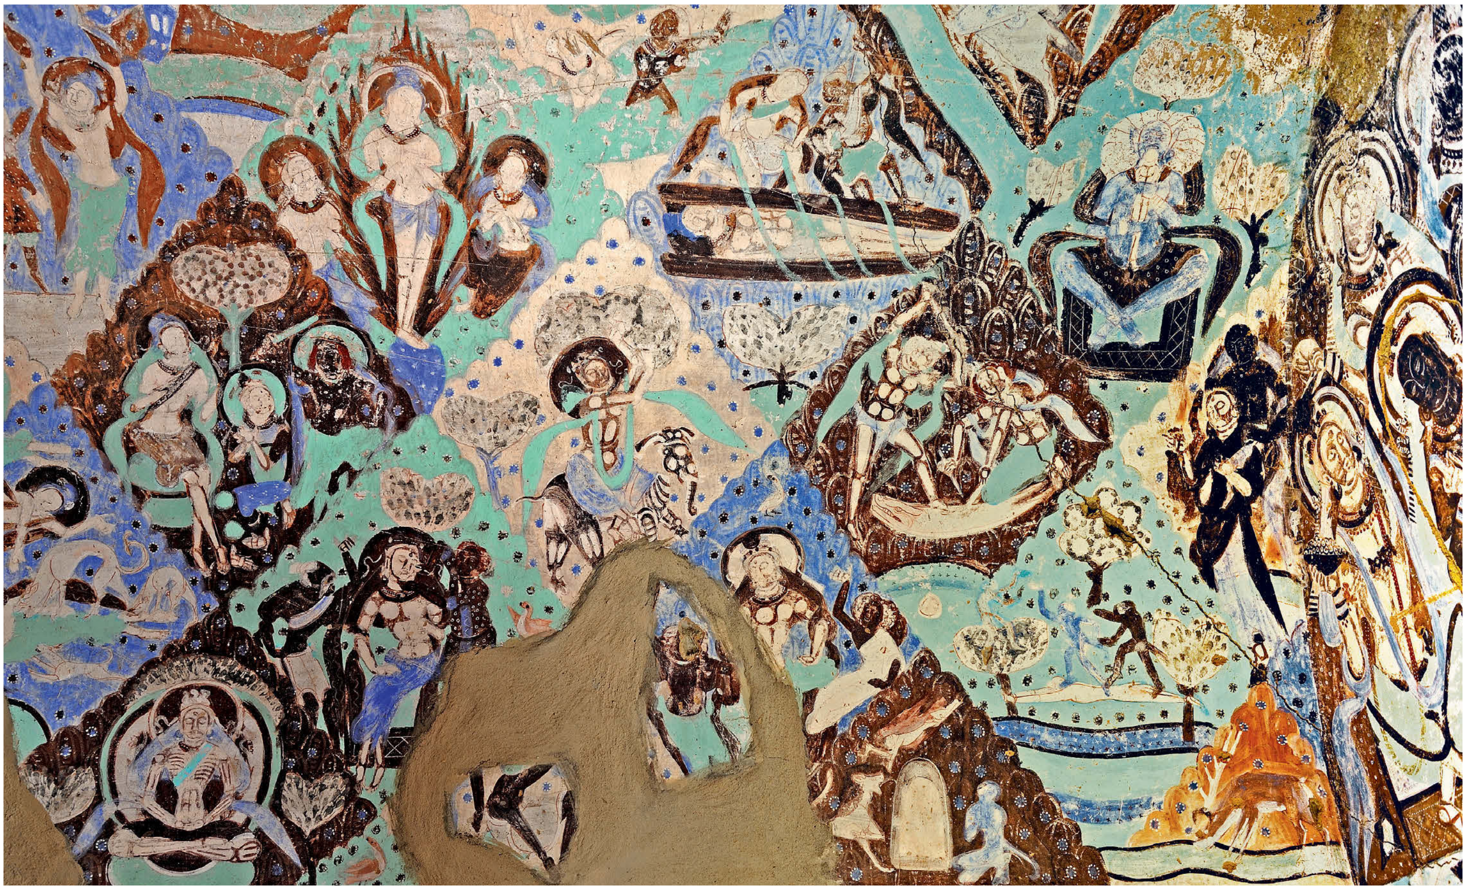
133. Cave 17 of Kizil near Kucha from the 4th to 5th c., Xinjiang, China. The paintings, which were executed in an Indian style complemented with Iranian elements, illustrate jatakas, edifying tales about previous incarnations of Buddha Shakyamuni, as well as avadanas. The areas which now look dark brown to black were originally red; the mineral pigments have oxidised over time. In the first scene at the top left, a queen is offering her breasts so that a hungry woman does not eat her newborn child, after which the queen is transformed into a man. In the third scene from the left in the upper row, a king hands himself over to a poor brahmin so that the latter can claim a valuable bounty from an enemy king. At the extreme right in the upper row, King Anaparadhimukha passes a Solomonic judgement on the question of which of two arguing women is the true mother of a child. In the third scene from the left in the middle row a bodhisattva allows himself to be eaten by a giant snake in order to save three merchants; further right is a hunting scene. In the first scene on the bottom left King Chandraprabha lets a brahmin behead him so that the latter receives a bounty promised by a neighbouring, jealous king. In the next scene Prince Dharmakama jumps into a burning pit to be instructed in the teachings of the dharma, and on his right the ascetic Udaka Ramaputra fasts until he is reduced to a skeleton. Further right the greedy king Mandhata sits down on a celestial throne to which he is not entitled, after which he is expelled from the sky and succumbs to a fatal illness.[13]



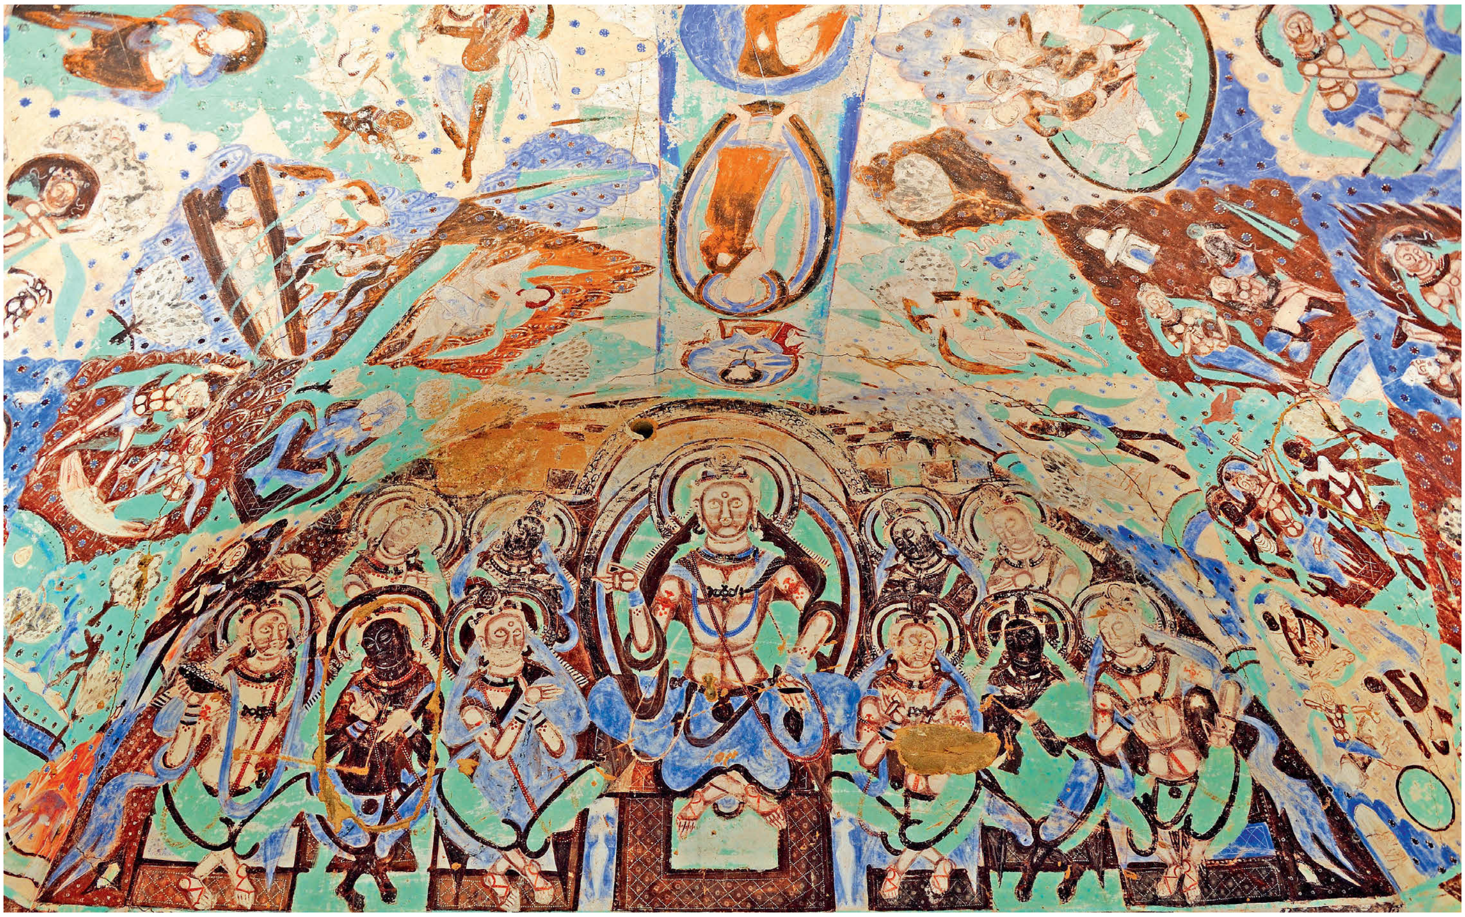


come to a sculpture[325] or painting of the departed Buddha in *Mahaparinirvana*, lying in his coffin. The images of grieving gods and of the death of Shakyamuni also show weeping laypeople, who in their grief are tearing their hair and lacerating their faces with sharp knives, customs not of Buddhist origin but deriving from the funerary rituals of Central Asian nomadic horsemen and Iranian Sogdians, as described on the 735 CE funerary monument to Bilge Khagan, in the chronicles of China's Sui dynasty, and in the work of historian al-Tabari.[326] These scenes of mourning are surrounded by flying heavenly beings called *apsaras* (in Chinese, *feitian*), borrowed from Indo-Aryan mythology. Finally passing along the second corridor and following the right-hand wall towards the exit, pilgrims would find edification in further jatakas. On the ceiling vault they would see countless meditating buddhas, and on the crown of the vault sky gods, such as the sun, moon or wind gods, whose representations recall the Kushan wind god Oado with his billowing cloak. On leaving the grotto, pilgrims would find hope and courage in Maitreya, Buddha of the future, painted in the lunette above the door lintel (fig. 135).[327]

In terms of their content, many jataka tales derive from the *Sutra of the Wise and the Foolish*.[328] Particularly prominent is the theme of bodily self-sacrifice, as performed by one of the Buddha Shakyamuni's earlier incarnations on his path to perfection: the bodhisattva in Cave 17 (figs. 133f), for example, offers his body to be eaten by a hungry lioness;[329] with oiled, flaming hands he lights the way for merchants lost in a dark wood; or he allows himself to be swallowed by a gigantic snake so as to save the lives of three merchants. The theme of bodily self-sacrifice was as popular on the Northern Silk Road as it was in Gandhara and in Buddhist China. Monks, nuns and laypeople saw it as a highly meritorious path



134. At the top left, Sarthavaha sets his hands alight to show the way to two merchants who are lost at night; in the next but one scene the young prince of Benares (Varanasi) lies in a coffin because until then he has refused to speak. It is only once he is in the coffin that his voice returns. At the far right on the top, the King of the Sky, who appears as a ghost, tests a pious ruler, who is very eager to receive the true teaching. As a precondition for meeting his request, the King of the Sky demands that the ruler let him eat his wife and son. But it is also possible that this scene depicts the child-eating Hariti before her conversion. In the third scene from the left in the middle row, a king transforms into a giant fish so that his hungry subjects can eat him. In the third row on the extreme left, the bodhisattva lets himself be eaten by a hungry tiger and her two cubs. In the same row on the right, the monkey king Mahakapi rescues his people from the hunting king of Benares by using his body as a bridge, which is attached to two trees on each side of a river. At the very bottom on the left, the ascetic Sankhacarya meditates under a tree and dares not get up since a bird has started nesting in his hair and laid eggs. On the right, a lion sacrifices itself so that an eagle returns the young monkey to its mother, who is painted in blue. Cave 17 of Kizil near Kucha from the 4th to 5th c., Xinjiang, China.



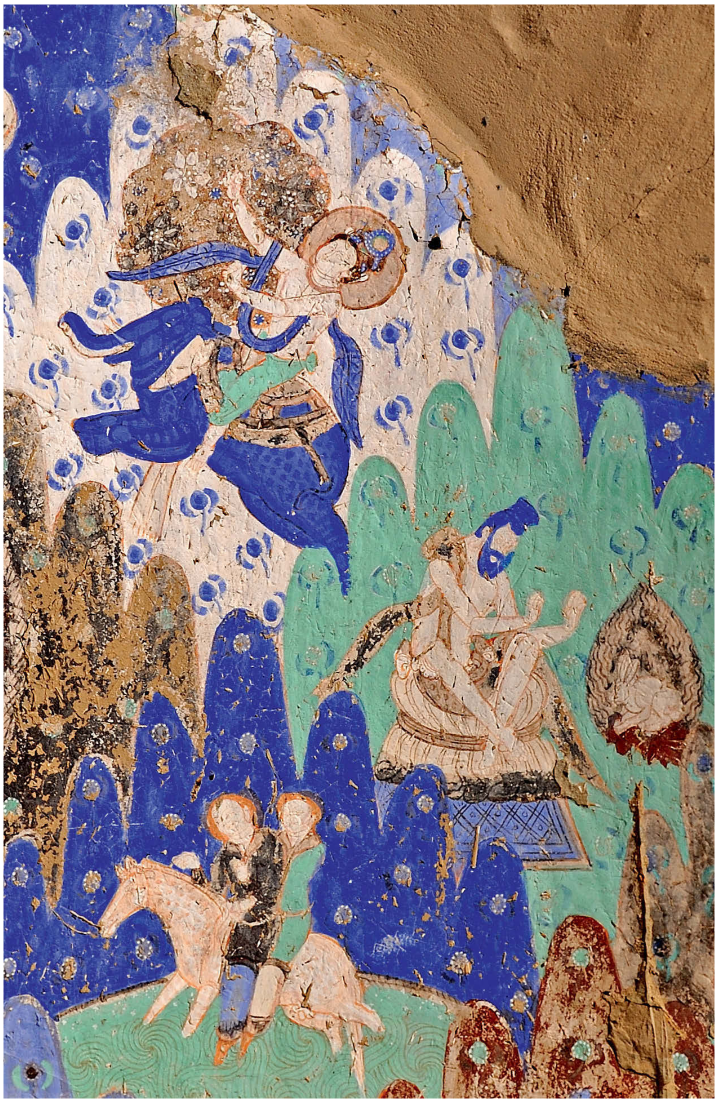
135. The Buddha of the Future, Maitreya, with other bodhisattvas, in his paradise Tushita. Tympanum lunette above the entrance door to cave 17 of Kizil near Kucha from the 4th to the 5th c., Xinjiang, China. In the scene at the very top right, a turtle rescues three merchants from the green ocean. On the evening after the rescue, the ungrateful leader of the merchants kills the turtle to eat it, and that same night a herd of elephants tramples him to death in his tent.

to Enlightenment, understood not simply figuratively and intellectually, but also concretely, in the form of self-mutilation and self-immolation.[330]

In the Kizil caves, which date from the late third to the late seventh centuries,[331] Indian-derived formal elements prevail until the end of the fourth century, as for example in the naked and half-naked bodies and the full breasts of female dancers and musicians (fig. 137). There follows a more vigorous style in which Iranian-Sogdian elements win the upper hand, particularly evident in portraits of Tocharian nobles, dressed in kaftans with typically Sogdian textile designs and carrying a Sogdian longsword at the waist (fig. 98). Among such Sogdian designs are pairs of ducks, lions or gazelles enclosed within pearl medallions. The Sogdian influence was long-lasting since Sogdian-Tocharian trade promoted cultural exchange. The Indo-Iranian imagination contributed the *apsaras*, the bird Garuda with a snake in its beak, the wind god Vayu, the sun god Aditya and the moon god Chandra. These last two were often represented standing or sitting in a quadriga, strongly recalling similar representations of Helios and Mithra. Such depictions are not unusual, being found also in Cave 23 at Kumtura,[332] at Bamiyan[333] and at Mogao.[334] The sun and moon held in the upper hands of many-armed examples are quite similar to representations of the Sogdian goddess Nana.[335] Towards the end of the cycle of paintings at Kizil, the jatakas tend to give way to representations of the Thousand-Buddha motif, and of groups of monks; that is, of the Sangha or monastic community.

In the depiction of jatakas the Kizil artists developed a distinctive style of landscape painting. Most individual scenes are surrounded by a quasi-crenellated frame that at first glance suggests a medallion of serrated leaves. These schematic zigzags, however, represent not leaves but stylised mountain chains. Also distinctive to Kizil is the prominent use of ultramarine pigment, obtained from lapis lazuli. This blue paint, also used to render the Buddha's hair, symbolised the blue light of universal compassion. Unlike at Dunhuang, where many anonymous wealthy merchants also contributed to the decoration of the caves, patronage at Kizil came mainly from members of the Tocharian royal house. An inscription discovered by Grünwedel records that a Tocharian king called Mendre commissioned a painter from India and another from Asia Minor, together with assistants, to paint some of the early caves.[336] In the Tocharian kingdom of Kucha the royal house was very close to the well-organised Sarvastivada School, for the kings showed the greatest respect to the higher clergy, whose members themselves often came from the royal milieu.[337]

Some 25 kilometres south-west of Kucha is the cave complex of **Kumtura**, whose wall paintings date from the fourth to eleventh centuries. The domed caves GK 20 and GK 21 are particularly outstanding.[338] Both are associated with Mahayana Buddhism, for the domed ceiling of GK 20, created around 400, is painted with five buddhas and six bodhisattvas, each standing within a trapezial field. In neighbouring GK 21 (fig. 1), dating from the early second half of the fifth century, are 13 different bodhisattvas, each again occupying a trapezial field. The assemblage of 11 and 13 painted figures is unusual and does not correspond to any known grouping; the numbers may perhaps have some astrological significance.[339]

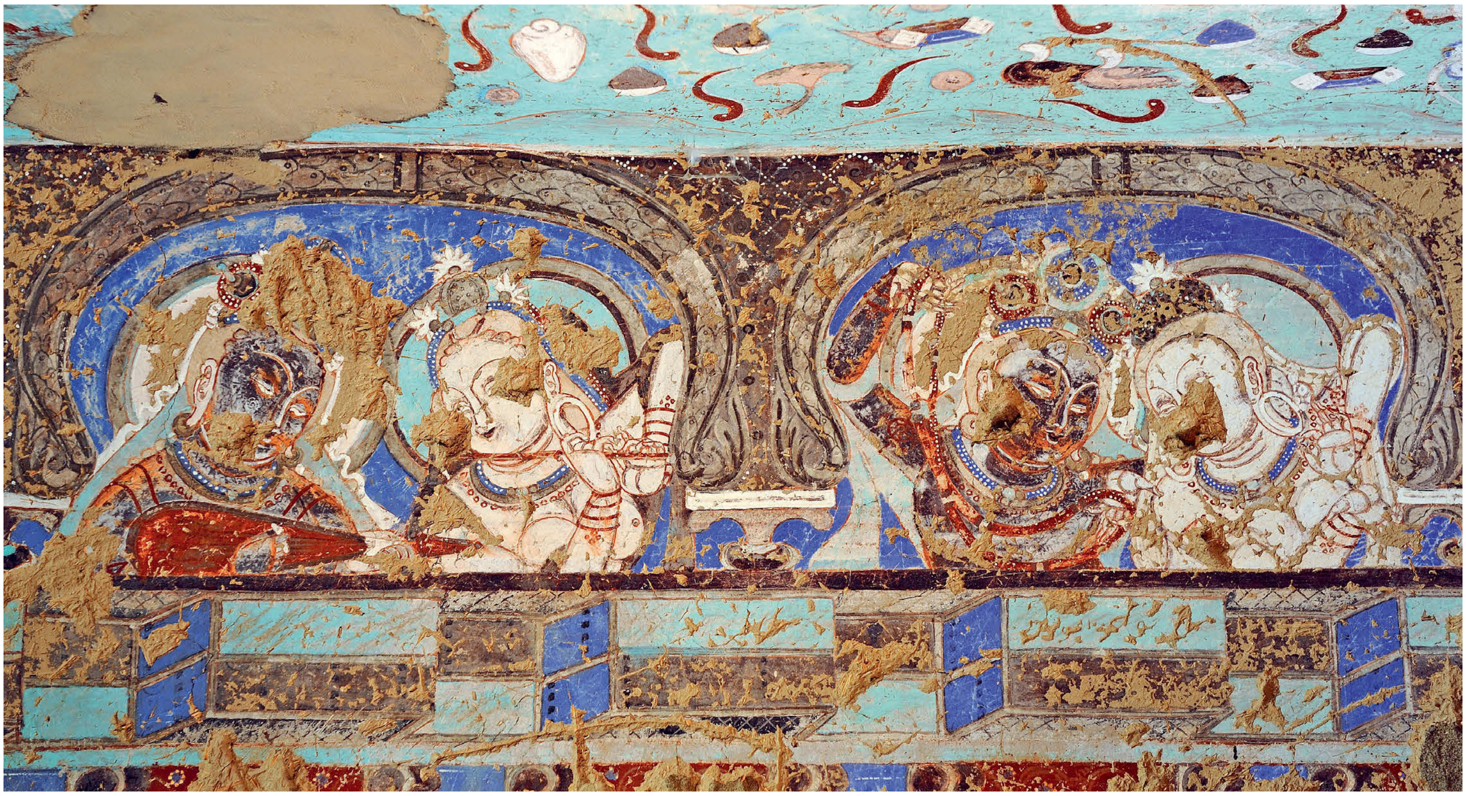


136. Detail from cave 14 of Kizil, 4th/5th c., Xinjiang, China. At the top, King Mahaprabhasa has to grab on to the branches of a tree as he attempts to stay on a bucking elephant; thus he understands the necessity of taming one's passions. In the middle on the right, the king of the hares is jumping into a fire to serve as food to a hungry ascetic. At the bottom, a bodhisattva, in the guise of the king of horses, saves merchants from female man-eating sea monsters. The radiant blue colour, unique in Kizil, came from lapis lazuli, whereas the azurite used in Dunhuang yielded a softer, less intense blue.

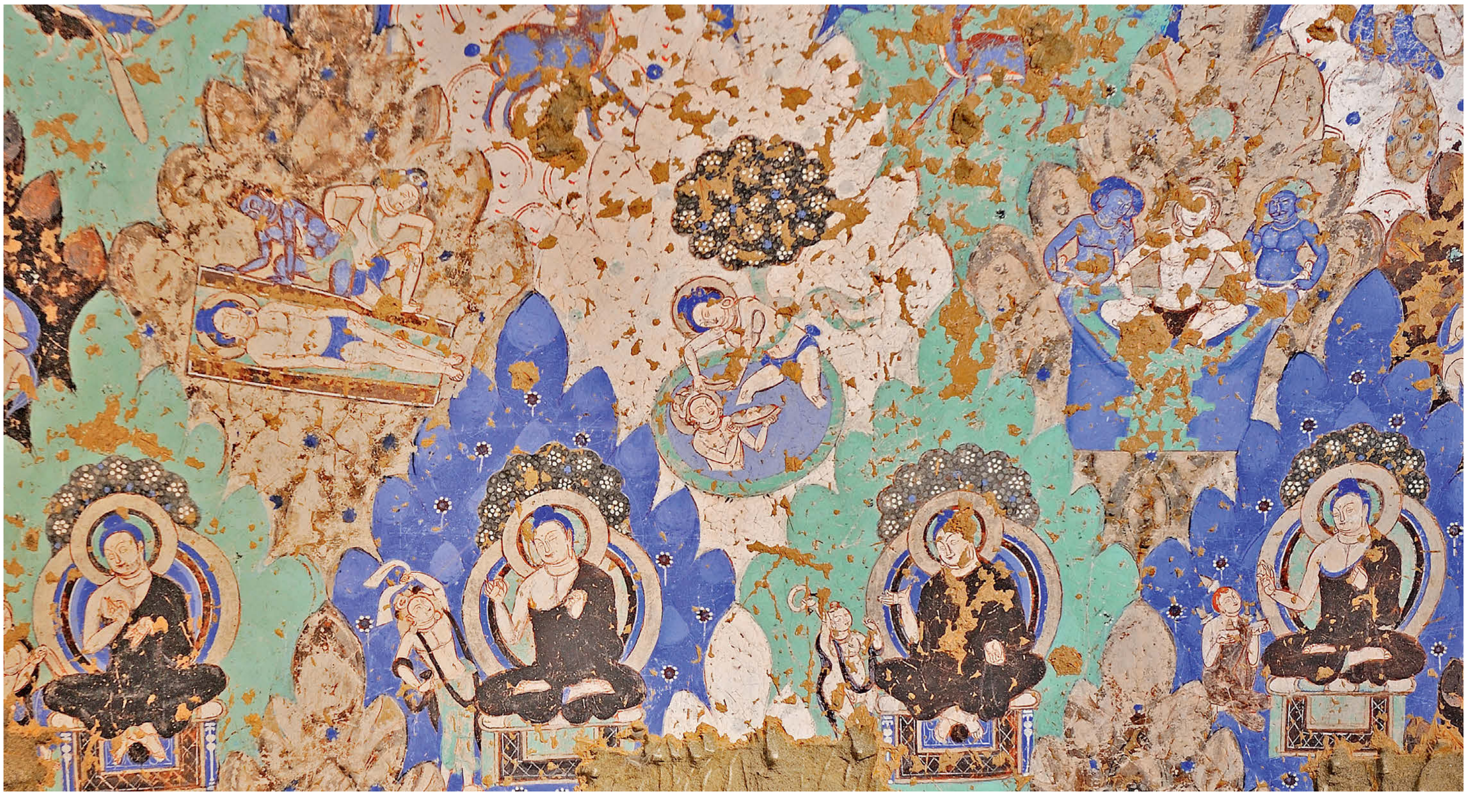
Lying to the west of the kingdom of Kucha, the ancient city of **Tumshuk** was the only major settlement on the Northern Silk Road to have a Saka population, for Tocharians dominated in Kucha until the seventh century and in the Turfan Oasis until the fourth, intermixed with others of Xiongnu or Turkic origin. Of particular cultural-historical interest in Tumshuk, which enjoyed its heyday in the fourth century and the first half of the fifth, is a further development of the Bactrian model of Buddhist temple. This consisted of a rectangular cella, surrounded by a passageway that was in turn enclosed by an external wall.[340] Examples are the early Temple J at Toquz Sarai in Tumshuk, the little Shrine 61 in Karadong and the earliest temples at Karashahr, as well as other temples and cave shrines with central pillar in Turkestan and northern China.[341] At Shrine B in Tumshuk's Toquz Sarai (fig. 141) (following Pelliot's designation) the outer wall of the cella, forming the inner side of the corridor devoted to ritual circumambulation, is decorated with a frieze of clay statues, like the perimeter wall of the stupa at Rawak.[342] The Buddhist shrines of Tumshuk remained active until the tenth century, when they were sacked and put to the torch by the Muslim Karakhanids.

3.2 The Kingdoms of Jiaohe and Gaochang in the Turfan Oasis

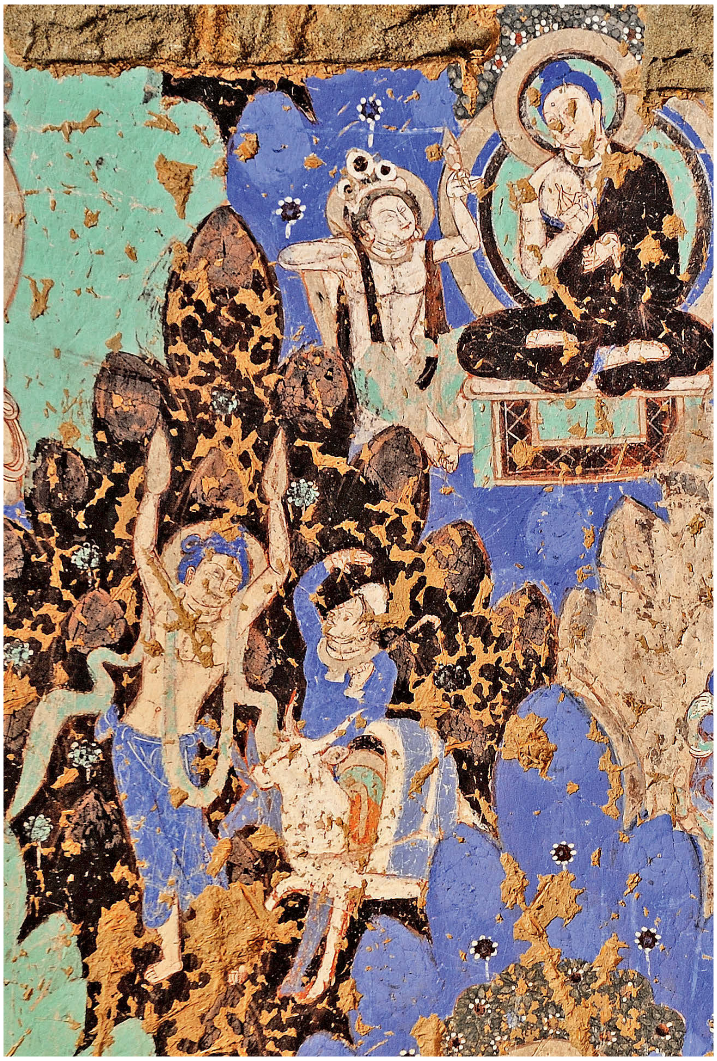
The two important cities of the Turfan Oasis were Jiaohe (Uyghur: Yarkhoto) and Gaochang (Karakhoja), which belonged to the 'Kingdom of Nearer Jushi'.[343] Hotly contested between China and the Xiongnu and the object of five wars between 99 and 60 BCE, the kingdom of Jushi had in 60 BCE been divided by the eventually victorious China into a 'Nearer Jushi' with **Jiaohe** as its capital and a 'Further Jushi' centred on Beiting, near Jimisar.[344] In the first century CE, Nearer Jushi first fell back into the Xiongnu sphere of influence, until it was regained by General Ban Chao around 89, and General Ban Yong stationed imperial troops there, at Lukchun, in 123.[345] Two years later Ban Yong subdued Further Jushi, north of the Tian Shan, which nevertheless fell again to a successor clan



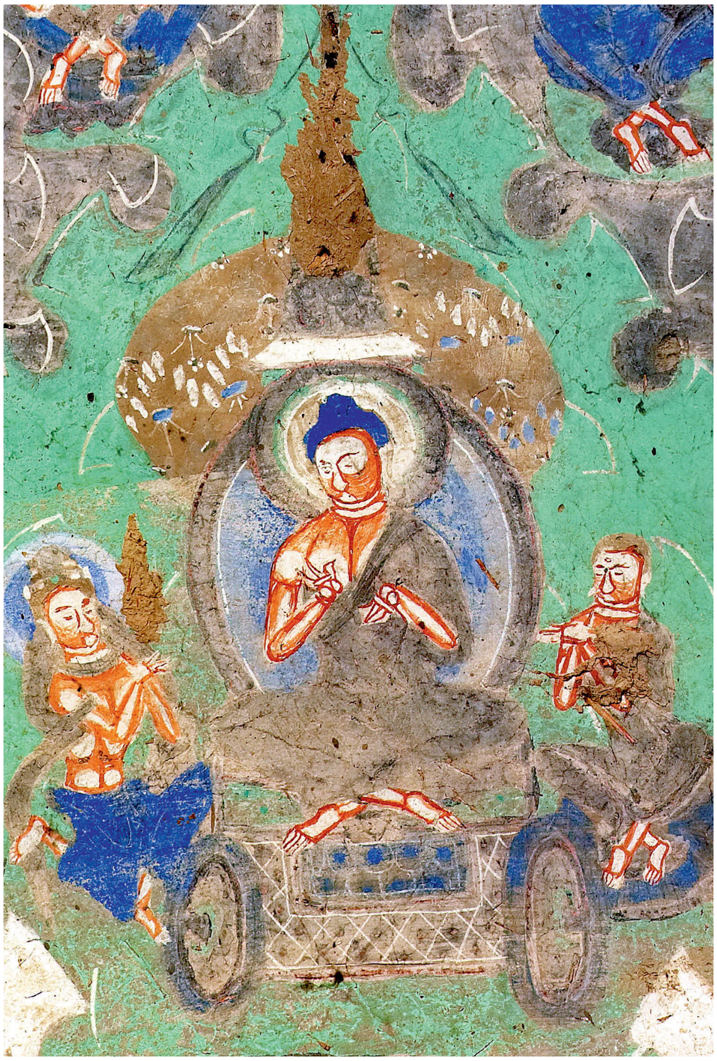
137. Frieze of celestial female musicians in cave 38, 2nd half of 4th c., Xinjiang, China.



138. Cave 38, dating from the second half of the 4th c., is one of the oldest of Kizil. Visible on the left is the Prince of Benares, who only started speaking when lying in his coffin. In the middle, a sea god rising from the water hands a precious pearl on a tray to King Mahajanaka after the king has tried to steal it from him in order to sell it and alleviate the famine of his suffering people. The king has attempted to empty out the ocean to reach the pearl. When a god takes pity on him and scoops up half of the ocean with a single movement, the god of the sea, fearing for his home, hands over the pearl.



139. Sarthavaha sets his hands and arms alight to show the way to merchants who are lost in the night. Detail from cave 38, 2nd half of 4th c., Xinjiang, China.



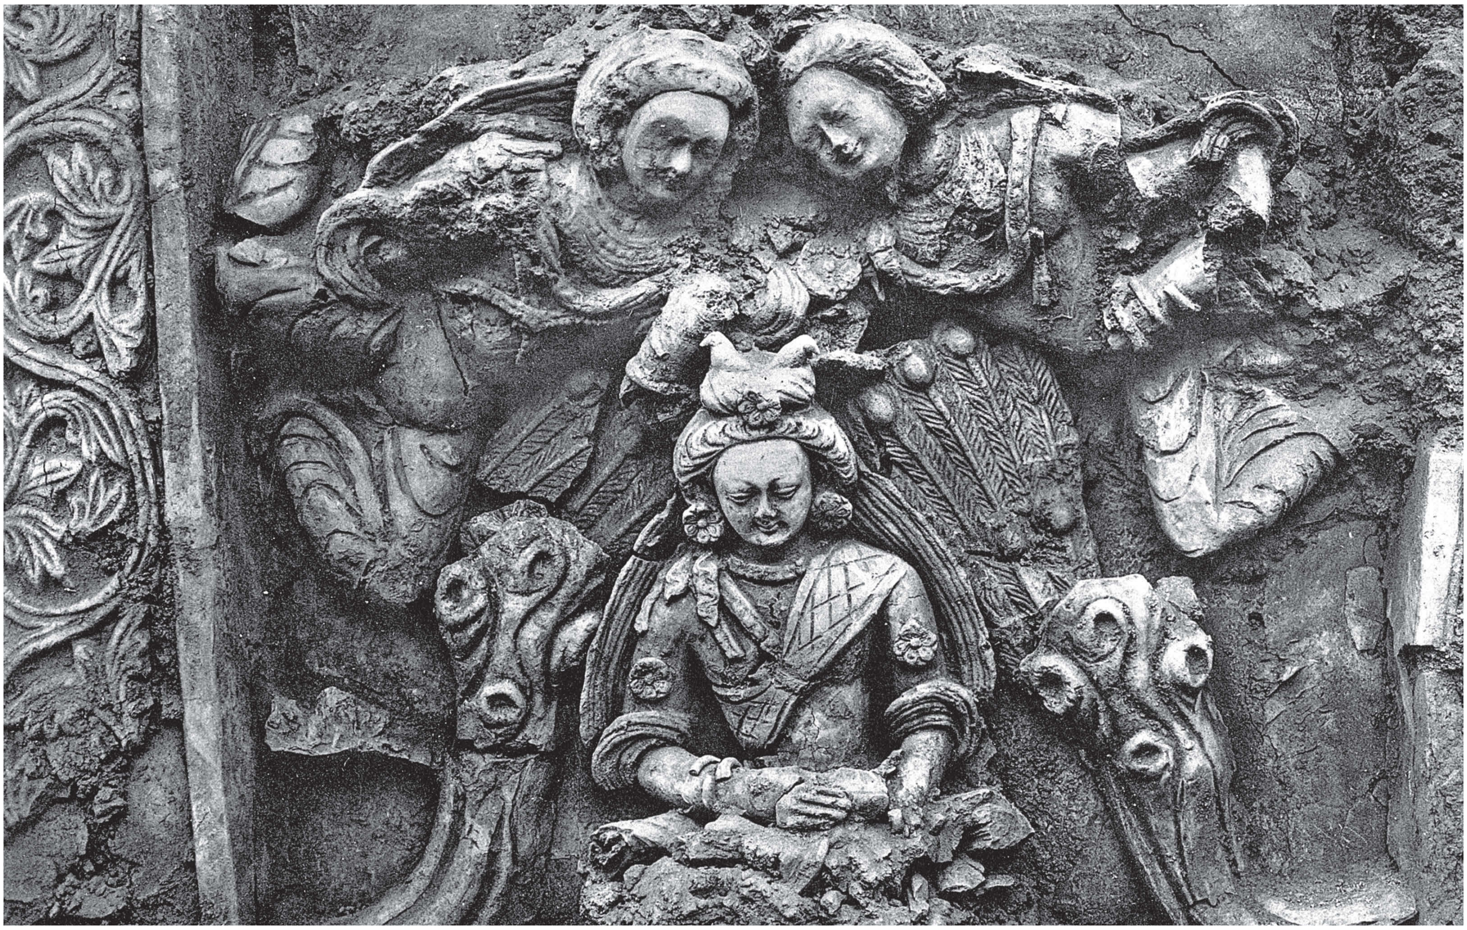
140. The sun god in the guise of a Buddha is represented in frontal view in his celestial chariot, in Hellenistic-Sassanid style. Although the sun god was a minor deity in the Buddhist pantheon, he was rather popular in Kizil and can be found in at least eight caves. Cave 175 of Kizil, 5th/6th c., Xinjiang, China.

of the Xiongnu in 135.[346] As is suggested by the names Jiaohe and Yarkhoto, which both mean 'fork in the river', the city stands on a more or less impregnable, 30-metre-high rock that rises almost like an island between two rivers (fig. 15). To protect its inhabitants from unbearable summer heat and icy winter winds, most of the streets were dug two to five metres into the ground, and the one- or two-storey homes and workshops were likewise sunk into the earth, each with an entrance from ground level and from the lower street level (fig. 71).

Even after the fall of China's Eastern Han dynasty in 220, Jushi remained loyal to its successors, the Wei (220–65) and the Western Jin (265–316), up to its conquest in 327 by the Han Chinese Former Liang (320–376). The latter established the prefecture of **Gaochang**, which saw Karakhoja develop into a second centre of power in the oasis. Gaochang had been established in the first century BCE as a Chinese military compound, serving as headquarters for the commander of the *tuntian* military colony.[347] As it lay on a flat plain, it needed reliably strong city walls. The Former Liang were followed by short-lived dynasties, until in 444 the elite of the Xiongnu Northern Liang dynasty, in flight from the Northern Wei, seized power in Gaochang. Six years later these descendants of the Northern Liang also conquered the neighbouring city of Jiaohe, bringing about the political reunification of the Turfan Oasis.[348] At the same time, the new rulers declared Gaochang the new capital of the kingdom, shifting the centre of political, economic and religious power from Jiaohe to Karakhoja. However, Juqu Anzhou, the last Xiongnu ruler of Jushi, was too weak militarily to hold his own in this strategically important oasis, and in 460 he fell in battle against his northern neighbour, the nomad empire of the Rouran, who installed the Han Chinese Kan Bozhou as a vassal king. Three decades later, the Turkic Gaoche, also called the Tiele, swept away the ruling Kan dynasty, which in 485 had broken with the Rouran and declared its independence.

Yet the two vassal kings installed by the Gaoche were unable to assert their authority in the face of resistance by the local population, whereupon, in 501, the probably Turkic Qu dynasty seized power in Gaochang, and managed to maintain its hold more or less successfully until 640 thanks to a more flexible policy towards its mightier neighbours. With the turkicisation and sinification of the oasis, the old Tocharian elite found itself eclipsed and its Turfanian language (Tocharian A) became extinct.[349] Pressure from Turkic tribes increased in the mid-sixth century, and when the Ashina Turks founded the powerful First Turkic Khaganate in 552, Gaochang recognised its suzerainty, though in 605 the Tiele would conquer Gaochang, Yanqi (Karashahr) and Iwu (Hami).[350]

With the rise of China's Tang dynasty (618–907), which in 630 defeated the Eastern Turkic Khaganate and compelled the princedom of Iwu (Hami) to Gaochang's east to recognise its overlordship, the Qu dynasty found itself faced with an enormously powerful adversary. King Qu Wentai entered into alliance with the Western Turkic Khaganate, conquered Yanqi and disrupted one branch of the Northern Silk Road, plundering Chinese trade caravans and detaining the merchants. But when a Chinese army, which included a substantial Eastern Turkic cavalry, advanced on Gaochang in 640, Qu Wentai is said to have died of fright, leaving his son Qu Zhisheng with no choice but to capitulate.[351] Four years later, Yanqi surrendered; in 719 it would replace Suyab as one of the Four Garrisons.[352] Immediately after the conquest of Gaochang, China reintroduced the office of Protector-General of the Western Regions, whose headquarters were first in Si, west of Turfan, and then in Gaochang from 651 to 658, when it was transferred definitively to Kucha.



141. **Clay sculpture from the 1st half of the 5th c., Xinjiang, China, excavated by Paul Pelliot at the end of 1906 in the temple 'B' of Toquz Serai near Tumshuk. The scene illustrates the Sankhacarya Avadana and shows the meditating ascetic Sankhacarya in whose hair knot a nesting bird is sitting on its eggs. The ascetic pledges not to move until the young birds fly off. Over this thoughtful ascetic two *apsaras* (female spirits of clouds and waters) levitate as a sign of divine recognition. Photo on site, 1906. Louis Hambis (ed.), *Mission Paul Pelliot*, vol. I: *Toumchouq, planches* (Paris, 1961), pl. LXVIII, fig. 170.**

Chinese sovereignty would be briefly interrupted in the 670s, when the Tibetans overran the Four Garrisons, though China would reassert its power in 692. In 727 the Turfan Oasis was raided by Suluk, the khagan of the Western Turkic Türgesh, who had his residence at Suyab, though he was nominally a Chinese vassal.[353] Although the rebellion of An Lushan (755–763) eased the way for another push forward by the Tibetans, it was only in 791 that they succeeded in taking Gaochang,[354] leaving the oasis to fall to the Uyghurs in 803.[355] Like Besh Baliq to its north, Gaochang found itself on the fiercely disputed border between Tibet and the Uyghur Empire, and while culturally affiliated to the Manichaean Uyghurs, it rather belonged to the Tibetan sphere of influence. Returning by 840 at the latest, the Tibetans were driven back in the winter of 851–52 by Zhang Yichao, the warlord of Shazhou (Dunhuang), and in 866 Gaochang finally fell to the Uyghur leader Pugu Jun.[356] Gaochang became the capital of the Uyghur kingdom of Turfan, which they called Kocho or *Idiqutshari*, meaning 'city of the Idiqut', the Uyghur ruler.[357] In 1209, the little kingdom voluntarily submitted to Genghis Khan, thereby escaping certain destruction. The Uyghur kingdom of Gaochang would enjoy almost five centuries of unparalleled cultural and economic well-being, partly because of its religious tolerance, which enabled the peaceful coexistence of Manichaeism, Nestorian Christianity and Buddhism. Only forcible Islamisation at the hands of Khizir Khoja Khan (r. 1389–99), a ruler of Moghulistan who had his capital at Balasagun (Burana), near present Tokmak, brought an end in 1395 to this period of religious tolerance which corresponded to the traditional cosmic outlook of pre-Islamic Turks and Mongols.

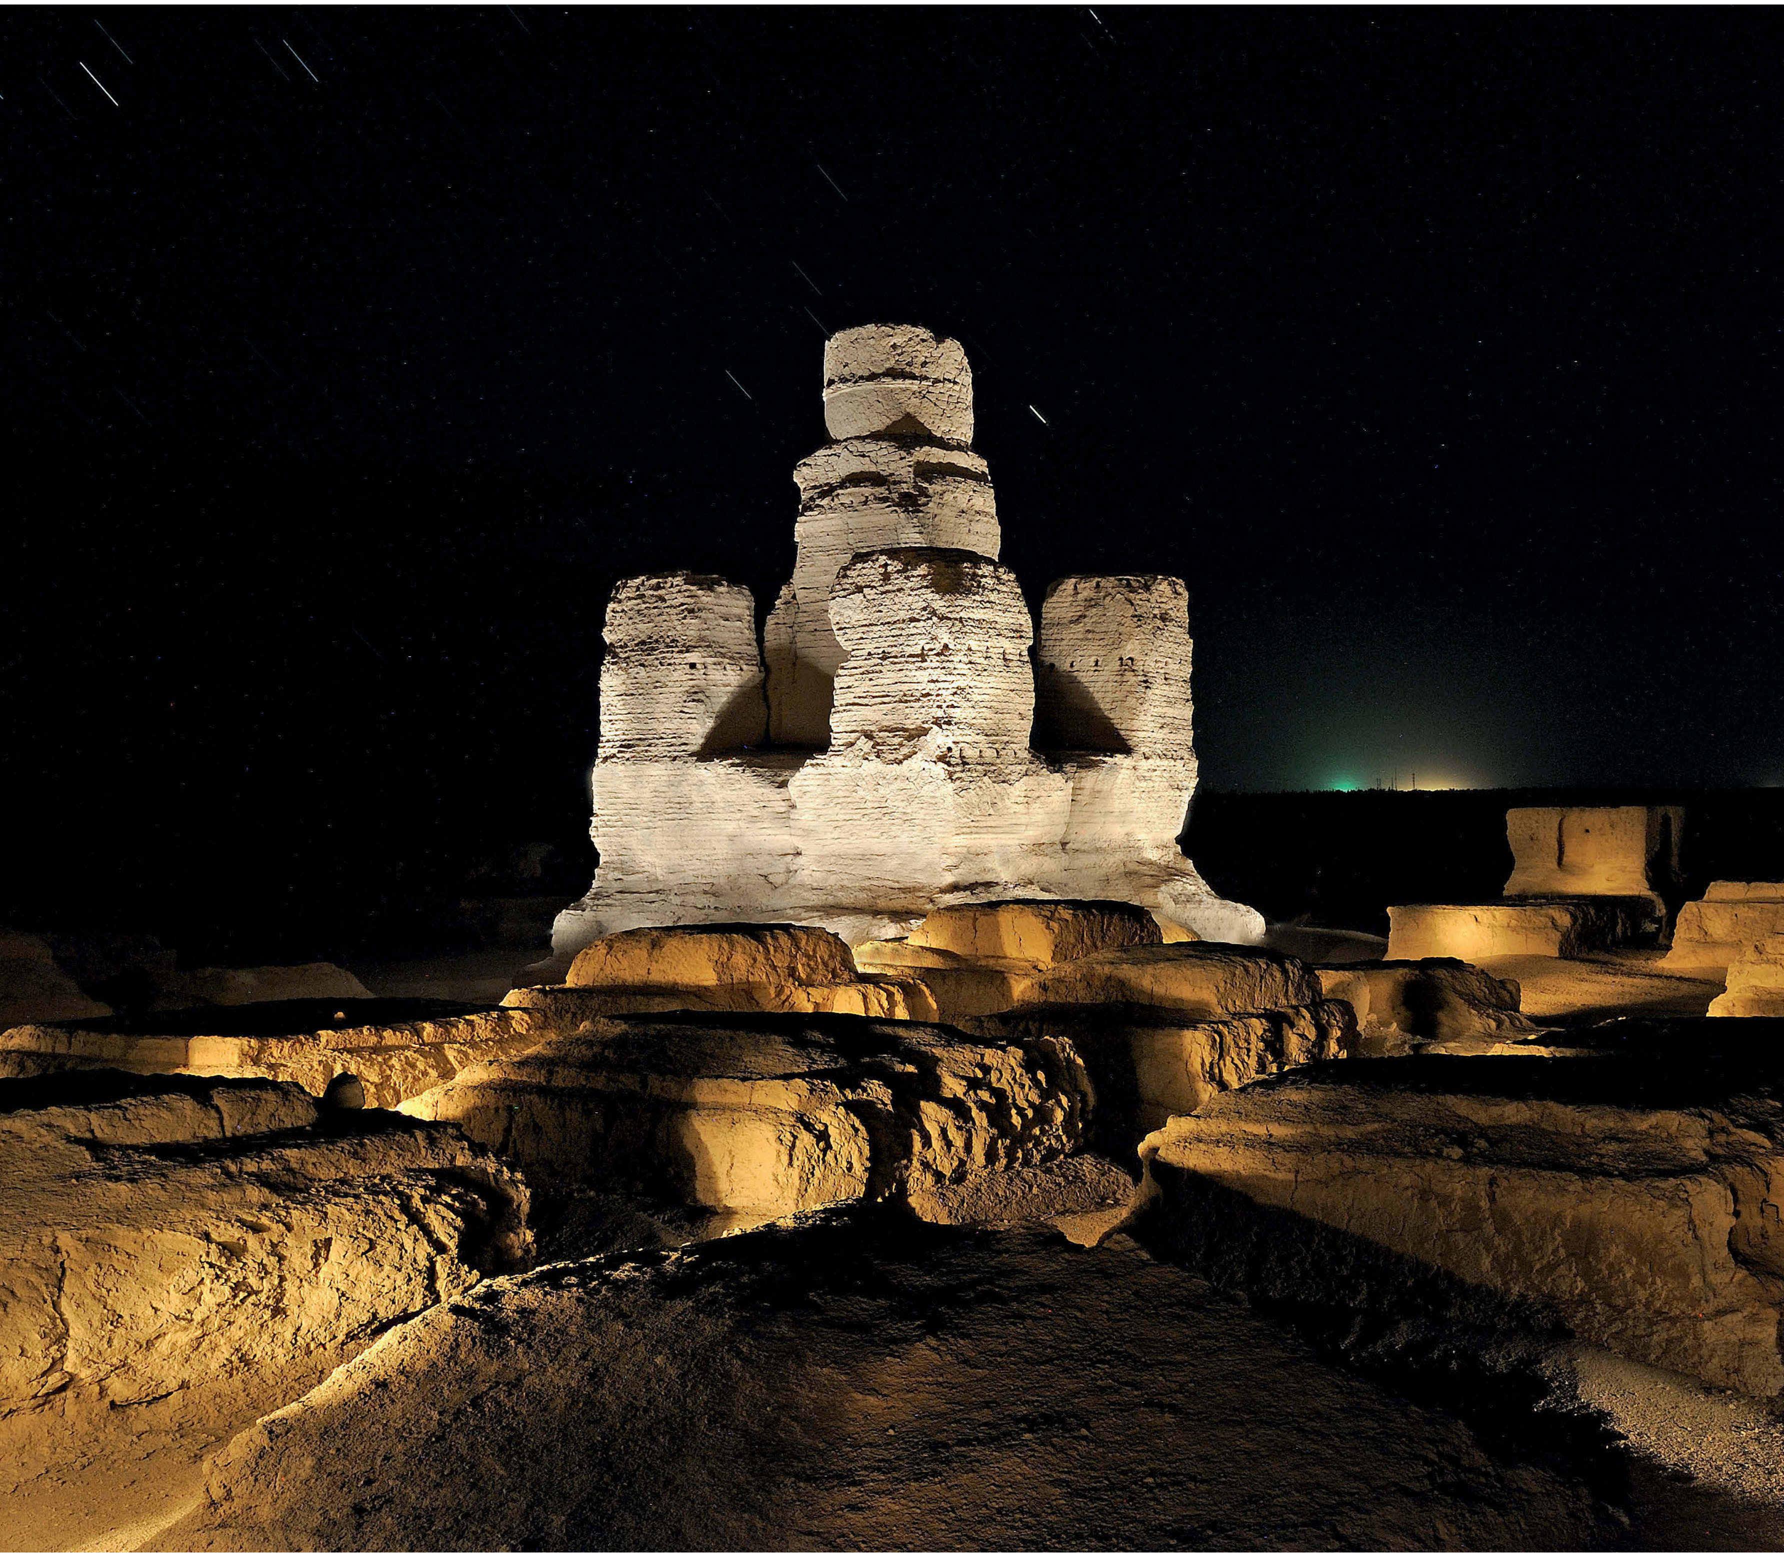
In the time of the Qu dynasty, Confucianism attracted a certain interest among some of the nobility, but Buddhism was the preferred religion of the oasis between the seventh and ninth centuries. Having set out from Chang'an in 629, intending to study at India's Buddhist universities, the Chinese pilgrim monk Xuanzang reached Gaochang in 630, where King Qu Wentai received him with much reverence. Several thousand Buddhist monks lived in Gaochang, and the king sought by all available means to keep Xuanzang there as a teacher. When he threatened to send him back to his own country if he would not stay, the monk replied: 'Only my physical body may be detained by Your Majesty; my mind can never be withheld'[359] and then began a hunger strike. After four days, Qu Wentai relented, providing a small escort under the leadership of his clerk of the palace to accompany him to the king's Western Turkic overlord, Tong Yabghu Khagan, who had his residence at Suyab, not far from today's Bishkek, capital of Kyrgyzstan.

The *Karez* Irrigation System

The *karez* irrigation system was in two respects an essential foundation for life in the Turfan Oasis, whose climate is characterised by extreme summer temperatures and limited precipitation. The oasis required much water throughout the year, not only for agriculture but to provide water and pasture to the camel caravans, sometimes hundreds or even thousands strong. The inhabitants knew how to make the very best of the topographical and geological peculiarities of the oasis, and by the time of the Western Han dynasty (202 BCE–9 CE) at the latest they had adopted the *karez* water system already proven in Bactria and Iran, whose name means 'well' in Persian. North of Turfan are the Bogdo Shan Mountains, eastern outliers of the Tian Shan, rising at their highest to 5,455 metres. The glaciers there feed numerous southward-flowing watercourses, the majority of which run down to a range of relatively low sandstone hills called the Flaming Mountains, which form an aquifer. The skilled artisans responsible for the construction of the system would dig a line of well-like shafts, up to 80 metres deep and 10 to 40 metres apart, running from the foot of either mountain system to the intended destination, these being connected at the bottom by tunnelled underground channels about a metre wide and up to two metres in height. Thanks to the downward slope to the floor of the basin, itself 156 metres below sea level, the water flowed by itself towards the oasis, while the underground channels reduced losses from evaporation to a minimum. At its height, the Turfan Oasis had 1,784 such channels for a total length of 5,272 kilometres; 614 are still in operation today, some of them now provided with a plastic lining.[358] Attempts to use open channels have proved unviable, on account of the very high level of evaporation. As long as the oasis, which has extremely low precipitation, uses only the water coming from Bogdo Shan, the relation between fluvial replenishment and use remains balanced. But if the subterranean resources of fossil water are harvested for irrigation purposes, the day can be foreseen when water, like mineral oil, will not be available any more.

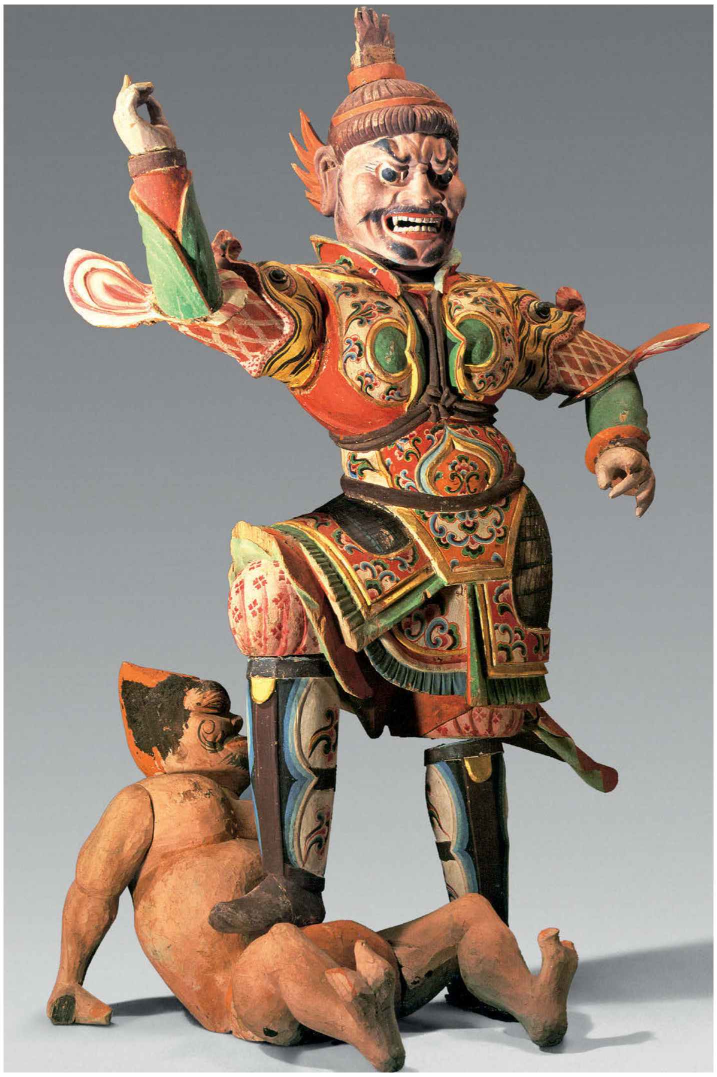
On his way to Kucha, Xuanzang set off first to **Karashahr** (Chinese: Yanqi), called Agni in Sanskrit. There occurred the first of the bandit raids that Xuanzang would suffer over the following years. He and his companions offered a number of gifts, the bandits left, and the caravan then struck camp. However, several dozen merchants who had been travelling with the caravan wished to reach the city before their colleagues, and so went on at midnight. 'After having gone about ten *li* [4 km], they met robbers who killed them all.'[360]

Like that of other oases in the Tarim Basin, the history of the kingdom of Yanqi, which lay between Turfan and Korla, alternated

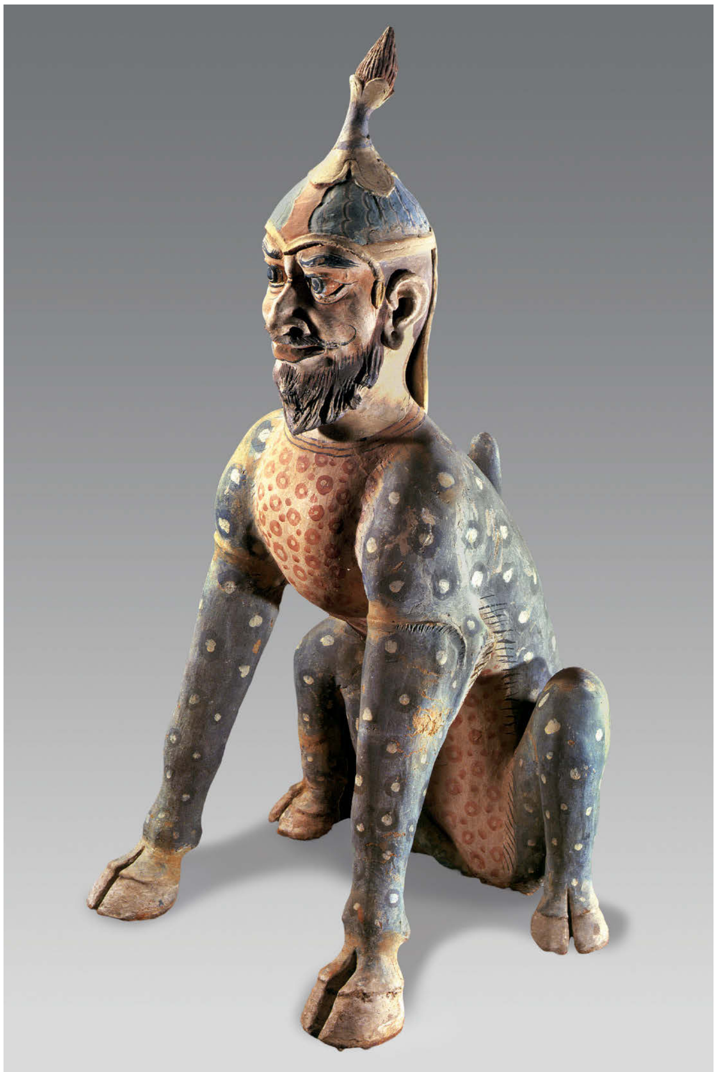


142. The religious complex of Jiaohe, Turfan Oasis, Xinjiang, China, consisting of 105 stupas. In the centre of this symmetrically arranged group, which was erected in the 4th or 5th c., an 8-metre-high stupa, flanked at each cardinal point by a nearly 5-metre-high stupa, stands on a 150-centimetre-high platform. Around this five-fold stupa construction stood – again directed to the cardinal points – four groups of slightly smaller stupas, probably around 3 m high, which were arranged in squares of 5 x 5, so that the whole complex contained 105 stupas. This unique construction symbolised the universal presence of the Buddha.

between independence and dependence on its powerful neighbours. After its definitive conquest by the Tang dynasty in 648, Yanqi grew in importance and in 719 it was made one of the Four Garrisons. After it fell, the region was fought over by Tibetans and Uyghurs. While Xuanzang stayed only one day in Yanqi, which was still scarred by its recent defeat by Gaochang, Faxian in 400 had spent two months in the city, home to some 4,000 Hinayana monks. In his account of his travels, Faxian complains of the natives' unfriendliness towards strangers, which may have been the reason why he did not continue his journey via Kucha but crossed the Taklamakan Desert to Khotan, which even today is a risky and difficult undertaking. 'Along the route they found the country uninhabited; the difficulty of crossing [the desert] was very great; and the hardships they went through were beyond all comparison.'[361] The time of Faxian's and Xuanzang's visits represented the high point of Buddhist temple architecture and cave decoration in Yanqi, as can be seen in the ruins at Shikshin, Mingoi and Shorchuk.[362] All the temples were burnt in the course of an attack by the Muslim early Karakhanids in the second half of the tenth century.[363]



143. A Buddhist guardian of the heavens, probably Vaishravana, crushes a demon with his right foot. The arm openings in his armoured cuirass are in the form of a gaping dragon's mouth. Such figures were placed into graves to protect them from demons. The two figures from the Tang dynasty (618–907) consist of 30 wooden parts which are glued together. Grave 216 of the necropolis of Astana, Turfan Oasis, Xinjiang, China. Uyghur Regional Museum, Urumqi.



144. Guardian figure from grave 224 of Astana, Turfan Oasis, Xinjiang, China. The composite creature has a leopard's body with paired hooves and the head of a helmeted, bearded warrior. The 90-centimetre-high clay figure dates from the Tang dynasty (618–907). Uyghur Regional Museum, Urumqi.

V

The First Turkic Khaganate

The strength of the Turks is that they rely solely on mounted archers. When they see an advantage they advance; when they know they will encounter difficulties they retreat. They gallop like the wind and turn like lightning; they have no permanent formations. They make bow and arrows their teeth and claws.

The Chinese general **LI YUAN**, later founder of the Tang Dynasty as Emperor Gaozu, 616 CE.[1]

Unlike the Rouran Empire, the Göktürks dominated for almost two centuries, with only brief interruptions, the northern half of Central Asia, from Manchuria to the Caspian Sea. Founded in 552, the First Turkic Khaganate[2] began with an initial period of nominal unity (552–581), after which it split gradually into an Eastern Khaganate (581–630) and a Western Khaganate (581–659). After a period of Chinese suzerainty, the east then saw the emergence of the Second Turkic Khaganate (682–742), which would be displaced by the Uyghur Empire (744–840). In 699 the west witnessed the birth of the Türgesh Khaganate, only for this to fall into civil war in 738 and be absorbed by the Karluks in 766. This chapter will be devoted to the First Khaganate, while the Second Turkic Khaganate and the Türgesh Khaganate will be dealt with in Chapter VIII.

1. A Two-in-One Khaganate

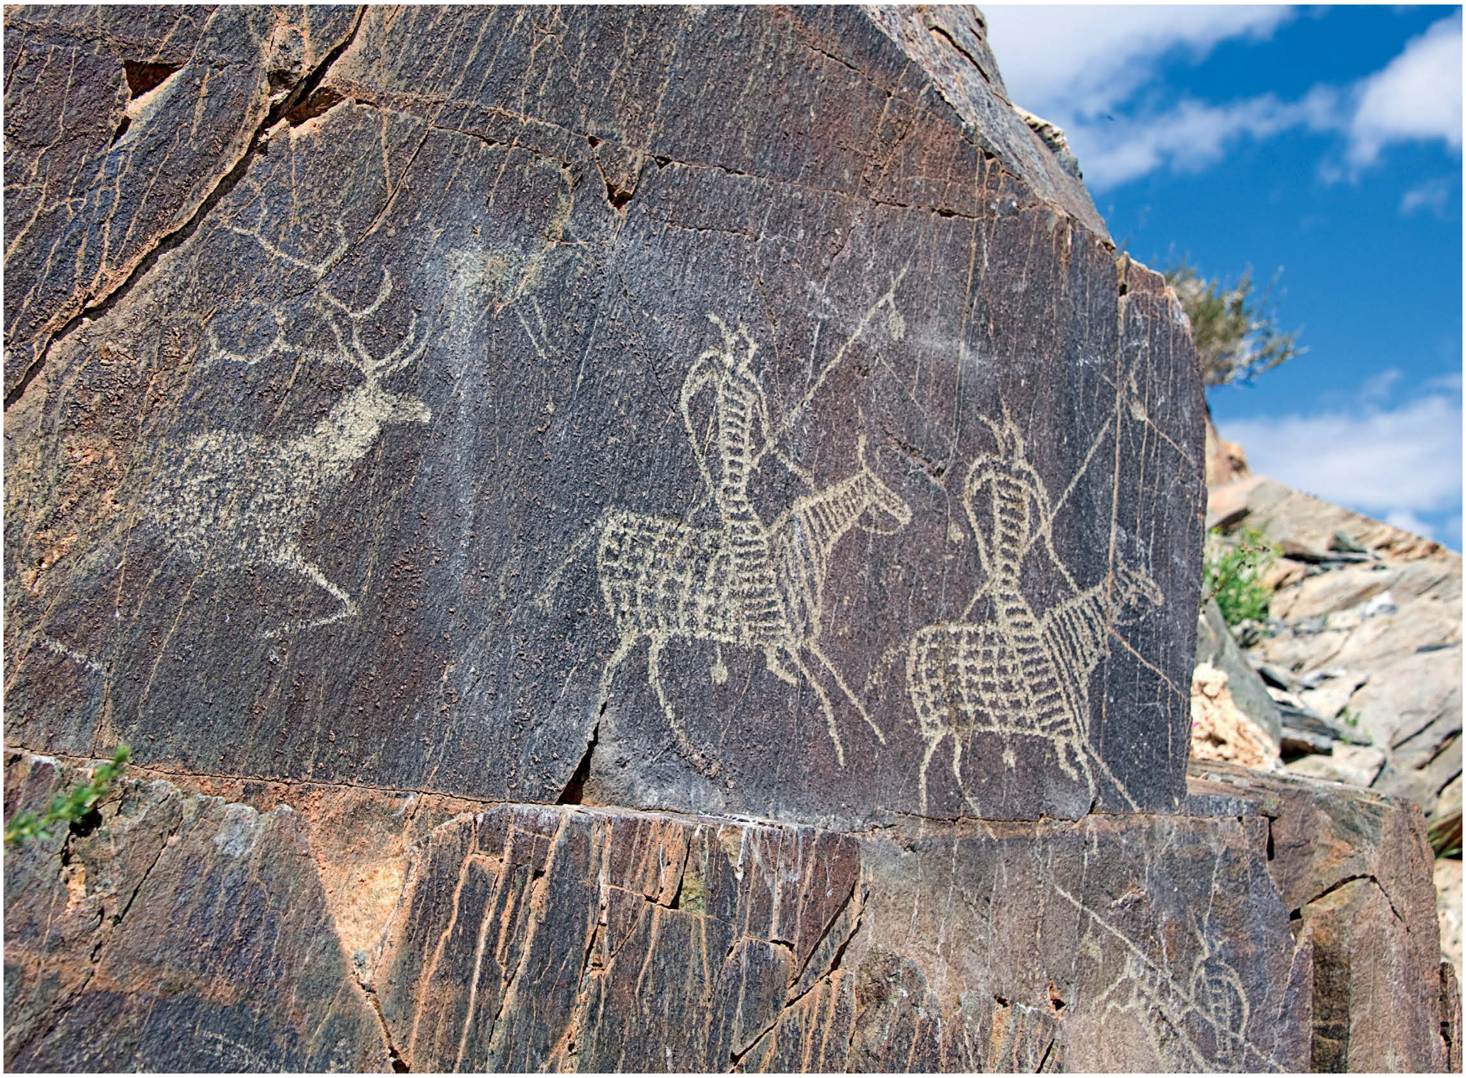
The ethnonym *Türk*, rendered *Tujue* in the Chinese sources, was originally the self-description of the small Ashina tribe;[3] its meaning is 'strong' or 'the strong'. In the early years of the new Turkic khaganate dominated by the Ashina elite, it was extended to cover those under their rule, such as the Oghuzes or Karluks, who were not related to the tribe of the Turks, so that the term took on a more political connotation. And when Muslim historians later used the term for all those peoples who spoke a Turkic language, it acquired a linguistic dimension. The Old Turkic spoken by the Ashina was a member of the Altaic language family, which also includes the Mongolic and Tungusic language groups. Like the Uralic and the other Altaic languages, the Turkic languages are agglutinative: each unit of meaning is expressed by an affix indicating, for example, tense, gender or case, which is added to the unchanging root of the word. Today, the Turkic language family includes 51 modern and 11 historic Turkic languages.[4] The name *Ashina* itself is the Chinese transliteration of an unknown Turkic word whose origin is to be sought in Eastern Turkestan, the putative homeland of the Ashina clan. Very likely related to the Saka-Khotanese word *āşşeina* meaning blue,[5] it was deliberately adopted by the tribal elite, for on the memorial steles to their khagans they refer to themselves as the *Göktürks*, the 'Blue Turks'.[6] As blue is the colour of the sky, which the Turks venerated, this self-description may also be understood as meaning 'Celestial Turks'.

Transmitted by Chinese historians, the two most important origin myths of the Ashina are related to those of the Wusun. According to the better known of these stories, the Ashina were a Xiongnu tribe whose members were all slaughtered by neighbours in the third century CE, all but for one ten-year-old boy. Although his life was spared, his feet and arms were cut off, and he survived only because he was adopted by a compassionate she-wolf. The youth later impregnated the animal, which, in the face of new dangers, fled to a den north of Gaochang, where she gave birth to ten boys, who would all become tribal chiefs. One of them, the leader of them all, was called Ashina.[7] In honour of their tribal ancestress, the khagans offered sacrifice at the ancestral den each year, and their standards bore a wolf's head in gold.[8]

Probably coming from the region north of the Turfan Depression, the Ashina Turks were resettled to the Altai by the Rouran around 460. They gradually developed into a powerful tribal confederation[9] and in 552, under their chief **Bumin** (d. 552), they rose in rebellion, and over the next three years they wrested control of north-east Central Asia from the Rouran.[10] Bumin, who named himself **Illig Khagan** after his victory over the Rouran, died shortly thereafter and was succeeded by his son **Issik Khagan** (r. 552–53), who survived him by only a few months. The Ashina now divided their newly established and rapidly growing empire into two parts: while Bumin's son **Muqan Khagan** ruled in the east (r. 553–72), choosing as his residence the Orkhon Valley in central Mongolia, which was sacred to the Turks, the west was ruled by **Ishtemi Yabghu** (viceroy) (r. 552/53–75), Bumin's brother and Muhan's uncle, who had his camp in the eastern Tian Shan mountains, some 200 kilometres north of Kucha.[11] The khaganate was thus bicephalous almost from the outset, with the Eastern Khagan enjoying nominal suzerainty over the ruler of the west. Muqan Khagan quickly succeeded in driving out the remaining Rouran, and forcing the Khitan to the east and the Kyrgyz to the north-west to recognise his suzerainty. In the west, Ishtemi formed an offensive alliance with the Sassanid Shah Khosrau I Anushirvan (r. 531–79), directed against the Rouran's former allies, the Hephthalites, and between 557 and 563 the allies succeeded in destroying the Hephthalites' Central Asian Empire.[12] With this, the important oasis cities of Sogdiana, such as Samarkand and Paykend, became vassals of the Turks, and the Sogdians who controlled their trade became their subjects. The border between Turks and Sassanids first lay on the Oxus, but their struggle over the silk trade soon turned to open war, and in 568 Ishtemi conquered part of Bactria. Advancing further south, the Turks suffered a serious defeat near Herat in 588 or 589, but they would return in 616–17, penetrating as far as Isfahan, deep in Sassanid territory, though they failed to gain any political advantage from this.[13]

1.1 A Military and Commercial Alliance with Byzantium

The defeat of the Rouran and the Hephthalites would, however, have serious consequences beyond Central Asia, in Byzantium and later the Balkans. As the Byzantine historian Menander reports, in 557 or 558 horse nomads called Avars came from the east to occupy parts of the Caucasus and the Pontic steppe. These Avars, whom Theophylact Simocatta described as ‘Var’ and ‘Chunni’,[14] hence as Varchonites, were in fact defeated Rouran tribes, together with Hephthalites who had joined them, all fleeing before the Western Turks. In the winter of 558–59 an Avar embassy arrived in Byzantium to propose a military alliance to Emperor Justinian I (r. 527–565), asking in exchange for costly gifts and fertile land on which they might settle. Justinian’s representative Valentinus concluded an agreement with the Avar envoy Kandikh, whereupon the Avars attacked and defeated the three Hunnic tribes of the Onogurs, the Zali and the Sabirs, and also the Slavic Antes.[15] His search for a safe long-term home for his people led the Avar khagan Bayan (r. 560/62–82/83) to embark on two campaigns against the Frankish king Siegbert I. The first, in 562, ended in defeat; the second, in 567, in victory and an alliance with the defeated Siegbert. Despite this success, the Avars found themselves facing two fresh dangers: the new Byzantine emperor Justin II (acceded 565, abdicated 574, d. 578) refused to honour the agreement entered into by his predecessor Justinian. And after sending an embassy to Constantinople in 563 to warn Byzantium against concessions to the Avars, the latter’s Turkic arch-enemies had now crossed the Volga. Bayan thus concluded a military alliance with the Lombards, and together in 567 they defeated the Gepids, who lived in Pannonia, after which the Lombards moved on to northern Italy



145. Stone engravings of three Göktürk armoured horsemen and a stag near Khar Khanatyn Khad, Khovd Aimag, Mongolia. These petroglyphs from the 6th/7th c. show the full-body scale armour of Göktürk equestrian warriors and their horses, which is known from archaeological finds[14] and Chinese chronicles.

with their share of the booty, leaving the Avars to take occupation of the now vacated Hungarian Plain in 568.[16]

With the westward flight of the Avars, who originally came from Mongolia and who spoke a Turkic language, and whose leaders also spoke a proto-Mongolian dialect,[17] yet another Central Asian people – the fifth after the Scythians, the Sarmatians, the Alans and the Huns – had projected their presence far into Eastern Europe. With the Avar occupation of Pannonia and the settlement of the Lombards in Italy, the mass migrations came to an end, and the Middle Ages began in Eastern Europe. In the Avars, however, Byzantium had nurtured an extremely irksome enemy, who would finally be defeated only by Charlemagne in 796. Byzantium and Western Europe adopted the iron stirrup from the Avars, which led to a renaissance of heavy cavalry.[18] Combined with a high pommel, stirrups made it possible for armoured bowmen to rise in the saddle and shoot an asymmetric recurve bow in almost any direction. Avar warriors had also very early adopted curved blades for their swords, which increased their cutting efficiency.[19] As the blade was still pointed at the end, the sword could still be used as a thrust weapon, the curve allowing a warrior to strike behind the opponent's shield.

Hot on the heels of the fleeing Avars were the Western Turks under Ishtemi, who like most steppe-nomad leaders defined his realm not so much in terms of territory as in terms of the peoples under his control. In escaping the newly established khaganate, then, the Avars were committing treachery, and whoever took them in was aiding and abetting it. In response to this, a Turkic embassy led by the Sogdian nobleman Maniakh came to Constantinople in the winter of 568–69. It had three objectives. First, Ishtemi asked that Emperor Justin II offer no land to the Avars, whom he considered to be no more than runaway slaves. Already during the war against the Hephthalites, he had declared: 'They [the Avars] are not birds that can take to the sky to escape the swords of the Turks, nor are they fish that they can take to the water and hide in the depths of the sea; but they must travel the earth. When I have ended the war with the Hephthalites, I shall attack the Avars and they shall not escape my might.'[20] Secondly, the yabghu Ishtemi was looking for any ally against his earlier partner Sassanid Iran, which not only stood in the way of further southward advance by the Turks, but had also had the temerity to seriously mistreat a Turkic embassy. This conflict between Turks and Persians arose from the enormous annual

146. The Citadel of Herat, Qala-e Iktyaruddin, Afghanistan, where the Göktürks suffered a heavy defeat in 588 or 589 on their southward advance. The hill on which the citadel stands has been settled since the time of the Achaemenids (550–330 BCE), and the current fort dates from the time of the Timurid Shah Rukh (r. 1405–47).

payments – in the form of bales of silk – which the two contending Chinese dynasties of the Northern Zhou and the Northern Qi were prepared to make to the Turkic Khaganate to ensure its neutrality.[21] With their existing networks in China and Central Asia, and a clear idea of the value of the Eurasian market for luxury goods, the merchants of Sogdiana had been quick to recognise the promising commercial opportunity now offered by Sogdiana's incorporation into the khaganate. For the two Chinese states sent some 200,000 bales of silk annually to north Central Asia, which the Turkic warrior elite was in no position to make use of itself. The Sogdians could buy this silk from their new masters and sell it to the west at a profit, without themselves having to pay the high cost of transport from central China.

The Sogdian merchants now needed unobstructed access to the Byzantine market, which meant a right of transit through Iran. And so in 567, on Maniakh's advice, Ishtemi sent two embassies to Shah Khosrau I. The first, led by Maniakh himself, the Iranian ruler merely snubbed: while he bought the proffered silk, he immediately had it burnt. When Ishtemi – whom the Byzantine historian Menander calls Sizabul – sent a second embassy, Khosrau then had most of the delegation poisoned, clear grounds for war.[22] As negotiation with the Sassanids had failed, Maniakh, Ishtemi's trusted counsellor, advised that direct negotiations be opened with the Byzantines, negotiations that led to a defensive-and-offensive alliance.[23] The agreement concluded in early 569 was historic, for this was the first time that a major east-Central Asian power had engaged in such negotiations with a powerful European state. The outcome was a strategic alliance, which – despite a war between the two parties in the late 570s – would be decisive in ensuring Constantinople's survival. But the Sassanid response was not long in coming, and in 570 Khosrau occupied the Yemen, in order to disrupt Byzantium's maritime trade with India.[24] The history of Turkic-Sassanid and Byzantine-Sassanid relations shows that even in the first millennium many wars had their origin in trade disputes.

The conclusion of the treaty was followed by regular diplomatic exchanges between Constantinople and the Turkic Khaganate. In August 569 the Byzantine ambassador Zemarchus travelled with the returning Turkic delegation, and there in the eastern Tian Shan Mountains, by the Tekes River – and so in

147. In the late 570s, during the war against the Byzantine Empire, the Göktürks conquered almost the entire Crimea. In their footsteps, Sogdian merchants, who had close trade relationships with the Göktürk elite, founded the port of Sogdaia, today's Sudak, on the southern coast of the Crimea around the end of the 6th or beginning of the 7th c. From this port on the Black Sea, goods could easily be transported to Byzantium. The architecture seen in the picture dates from the time of the Italian trade republics, for between *ca.* 1204 and 1261 Sogdaia intermittently belonged to the Venetian trade empire, and from then until 1475, but also with interruptions, it was controlled by the Genoese.

north-west Xinjiang[25] – he was able to meet Sizabulos (Ishtemi), after having undergone a ritual purification by fire. They 'led Zemarchus himself through the fire [and] thought that by this means they had purified themselves also'.[26] Then he was ushered to Sizabulos. 'He was in a tent, sitting upon a golden throne with two wheels, which could be drawn when necessary by one horse.'[27] Ishtemi and Zemarchus reaffirmed their mutual friendship, and the khagan began preparations for an attack on the Sassanids. Since Maniakh had died in the meantime, Ishtemi appointed Tagma as his successor, who accompanied Zemarchus on his return to Constantinople, which they reached in late 571. There followed four other Byzantine embassies to the Turks.[28] In the meantime, in 572, Emperor Justin had thoughtlessly provoked – so says Menander – a war with the Sassanids that cost Byzantium dear and which would only be brought to an end by the emperor Maurice in 591. Justin, however, became mentally ill in 574 and abdicated in favour of his general Tiberius.[29] And nor did Ishtemi's half-hearted offensive bring any advantage to the Turks.

When in late 575 or early 576 the Byzantine ambassador Valentinus arrived in the khaganate on his second mission to the Turks, he found a changed political situation. Ishtemi had just died, his son Tardush was the new viceroy (with interruptions r. 575–*ca.* 603?), and the Byzantine representative was first taken to the camp of Turxanthus,[30] which lay west of the Caspian Sea.

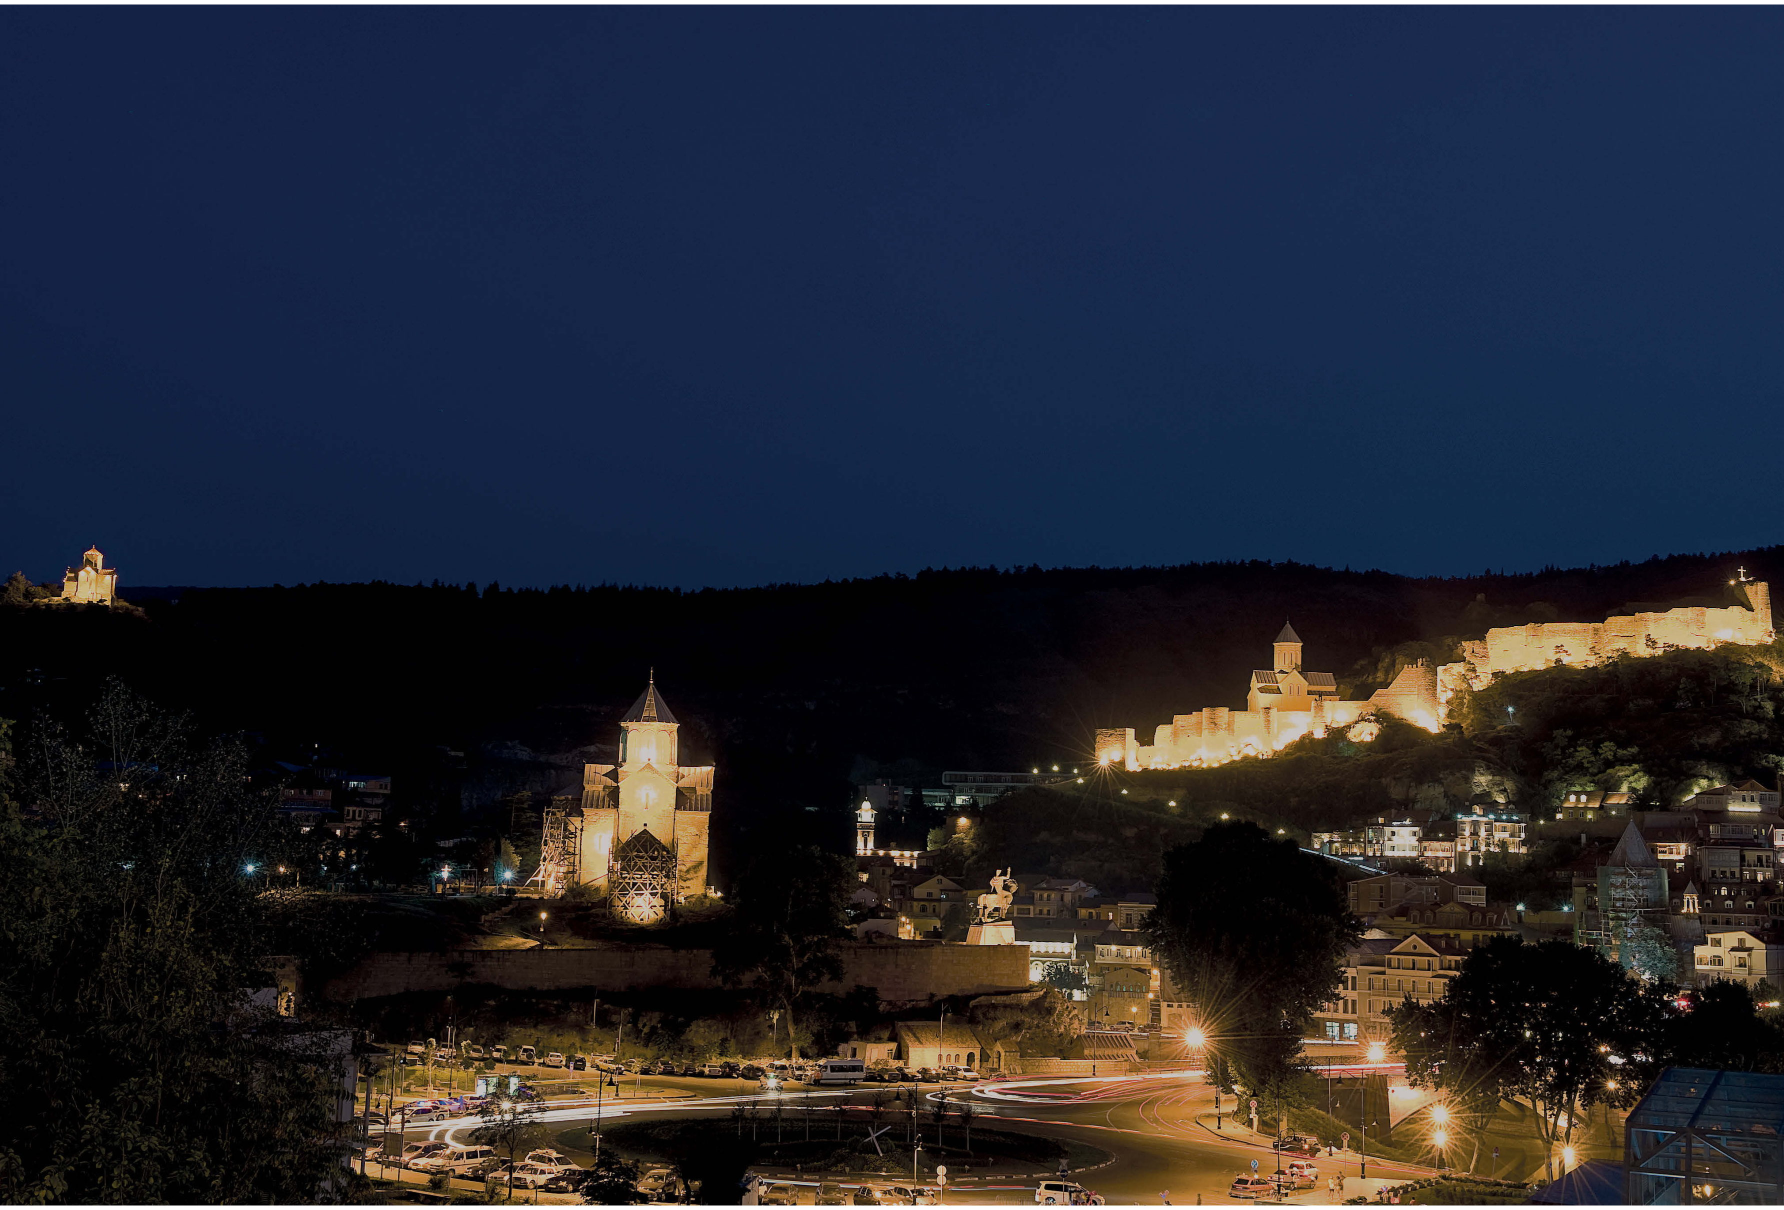
Turxanthus was a son of Ishtemi's, and brother or half-brother to Yabghu Tardush. When Valentinus asked Turxanthus to finally put some energy into the attack on the Sassanids, the Turkic leader angrily retorted that the emperor was a deceiver, for he had concluded an agreement with the Avars. He recalled the fate of the Caucasian Alans, defeated not long after 572, threatened Valentinus with death, and ordered his general Bokhan and his Utrigur vassal Anagai to attack the Crimea. Turxanthus concluded by compelling the Byzantine diplomats to express their condolences on the death of Ishtemi in the manner of the Turks: 'You must follow the custom which prevails among us for the dead and slash your faces with daggers.' Turxanthus then had four prisoners and Ishtemi's horses sacrificed in honour of the deceased, before sending Valentinus to Tardush in the eastern Tian Shan.[31] Turxanthus's talk of war had not been empty, for in the winter of 576–77 Bokhan crossed the probably frozen-over Cimmerian Bosporus and captured the Byzantine city of Pantikapaion (today's Kerch). The Turks then slowly made their way through the Crimea, towards the important Byzantine outpost of Cherson, whose eastern approaches were guarded by a series of strong mountain fortresses garrisoned by Alans and Goths. Though the Turks succeeded in reaching Cherson in mid-579, their siege proved fruitless.[32] With this advance, though, the khaganate had reached its maximum extent, stretching from

Manchuria in the east to the shore of the Black Sea: the Göktürks had not only constructed a state that spanned the entire Eurasian land mass, commanding the trade routes that went with it, but they also controlled much of the continent's horse breeding, giving them a significant strategic advantage over their Chinese and Sassanid opponents.

Twelve years later, the Byzantine emperor Maurice (r. 582–602) had a surprising encounter with Turkic prisoners of war. In 590, the Sassanid general Vahram Chobin, who had just defeated a Turkic army near Herat, had staged a putsch against Shah Hormizd IV (r. 579–90), forcing his son Khosrau II (r. 591–628) into Byzantine exile. Khosrau won the support of Maurice, who sent an army against the usurper, who was defeated at Urmia. Theophylact Simocatta tells of the fate of those taken prisoner: 'Khosrau handed some [prisoners] to the jaws of the sword, while others he presented as toys for the feet of the beasts [elephants]. When he learned that some of the captives were of Turkish race, he sent them to Emperor Maurice. On their foreheads was inscribed the sign of the Lord's passion, which is called a cross by the ministers of the Christian religion.'[33] These prisoners were Turkic and perhaps also Sogdian mercenaries from Bukhara, whose mothers had had the sign of the cross tattooed on their foreheads as children. Christian missionaries had told them 20 or 30 years earlier that such a tattoo would ward off the plague.

The Turkic-Byzantine alliance was revived in the mid-620s, ensuring Constantinople's victory over the hitherto unvanquished Sassanids. Emperor Heraclius (r. 610–41) wanted an ally to take the war to the Persian Empire, while the Western Turkic ruler Tong Yabghu (r. *ca.* 617–30) sought to secure the steppe trade routes against the threat of Sassanid attack. Tong Yabghu first sent Heraclius an elite unit of mounted warriors,[34] then in early 627 his nephew Böri Shad led a force from the North Caucasus southward into Sassanid territory. The Turks stormed the supposedly impregnable fortress of Derbent on the western shore of the Caspian Sea and advanced into the region of today's Azerbaijan. They then swung west to invade central Georgia, a small Sassanid

148. **The eastern casemates of Eski Kermen in the south-western Crimea. This fortified cave town, which was founded in the 6th c. CE by the Byzantines, was situated on a rock plateau 1,040 m long and 170 m wide. In the late 570s the fortress was unable to halt the Göktürk advance, and a century later Eski Kermen, like the neighbouring cave towns, had to recognise the suzerainty of the Turkic Khazars.**



149. From 626 or early 627, a Western Turkic-Byzantine alliance besieged the main fortress of Tbilisi, Georgia, which was held by the Persian Sassanids, but it only fell in 628. The fortress called Narikala in the right of the picture, which was founded by the Sassanids at the end of the 4th c., was always swiftly rebuilt by its conquerors because of its strategic importance. In 1827 a powerful explosion destroyed the fortress, since the Russian occupants had stored their gunpowder there. In the centre of the picture is the Metechi Church, which was built by the Georgian king Demetrius II between 1278 and 1289.

vassal state. The Turkic army, now perhaps led by Böri Shad's father Bagha Shad, or even by Tong Yabghu himself,[35] hurried to the capital Tbilisi, already under siege from Heraclius. There the Turkic and Byzantine rulers agreed an alliance by marriage, though this was never acted on. As the siege stretched on, the Turkic commander returned to Central Asia and Heraclius turned to the south, where in late 627, near Nineveh, he defeated a large Persian army, prompting unrest among the Sassanid nobility and officer corps, a disquiet that led in early 628 to the deposition and murder of Khosrau II by his own son Siroe.[36] Not long after, the Turks under Böri Shad's command took Tbilisi and massacred the Persian garrison. Heraclius managed to benefit from the victory of his Turkic ally by converting Iberia (central and eastern Georgia) into a vassal state; Lazica (antique Colchis, which is western Georgia) had already been a Byzantine vassal state since 562.[37] After the conquest of Tbilisi the shad sent his general Chorpan Tarkhan to Armenia, then occupied by the Sassanids. There Chorpan Tarkhan defeated a Sassanid cavalry army, bringing most of Armenia back into the Byzantine Empire as well.

1.2 Buddhism, Funerary Rituals, and the Splitting of the Khaganate

Residing in the east of the khaganate, Muqan Khagan not only quickly extended his authority to the Khitan and the Kyrgyz but in 554 surprised the Tuyuhun with a lightning attack, winning much booty. Ten years later, however, he failed in his attack on the Northern Qi in Shanxi.[38] Muqan was succeeded on his death by his younger brother **Taspar Khagan** (r. 572–81), the last universally recognised ruler of the united khaganate. Although Taspar succeeded by military means in forcing the mutually hostile states of Zhou and Qi to pay him substantial tribute, he did draw nearer to Chinese culture. He allowed the monk Huilin to convert him to Buddhism, built a monastery, and sent for Buddhist sutras from China,[39] though it is worth remembering that his predecessor Muqan Khagan had already asked the Northern Zhou to build a Buddhist 'Temple of the Turks' for him in Chang'an.[40] Erected shortly after Taspar's death around 582, the famous Bugut Stele, inscribed on three sides in Sogdian and on the fourth in Brahmi-Sanskrit, confirms Taspar's commitment to Buddhism in the following words: 'And he [most probably Taspar] ordered: "Establish a great new samgha [a Buddhist monastery]!"'[41] Taspar also invited the Gandhara-born Buddhist monk Jinagupta (*ca.* 528–605) to come to him, when the Northern Zhou banned Buddhism in 574, forcing Jinagupta to flee the court where he had been residing. Not long afterwards, 11 monks returning from India with the 260 Sanskrit sutras they had acquired there found refuge with Taspar.[42] That the inscription on the official memorial stele to Taspar Khagan should be for the most part written in Sogdian indicates the importance of Sogdian merchants and counsellors within the khaganate; Sogdians, in fact, held important posts in the civil service and Sogdian seems to have been used as the language of administration. Only towards the end of the seventh century does a Turkic script seem to have been adopted in the khaganate.[43]

The presence of a dozen or two Buddhist monks at the khagan's court left no archaeological trace and changed neither the attitudes nor the customs of the Turks. The most important deities of the

150. The David Gareja cave monastery complex, founded in the 6th c., was then an eastern outpost of Orthodox Christianity. It was destroyed several times by Central Asian conquerors, including the Seljuks, the Mongols and Timur Lenkh as well as by Muslim great powers such as the Persian Safavids and the Turkic Ottomans. Today five monks live in the cave hermitage of St David at the foot of the complex which once consisted of 13 monasteries.

151. The main church of the Udabno Monastery of David Gareja was partly destroyed by an earthquake. Its murals from the 11th c. feature episodes from St David's life, for example in the top right corner St David and his disciple Lukian encounter a herd of does which offer the two thirsty hermits their milk.

Göktürk pantheon were the sky god Tengri, the earth and water goddess Iduk Yer-sub, the fertility goddess Umay, and the god of death Erklig Khan.[44] And the Göktürks' creation myth figures on the memorial stele raised for Kül Tegin in 732: 'When the blue sky above and the brown earth below were created, between them a human being was created.'[45]

The Göktürk elite also retained their funerary rituals, described not only by Valentinus but also by the *Zhou Shu*, the chronicle of the Northern Zhou (557–81) composed in 636: 'If a person [from the ruling clan] dies, the deceased is laid in his tent. And his descendants and relatives kill and lay their own sheep and horses at the front of the tent and hold a kind of a funeral ceremony. They ride around the tent seven times clockwise, and whenever they reach the door of the tent, they cut their face with swords and cry each time. Thus, they shed blood and tears together. [. . .] They cremate and bury the deceased together with his horses and articles of every day use on a special day. Then they bury the ashes of the deceased on an appropriate day. If a person died in spring or summer, they dig the ground for burial of his ashes in the autumn when plants and trees wither. If a person died in autumn or winter, they dig the ground for burial the next spring when flowers or trees come into bud. On the funeral day, all the relatives of the deceased perform a ceremony riding around on a horse and cutting their own faces as mentioned above. After the funeral, they erect stones at the grave and establish the grave marker. As to the stones, their number depends on the number of enemies killed by the deceased in his lifetime.'[46] A little later the Göktürk elite replaced cremation by the earth burial that by then prevailed among the ordinary members of the tribe. The Tang emperor Taizong (r. 626–49) noted in 628: 'It was earlier the custom among the Turks to burn their corpses, but now they bury them and raise a grave mound'[47] – like the Chinese.

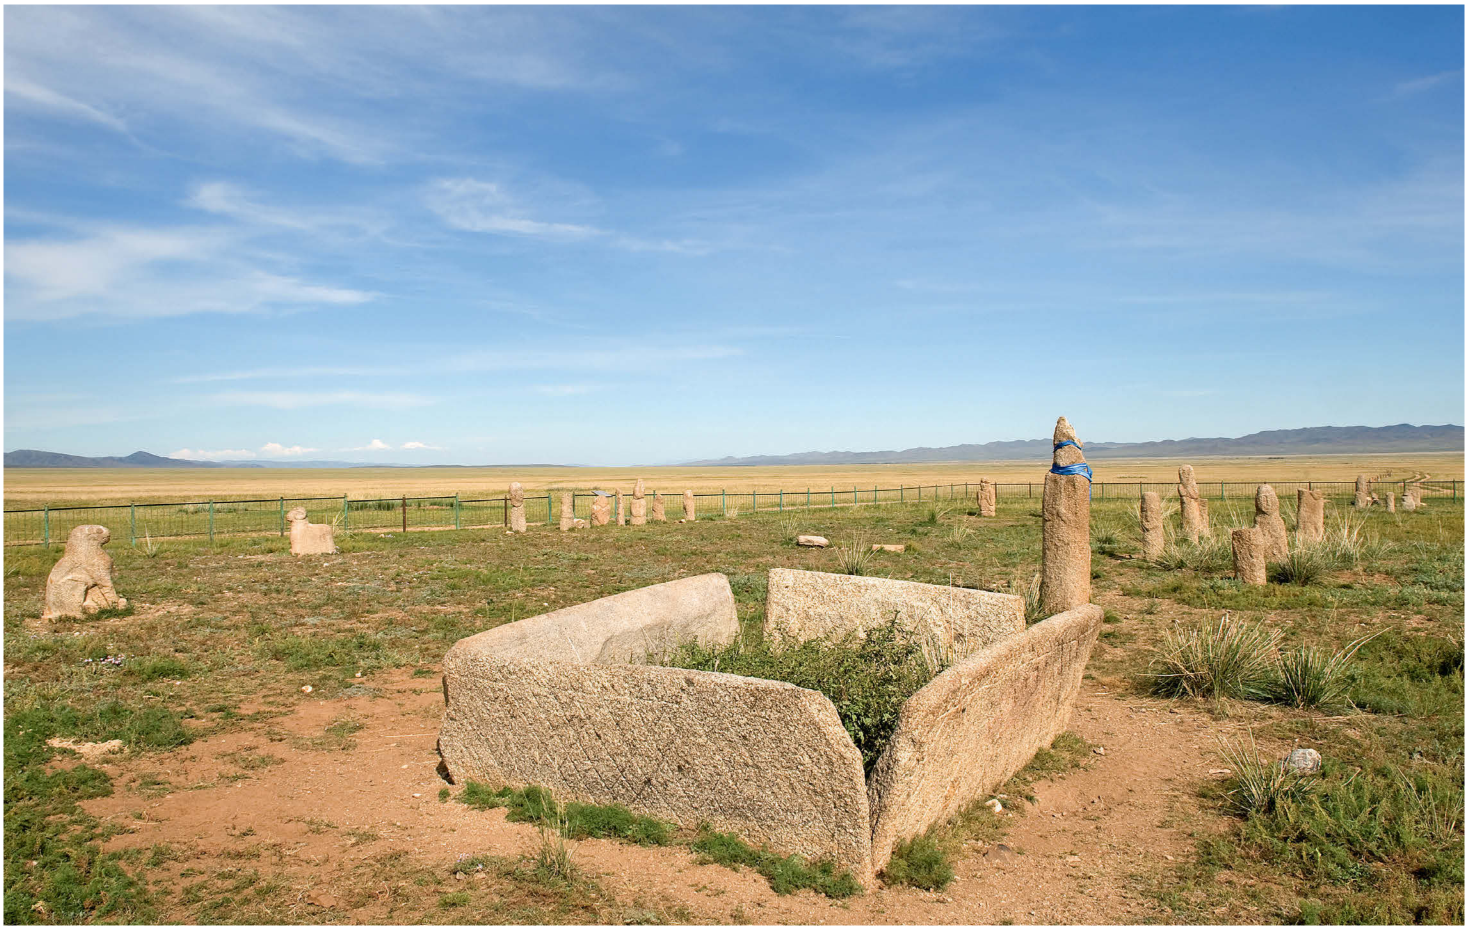
The funerary ritual for leading members of the tribe thus took place in three stages (fig. 222). The deceased was at first laid out and ritually mourned, then the body was cremated, and in the following autumn or spring the ashes were finally buried and a memorial was erected. In most of its aspects, including the burial with the deceased of a bridled and saddled horse and the less common human sacrifice observed by Valentinus, this ritual was

152. The Georgian rock-hewn town of Uplistsikhe, an important hub on a trade route which existed since the 5th c. BCE, attained great wealth in the Middle Ages. The destructions by the Central Asian Timur Lenkh between 1386 and 1404, as well as the loss of access to the Western European markets after the fall of Constantinople in 1453, led to the decline of the town. On the left, a late Hellenic complex with gable architecture, on the right a three-nave basilica from the 13th c.

very close to that of the Scythian and Hunnic nomadic horsemen. Grave and memorial were not, however, at the same location, and the site of the actual burial remained a secret.[48] Furthermore, the same number of stone steles (called *balbals*) were erected as of enemies the deceased had slain in his life. It is clear from both Chinese chronicles and Turkic runic inscriptions that each one of the *balbals* set out in a long row represented one adversary killed.[49] The number of such steles varied with the military career of the departed, ranging from just a few to more than 300, giving rows of up to three kilometres long. The rows generally extended eastward from the wall of small stones surrounding the memorial. This custom indicates how great a value the Göktürk elite attached to a warrior's performance in battle. The custom continued in the tenth century among the Turkic Oghuzes, who lived north-west of the Aral Sea, as witnessed by Ibn Fadlan, secretary to an Abbasid ambassador, in 922: 'If he [the deceased] has killed any one and has been a hero, then they carve statues out of wood in the number of those whom he has slain.'[50]

Distinct from the *balbals* are the anthropomorphic granite figures within the stone enclosure, generally standing, less often seated, with stylised faces, arms and hands, by which later descendants commemorated their ancestors and sought their protection.[51] In the days of the Göktürks, these figures are largely male, as can be recognised from their moustaches and war belts (fig. 155).[52] The central stone figure, up to two metres high, which generally represents the dead hero, is sometimes surrounded by short rows or groups of small anthropomorphic or zoomorphic stone figures representing high-ranking persons from the deceased's milieu or animals such as horses or lions. The largest complexes contained stone cists formed of four upright granite slabs, whose outer sides were decorated with geometrical and floral patterns, or, as at the mausoleum of Kül Tegin, with paired phoenixes. While these last were adopted from Chinese iconography, the bird here represents the soul of the deceased in flight to the beyond, for the inscription on the memorial stele says explicitly 'flown away' rather than 'dead'.[53] Containing neither an inhumation nor vessels for cremation ashes, these cists were not sarcophagi, and it is clear that these sites were pure memorial complexes.[54] Of the monumental Göktürk tombs of Mongolia, that of Öngüt, 90 kilometres south-west of Ulaan Baatar and dating from 645 or 646, is the best preserved in situ (figs. 153f). Some memorials, such as Taspar's at Bugut and those of the minister Tonyukuk, the commander Kül Tegin, and Bilge Khagan, also have inscribed stone steles celebrating the achievements and military successes of the deceased. Sometimes the complex included a building resembling a pavilion, whose walls are decorated with murals. 'The court painters of the Chinese emperor took part. I got them to build an extraordinary mausoleum. They decorated the inside and outside with wonderful paintings and sculptures.'[55]

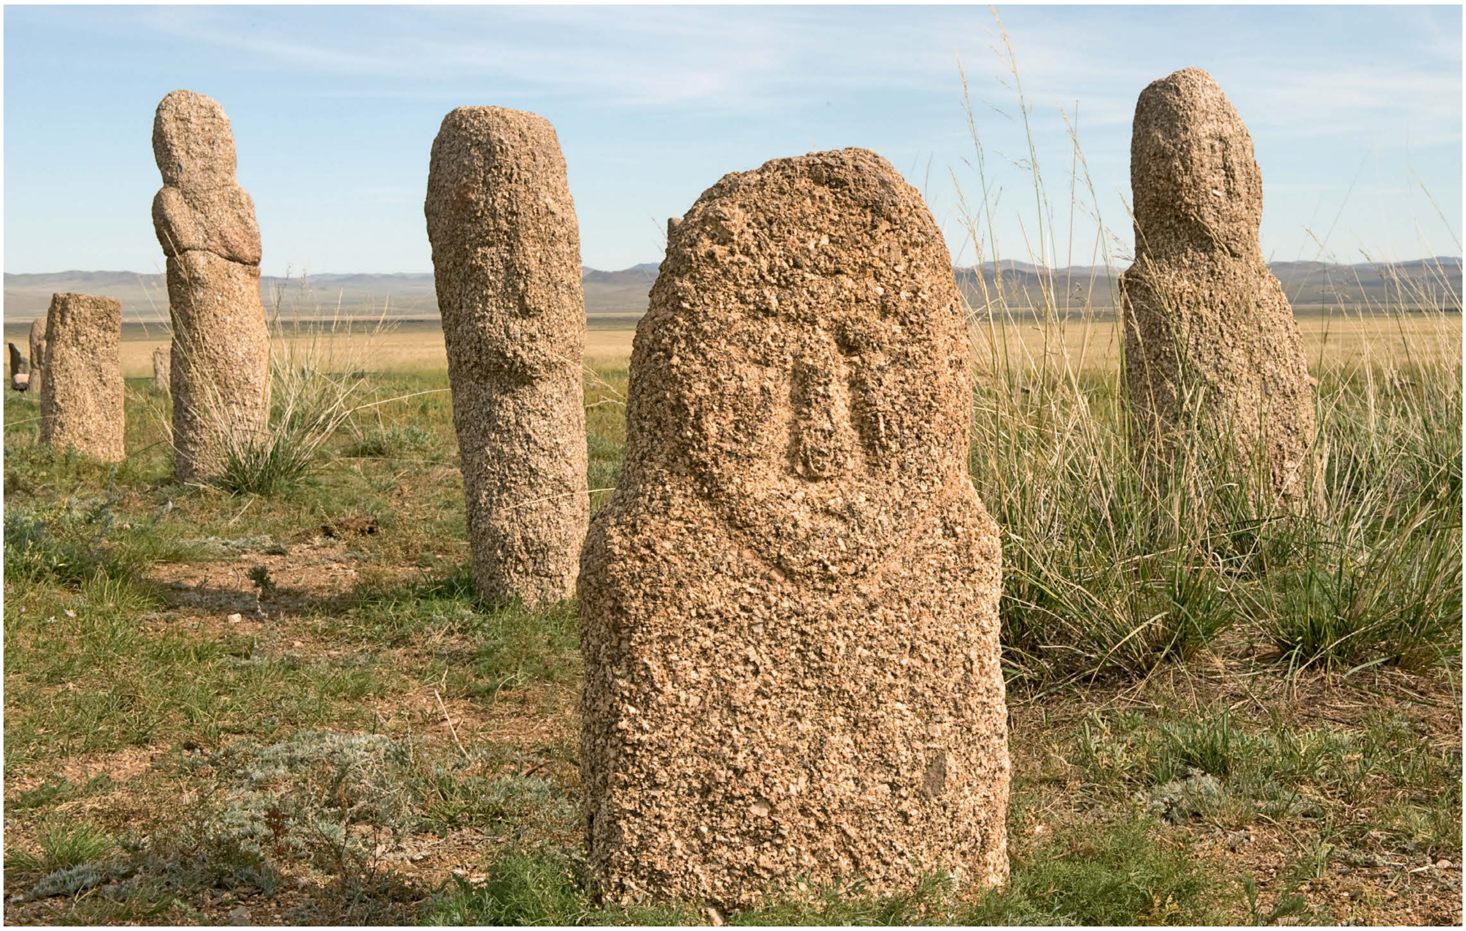
The inscribed steles standing on stone turtles, the rows of sculptures, and the pavilion-like building clearly all derive from Chinese models. Even closer to Chinese Tang dynasty examples are two recently excavated Göktürk graves, with a dromos leading down to the burial chamber, which contained typically Chinese grave figurines called *mingqi*. In a grave excavated in 2010 at Zaamar Sum in Töv Aimag, Central Mongolia, a military commander of the Göktürk Pugu tribe, who had died in 677, was buried, as was recorded on a stone slab with an inscription of 750 Chinese characters.[56] Even more exceptional is the 42-metre-long Shoroon Bumbagar grave complex, which was excavated in 2011 near Ulaan Kherem in Bulgan Aimag, Central Mongolia. This was the first Göktürk tomb with well-preserved wall paintings, showing both Chinese and Korean influences, that had ever been discovered. The 22-metre dromos, three of the four antechambers and the main chamber were all richly painted. In the dromos, a dragon and a white tiger are represented, in the first antechamber two grooms each holding a horse, in the second four Chinese dignitaries, and over the entrance to the third a dragon's head. In the burial chamber proper, in which stood a wood coffin containing an urn



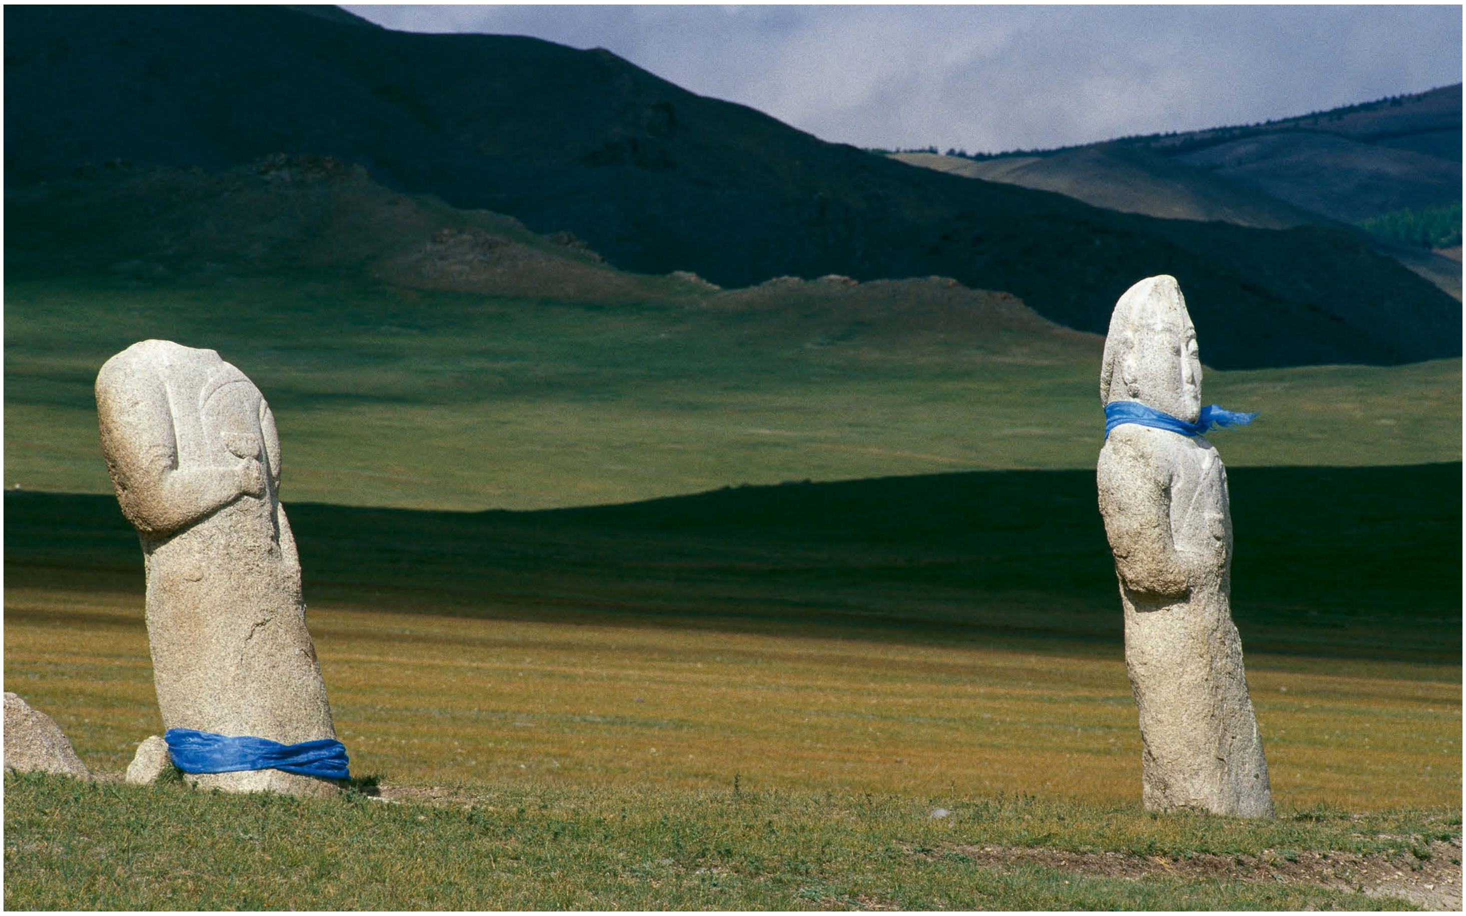
153. The Göktürk memorial complex of Öngöt, which was once surrounded by a wall measuring 55 x 38 m, Töv Aimag, Mongolia. In the foreground stands a stone cenotaph, decorated with diamond patterns, measuring 268 x 245 cm; behind it a 205-centimetre-high, anthropomorphic stone figure and 25 medium-sized additional humanoid granite statues. There are also sculptures of a ram and a lion. Extending the largest group of stone men is a row of 550 *balbals*, *ca.* 2 km long. As Mongolian runic inscriptions and Chinese chronicles report, each *balbal* stood for an enemy killed by the deceased. Given the very high number of *balbals*, the deceased must have been a khagan or a very important military leader. V.E. Vojtov hypothesises that the complex was built for the ruler of the Xueyantuo, Zhenzhu Khagan, who died in 645 CE.[15]

with ashes, the walls are decorated with eight persons either seated or strolling in a garden setting.[57] Of the 117 *mingqi* figurines found, most represent armoured horsemen, infantry soldiers (fig. 156), officials and noblewomen; there are also a number of Buddhist guardians of the four cardinal directions, represented in armour and standing on a cow or bull, symbols deriving from the Hinduism that Buddhism had superseded. There were also wooden figures of birds, fish, and human-bird hybrids. Together with jewellery, the burial chamber also contained 41 gold bracteates of the Byzantine emperor Heraclius (r. 610–41), some overstamped with Turkic runic or Sogdian characters. These give a *terminus post quem*, the earliest possible date at which the tomb complex was constructed. The identity of the person buried there has not yet been established, but he must have been a member of the highest strata of the tribal elite. Entirely foreign to the Chinese, however, was the kind of levirate marriage widely practised among the Göktürks and later the Mongolic peoples. 'After the death of the father, or of one of the father's brothers, a son, brother or nephew of the deceased would marry the step-mother [never the natural mother], aunt or sister in law as the case might be.'[58]

The year 581 saw decisive shifts in both China and the First Khaganate. In China, the Sui dynasty succeeded in reuniting the country politically, massively increasing its military power. In the khaganate, Taspar's death provoked a civil war that lasted from 581 to 603 and led to its division. This brought about a reversal of roles: while until 581 the united khaganate had secured its own advantage by playing the Northern Zhou and Northern Qi off against each other, now Emperor Sui Wendi (r. 581–604) succeeded in sowing discord among the Ashina chiefs and in setting the claimants to the Turkic throne at each others' throats. At the start of the Turkic power struggle, the emperor's foreign policy adviser, General Zhangsun Sheng had recommended: 'Tardush [the Western Turkic yabghu] has more soldiers than Shetu [Ishbara Khagan], yet ranks beneath him; outwardly, they stick together, but among themselves they are at enmity. Were one to stir up their passions, they would begin fighting each other without any ado! [. . .] Now one should ally with the one who lives afar [i.e. from the Sui] and attack the one who lives nearer, divide the power of the strong, and muster the weak.'[59]



154. Some of the anthropomorphic granite figures of the Göktürk memorial complex of Öngöt from the 7th c., Töv Aimag, Mongolia.



155. Two life-size Göktürk stone figures on the north-western shore of the Terkhin Tsagaan Lake, Arkhangai Aimag, Mongolia. It is a characteristic of Göktürk stone men that they hold their drinking vessels in their right hands in front of their chests, while their left hands rest near the belts with their daggers. Depictions of the vessel held in both hands and of belts with numerous straps, on the other hand, suggest a post-Göktürk dating, such as the time of the Uyghurs (fig. 250).

2. The Eastern Turkic Khaganate

After Taspar's death four claimants contended for the khaganate: Taspar Khagan's son **Anluo**, Muqan Khagan's son **Daluobian**, later Apa Khagan, and Issik Khagan's son **Shetu**, who was then Nivar Khagan of the easternmost territory and who not much later would become Ishbara Khagan. They were joined by **Tardush** Yabghu, a son of Ishtemi's, encouraged to lay a claim to the whole khaganate by the machinations of Emperor Sui Wendi. The council of elders rejected Daluobian, whom Taspar had designated as his successor, appointing Anluo Khagan in 581. The latter was unable to establish his authority over the spurned Daluobian, and so abdicated in favour of Shetu, who ruled under the name of **Ishbara Khagan** (r. 581–87). He first conferred on Daluobian the title of Apa Khagan, but then launched a surprise attack on him in 583, fearing the possibility of an alliance against himself between Daluobian and Emperor Sui Wendi. Apa Khagan took refuge with Tardush Yabghu in the west, although Sui Wendi then managed to inflict a crushing defeat on Ishbara Khagan. Threatened by a coalition between **Apa Khagan** (r.? d. 587) and Tardush on his western flank, Ishbara Khagan recognised Sui suzerainty, thereby securing his southern border. He then attacked and defeated Apa Khagan in the west.[60]

Ishbara was succeeded by his brother **Baghan Khagan** (Chuluohu, r. 587–88), who may have been killed in battle against the Sassanid general Vahram Chobin at Herat.[61] He was followed by Ishbara's son **Dulan Khagan** (r. 588–99); his reign was marked by the discord provoked among the royal family by a Chinese policy of favouritism in the matter of gifts, and in 597 he stopped paying tribute to the Sui. Two years later he was assassinated, and the Western Turkic **Tardush Khagan** (r. 599–603?) seized the opportunity to assert his claim to a united khaganate. As Emperor Sui Wendi wished at all costs to prevent such a reunification, he bribed several Turkic chiefs to reject Tardush Khagan's authority.

156. **A Chinese-style painted clay figure with Central Asian features, *ca.* 70 cm high, of a Chinese officer. From the grave complex of Shoroon Bumbagar, Bulgan Aimag, Mongolia, which was discovered in 2011. Karakorum Museum, Kharkhorin, Mongolia.**

When the latter then launched a campaign against China and his renegade chiefs, Zhangsun Sheng poisoned the springs and wells along Tardush's line of march, decimating his army and forcing him to flee.[62] The unity of the Göktürk empire was now definitively broken, with **Yami Khagan** (r. 603–09) left to rule the Eastern Turks only, as China's vassal. The new khagan also seems to have preferred the comforts of Chinese life over the ruder amenities of Mongolia. In 608 Emperor Yangdi (r. 604–18) noted in an edict that the khagan had 'often expressed his wish to erect a house like those of his [Chinese] neighbours, with timbers and rooms, finding the felt walls and hangings [of the yurt] to be primitive'. The khagan was thus granted a house on the great loop of the Yellow River.[63]

The weak and dependent Yami was succeeded by his son **Shibi Khagan** (r. 609–19), who actively interfered in Chinese domestic politics. He began by strengthening his administration, introducing more Sogdian advisers and officials, a move which displeased the Chinese government. Counsellor Bei Ku advised the emperor that 'The Tujue [Turks] are essentially artless and uncomplicated, and one may promote discord among them; unfortunately there live among them many Hu [barbarians, Sogdians] who are cunning and shrewd and who instruct and direct them.'[64] In 615, on Bei Ku's advice, the Emperor lured the khagan's Sogdian chief counsellor Shi Shuhuxi (this being his Chinese name) into a trap, and had him executed. Upon this, Shibi Khagan ceased paying tribute and briefly besieged the emperor as he undertook a tour of inspection in the province of Shanxi. At the time, there was unrest in China as a result of an extremely costly war against Korea, and Shibi Khagan's success encouraged discontented Chinese princes to abandon the Sui and recognise his suzerainty. The khagan's dominion now extended from the Khitan in the east to the Tuyuhun and Gaochang in the south-west. In 617, determined to bring down the Sui dynasty, he formed an alliance with the rebellious Sui general Li Yuan, who would soon become the founder of the Tang dynasty. To help Li Yuan take the capital Chang'an, he sent him a contingent of mounted bowmen, who were rewarded by being allowed to thoroughly plunder the fallen city.[65]

Shibi's successor **Chuluo Khagan** (r. 619–20) ruled for just 18 months, and was succeeded by his brother **Illig Khagan** (**Xieli** in Chinese, r. 620–30), the last ruler of an independent Eastern Turkic Khaganate. Like Shibi, Illig Khagan pursued an active foreign policy in relation to China's Tang dynasty, seeking not territorial expansion but rather constant pressure on the first Tang emperor, Gaozu (r. 618–26), the former General Li Yuan, so that he paid regular tribute. It was to this end that between 621 and 625 he undertook yearly campaigns in the north of the Chinese Empire. As a first defensive response, Gaozu had a flotilla of warships patrol the Yellow River, but in the late summer of 626 events began moving very rapidly. While Illig Khagan and his nephew Tuli advanced into China at the head of a large cavalry army, Gaozu's second son staged a coup against his father, ascending the throne on 3 September, under the name Taizong (r. 626–49). Three weeks later, Illig arrived at the gates of Chang'an, demanding tribute.

Taizong had to yield, paying the khagan an enormous ransom, upon which the latter withdrew. The emperor, however, swore to avenge this humiliation, and was soon presented with an opportunity.[66] Firstly, though, he reformed the Chinese army, which consisted mostly of infantry and whose small, heavily armoured cavalry was badly trained. Taizong established separate units of mounted archers, whose training he personally supervised. Secondly, he ordered large-scale manoeuvres, in the course of which this new arm operated independently as light cavalry units, thereby familiarising his generals with the strategy of the highly mobile steppe war.

After his 626 campaign, Xieli Khagan seems to have taken up residence not far from the present city of Hohhot in Inner Mongolia, together with the numerous Sogdian advisers who controlled the Eastern Turkic administration. In that same year there was apparently an enormous volcanic eruption that saw ash fall as far away as Constantinople and caused years of dramatic climate change in Mongolia and northern China. Various Chinese chronicles report that the weather cooled markedly, with summer frosts in Mongolia, and that the Mongolian steppe saw unusually heavy snowfall in the years 627–629. The transformation of this snow cover into ice led to mass livestock deaths and famine.[67] Rather than helping the starving population, Xieli Khagan raised taxes to compensate for the foreseeable shortfall in income. This wrongheaded policy provoked the ire not only of the associated tribes but also the Ashina clan, already angered by Xieli's preference for Sogdian advisers. The first to rebel in 627/28 were the Turkic Xueyantuo, accompanied by the Uyghurs and the Bayegu, who defeated the armies sent against them by Xieli, including one led by Xieli's nephew Tuli. When Xieli upbraided his humiliatingly defeated nephew, he too rose in rebellion, together with part of the Ashina. In 629, Yinan, chief of the Xueyantuo, declared himself khagan under the name **Zhenzhu Khagan** (r. 629–45), and together with the Uyghurs and the Khitan, formed an offensive alliance with the Chinese emperor Taizong against Xieli Khagan. In the winter of 629–30 six separate Chinese cavalry formations attacked Xieli along a 1,200-kilometre front, and he was taken prisoner that year.[68] With this the First Göktürk Khaganate ceased to exist as an independent state, and Zhenzhu Khagan of the Xueyantuo took

157. Morning milking of the goats in Khovd Aimag, Mongolia. The animals are tied together with a long rope around their necks.

up the succession. This prompted Emperor Taizong to adopt for himself, on the request of several Turkic chiefs, the title of *Tian Kehan*, or 'Celestial Khagan'.[69]

Despite Emperor Taizong's triumph, the Turco-Chinese border region remained unsettled. In order to break the remaining power of the Ashina, Taizong fragmented their tribal organisation, dividing them into different hordes, which he settled in the Ordos, south of the Yellow River, in the hope of sinicising them. In 639, however, he only narrowly escaped assassination by the younger brother of the former Ashina commander Tuli, who was serving as an officer of the guard in the Chinese army. Taizong then forced the Ashina Turks to resettle in the region north of the Yellow River and south of the Gobi Desert and appointed **Qilibi Khagan** (r. 639–43, d. 645) as their puppet ruler. At the same time, he told the Xueyantuo to go and live on the grass steppe north of the Gobi; that is, in Central and Northern Mongolia, so that they were cut off from the remaining Göktürks by the desert. For Taizong, Qilibi Khagan's Eastern Turks were to serve as a submissive buffer state between China and the Xueyantuo, who were now growing dangerously strong. The plan failed when the Xueyantuo's Zhenzhu Khagan advanced southward in 642 and the Eastern Turks beat a hasty retreat across the Yellow River. For a few years, Zhenzhu Khagan would be the most powerful ruler north of that river. But when his son and successor **Duomi Khagan** (r. 645–46) made plans to attack China, Taizong made an alliance with Uyghur tribes, who in 646, combined with a Chinese army to inflict a crushing defeat on Duomi Khagan, prompting the dissolution of his clan.[70]

At the same time, Ashina Hubo, a member of a junior family of the Ashina clan, took advantage of the destruction of the Xueyantuo to make an attempt to revive the Eastern Turkic Khaganate, declaring himself **Chebi Khagan** (r. 646–50). On his refusal to recognise him as suzerain, Taizong again struck an agreement with Uyghur bands and in 650 took him prisoner. Two further attempts on the part of the Eastern Turks to escape Chinese tutelage and to win independence under **Nishufu Khagan** (r. 679–80) and **Funian Khagan** (r. 680–81) were both brought quickly to an end by Emperor Gaozong (r. 649–83).[71]

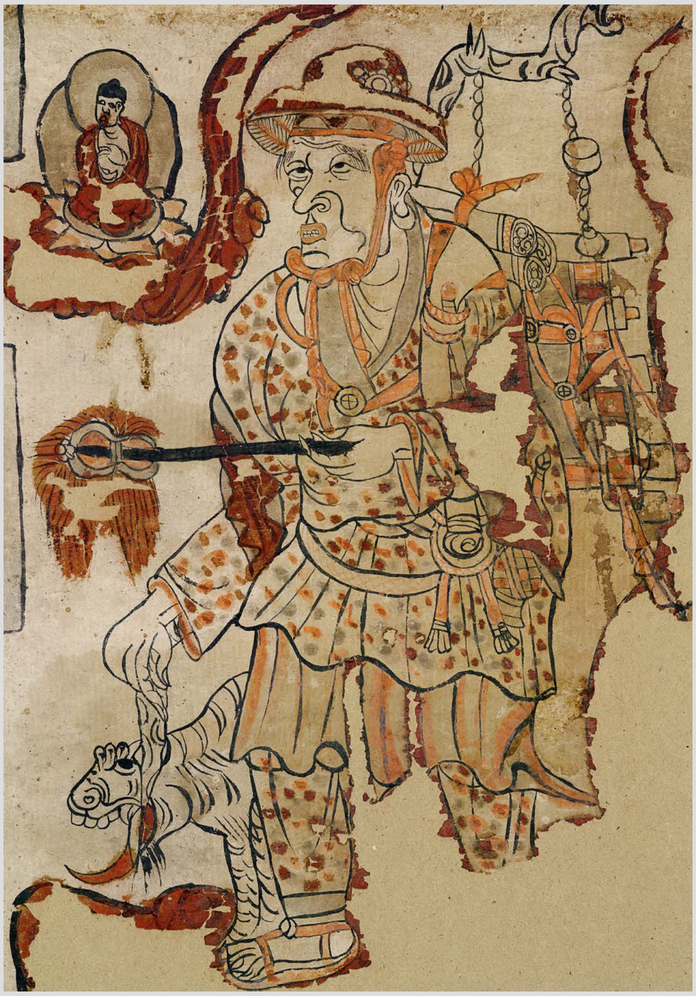
Chinese Pilgrim Monks

After the Chinese annals, the most important literary sources for the history of Central Asia are the travel writings of Chinese pilgrim monks. Between the third and the late tenth centuries, Buddhist monks from China would make the years-long journey to India, and their route would take them through Central Asia. Only three decades of destructive raiding by the Islamic warlord Mahmud of Ghazni, between 1001 and 1030, would bring these Indian pilgrimages to an end. Such journeys had three objectives: to make pilgrimage to sites associated with Shakyamuni's life, and others where his widely dispersed relics were preserved; to bring original Buddhist texts back from India to China; and to study at Buddhist monastery universities of India, this last being an especial concern of Faxian and Xuanzang. They might also have a diplomatic function. Some of these pilgrims diligently observed the political, cultural and religious life of the places they passed through, and the journals they kept thus represent historical sources of the first order, although it can sometimes be difficult to distinguish eyewitness reports from hearsay.

Among the earliest such travellers were **Zhu Shixing,** who in 260 travelled from Luoyang to Khotan, to study the Mahayana sutras in Sanskrit and to send copies of them home, and **Faxian** (d. *ca.* 418/23), who in 399 set out for India by the land route, returning in 413 by sea. Leaving Chang'an, he travelled to Dunhuang and crossed the dreaded Lop Desert to reach Shan-shan. Of the desert crossing he noted: 'In this desert there are a great many evil spirits and also hot winds [. . .]. There are neither birds above nor beasts below. Gazing on all sides as far as the eye can reach in order to mark the track, no guidance is to be obtained save from the rotting bones of dead men, which point the way.'[72] In the years around 400, the road between Shan-shan and Khotan was apparently impassable, for Faxian went north to Yanqi, then crossed the Taklamakan Desert, probably following the Keriya river. From Khotan Faxian proceeded to Kashgar, traversed the 'hanging passages' of the Karakorum mountain range, and in the Darel Valley, not far from the Indus, he admired the famous monumental statue of the Bodhisattva Maitreya in gilded sandalwood. He then visited the many pilgrimage sites of Gandhara, amongst others the cliff caves at Hadda, where Buddha Shakyamuni was said to have left his shadow.[73] After visiting the Buddhist holy places of India, Faxian then returned to China via Sri Lanka and Sumatra.

Unlike Faxian and Xuanzang, **Song Yun** and **Huisheng** had more than religion in mind when they made their journey from 518 to 521. Huisheng was a monk, but Song Yun was a diplomat, asked by Empress Dowager Hu of the Northern Wei dynasty (who ruled as regent in 515–20 and 525–28), to reconnoitre and spy out the newly emerging Hephthalite empire. Song Yun reported that the ruler of Shan-shan was a member of the Tuyuhun royal family and that Khotan paid tribute to the Hephthalites. Their dead were cremated in accordance with Turkic custom, and mourners cut their faces with daggers, though the king was actually buried far out in the desert. From Khotan, the delegation travelled through Tashkurgan to the Wakhan and on into the Swat Valley. There Song Yun and Huisheng made pilgrimages to two places associated with jataka tales. At one place Shakyamuni in an earlier life had offered his body as food to a hungry tiger, and at the other had 'peeled off his skin for the purpose of writing upon it and extracted [broke off] a bone of his body for the purpose of writing with it'.[74] They then visited the king of the Alkhan in Gandhara, to whom they delivered a written communication from Empress Dowager Hu.[75]



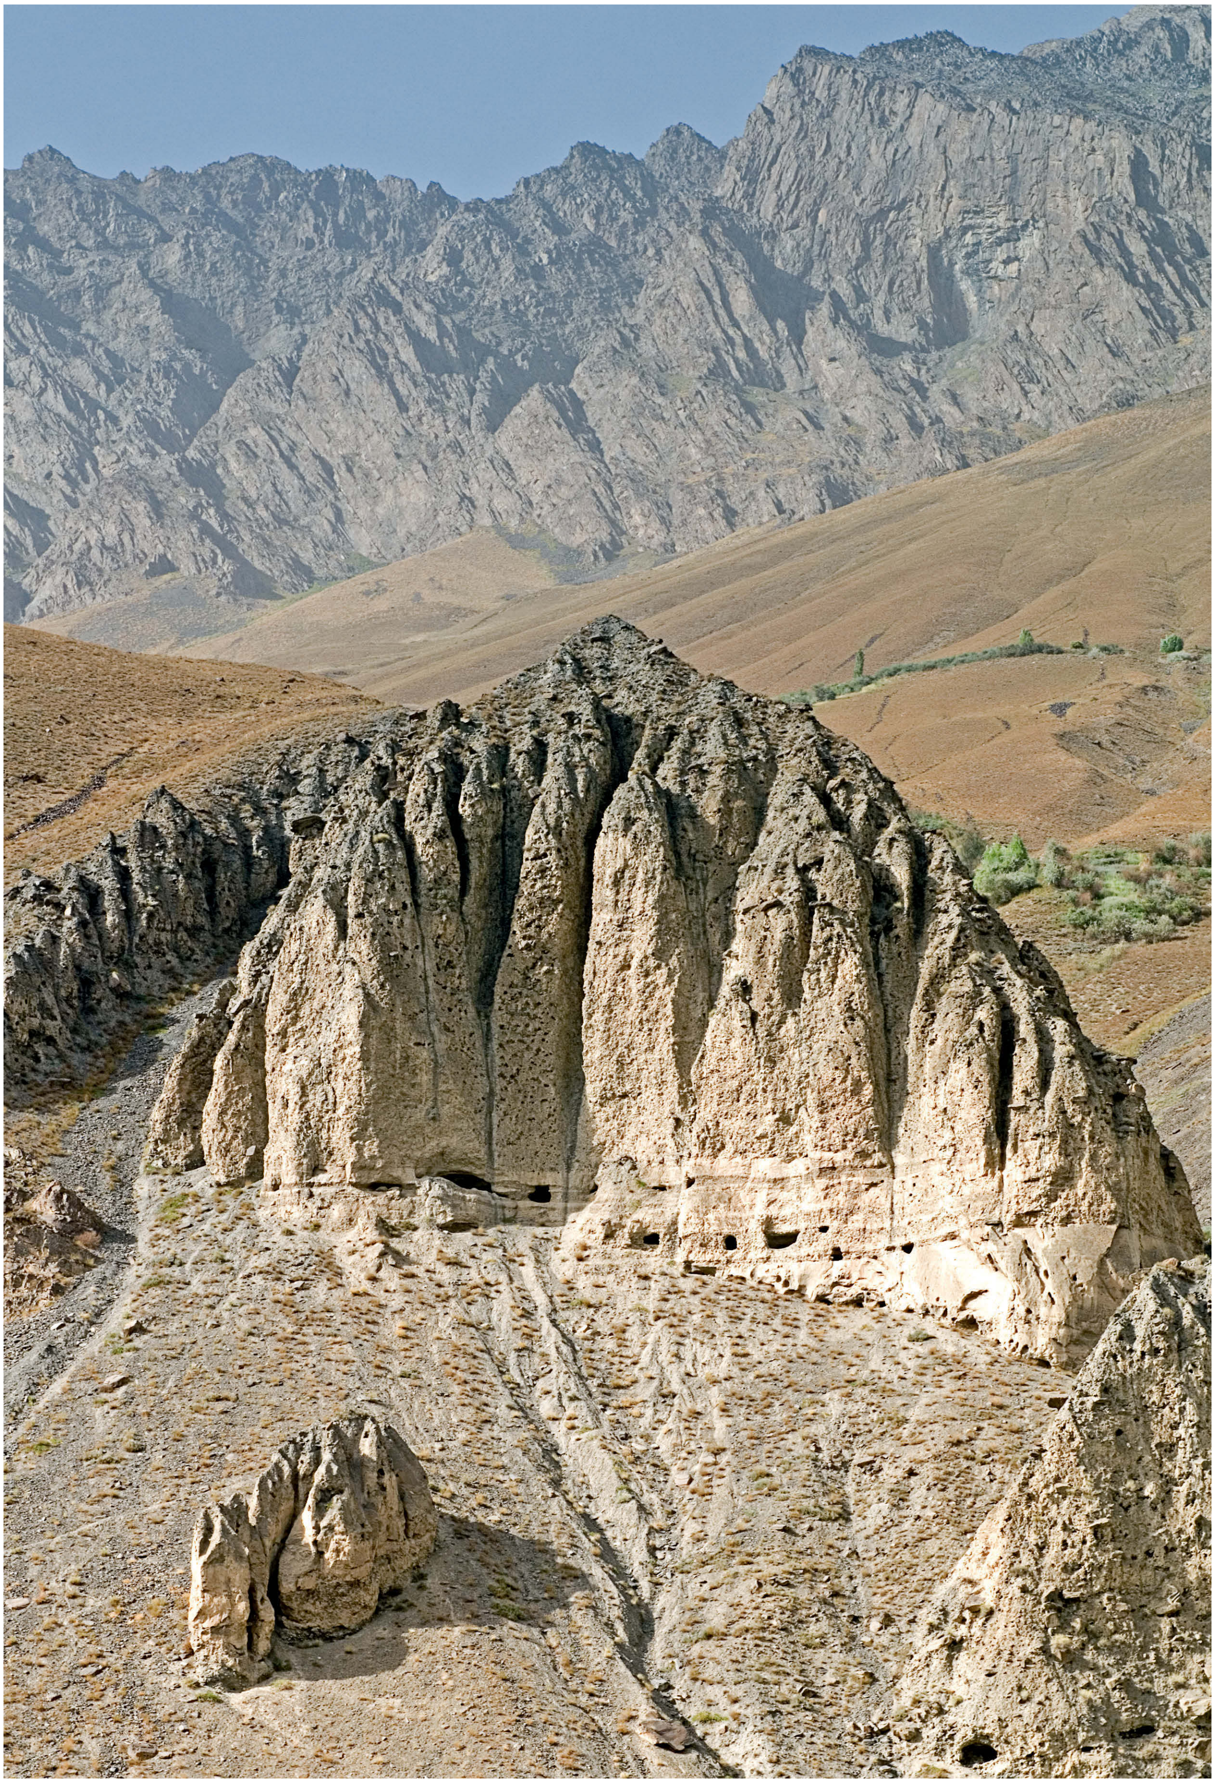
159. Drawing, ink and colours on paper of a travelling monk, late 9th c, Dunhuang, Gansu, China. The monk, with a back-carrier of Buddhist scrolls and a fly whisk, is accompanied by a tiger. Buddha Prabhutaratna, sitting on a cloud, is protecting him. Such pictures have remained popular to this day and appear either in connection with Xuanzang or with the boundless wisdom of Lohan (Sanskrit Arhat) Dharmatrata, from whose right knee sprang a tiger which protected him.[16] The Trustees of the British Museum, London.

The most famous of the pilgrim monks was doubtless **Xuanzang** (600–64), whose 15-year odyssey was the subject of a popular late sixteenth-century Chinese novel entitled *Journey to the West*. The circumstances of Xuanzang's departure were difficult, for he and his companions were forbidden by imperial decree to travel abroad.[76] Undeterred by this prohibition, Xuanzang secretly left Chang'an in 629 and made his way to the Wuwei prefecture in Gansu. As the governor there had launched a search for him, he went on, travelling only under cover of night, to Anxi, 100 kilometres east of Dunhuang. The road west was guarded by the border fort of Yumen Guan, and north of that by a chain of watchtowers, and these he had to do his best to avoid. He found himself a horse and a non-Chinese guide, most likely a Turk. The old horse proved more useful to him than the guide, as it had already done the journey to Hami 15 times and knew the way, while the guide, on the other hand, tried to kill his client. So Xuanzang continued alone with his horse, and after being twice shot at from a watchtower, he entered the Moheyan Desert, which lay between him and Hami. His description of crossing that arid waste recalls that of Hedin's fateful excursion in 1895. 'There was no bird flying above, nor any beast roaming below; neither was there any water or grass. Now the Master had only his lonely shadow travelling with him.' After some 50 kilometres he wanted to drink, but he dropped his water container from fatigue and his entire supply spilt on the ground. In his despondency, he first wanted to turn round, but then he braced himself: 'I would rather die on my way to the West than return to the East and live.'[77] After five days of desperate walking and agonising thirst, his experienced horse smelt out a pool of water and saved them both from death by dehydration. As Aurel Stein observed, camels and horses were able to sense water and forage from afar, and also remembered where they had grazed before.[78]

After Hami, the monk made his way to Gaochang, where he entered the realm of the Western Turks, travelling on to Kucha and then Suyab, where he was received by Tong Yabghu Khagan in a magnificently decorated tent. He then went on to Kunduz, where in 630 he was a witness to Ishbara Yabghu's violent seizure of power, when the latter had his father Tardush Shad poisoned. On his way to Gandhara, Xuanzang first visited the reputed hundred monasteries of Balkh, and also those of Bamiyan, whose three colossal Buddha figures he described in detail, before, like Faxian, seeking out the cliff-side cave with the Buddha's shadow.[79] In Peshawar Xuanzang marvelled at Kanishka's stupa and described a distinctive statue of the Buddha which seems to match the clay figure that Kozlov discovered at Kara Khoto in 1909.[80] 'There is a painted figure

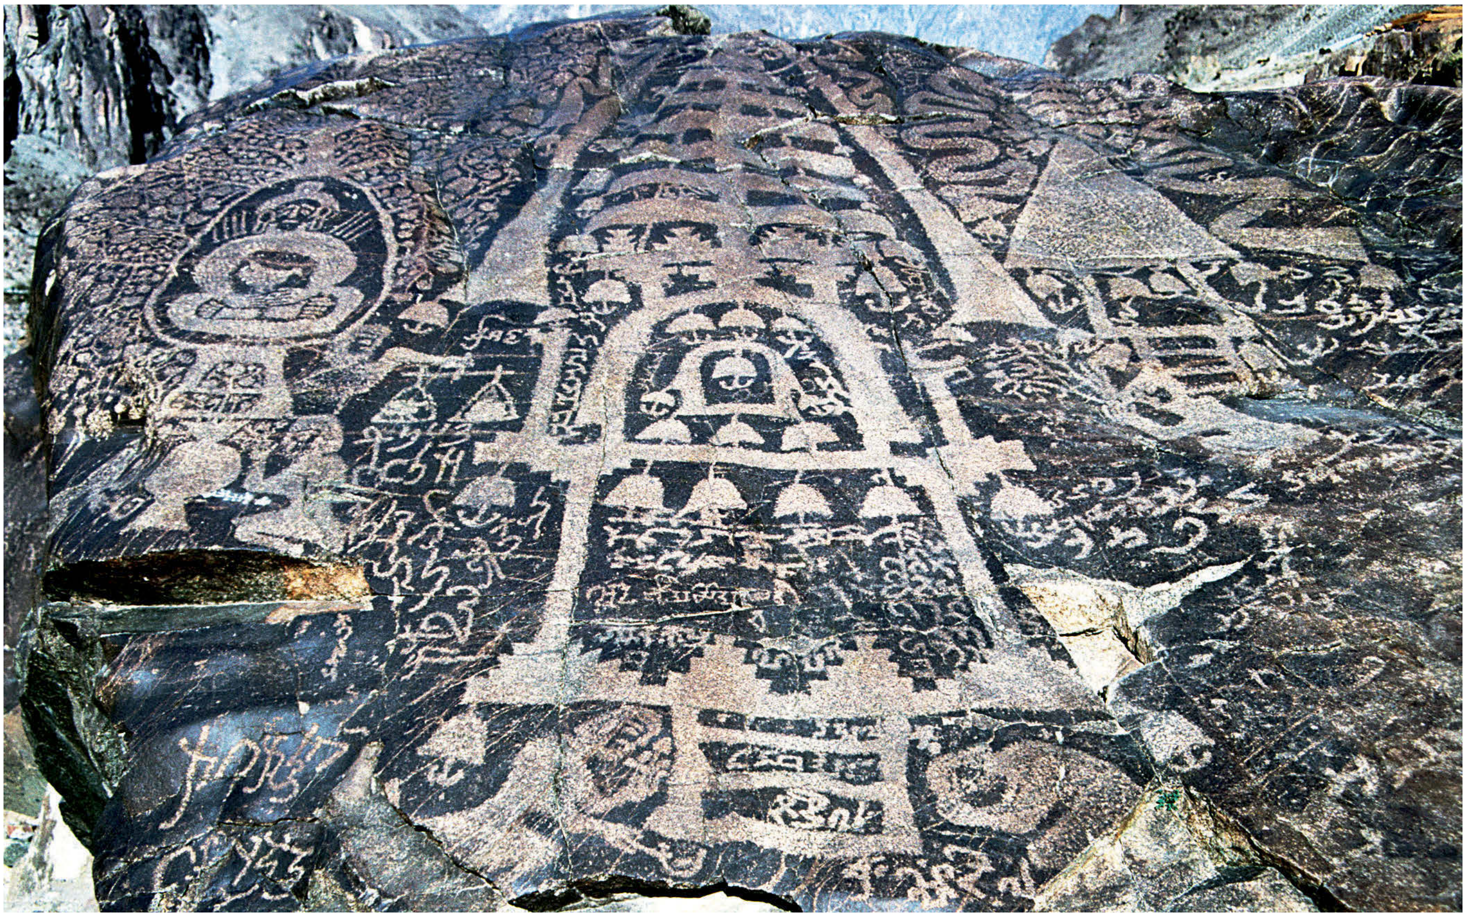
160. Ratm Fort, high above the Pamir, a tributary of the Panj. Together with the forts Kala-i Kahkaha and Zamr-i Atish-Parast, it belonged to a chain of strong forts which controlled the trade route from Badakhshan to Sogdiana. Gorno-Badakhshan Province, Tajikistan.

161. Cells of Buddhist monks above the right bank of the Panj near Vomar, Gorno-Badakhshan Province, Tajikistan. During the 18th and 19th c., these caves served as hideouts for bandits.

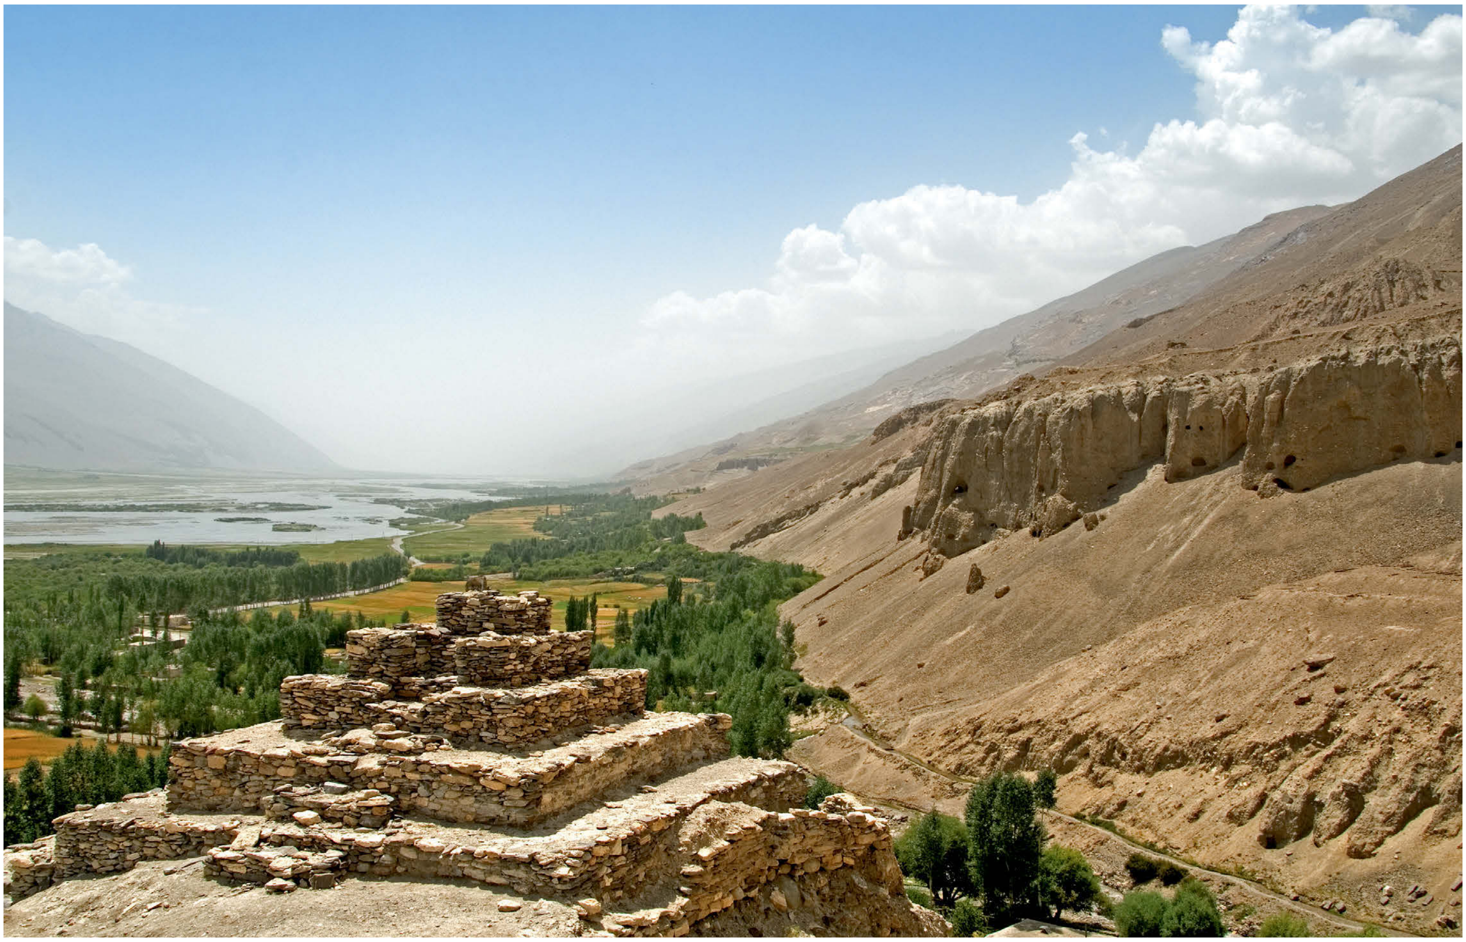


of Buddha about sixteen feet high. From the middle upward there are two bodies, below the middle only one.'[81] It was said that two poor believers had independently ordered a statue of the Buddha from the same sculptor, who for the little money produced only one single statue. As the two buyers stood before it, perplexed, it split apart from the middle upward, and light shone out from both halves. In Gandhara, as in Swat, Xuanzang had regretfully to record that Buddhist monasteries in their hundreds were neglected or abandoned.[82] On the ten-year tour of India that followed, he once narrowly escaped being sacrificed by devotees of the Hindu goddess Durga: while he was travelling on the Ganges, pirates attacked his boat and chose him as a sacrificial offering to the goddess. Only moments from death, Xuanzang prayed to Maitreya, who sent a storm down on the place of sacrifice, whereupon the pirates abandoned their deadly plans.[83]

Around 642, Xuanzang set off on his journey back, heavily laden with sutras. North of Taxila, he suffered an accident when crossing the Indus. The boat capsized and 50 manuscripts sank into the river. Arriving in Khotan a little later, he sent a messenger to Kucha to purchase new copies of the sutras lost in the Indus, which suggests that Kucha's monasteries must have had excellent libraries. First, though, he returned to Kunduz before turning east and following the river Panj upstream towards the Wakhan.[84] On his way, he was struck by the many fortresses intended to protect the land from marauding Turkic forces.[85] After an attack by bandits in the region of Sarikol, and eight months in Khotan, where he had to await imperial permission to return to China, Xuanzang returned to Chang'an in 644, bringing with him 657 Sanskrit texts. He immediately set about translating the most important of the sutras into Chinese, and founded the school of Buddhism that came to be known as *Weishi Zong*.[86]



162. **Petroglyphs and inscriptions on rock 34 of Shatial near the left bank of the Upper Indus, in the autonomous region of Gilgit-Baltistan, the former Northern Areas, in northern Pakistan. Between *ca.* 3rd to 7th c., the settlement of Shatial was a trade hub, for it lay on the crossroads of routes from Swat, Gilgit, the Wakhan and Chitral. In the middle and on the right, two unique pagoda-shaped stupas are engraved, and on the left sits a Buddha with flaming shoulders, holding a bird in his lap. This special representation of the Buddha illustrates the Sibi Jataka, which tells how the gods Indra and Agni put pious King Sibi's generosity to the test. First they transformed into a hawk and a dove, and then the hawk chased the dove, which fled in terror and sought protection in the lap of the king. When the hawk demanded that he hand over the dove, Sibi refused and as compensation offered the equivalent in weight from his own flesh. The hawk accepted but though the king cut several large slices of flesh from his body and threw them on to the scales, they never equalled the weight of the dove. Finally Sibi finally put his whole body on the scales, preparing to die. But even then, the dove was heavier – at which point Indra and Agni revealed their true identities and praised the king for his boundless beneficence. Thanks to the inscriptions in Kharoshthi, Brahmi and Sogdian, the petroglyphs can be dated to the first half of the 4th c.[17] Felsbild-Archiv, Heidelberg Academy of Sciences and Humanities.**



163. **The restored Buddhist stupa of Vrang; in the background the River Panj, Gorno-Badakhshan Province, Tajikistan. Near the stupa stands a second, unrestored stupa (not visible in this photo), and west of this caves were cut into the loose rock, which were used as monks' cells.**

Quite different in nature were the three journeys undertaken by the Chinese diplomat **Wang Xuance**. On his first trip in 643–45 he formed part of an embassy to the North Indian king Harsha (r. 606–47), who was, as Xuanzang tells us, a great champion of Mahayana Buddhism. The second time, in 646–48, he led another delegation to North India only to discover on arrival that a minister of Harsha's had usurped the throne after the king's death, ruling under the name of Arjuna or Arunashwa (Chinese. Aluonashun). Arunashwa mistreated the Chinese delegation, and Wang Xuance fled to Tibet, which in those days maintained good relations with China. Wang returned to North India with Tibetan troops and defeated and captured the usurper.[87] On his third journey around 657–61, Wang visited Buddhist pilgrimage sites and afterwards took the monk Xuanzhao back to China with him. Another great traveller was the Chinese monk **Yijing** (635–713), who spent the years 671–95 in India and Sumatra. But as his journeys were all undertaken by sea, he never had any contact with Central Asia.

Almost a century after Xuanzang, the Korean-born monk **m**
, (*ca.* 700–after 780) made the pilgrimage to India. He set off on his journey by ship, around 723, and travelled back to China by the land route through Central Asia in 726–29.[88] He witnessed not only the decline of Indian Buddhism – finding both Shakyamuni's birthplace Kapilavatsu and Kushingara, where the Buddha entered Nirvana, abandoned and fallen into ruin – but also the advance of the Arabs. When he crossed Sindh in today's Pakistan, he was struck not only by the great piety of the Mahayana and Hinayana Buddhists but also by the devastation wrought by the Arabs in 712 and 725.[89] In the north of today's Pakistan, Huichao noted that the land of 'Greater Bolor' (Gilgit, Punial, Chilas) was under Tibetan control and that its king, expelled between 720 and 722, had fled to 'Lesser Bolor' (Yasin).[90] At that time the region between Tibet and China was fiercely contested, as the Tibetans saw it as a strategic springboard for launching attacks on the undefended south-west flank of the Four Garrisons. As in the 'Great Game' between Russia and Great Britain in the late nineteenth century, the area was a hotspot in the conflict of two great powers. After Huichao, **Bukong Jingang** (Amoghavajra, 705–74) would travel to India, Sri Lanka and south-east Asia between 741 and 746, founding on his return the Chinese school of esoteric Buddhism *Mi Zong*.[91]

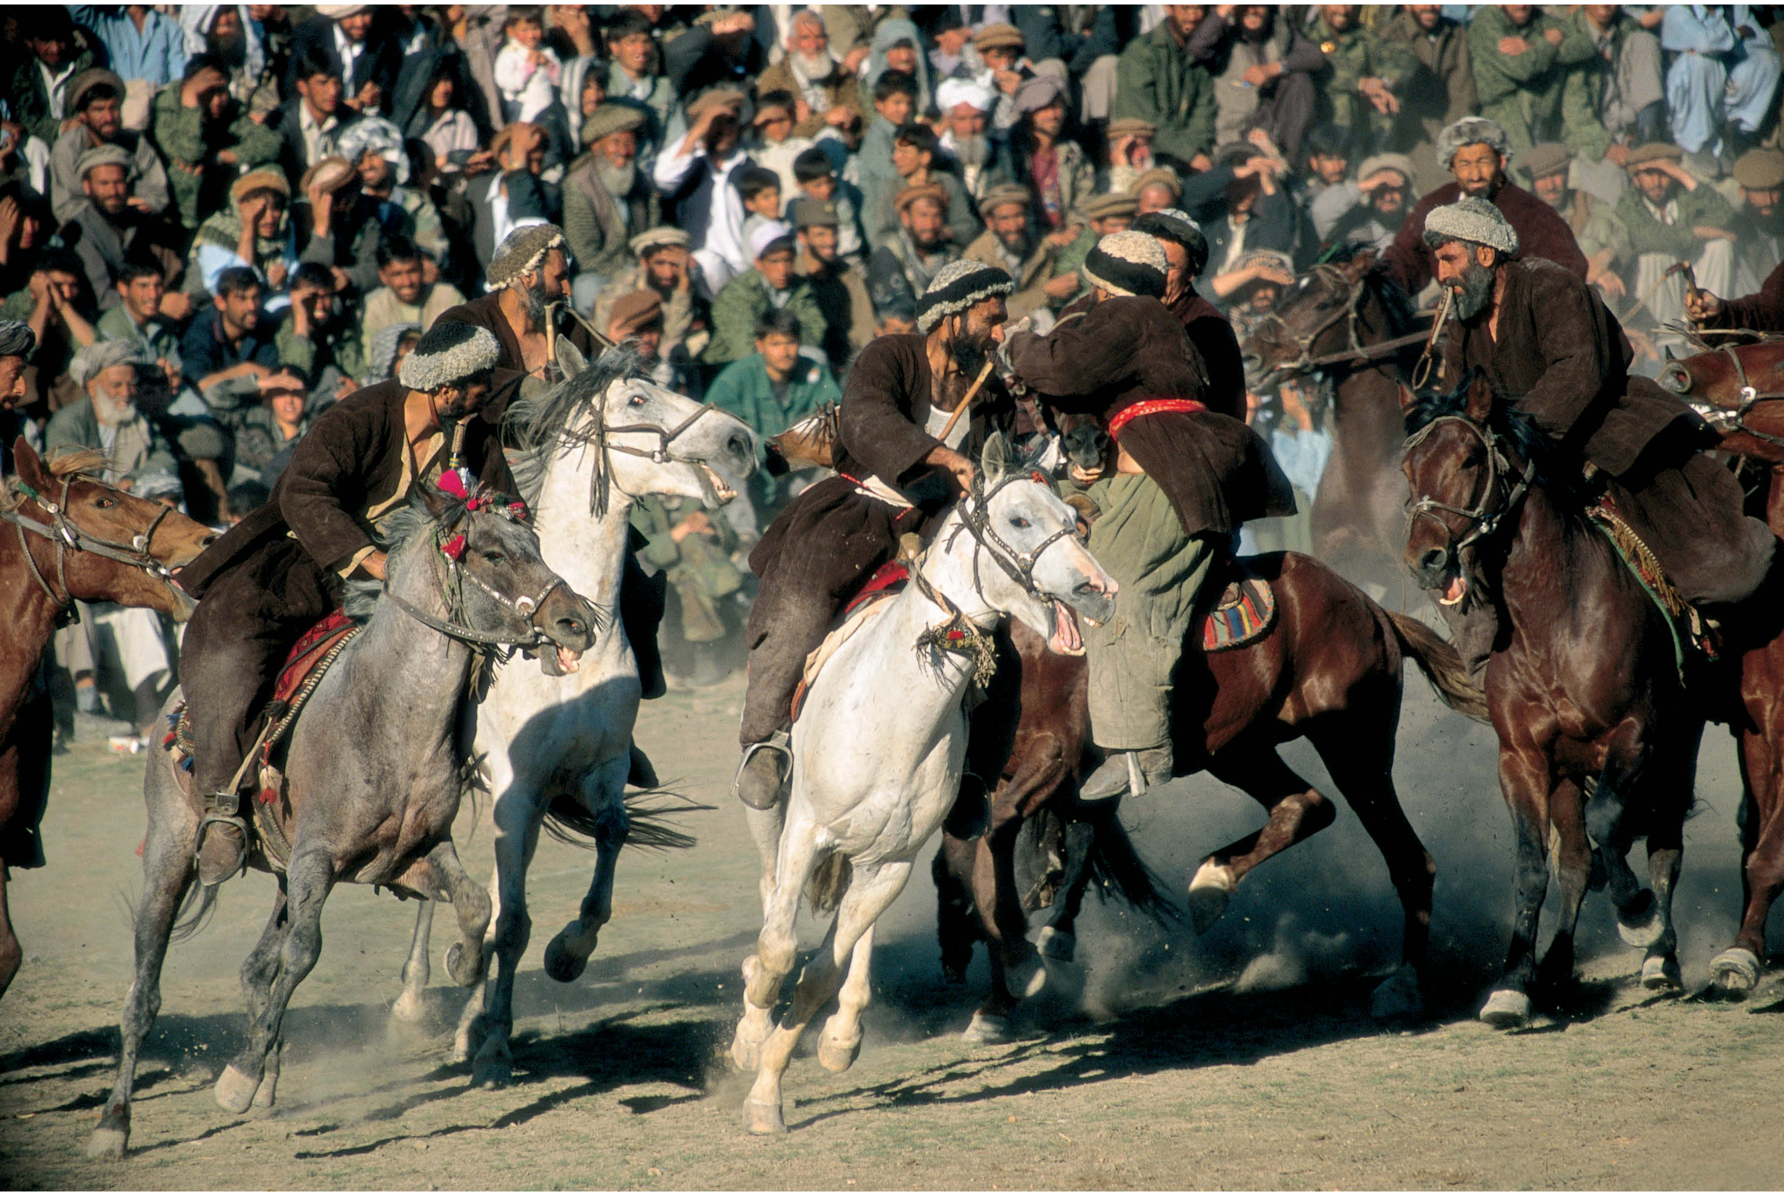
3. The Western Turkic Khaganate

Given the bicephalous organisation of the Göktürks, the western half of the empire enjoyed from the beginning a high degree of autonomy. **Ishtemi Sir Yabghu Khagan** (r. 552/53–75) owed only nominal obedience to the Khagan and followed an independent policy. As one of his camps lay on the River Tekes, the boundary between the two parts of the empire must have run through north-west Xinjiang, meaning that in 630 practically the whole of the Tarim Basin was under Western Turkic rule. Ishtemi's son and successor **Tardush Yabghu** (r. with interruptions 575–*ca.* 603?) not only brought about the definitive separation of the western half of the empire but in 581/82 also started to lay claim to the leadership of the whole khaganate. Towards the end of an only fragmentarily documented political career he succeeded around 599 in extending his rule over a number of Eastern Turkic tribes. But his claim to rule was very strongly resisted, and an eastern campaign around 603 ended in disaster, without a battle fought, after Chinese troops had poisoned the wells. Also obscure is the role that Apa Khagan played in the Western Turkic Khaganate, after taking refuge there in 583. After Apa's capture in 587, the *Sui shu* tells us, a grandchild of Muqan Khagan ascended the throne of the Western Turkic Khaganate as **Niri Khagan** (r. 587–*ca.* 602/03), which leaves Tardush's position at that time unclear.[92] The anthropomorphic stone stele with Sogdian text, raised in honour of Niri Khagan on the steppe north of the Tekes river, stands not far from Tardush Khagan's earlier camp.

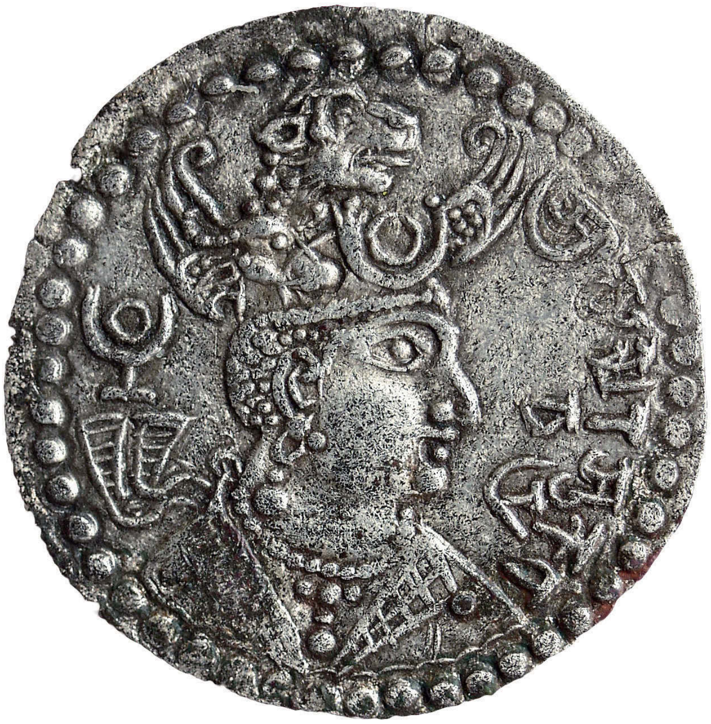
Niri Khagan was followed by his son **Heshana Khagan** (Chuluo, r. 602/03–11), who in 605 attracted the enmity of the Turkic Tiele by levying a heavy exceptional tax on them and having their chiefs killed. The Tiele formed an alliance with other Turkic tribes and drove him out of Dzungaria, west towards the former homeland of the Wusun on the Ili river.[93] In 610 **Shikui Khagan** (r. 610–17), a grandson of Tardush Khagan, acceded to the throne with the support of the Sui, inflicting such a heavy defeat on Heshana Khagan that the latter fled to Karakhoja, and a year later to Chang'an, where he was murdered in 619. Shikui Khagan incorporated the whole of the Altai into the khaganate, conquered the oasis of Čač (Tashkent), made a brief foray to Isfahan in 616–17, and resided north of Kucha.[94] Shikui was followed by his brother **Tong Yabghu Khagan** (r. *ca.* 617–30), who pacified the restless Tiele and expanded the Western Turkic Empire to its maximum extent, stretching in the east from the Tarim Basin to Karakhoja, and as far as the Caspian Sea in the west. His choice of camps reflected this turn towards the west, and he moved the summer residence from the Tekes Steppe to Čač, and chose Suyab, near today's city of Bishkek, as his winter residence.[95]

During the second half of the 620s, Turkic horsemen, as allies of Emperor Heraclius, undertook campaigns in the Caucasus and in Georgia and Armenia. While their military activity in Georgia and Armenia brought the Western Turks no long-lasting gains, benefiting mainly the Byzantines, in the northern Caucasus they laid the foundations for the Khazar Empire, whose khagans were descendants of the Ashina clan.[96] The same period, from 625 onward, saw the Western Turk conquest of Tocharistan and

164. Palace ruin in the circular fortress of Tar-o-Sar, Sistan, Nimruz Province, Afghanistan. The diameter of the fortress, which is also called Sar-o-Tar, was 515 m and it was the centre of a fortified city which measured *ca.* 1.3 km^2. Founded in the 2nd/1st c. BCE by the Parthians, the city remained inhabited until the 15th c. The spectacular shapes of the ruins have been created by the wind, which during the autumn and winter can reach speeds of up to 200 km/h. J. Hackin, J. Carl et J. Meunié, *Diverses recherches archéologiques en Afghanistan (1933–1940)* (Paris, 1959), fig. 65.



165. Buzkashi, an equestrian sport played in Kabul, Afghanistan. The name Buzkashi says it all: *buz* means 'goat' and *kasha* 'to take out', so this is a game of 'dragging a goat'. The sport can either be played by teams or lots of individual competitors. After a dead goat is placed in a chalk circle in the centre of the playing field, several dozen riders charge out and try to lift up the carcass at full gallop. The carcass must then be deposited in a second chalk circle in front of the judge. In the team sport version one team tries to protect their player, as he struggles to grab the dead goat, while their opponents do their best to kettle him in and snatch away the carcass. In the 'every man for himself' version, all the players charge at whoever has the goat to wrest it from him. The game is very rough, and the riders are allowed to use their whips on their horses and sometimes on other players.



166. **Billon drachm of Sakadara, a ruler of the Turk Shahi of Kabulistan. First quarter of the 8th c. Collection Jean-Pierre Righetti.**

a number of expeditions to northern Gandhara under the leadership of Tardush Shad (d. 630), eldest son of Tong Yabghu Khagan, whose troops advanced as far as the Indus. As in Sogdiana, the Turks retained the highly fragmented political structures of Tocharistan and northern Gandhara but often installed Turkic nobles or officers as rulers over their petty states. As Xuanzang recorded, Tocharistan alone accounted for more than two dozen statelets: 'Thus they have constituted [in Tocharistan] twenty-seven states, divided by natural boundaries, yet as a whole dependent on the Turkish tribes.'[97] Among the more important vassal kingdoms, answerable to the Turkic governor who resided at Kunduz, were Zabulistan, Kapisa (Kabul), Gozgan (in eastern Turkmenistan), Bamiyan, Khuttal (Khatlon province in Tajikistan), Chaganian (the Surkhan Darya Valley in southern Uzbekistan), the trading city of Termez (important for being on the Oxus), Shuman (the area around Dushanbe), Shignan (part of Badakhshan), Badghis (northwest Afghanistan), Kobadian (the Kafirnigan Valley in southern Tajikistan) and Badakhshan.[98] To keep all these petty states under control, the yabghu adopted a mobile form of government, as noted by Xuanzang in 642/43: 'The king [yabghu] is of the Turkish clan; he governs all the little kingdoms to the south of the Iron Gates [between Samarkand and Termez]. He constantly shifts his dwellings like a bird, not constantly occupying this town [Kunduz].'[99] One of his most important means of control was the office of the *tudun*, who either acted as resident, collecting taxes and supervising the local ruler, or administered a province on his own account.

The yabghu Xuanzang referred to here was Ishbara Yabghu, who had come to power by killing his father. Xuanzang himself witnessed this terrible event in 630, when he spent some time in Kunduz, at the court of Tardush Shad. That ruler was then in mourning for the death of his wife, a princess from Karakhoja, which didn't prevent him from marrying the dead woman's younger sister. But this young woman poisoned her new husband immediately after the wedding at the instigation of Tardush Shad's son Ishbara, who then married his new stepmother.[100] Turkic rule over Sogdiana and Tocharistan then suffered a severe setback between 648 and 659, when the Western Khaganate collapsed under Chinese attack and both heartland and vassal states came under the actual or nominal suzerainty of China's Tang Dynasty. The following century was characterised by the changing alliances and conflicts between Sogdian and Turkic petty states on the one hand and the great powers of Türgesh, China and the advancing Arabs on the other.

Kabulistan in the late fifth century was ruled by the Nezak Dynasty, which recognised Turkic suzerainty.[101] When, however, Abd ar-Rahman bin Samurah – the governor of Sistan who had brought that province under Arab control in 653–54 – twice captured and plundered Kabul, in 665 and 666, a Turk called **Barha Tegin** (r. *ca*. 666–*ca*. 680) took advantage of the evident weakness of its Nezak ruler by occupying Kabul, killing the last of the Nezaks, and founding the ***Turk-Shahi*** dynasty (*ca*. 666–*ca*. 843). He immediately threw off the yoke of Arab suzerainty, expelled the Arabs from the city, and extended his authority to Zabulistan, southwest of Kabul.[102] A little later, in 671/72, Barha Tegin suffered a reverse when Ubayd Allah bin Ziyad, the Arab governor of Sistan, advanced into Zabulistan and also set fire to the great Kushan-era Buddhist shrine of Tepe Sardar south of Ghazna whose clay figures displayed distinct sinicised stylistic features typical of the early Tang dynasty.[103] Tepe Sardar was extensively rebuilt during the eighth century, and the manner of reconstruction suggests a religious syncretism. For in the famous chapel 23, next to a jewel-studded buddha figure in the style of Fondukistan, stood a figure of the Hindu goddess Durga Mahishasuramardini, who had entered the Buddhist pantheon.[104]

As early as Barha Tegin's death around 680, the kingdom split into two parts: when his son **Khorasan Tegin Shah** (r. *ca*. 680–738) took the throne in Kabul, an elder brother departed for Zabulistan, declaring himself an independent ruler and taking the title

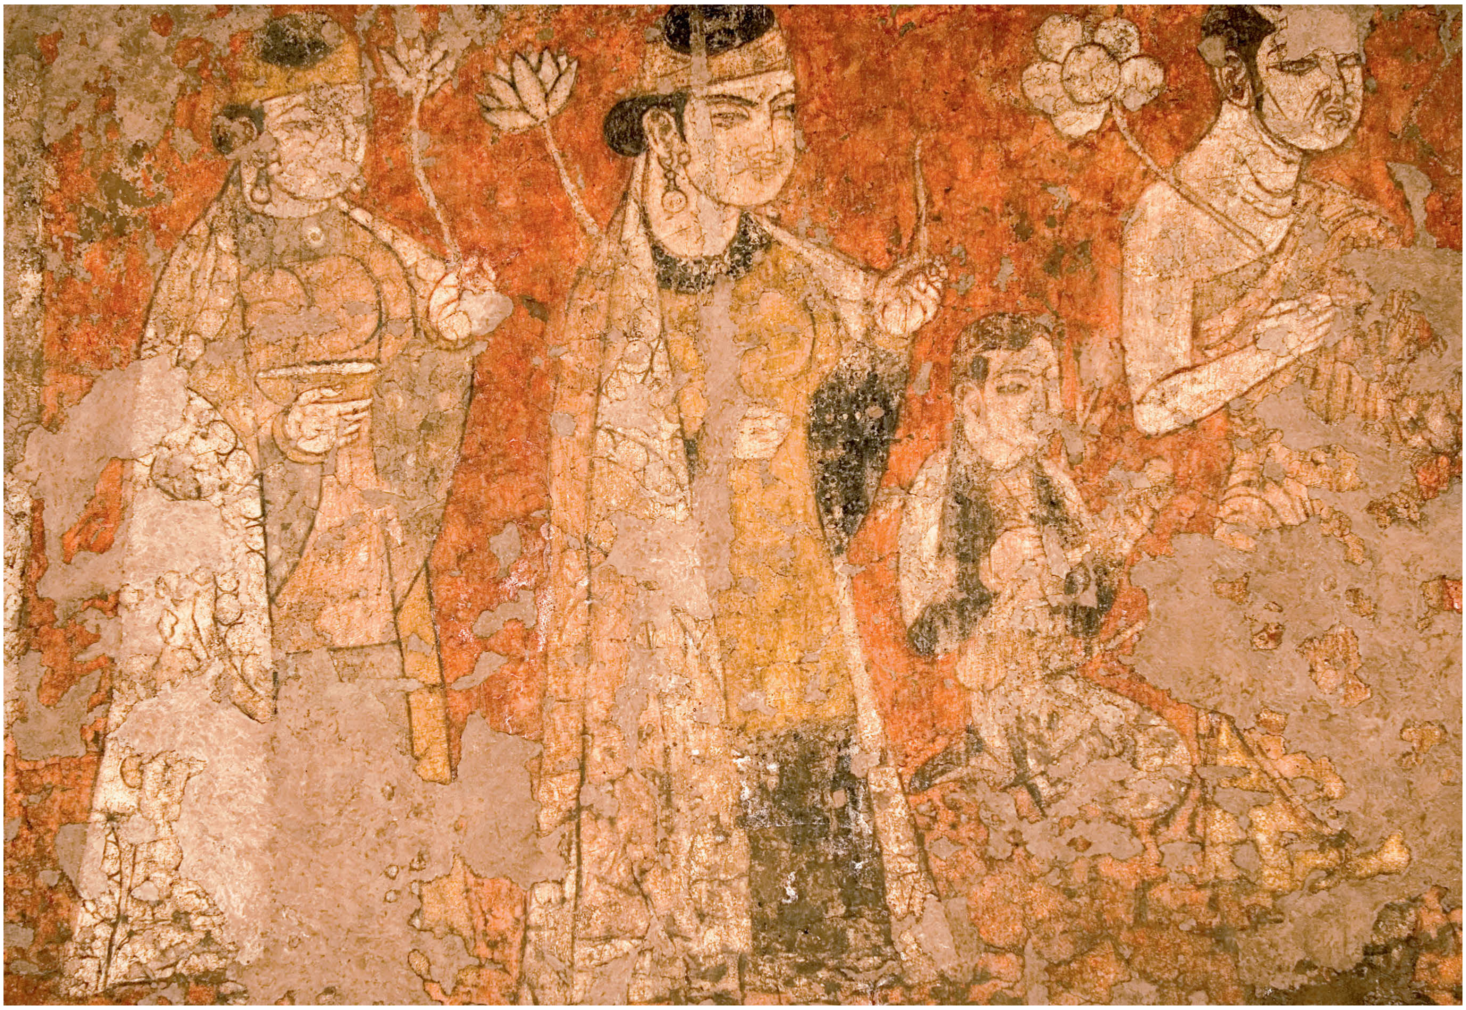
of ‘rutbil’ (in Turkic ‘Iltäbär’).[105] Despite this family rift, and probably with Kabul’s assistance, Zabulistan’s rutbil successfully defeated two invading Arab armies, one in 683 and the other in 698–99, allowing them to penetrate deep into his territory and then bottling them up in a valley between high passes.[106] Presumably Khorasan Tegin Shah, whose name means ‘King of the East’, shared power with sub-kings, who also minted their own coins. In 738 Khorasan Tegin ceded power to his son, who adopted the grandiose regnal name of **Phromo Kesaro** (r. 738–45), ‘Emperor (Caesar) of Rome’ and whose military successes against the Arabs provided one of the bases for the Tibetan epic of King Gesar.[107] That Kabulistan, Zabulistan and Bamiyan were ruled in the early eighth century by kings of Turkic origin, who promoted the Buddhist religion, is reported by the pilgrim monk Huichao, who travelled in 726–27 from Gandhara to Kucha. He noted that ‘All natives are Hu [aboriginals, barbarians] the king [probably Khorasan Tegin Shah] and the military however are Tu-chueh [Turks]. Though they are Tu-chueh, the king here and the great men greatly venerate the *triratna* [the Three Jewels of Buddha, Teaching and Community]. There are many monasteries and monks, and the Mahayana teaching is followed.’[108]

The Turk Shahi of Kabulistan managed to defend their independence until 813/14 or 814/15, when the Abbasid caliph al-Mamun sent his vizier al-Fadl ibn Sahl to Kabul to punish them for supporting the Tibetans in their successful resistance. Al-Fadl compelled the capitulation of the Turk Shahi, exacting enormous tribute.[109] Still obliged to pay vast sums to the Abbasids, **Lagaturman**, the last Turk Shahi, was overthrown around 843 by his Brahmin minster Kallar, who founded the ***Hindu-Shahi*** dynasty (*ca*. 843–1026).[110] On the obverse of their coins is a recumbent bull, the *vahana* or ‘mount’ of the Hindu god Shiva, suggesting that the Hindu Shahi were followers of that god. Until 870/71 the Turk Shahi of Zabulistan held their ground until they suffered several defeats by Yaqub bin Layth al-Saffar (840–79), Muslim Persian warlord and founder of the local Saffarid Dynasty. After his victory, Yaqub marched on Kabul and took it from the Hindu Shahi. In plundering the temples of Kabul he seized some 50 gold or silver statues of divinities and sent them to the Caliph

in Baghdad, who passed them on to Mecca, possibly re-enacting symbolically Mohammed's cleaning of the Kaaba of its idols in the year 630. Although the Hindu Shahi moved their centre of government to Udabhandapura to the south-west (today the village of Hund between Peshawar and Taxila), they recaptured Kabul in 879 and only lost it again to the Samanid Emir Ismail in 900. Ismail's victory set the seal on the Islamic conquest of Afghanistan, 'the little kingdom in the Hindu Kush' that had 'for 250 years successfully resisted the Arab expansion'.[111]

Although fire worship was practised among the Western Turks, Tong Yabghu himself was sympathetic towards Buddhism, as Xuanzang reveals. The khagan received him in 630, not far from Suyab, and listened attentively to his teaching. The khagan was killed not long afterwards, almost simultaneously with his son Tardush Shad.[112] In Samarkand, on the other hand, Xuanzang found a hostile environment, as its inhabitants were followers of Sogdian Zoroastrianism. When a pair of Xuanzang's companions wanted to visit the two abandoned Buddhist monasteries there, to venerate the Buddha, they were pelted with burning wood and driven off.[113] On the deaths of Tong Yabghu and Tardush Shad, the ruler of Samarkand immediately sought to regain his independence of the Turks, sending an embassy to Emperor Tang Taizong in 631 to ask if he might become a Chinese vassal. For Taizong this request came too early, for he had only just broken up the Eastern Turkic Khaganate, and the Western Turks were still a substantial military power. He did, however, agree to open diplomatic and trade relations with Samarkand, thereby granting its ruler equal status with the khagan.[114]

After the destruction wrought by the Sassanid campaigns of the third and fourth centuries and the Hephthalite invasion, Buddhism in Tocharistan experienced a veritable renaissance under Western Turkic rule. Xuanzang's account of Tocharistan's many monasteries but also the archaeological evidence indicate that Buddhism flourished again under the Turks, who were tolerant in matters of belief and unconcerned to impose a state religion.[115] Among the outstanding examples of seventh-century Buddhist temple architecture and wall-paintings discovered in the Tajik part of Tocharistan are the monasteries of Kala-i Kafirnigan (fig. 170), Kafyr Kala,



170. Wall painting from the Buddhist monastery Kala-i Kafirnigan. Two noblewomen, a monk and another man in the background hold lotus flowers. 7th to early 8th c. Khisht Tepe and especially Ajina Tepe, whose Turkic royal family, nobility and population were all followers of Hinayana Buddhism in the eighth century.[116]

In 1959, archaeologists found not only a classic monastery complex in Ajina Tepe, consisting of monastery buildings and an adjoining temple with a central terraced stupa of cruciform plan, but also, in a covered lateral corridor, a 13-metre-long clay sculpture of the sleeping Buddha (figs. 167f). United here were the two most important symbols of the Buddha: the stupa and Shakyamuni entering Parinirvana. Monumental representations of the Buddha in eternal sleep were very highly esteemed in Buddhist Central Asia, and such figures are also to be found at Kizil (Xinjiang), Mogao (Gansu), Krasnaya Rechka (Kyrgyzstan), Bamiyan, Tepe Sardar near Ghazni[117] and Mes Aynak (all in Afghanistan). As has been noted by Boris Litvinsky, leader of the Ajina Tepe excavation, both parts of the complex, monastery and temple, are laid out on the classic four-iwan (an iwan being a vaulted hall, walled on three sides and open at the front) courtyard plan that would decisively influence the design of the Muslim madrasa. That the Buddhist four-iwan monastery served as the model for the madrasas that first developed in Central Asia, and then, indirectly, for the Iranian four-iwan mosque, had already been recognised by Vasily Bartold (1869–1939): ‘The higher Muslim schools, *madrasas*, appeared on the caliphate’s eastern fringes earlier than in its central and western parts. It seems that in this respect Islam was greatly influenced by Buddhism and that the *madrasa* was born on the banks of the Amu Darya, close to Balkh, where Buddhism remained the dominant religion until the Muslim conquest.’[118] The monastery complex, probably built in the seventh century, was transformed in the mid-eighth century into a centre for the production of glass, pottery and iron, after the little kingdom of Kuttalan, today’s Tajik province of Khatlon, was conquered by the Arabs in 737.[119]

The murder of Tong Yabghu Khagan by his uncle Baghatur (Moheduo) in 630 plunged the empire into a deep crisis. The Western Turkic confederation of the ten tribes of the *On Oq* (the name meaning 'ten arrows') broke up into the two wings of the Duolu in the east and the Nushibi in the west, from which by the end of the seventh century the Türgesh of the Duolu emerged as the strongest tribe.[120] When **Baghatur** (Qulipiqie) **Khagan** (r. 630) seized power, the Nushibi rebelled and installed on the throne a son of the murdered khagan called Dieli Tegin, who adopted the title **Si Yabghu** (Siyehu) **Khagan** (r. 630–32) and killed his father's murderer.[121] After a failed campaign against the Xueyantuo, the Nushibi rebelled again and forced him into Sogdian exile. His successor **Tughluq** (Duolu) **Khagan** (r. 632–34) also barely managed two years before a four-year civil war broke out among the On Oq, at whose end in 638 the Western Turkic heartland along the Ili river was divided into a northern and a southern half.[122] Three years later, **Illig Beg Tughluq** (Yipiduolu) **Khagan** (r. 638–42, d. 653) defeated his rival **Illig Beg Ishbara Yabghu** (Ashina Bobu) **Khagan** (r. 639–41) and briefly reunited the khaganate, upon which, according to the Chinese chronicles *Jiu* and *Xin Tang Shu*,[123] he despatched governors to the vassal states of Kucha, Yanqi (Karashahr), Shan-shan and Qiemo in the east; Čač (Tashkent), Kang (Samarkand), Kesh (Shahrisabz), Mu (west of the Oxus), Ho (south of the Zerafshan river) and Tocharistan in the west.[124] Unrest broke out again almost immediately and one of the rebel leaders asked Emperor Taizong for help, who seized the opportunity to intervene in the affairs of the crisis-torn khaganate. He appointed this rebel leader **Illig Beg Shekui** (Yipishekui) **Khagan** (r. 642–51), by this very act making him a vassal of China's. Probably with Chinese help, Shekui defeated Illig Beg Tughluq and forced him into exile in Tocharistan.[125] When Shekui sought a Chinese princess for his bride in 646, Taizong demanded as bride price – and reward for his help in taking power – five city states in the western Tarim Basin: Kucha, Khotan, Kashgar, Kugiar south of Yarkand, and Tashkurgan. On Shekui's refusal, Taizong attacked and conquered in 648 the cities of Yanqi and Kucha, and it was only Taizong's death the following year that spared Shekui from further attack.[126]

At the same time, another prince had risen up at Taizong's prompting: this was Ashina Helu, who briefly occupied Besh Baliq

171. The southern church of the Christian three-church complex of Suyab (Ak-Beshim) from the 8th to 11th c., east of Bishkek, Kyrgyzstan.

north of the Turfan Oasis before toppling Shekui and declaring himself **Ishbara** (Shaboluo) **Khagan** (r. 651–658). Emperor Gaozong (r. 649–83), however, continued his predecessor Taizong's strategy of securing China's borders through the destruction of both great Turkic khaganates. He formed an alliance with the Uyghurs, and the military operations begun in 652 culminated in the capture of Ishbara Khagan in 658, the last resistance being crushed in 659.[127] China completed the integration of the territories of the former Western Turkic Khaganate into its own administrative structures, dividing both vassal states and the Western Turkic heartland – where it installed puppet khagans – between the two protectorates of Anxi, with its administrative capital at Kucha, and Beiting (Besh Baliq).[128] While China's suzerainty remained nominal in most vassal states west of Kashgar and Suyab, these states were theoretically incorporated into China's administrative machinery. So it was, for instance, that Emperor Gaozong sometime between 650 and 655 confirmed Varkhuman, the king of Samarkand (r. *ca*. 648-*ca*. 675), as 'Governor of Samarkand'.[129] Soon, however, two other great powers would challenge the Chinese presence in Central Asia: the Tibetans and the Arabs. While Tibet's foreign policy was focused on its strategic war with China and control of the trade routes, in the early eighth century the Arab raids, which had begun 50 years earlier in 654, developed into deliberate wars of conquest. When in 677 the Western Turkic commander Ashina Tuze (Chinese: Ashina Fuyan Duzhi) made an alliance with the Tibetans, who in 662 had joined with Turkic rebels to harry Chinese forces, the Chinese general Pei Xingjian took him prisoner by a ruse. Then, in 679, he constructed a Chinese fortress in Suyab (Ak-Beshim), which until 719 would be reckoned as one of the Four Garrisons, even if not always under Chinese control.[130]

The Western Turkic tolerance in religious matters manifested itself as much in their own heartland in the Chu Valley as elsewhere. While the elites practised a form of fire worship, they also permitted the spread of Buddhism and of the (Christian) Church of the East, commonly known as the Nestorian Church.[131] The close relations with China between 658 and 751 further encouraged the diffusion of Buddhism. Among the most important discoveries of Buddhist architecture are the monastery with two seventh- or eighth-century monumental clay sculptures (a 10-metre-long sleeping Buddha Shakyamuni and a 6.6-metre-high seated Buddha), and another eighth-century monastery, both at Krasnaya Rechka (ancient Navekath); and two temples at Ak-Beshim (Suyab), one dating from the seventh and the other from the seventh/eighth century.[132] In addition, many Buddhist objects have been found at Novopokrovka (Pakap) east of Bishkek and Novopavlovska (Djul), indicating the presence of as yet unexcavated Buddhist monasteries or shrines.[133] The most important Christian remains[134] are at Ak-Beshim (Suyab): a small mudbrick church of Mesopotamian type and a large complex consisting of at least three churches built next to each other with traces of wall paintings with floral patterns (fig. 171). Both churches were built in the eighth century. Written sources tell of other Nestorian churches in Merke and Taraz, both converted into mosques in around 893. There have also been finds of small Christian items such as pectoral crosses in Krasnaya Rechka and Kostobe, the ancient Sogdian city of Jamukat.[135] This age of religious tolerance, for Christians more especially, only truly came to an end in the mid-fourteenth century.

VI

Turkic Kingdoms of Eastern Europe

It is more painful to be the friends of the Avars – nomads and foreigners – than their enemies, since their friendship is treacherous.

EMPEROR JUSTIN II OF THE BYZANTINE EMPIRE (acceded 565, abdicated 574, d. 78)[1]

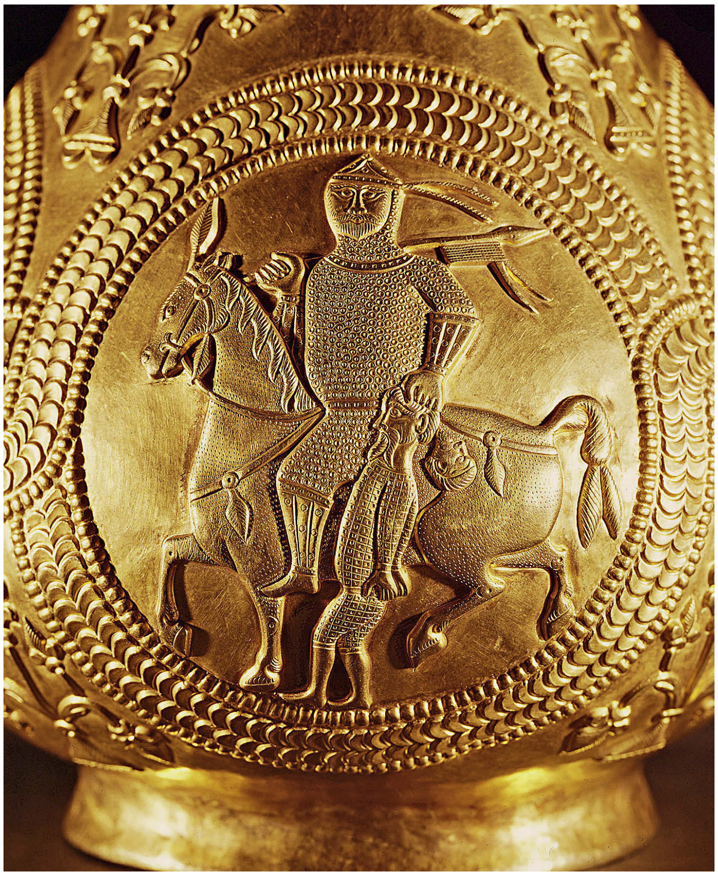
The words of Emperor Justin II reflect the ambivalence which reigned in the relations between the Byzantine trade empire and the neighbouring equestrian peoples of Central Asian origin. These peoples tended to be poor but were good warriors, which is why their mobile cavalries were their preferred 'means of production'. Rather than conducting trade themselves and producing an agricultural surplus which could be exported, they preferred to levy high transit taxes and extort enormous tribute payments from Byzantium. On occasions when Byzantium stopped paying tributes and was able at the same time to demonstrate military power, the economy of the equestrian peoples would often suffer considerably, and their rulers would lose authority, as the example of the Avars demonstrates so clearly. But despite their military strength, the equestrian peoples were no significant threat to the city of Byzantium. For Byzantium, on the other hand, which was also threatened by the Sassanids as well as the Muslim caliphates of the Umayyads and Abbasids, it was usually more beneficial to buy peace with Central Asian peoples than to go to war with them. Just as the Chinese general Ban Chao had been, the Byzantines were well versed in 'using barbarians against barbarians', setting bellicose neighbours against one another. In the case of the Khazars, Byzantium even succeeded in entering into a strategic alliance: by protecting their north-eastern borders against other equestrian peoples, the Khazars indirectly protected Byzantine borders, and thanks to their refusal to convert to Islam they, together with their neighbour, formed an anti-Islamic bulwark north of the Caucasus.

1. The Empire of the Avars (568–796)

The Avars were a heterogeneous people consisting of Rouran and Hephthalites as well as Turkic-Oghuric confederacies which all wanted to escape the rule of the Göktürks. After leaving their Central Asian homelands, they reached the Pontic grass steppe around 557 or 558. They sent a legation to the Byzantine Emperor Justinian I who, by showering them with lavish gifts, persuaded them to attack the three Hunnic tribes of the Onogurs, Zali and Sabirs, as well as the Slavic Antes, and incorporate some of their warriors into their own army. Despite these victories, the Avars found themselves acutely threatened since they were followed by a Turkic army which marched towards the Pontic steppe. At first the Avar khagan **Bayan I** (r. *ca*. 560/62–582/83) led two campaigns against the Merovingian king of the Franks, Siegbert I. Although the second war of 567 ended with an Avar victory, Bayan orientated himself towards Pannonia rather than Western Europe, perhaps because the dense forests which covered large parts of the empire of the Franks were difficult territory for the Avar cavalry. In the same year Bayan allied himself with the Lombards to attack the Gepids, who lived in Pannonia. After their victory the Lombards went to Italy, taking part of the spoils with them. The Avars settled in the Great Hungarian Plain where they founded the Avar Empire.[2] Here, west of Byzantium, the Avars felt safe from the Göktürks.

When Emperor Justin II rashly started the 20-year war against the Sassanids in 572, the Avars took advantage of the military exposure of the Byzantine western border to force Byzantium, through campaigns into the Balkans, to pay ever higher tribute. Together with the beaten Slavs, whom they abused as a kind of 'cannon fodder', they invaded Greece in the 580s which led to a slavicisation of the Peloponnese.[3] Only Emperor Maurikos's peace with the Sassanids in 591 allowed Byzantium to renew its offensives in the Balkans. But his murder in 602 rekindled the war with the Persians, bringing the active Balkan policy of Byzantium to an abrupt halt. The Avars took advantage of the new situation two years later by contractually binding Byzantium to pay higher tributes. In 623 the khagan even tried to lure Emperor Heraclius into a trap and capture him. As described by Theophanes, the khagan agreed to a truce to enable peace negotiations in a place some 60 kilometres from Constantinople. But when Heraclius had left the Anastasian Wall, also called the Long Walls of Thrace,[4] he noticed enemy cavalry. He only narrowly escaped and managed to flee back to the city.[5]

In summer 626 the decisive turning point came not only for Avar relations to Byzantium but also in the development of the khaganate. Allied with the Sassanids, a huge Avar army led by Bayan's youngest son laid siege to the city of Byzantium, almost at the same time as Chang'an, which was just under 7,000 kilometres further east, was threatened by the Eastern Turkic khagan Xieli. But the Sassanid army could not overcome the strong Byzantine defence system, and the Byzantine fleet sunk the Avar boats in the bays of the Golden Horn. After this the khagan lifted the siege since he could not feed his war horses, which were useless in this situation.[6] Emboldened by the victory, Heraclius stopped the yearly tribute payments. This deprived the Avar Khaganate, whose tribes and clans depended on regular distribution of goods, of their economic basis. When Bayan's youngest son died in 630, a civil war broke out between the Avars and the Bulgars which led some Slavic tribes to break away and seek protection from Byzantium or Bavaria.[7] It was only thanks to heavy Arab attacks on the Byzantine



172. Depiction of an armoured rider on a gold pitcher from the treasure of Nagyszentmiklos, Romania, 6th to 9th c. The rider wears a long coat of chain mail and a *spangenhelm* (a type of strap helmet) as well as a lance with banner over his right shoulder. With his left hand the victorious rider holds a prisoner, also in armour, by his hair; a severed head dangles from his concealed saddle. The treasure, which was discovered in 1799, consists of 23 gold vessels, and 12 of the objects have short, incised inscriptions of runic signs similar to those used by the Avars and Bulgars. The rider on the pitcher probably represents an Avar or Bulgar prince or leader. Kunsthistorisches Museum Wien.

Empire from 634, which forced Emperor Heraclius on to the defensive, that the Avar Khaganate survived this serious crisis.

Archaeological research shows that Avar material culture changed after 630, for in male graves the number of weapons as burial objects declined considerably.[8] The economy of the Avar Empire ceased to be based on wars and raids, being gradually replaced by agriculture; the former horse warriors exchanged lance and armour for the plough and now lived in houses with saddleback roofs which were dug into the ground. The Avars only rarely undertook regional campaigns within central Europe and only came into the focus of history again in 774, after Charlemagne, king of the Franks (r. 768–814) had been victorious against the Lombards and thus become the Avars' western neighbour. The first Frankish–Avar War of 791 ended inconclusively since a horse epidemic decimated Charlemagne's cavalry, after which the king had to postpone the attempt to crush the Avars because of a new revolt of the Saxons. In 794/94 an Avar civil war broke out between the khagan and his co-ruler, the iugurrus, which cost both their lives, whereupon the third in rank in the Avar Empire, the tudun, seized power. Conscious of his weak position, the tudun sent a legation to Charlemagne and offered his submission, which did not prevent a Frankish-Slavic force from taking in autumn 795 'the Ring', the residence of the khagan, in a surprise attack, capturing the famous Avar Treasure. During the following year, the remainder of the Avar Empire fell to the Franks without a fight; when the tudun surrendered in Aachen and was baptised, the newly elected khagan also capitulated. The once mighty Avar Empire of Central Asian origin had ceased to exist, for from 796 the former tudun reigned as a vassal of the king of the Franks. The Avar revolt of 799 was crushed by 803, after which the Bulgar khan Krum attacked from the east and integrated many beaten Avars into his own army. With the administrative reorganisation in the east of the Frankish Empire in 828, the Avar vassal state, which had been forced to adopt Christianity, was dissolved.

2. The Pre-Christian Bulgar Empires

2.1 Great Bulgaria on the Sea of Azov

The nomadic equestrian people of the Bulgars consisted mostly of Oghurs who spoke a Turkic language. They also included some people of Sarmatian and Alan origin and appeared for the first time in 480–81 as allies of the Byzantine king Zenon against Ostrogoth confederations. In the 630s, **Kubrat** (r. *ca*. 632–660?), who claimed descent from the West Turkic clan group of the Duolu[9] and who had spent part of his youth at the Byzantine court, succeeded in uniting the Onogurs, Kutrigurs and Bulgars who had remained on the Black Sea, to shake off the supremacy of the Göktürks and to found the short-lived empire of Great Bulgaria.[10] The centre of Great Bulgaria lay north-east of the Sea of Azov. This state foundation is also seen as the ethnogenesis of the Bulgars. The Turkic roots of the Bulgar elite manifest themselves in the fact that apart from the Greek and the Glagolitic alphabet they also used a runic script. A third of these runic characters were comparable with those of the Orkhon inscriptions.[11] But Great Bulgaria did not last long, for after the death of its founder Kubrat around 660 it quickly disintegrated.[12] Kubrat's eldest son and successor **Batbayan** (r. ?–*ca*. 667/8) was confronted by the Khazars shortly after coming to power and had to submit to them together with his horde around 667/68. As

Theophanes reports: 'The great Khazar people came from the far interior of Berzilia in first Sarmatia [north-western Caspian region] and became the masters of the whole northern coast of the Black Sea. They made Batbayan [. . .] their subject and have taken tribute from him.'[13]

2.2 The Empire of the Volga Bulgars

At the same time as Batbayan's capitulation, his four brothers, together with their hordes, left the area of Great Bulgaria. **Kotrag** marched towards the north-east and settled at the confluence of the Volga and the Kama where he founded the **Empire of the Volga Bulgars** (*ca*. 668–1236), on the territory which is today the Republic of Tatarstan. Although the Volga Bulgars had to recognise the Khazars as overlords in the early eighth century, they retained their autonomy. To emancipate themselves from the Khazars, whose elite had adopted Judaism, the Bulgar Elteber (a vassal king of the Khazars) **Almish ibn Shilki** converted to Islam by 921. By choosing Islam, Elteber Almish distanced himself both from the Jewish Khazars and their ally, the Christian Emperor of Byzantium, and won the Abbasid caliph as ally. At the same time he hoped to find an ideological cement to unite his diverse tribes and to optimise his relationship with Muslim traders. For this reason he asked Kalif al-Muqtadir (r. 908–32) for Muslim teachers and financial aid to build a fortress in 921. The caliph sent a legation with the scholar Ibn Fadlan as its secretary, and Almish formulated his concern clearly to him: 'This money [should] be brought to me, so that I might build a fortress which would protect me from the [Khazar] Jews who have enslaved me.'[14]

Despite this loose alliance with the caliphate, the Volga Bulgars remained subjects of the Khazars until the latter were toppled by the Kievan Rus' between 965 and 969. Shortly after gaining their

173. The south-western corner of the kremlin of Kazan, Republic of Tatarstan, Russia. On the left, the Kul-Sharif Mosque, which was dedicated in 2005, on the right the Spasskij (Saviour) Tower, which was built by Tsar Ivan IV after the conquest of Kazan in 1552. The city, which lies on the confluence of the Volga and the Kama, was founded by the Volga Bulgars in the 11th c. Through it they controlled an important section of the waterway, which was part of the trade route between Baghdad and Scandinavia.

full sovereignty, the Volga Bulgars suffered a setback, when in 985 Prince Vladimir of Kiev ravaged their capital Bolghar (fig. 174), some 90 kilometres as the crow flies south of Kazan,[15] but despite this and various raids by Russian rulers, their empire developed into a stable and wealthy state. As Ibn Fadlan reports, the wealth of the Volga Bulgars was based on a ten per cent transit tax which the Khan charged for all goods transported via land or water.[16] This movement of goods was enormous since all the northern trade routes through the steppes, which linked Chorasmia and Sogdiana with the cities of northern Rus and with Scandinavia, passed through Bulgar territory. In 1223 the Volga Bulgars even succeeded in luring a Mongolian army or its vanguard under the command of generals Subotai and Jebe as well as Genghis Khan's eldest son Jochi Khan into an ambush and to defeat it at the Battle of Kernek, but they were later defeated themselves. The Volga Bulgars had defended their independence for the last time. In 1236 Subotai advanced again and destroyed their empire which was then integrated into the Ulus of Jochi (realm of Jochi), which later became known as the Golden Horde.[17]

2.3 The First Empire of the Danube Bulgars

Another brother of Batbayan, **Kuber**, led his horde to Pannonia where he submitted himself to the Avars, and **Alcek**, together with his retinue, marched to the kingdom of the Lombards and later to the region of Benevento.[18] But **Asparukh** (r. *ca*. 668–*ca*. 695/700; as king of Bulgaria from 680), Kubrat's third son, chose Moesia as his destination. Together with his horde, he crossed the rivers Dnieper and Dniester and settled in the southern delta of the Danube, where he allied himself with the Slavs who had settled there and conducted raids into Byzantine territory. In 680 he inflicted a crushing defeat on Emperor Constantine IV (r. 668–85) and forced him to pay a yearly tribute to the Bulgars, which meant that Byzantium indirectly recognised the new **Kingdom of Bulgaria**.[19] Within the kingdom the freshly arrived Bulgar equestrian warriors were the ruling upper class, and the Slavs the lower class, as can be deduced from the strictly separated cemeteries with either rich Bulgar or poorer Slav burials.[20] During the reign of Asparukh's son and successor **Tervel Khan** (r. 695/700–721), a large Bulgar army strongly supported the Byzantines at the second Arab siege of Constantinople in 717–18 and won an overwhelming victory in the decisive battle.[21] The historical importance of this Byzantine-Bulgar victory over the Muslims who laid siege to Constantinople far surpasses Charles Martel's victory in the battle of Tours-Poitiers. The Frankish victory merely brought a bold raid to an end; if Constantinople, which was a strategic military goal of the caliphate, had fallen, the only strong Christian power would have been crushed, and the path to Europe would have been open to the Arabs. It was two Old Turkic equestrian peoples, Tervel Khan's Bulgars and the Khazars, who in the eighth and ninth centuries decisively supported the Byzantine bulwark against the Arabs.

Despite Tervel Khan's help, the eighth century saw a series of conflicts between Bulgaria and Byzantium. Emperor Constantine V (r. 741–75) alone led nine campaigns against the Bulgarian khans, with the aim of eliminating this dangerous neighbour. Whereas Constantine's campaigns against several Bulgarian khans, who reigned for very short periods, met with some success, the khans Kardam and Krum brought the decisive turning point. **Kardam Khan** (r. 777–before 803) inflicted a heavy defeat on Constantine VI (r. 780–97) in 792 and forced him to pay tribute.[22] In 811, **Krum Khan** (r. 803–14) crushingly defeated Emperor Nikephoros I (r. 802–11), who had led an expedition into Bulgaria, captured the capital, Pliska, looted its treasures and massacred its population. As Nikephoros was retreating to Thrace with the booty, the Bulgarians attacked his force in a mountain pass, overwhelming it and killing the emperor. The khan was said to have made a drinking cup lined with silver from Nikephoros's skull, following the example of the Xiongnu Laoshang Chanyu. Two years later Krum Khan annihilated the army of Emperor Michael I (r. 811–13) near Adrianople, forcing the emperor to abdicate and enter a monastery after such a humiliating defeat.[23]

During his relatively short rule Krum enlarged the Bulgar territory to the north-west and south, and it now included today's Romania, Belgrade and Sofia. Krum Khan's successor **Omurtag Khan** (r. 814–31) negotiated a 30-year peace with Byzantium, which established the Bulgar Khanate as a state which was equal to the empire.

The successful wars of self-assertion of the Bulgar khans against Byzantium are celebrated in various inscriptions, which were engraved next to the Madara Rider, a monumental rock relief on the Madara Plateau near Pliska, 350 kilometres north-east of today's capital, Sofia. The relief represents a horseman, probably Tervel Khan, fighting with a lion. It served as a dynastic cult site of the Bulgar khans. The inscriptions celebrate the victories of the khans Tervel, **Kormesiy** (r. *ca*. 721–38) and Omurtag and invoke Tangra as their highest god, which shows that the Bulgar elite followed the Old Turkic religion of Tengriism.[24] The preservation of the Old Turkic heritage can also be seen in the arrangement of one- to two-metre high upright stones, *devtaslar*, around Pliska, which are similar to Old Turkic *balbals*.[25]

With its territorial expansion, the 'heathen' Bulgaria now bordered on two major Christian military powers of different confessions: orthodox Byzantium in the east and the Catholic Frankish Empire to the west. For political and prestige reasons **Khan Boris** (r. 852–89, d. 907) decided to adopt the Christian faith. In 864, after consultations with the Roman Catholic Church, Boris decided – under military pressure from Byzantium – to join the Byzantine Orthodox church and to force his people to adopt the same faith. In 870 the Bulgarian church organised itself as an independent archbishopric under merely nominal canonical subordination to the Patriarch of Constantinople. The Kingdom of Bulgaria, which continued expanding to the south-west by conquering the west of Macedonia and pushing as far as the Adriatic Sea, now constituted the equal western wing of Orthodox ecumenism. Despite this, hostilities between the two Christian Orthodox empires continued with unabated force. The bitter climaxes of these wars were the Bulgarian victory near Achelous in 917 and the Byzantine triumph a century later, in 1014, near Kleidion. After the battle of Achelous, which entered history as one of the bloodiest of the Middle Ages, the victor **Simeon I** (r. 893–927) was crowned Emperor of Bulgaria in Constantinople.[26] But following the battle of Kleidion, the triumphant Byzantine Emperor Basil II (r. 976–1025) carried out a particularly savage reprisal. According to the eleventh-century historian John Skylitzes, Basil divided more than 8,000 Bulgarian prisoners into groups of 100. He then ordered that 99 men in each group be blinded, while the last one had one eye pierced, so that each one-eyed man could lead the 99 blind men home.[27] Four years later the first Bulgarian empire collapsed and became a Byzantine province.

174. The Friday Mosque in Bolghar, which was transformed into a fortress by the Russians, and the 19th c. Church of the Ascension, Republic of Tatarstan, Russia. The city of Bolghar, on the Volga, was the capital of the Volga Bulgars (*ca.* 668–1236), where the Abbasid envoy Ibn Fadlan stayed in 922.

Ahmad ibn Fadlan's Journey to the Volga Bulgars

The letter of 921 from the Volga Bulgar ruler Elteber Almish ibn Shilki to the Abbasid caliph al-Muqtadir, in which he asked for religious instruction and financial aid for a fortress, was remarkable because the Volga Bulgar Khanate did not border on the caliphate and therefore offered the possibility of attacking the common enemy, the Khazar Khaganate, from two flanks. The secretary of the Muslim legation, Ahmad ibn Fadlan, left a unique account of his travels, which describes the customs of several different peoples. The delegation left Baghdad in June 921 and had to make a long detour via Merv and Bokhara, since the Khazars were blocking the direct route through the Caucasus. They reached the city of Bolghar in May 922. North-west of Old Urgench, the legation crossed the lands of the Oghuzes, who lived in yurts, sacrificed horses at the death of the leader and placed as many wooden statues near the burial mounds as the deceased had killed enemies. Ibn Fadlan was also surprised by the unusual punishment meted out to adulterers: two neighbouring trees would be bent right down and the victim tied to them both; the trees would then be released so they sprang back up again, tearing the condemned person apart.[28]

As Ibn Fadlan's party approached Bolghar, the khan went to meet them, and as a welcoming gesture poured coins, which he held in his sleeves, over the envoys, a custom which is maintained to this day at weddings in Central Asia. Bolghar lies 22 degrees of latitude further north than Baghdad, and Ibn Fadlan was surprised how long daylight lasted in summer: 'Their day is extremely long for a certain time of the year, while the night is short. Then [in winter] the night is long and the day short.'[29] The secretary also noticed that deceased men were not lamented by women but by men, who scratched their faces and arms with thorns. Ibn Fadlan was impressed by the size of the Varangian Rus' traders who encamped by the Volga, and he noted that their bodies were adorned with large green tattoos of figures and trees. He also witnessed the burial of a Rus' leader. The deceased was first put into a coffin and covered for ten days, while his family sewed special burial garments for him. On the tenth day the burial proper took place in the form of a cremation. The corpse was placed in a boat, which had been pulled on to land and placed within a wooden frame. While the mourners were drinking mead, often to the point of unconsciousness, the deceased was given his weapons, and sacrificed animals were placed with him in the boat. Then a young female slave, who had volunteered to be the victim, was also killed and placed into the boat beside the dead leader. Finally, the boat and its contents were set alight. At the end of the ceremony, the mourners erected a burial mound above the site of cremation.[30] Although ten years later a Bulgar legation paid a return visit to Caliph al-Muqtadir shortly before his death, the diplomatic contact remained without consequence, and the axis between Bolghar and Bagdad, which Elteber Almish had hoped to build, never materialised.

3. The Khazars and the Adoption of Judaism

The semi-nomadic Khazars, who lived in the Pontic steppe and in the Northern Caucasus, created a successor state of the West Turkic Khaganate, which began to break up after Tong Yabghu's murder in 630. Whereas most horse warriors were of Turkic descent, and the elite belonged to the Turkic clan of the Ashina, the Khazars also included Ugric, Sabir, Caucasian and Iranian tribes; the Khazars probably spoke an Oghur-Turkic dialect.[31] The Khazar confederation, which had become independent between 630 and 650 and whose Turkic ethnonym means 'freely wandering', subjugated Great Bulgaria in the 660s, after which some Bulgar hordes moved out towards the Volga and Danube. The Khazars swiftly extended their sphere of influence, eastward as far as the Kazakh steppe north-west of Chorasmia, and westward as far as the Dnieper and the Crimea. They occupied most of the trading cities in the Crimea but granted them considerable autonomy, except in the east at Kerch, the former city of Pantikapaion, which they turned into a stronghold of their power (fig. 175). In the west of the peninsula, in Cherson, a Khazar tudun was posted from the 690s, despite the fact that the city belonged to the Byzantine Empire, so that Cherson was effectively a Byzantine–Khazar condominium. But when the Crimean-Gothic population of Doros (Mangup), north-east of Cherson, whose table mountain Emperor Justinian I had turned into a fortress, rose up under the leadership of Orthodox Metropolitan John of Gothia in 787 and expelled the Khazar tudun and his garrison, the Khazars crushed the uprising ruthlessly.[32]

Cherson and the Khazar khagan also played an important role in Byzantine history at the turn of the seventh to the eighth century. The cruel Emperor Justinian II (r. 685–95, 705–11) was overthrown in 695 and exiled to Cherson after his nose had been publicly cut off in the Hippodrome of Constantinople. From Cherson Justinian fled to the Khazar khagan Busir (r. *ca.* 690–715), who gave him his sister as wife. But when Emperor Tiberius II (r. 698–705) demanded that Busir hand over or kill Justinian, Justinian was warned and fled to the Bulgar king Khan Tervel,

175. The Church of St John the Baptist in Kerch, in the easternmost corner of the Crimea, which was founded in the 8th c.

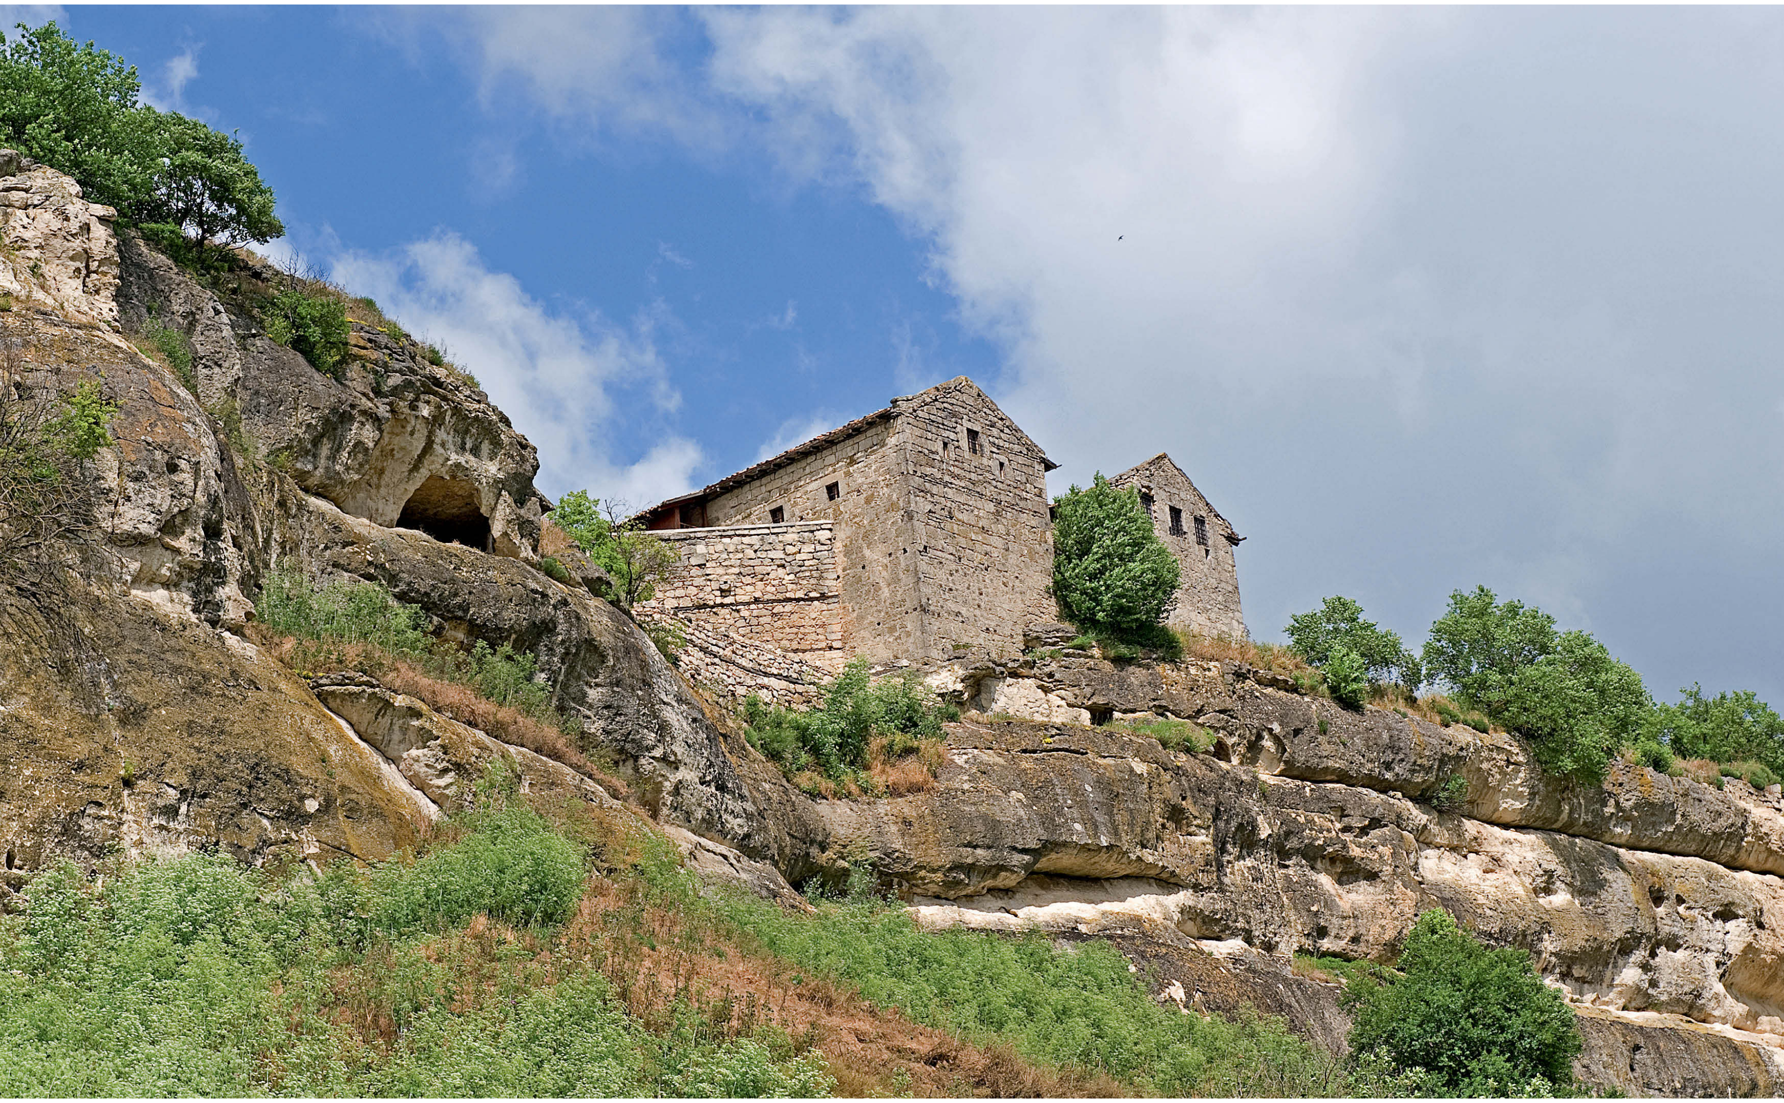
with whose help he regained power in Byzantium in 705. At first he established a reign of terror with mass executions in the capital, then he sent two fleets against Cherson to destroy the city. But the second fleet defected to the insurgents, returned to Constantinople with reinforcements and captured Justinian who was immediately beheaded.[33] Now Byzantium and the Khazars consolidated their alliance, with the khagan recognising Byzantine rule over Cherson, and Byzantium Khazar rule over the remainder of the Crimea. Faced with the growing threat of the Arab Umayyads, Emperor Leo III (r. 717–41) was keen to consolidate the alliance with the Khazars further by marrying in 732 his son, the future Constantine V (r. 741–75), to the daughter of the Khazar khagan; the Khazar princess Tzitzak was baptised Irene and gave birth to a son, the future Emperor Leo IV the Khazar (r. 775–80).[34]

From 626/27 to the second half of the ninth century the Khazars were quite loyal allies of Byzantium, first against the Sassanids,[35] and from 642 against the Arabs, who were pushing northward, when the latter overran the fortress of Derbent and attacked the first Khazar capital of Balanjar. The second Arab campaign against Balanjar ended with a Khazar victory.[36] A century later, in 722, the Umayyads attacked the city of Balanjar again, and this time they conquered and destroyed it. The Khazars rebuilt it but relocated their capital to Samandar, slightly to the north. In response, a Khazar army invaded Iraq in 730, reaching Arbil and Mosul.[37] But in 737 Marwan ibn Muhammed, the future caliph Marwan II, launched a surprise attack and penetrated deep into the Khazar Empire as far as the lower Volga, forcing the khagan to convert to Islam. Faced with political tensions within the Umayyad Empire, Marwan returned swiftly, and the khagan renounced Islam; the Khazars regained their independence, with the border now being north of Derbent. As a consequence of the Arab advance, the Khazars relocated their capital far to the north to Atil, which lay in the Volga delta, north of today's city of Astrakhan.[38]

The Khazars were strategic allies of Byzantium in two ways, for they were bitter and successful enemies of the Arab expansion, and they also protected the north-east of the empire from invasions of other equestrian nomads, so that they constituted its outer defence line. Thus it was in Byzantium's own interest to contribute to their defence costs. As recorded by the Byzantine Emperor Constantine VII Porphyrogenitus (r. nominally from 913, de facto 945–959), a scholar and author of important books on the history and administration of the empire and on court customs, Byzantium built the mighty fortress of Sarkel on the lower course of the river Don in 838–41. At the same time Emperor Theophilos (r. 829–42) raised the city of Cherson to the status of a *theme*, a military-civilian province under a military governor.[39] The fortress of Sarkel was to serve the Khazars first and foremost as a bulwark against the advancing Turkic equestrian people of the Pechenegs, and probably also to help them keep an eye on the movements of the Magyars. This Byzantine strategy is similar to the Chinese one of 'using barbarians against barbarians'.

Like the Danube Bulgars and the Uyghurs, who were also of Turkic descent, the Khazars were confronted with the question of a unifying ideology when they were trying to achieve a political concentration of power. Until the end of the Middle Ages, there were few comprehensive models apart from religions, so the Khazar rulers looked for a religion which would bind together their empire. Until then they had venerated Tengri as their supreme deity, along with a goddess of fertility, a sun and a thunder god, and ancestors and trees to which they brought sacrifices of humans or animals.[40] As so often in history, the choice between three or four monotheistic faiths which happened to be available was made according to political criteria. Adopting orthodox Christianity carried the risk of entering the zone of influence of Byzantium too deeply, and choosing Roman Catholic Christianity would have been a provocation to Byzantium without bringing any political gain; Islam as the religion of the arch-enemy was excluded from the start; therefore the remaining option was Judaism. This choice was not strange at all, for many Jews lived in the Khazar territory who had fled from Byzantine, Sassanid or Muslim discrimination and persecution. In addition, Jewish merchants, such as the Radhanites, who may have been organised in a merchants' guild, conducted an important part of the transcontinental trade on the northern steppe routes. Their wares included silk, furs, weapons, spices and slaves.[41] The exact time at which the Khazar elite converted to Judaism is disputed. A Khazar source from

176. The cathedral of Eski Kermen, a town and fortress carved out of the rock in the south of the Crimean peninsula. The cave settlement of Eski Kermen was part of the Khazar Empire from the second half of the 7th c. to the 10th c.



177. The double *kenesa* of the cave settlement of Chufut Kale in the south of the Crimea. The religious services of the Karaites, who spoke a Turko-Kuman dialect, were segregated: the larger *kenesa* on the left was reserved for men, the smaller on the right for women. This strongly fortified rock city was founded in the 6th c. by Emperor Justinian I (r. 527–65) and manned with Alan mercenaries. The city was mentioned by the 13th-century Franciscan missionary William of Rubruck and by the early 15th-century German slave soldier Johannes Schiltberger;[18] it remained inhabited by Jewish Karaites until the 1870s.

the mid-tenth century mentions a ruler called Bulan, who adopted Judaism around 740; according to the Muslim historian al-Masudi (*ca.* 895–957) the adoption of Judaism happened during the caliphate of Harun ar-Rashid (r. 786–809). In any case, in 2002 Khazar coins from the years 837–38 were discovered, bearing the inscription 'Moses is God's prophet', with which the Khazar rulers officially proclaimed their Mosaic faith.[42] In the second half of the ninth century, the relations between the Khazars and Byzantium began cooling noticeably, although the religious question only played a secondary role. As Emperor Constantine VII Porphyrogenitus noted in his political testament *De Administrando Imperio*, the decisive point was that from the tenth century Byzantium increasingly turned to the Pechenegs for military reasons and sought their friendship.[43]

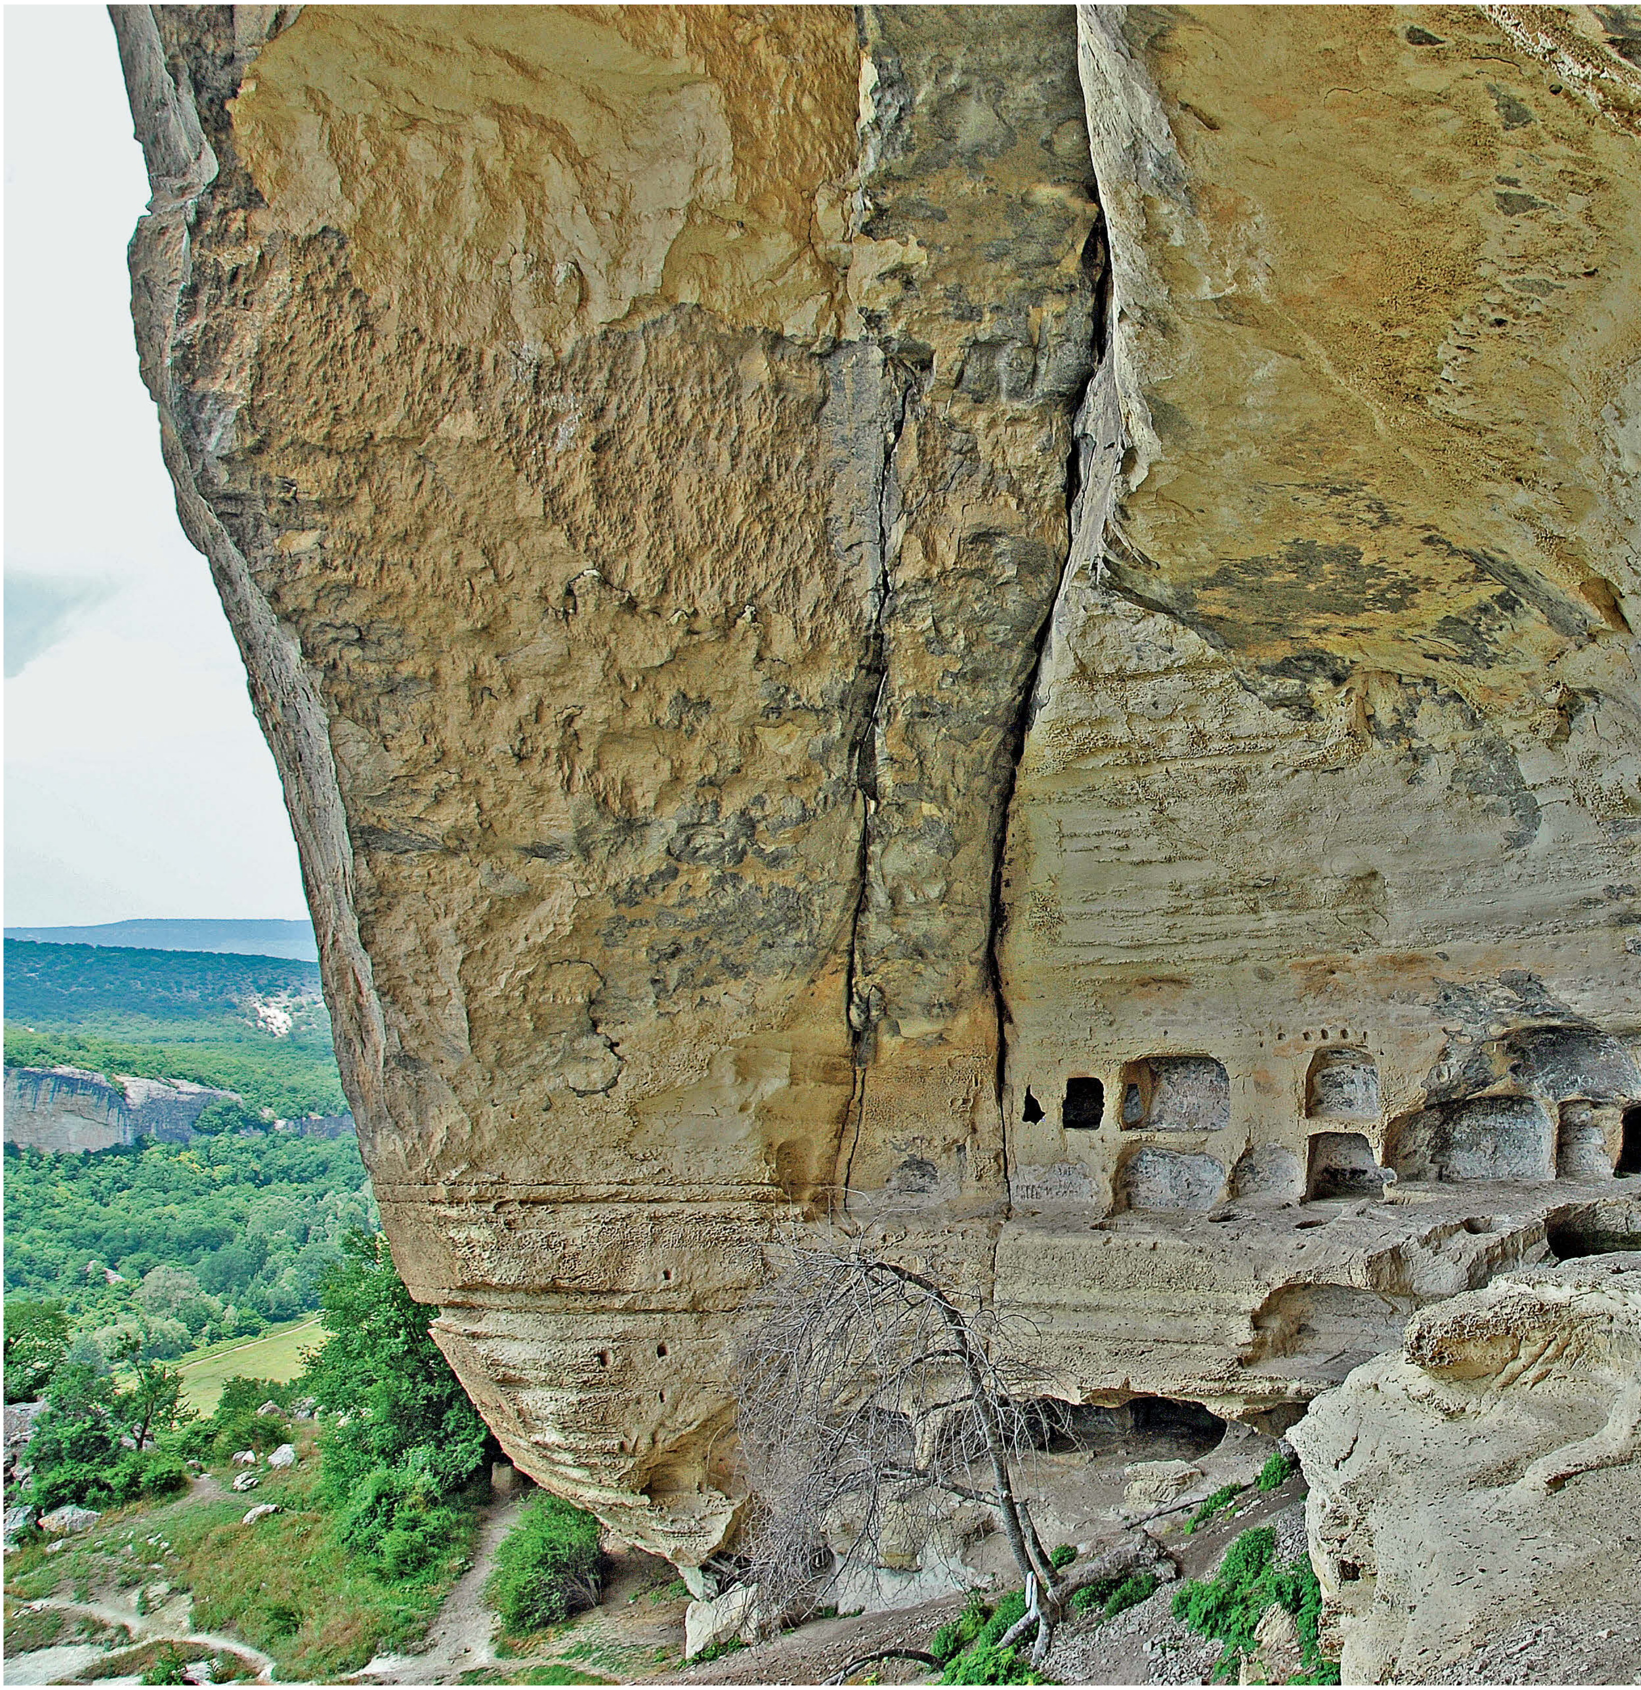
The conversion to Judaism never concerned the majority of the Khazar population, which remained Christian, Muslim or heathen. Al-Masudi, for example, highlights that in the capital Atil different judges imparted justice for members of different religions: two for Christians, two for Muslims, two for the Jewish Khazars and one for the various heathens.[44] The Islamic community had its roots in the numerous, constantly growing groups of Muslim merchants within Khazaria; the Christian group consisted of long-standing communities such as the one in the Crimea. It also included Byzantine iconodules (venerators of images), who in the eighth and ninth centuries had fled from persecution by the iconoclasts.

After the collapse of the Khazar Empire around 969 there remained in the Crimea the well-known Jewish community of the Karaites. Their legacy remains visible to this day in the medieval double *kenesa* (Jewish-Karaite synagogue) and the necropolis (fourteenth to twentieth century) of Chufut-Kale, or the extensive cemetery of Mangup-Kale (1456–1788). The Karaites follow the Pentateuch and reject the commentaries of the Talmud and the rabbinate. Although many Karaites venerate the Khazars as their ancestors, the Khazars themselves seem to have followed a form of Talmudic Rabbinic Judaism.[45] The Karaites, whose name means 'Readers', probably immigrated from the Iranian region between the ninth and twelfth centuries and adopted a Turko-Cuman dialect. After the collapse of the Soviet Union, many Karaites chose emigration, and today there are only some 1,000 left in the Crimea.

The early ninth century saw a struggle for supremacy within the Khazar elite, which led eventually to a form of dual power. Ibn Fadlan reported in 922: 'The king of the Khazars is called Khagan, and he only appears in public promenading once every four months. He is called the great Khagan and his viceroy is called Khagan Bek. It is the latter that leads and controls the armed forces [and] conducts affairs of the kingdom.'[46] The khagan, who probably represented the older line of rulers, now only had symbolic roles, while real power was held by the bek who led the state and the army. He came from a new line of rulers which had been victorious in the power struggle. The khagan mutated to a sacred figure resembling a demi-god and who – according to Old Turkic traditions – possessed a mandate from a higher power to mediate between the divine sphere and his people. As long as he possessed the divine charisma, *qut*, he was guarantor of the welfare of the Khazans, like a living amulet.[47] But if misfortune befell the state, in the form of droughts or military defeats, such catastrophes were interpreted as proof that the khagan had lost his *qut* because the higher power had withdrawn it from him. He was then executed.[48]

During the ninth century the Khazars came under increased pressure from equestrian peoples such as the Magyars, Pechenegs and Oghuzes, and their territory began to shrink. The Finno-Ugric Magyars, the later Hungarians, originally lived in the area between the Ural and the Kama rivers, then dispersed into the area of the

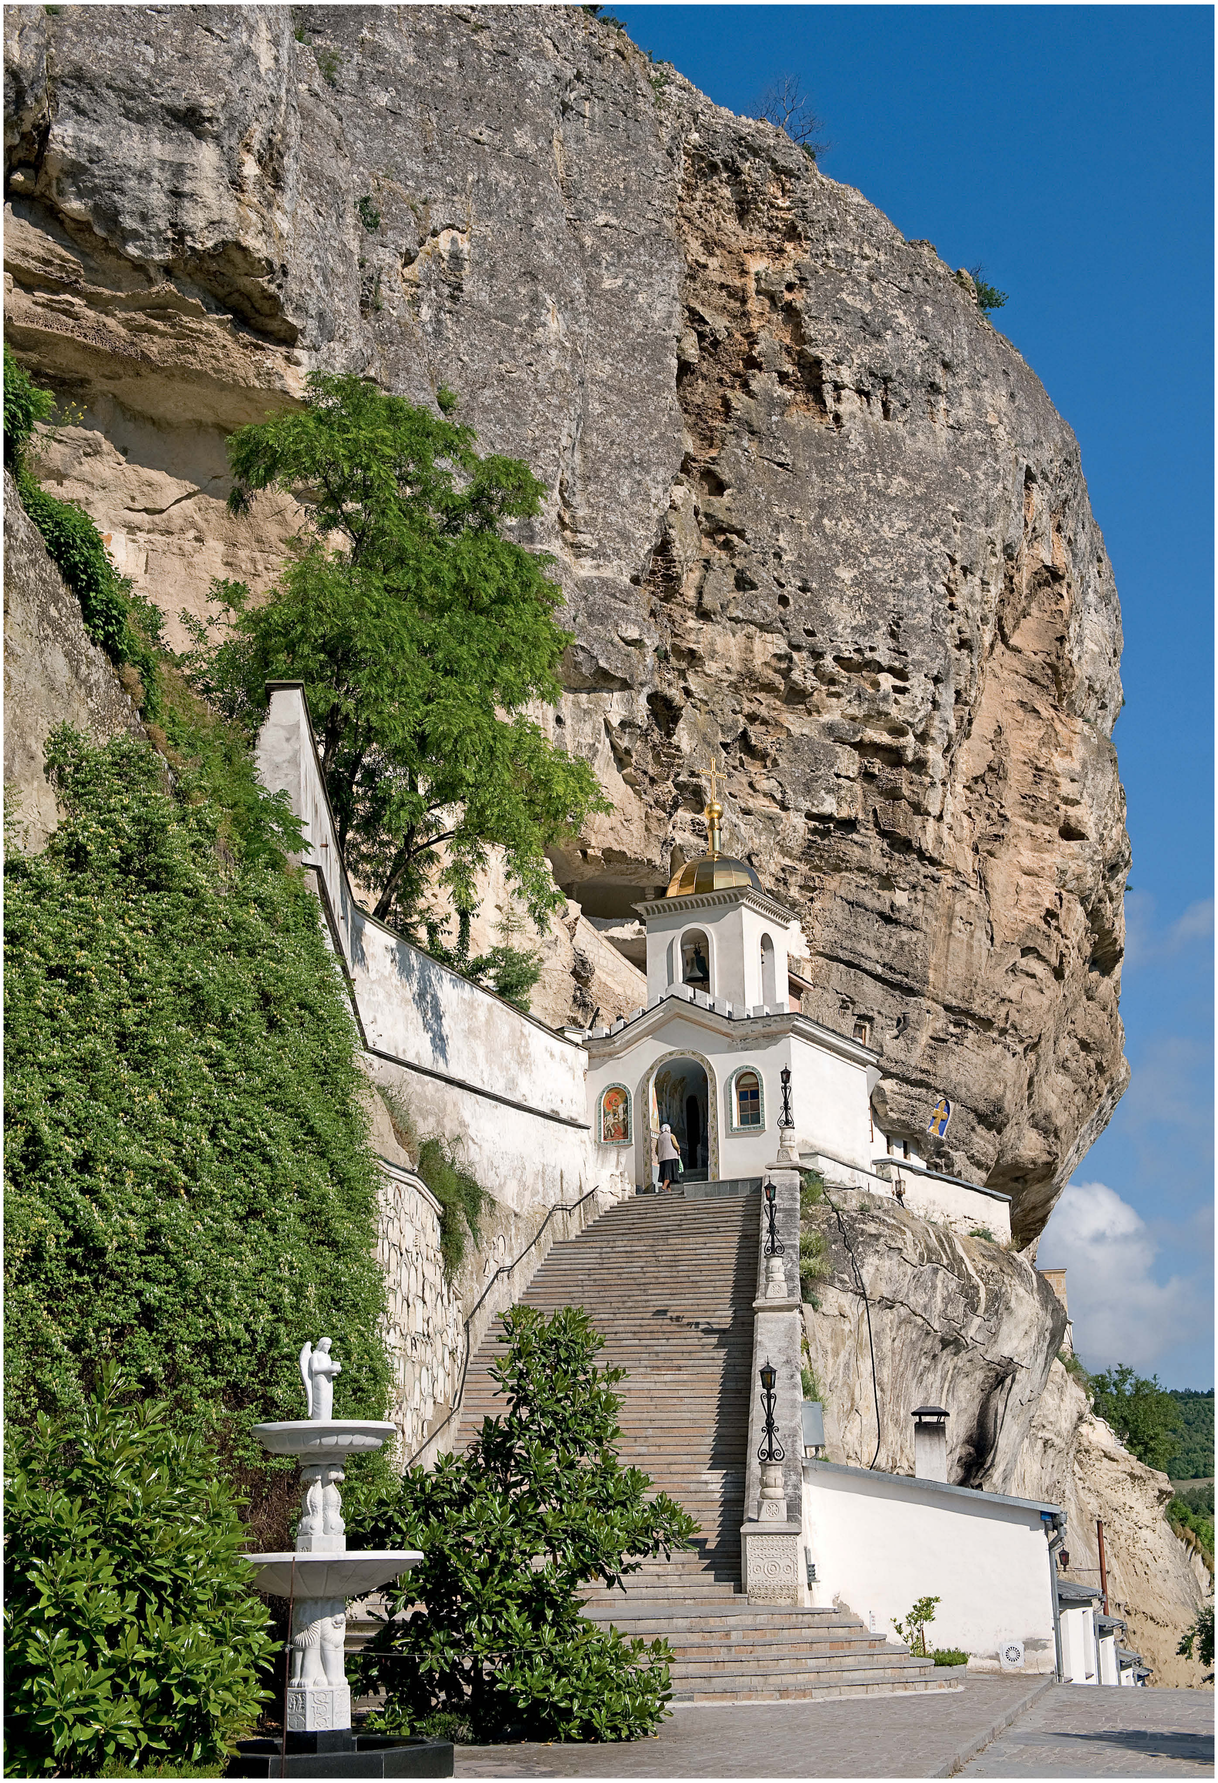
178. The necropolis of the Jewish Karaites of Mangup Kale in the southern Crimea. The picture shows a gravestone from 1707 with the following Hebrew inscriptions: 'This monument was erected on the tomb of the respected R. Yitzhak, the learned, son of the respected R. Yoseph the elder, of blessed memory, that left the wife of his youth. Passed away on Sunday, 4 of Adar, year 5467 from the Creation'.[19]



179. Like the Uspenskij cave monastery, the cave complex of Kachy Kalon in the southern Crimea was founded by iconodule monks, who had probably fled there in the 8th c. to escape the ban on religious images imposed by iconoclast Byzantine emperors. The Turkic Khazars of the Crimea practised religious tolerance. The picture shows the Hagia Sophia church.

Volga Bulgars and adopted Turkic cultural elements. In the second half of the eighth century, part of the Magyars went further southwest, first into the area between the lower courses of the Volga and Don, where they were subjects to the Khazars, and from the early ninth century further west, probably as far as the Danube. Here they settled from the 830s–40s in *Atelkuzu* (Etelköz), the 'land between two streams', which stretched from the Don to the Dniester or to the Danube, thus snatching control over this area from the Khazars.[49] Also at the end of the eighth or beginning of the ninth century Oghuzes, Kimeks and Karluks drove away hordes of the Pechenegs from their homeland at the lower course of the Syr Darya, after which the Pechenegs settled between the Urals and the Volga. As Constantine VII Porphyrogenitus reports, an alliance of Oghuzes and Khazars attacked the Pechenegs around 889–93 and drove them westward. The Pechenegs crossed the Volga and the Don, formed an alliance with the Bulgarian tsar Simeon I and in 896 annihilated the Magyars of Atelkuzu, whose survivors fled westward to the upper course of the Tisza. The eight tribes of the Pechenegs, who did not form a united khaganate, settled to the west and east of the Dnieper, and the Byzantines used the weakened position of the Khazars to regain control over the merchant cities of the Crimea.[50]

Although the Khazars, in alliance with the Oghuzes, succeeded in driving away the Pechenegs from their borders, their Oghuz allies turned out to be an even more dangerous adversary, since they wanted to push forward to the fertile steppes at the Don and gain control over the trade routes there. After some border skirmishes, the Oghuzes formed an alliance with the Prince of the Kievan Rus', Sviatoslav I (r. nominally from 945, de facto *ca*. 959/963–72). Under Sviatoslav's leadership, the allies conquered the fortress of Sarkel in 965 and in 968 or 969 the capital Atil, after which the Khazarian empire broke up. The Rus' were originally Scandinavian 'war merchants', also called Varangians, who either conducted trade along the Russian rivers or went on raids by boat into the territories of the Volga Bulgars and the Abbasid Caliphate.[51] With the appearance of the Kievan Rus' around the end of the ninth century, the Varangians became rulers of an agrarian society. So the victory of the Kiev Rus' over the Khazars also constitutes a success of an agrarian-mercantile society over a former equestrian people. In 985 a Russian-Oghuz attack on Bolghar followed, which remained without consequences for the Bulgars since soon afterwards unrest and uprisings broke out among the Oghuzes, when their yabghu tried to impose a system of yearly taxes on the nomadic tribes.[52]



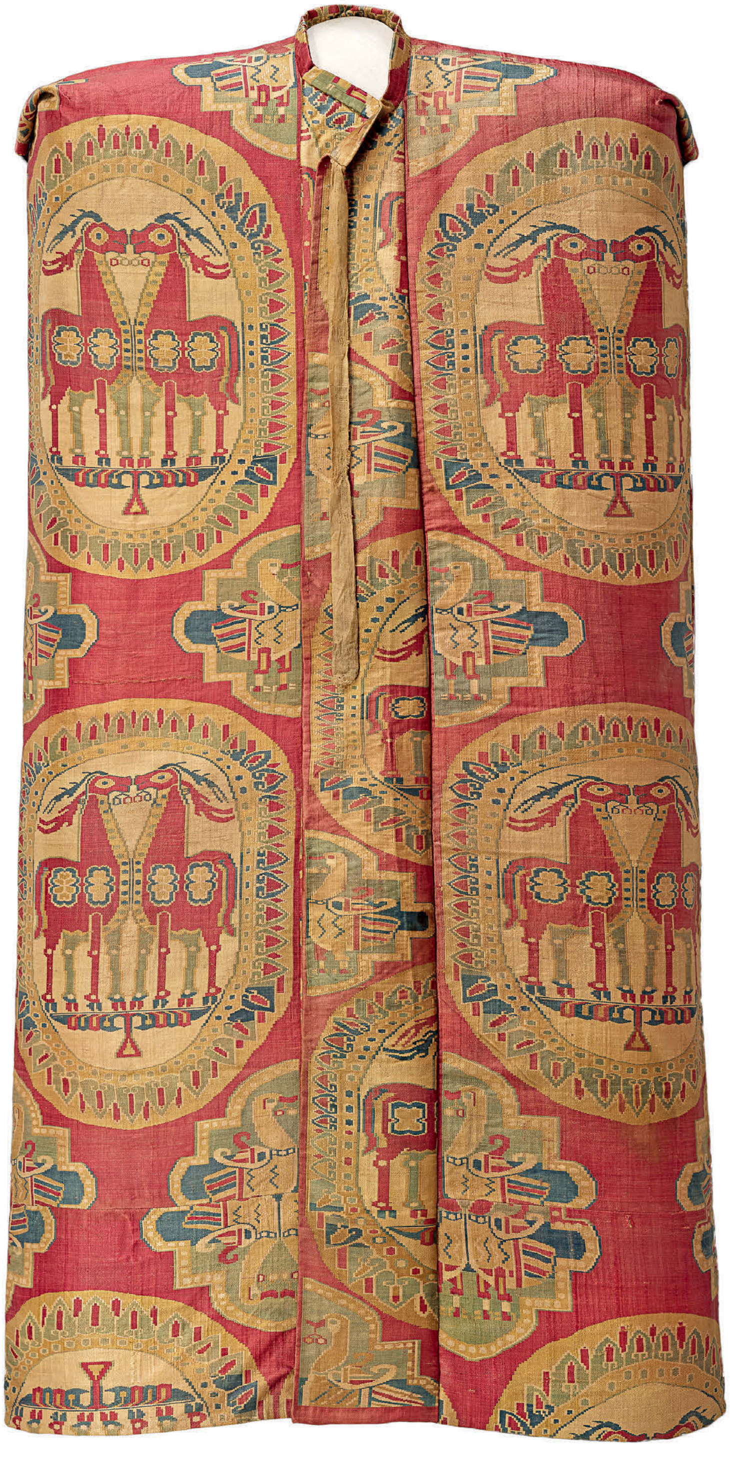
180. The Uspenskij (Church of the Assumption) cave monastery in the southern Crimea was probably founded at the time of the Khazar suzerainty in the 8th or 9th c. by iconodules, who had fled from the iconoclasts then dominant in Byzantium. In 1778 the Crimean Greek Orthodox Christians were forcibly resettled in the Asov region by the Russians, and the monastery fell into ruin. After being destroyed by the Bolsheviks in 1921, the monastery has been undergoing restoration since 1993, to the dismay of some local Muslim groups.

VII

The Sogdians

Oh, wise man, this is a lion! If you bring it back to life, it will kill us all!

Adapted from the Indian legend *The Story of the Brahmins Who Put Life into the Lion*, which was twice illustrated as a mural in the Sogdian city of Panjikant.[1]



181. Sleeveless coat with the post-Sassanid Sogdian motif of a medallion with dual animals facing each other, here with medallions of dual deer standing on the tips of their hooves, and paired ducks. The silk fabric is probably from Central Asia and can be dated to the 8th/9th century; the shape of the garment is similar to that of the painted coffin planks from the ancient Tibetan necropolis of Guolimu in the Dulan region (today's Qinghai province) which was then part of the Great Tibetan Empire.[20] Abegg-Stiftung, CH-3132 Riggisberg, inv. no. 5405, 5409.

1. A Trade Empire from the Crimea to China

1.1 Sogdian Trade before Old Turkic Rule

The Sogdians maintained an empire of commercial centres whose hub was Samarkand, the meeting place of several important trade routes. But unlike the Phoenicians or the British East India Company, the Sogdian trade empire was neither organised nor possessed a military arm to advance its interests abroad and acquire territorial rights. They lacked the structural basis for this, for Sogdiana had no central authority, only a large number of city states which were in competition with each other. Among them were cities in what is now Uzbekistan, such as Bukhara, Vardana, Varakhshah, Paykend and Uch Kulakh, all within the large Bukhara Oasis; Kushaniyya, Shahrisabz and Samarkand further east, and Tashkent north of these. In the north-west of Tajikistan there were also the city of Panjikant and, further north-east, Bunjikat. All built of mudbrick, they possessed – as is clearly demonstrated by the example of Panjikant which has not been built over since the eighth century – a princely citadel, called *kala* in Arabic, a walled part of the city called *sharistan*, and outer quarters known as *rabat*. In one respect the political structures of Sogdiana resembled the medieval trade republics of Venice or Genoa, whose leadership was recruited from their own wealthy nobility. The cities minted their own coins but these were only in circulation within Sogdiana; they used the Sassanid drachma and silk bales as international currencies.[2] It was not until the seventh century that some larger centres of power emerged, such as Samarkand, Bukhara, Čač (Tashkent), Panjikant and Bunjikat.[3] The achievements of the Sogdians in building a trade network and in diplomacy are comparable to those of the pre-Christian Phoenicians.

Despite their political fragmentation, the Sogdians succeeded in establishing a vast trade network and they maintained a quasi-monopoly of the trade in luxury goods for three to four centuries. The Sogdians compensated for the weakness caused by the lack of central political organisation by offering their services as administrators and advisers to nomadic equestrian peoples, especially the Göktürks, and making themselves indispensable during the establishment of a state and its administration. They also founded their own trading centres along the major trade routes, stretching from the Crimea in the west to the Chinese capitals Chang'an and Luoyang in the east. As surviving documents show, they also maintained a chain of numerous trade offices between Sogdiana

182. Ruins of Kala-i Kahkaha in the Sogdian city of Bunjikat, Ustrushana, which kept its sovereignty until 893. Northern Tajikistan.

and central China, especially in Semirechie (south Kazakhstan and west Kyrgyzstan), where there is archaeological evidence for 29 towns and settlements from the sixth to the ninth century; many of these were built according to similar grids, which suggests centralised planning.[4] Further Sogdian establishments were found in Xinjiang, Dunhuang, the Hexi Corridor, Ningxia, Datong[5] (Shanxi) as well as in Mongolia and the Ordos where the Sogdians bred horses for the Chinese market from the seventh century.[6] The different strongholds of the Sogdian diaspora were linked by their own postal service, as can be concluded from the *Sogdian Ancient Letters*.[7] Further west, the Sogdians, together with Chorasmian traders, were active on the so-called 'Fur Route' and ran trading posts on the Taman Peninsula on the eastern shores of the Cimmerian Bosporus[8] and the southern coast of the Crimea, where in the sixth or seventh century they founded the port of Sogdaia, today's Sudak (fig. 147). Sogdaia stood on Turkish-Khazar territory and was an ideal bridgehead to the Byzantine market.[9] Over what distances products could be traded can be seen from the example of a small bronze figure of the Buddha in the Late Gandhara style of the sixth or seventh century from Kashmir or Afghanistan, which was discovered in a Viking trading post on the island of Helgö in Lake Mälaren west of Stockholm.[10] Sogdian inscriptions in the Karakoram mountains from the fourth century, and inscriptions from the year 825/26 near Tangtse, beside the Pangong lake on the Ladakhi–Tibetan border,[11] are evidence for Sogdian trade activities reaching south to the Indus and to Tibet.

As early as the first century BCE, the Sogdian city-states were already adept at exploiting the vain desire of Chinese rulers to receive legations bringing tribute from distant countries. Traders mingled with the legations, or trade expeditions were disguised as diplomatic missions. Protector-General Guoshun (in office 16–12 BCE) warned Emperor Han Cheng Di: 'If in view of these considerations we ask why [Kangju] sends its sons to attend [at the Han court], [we find] that desiring to trade, they use a pretence couched in fine verbiage.'[12] The warning of the protector-general, which was ignored, was based on the fact that such legations, as soon as they had obtained a travel permit, called *guosuo*,[13] received free food and hospitality on the prescribed route within China,

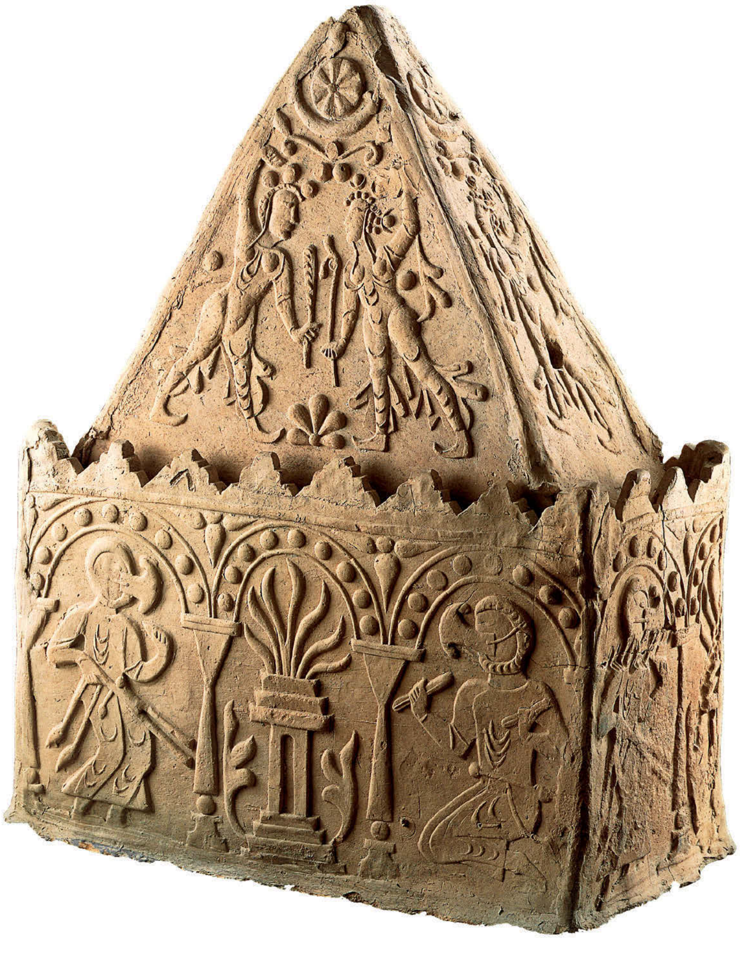
183. Gilded silver plate with the mythical primordial bird *senmurv*, which has the head of a dog with lion's claws, late Sassanid, 7th c. The Trustees of the British Museum, London.

incurring high costs. Sogdiana's economy was based primarily on irrigated agriculture, but since in the north and north-east its territories bordered on those of various steppe peoples, who needed many agricultural and craft products, the trade to the east started by the time of the Achaemenid Empire. The trade with Chinese wares began in the second century BCE, when China paid tribute to the Xiongnu in the form of silk bales and also used silk to buy the benevolence and services of semi-nomadic princes of Xiyu, today's Xinjiang. These petty rulers then acquired other goods from Sogdian traders in exchange for silk. Chinese envoys and officers, who were stationed in Xiyu, traded with the same precious textile; they were either paid their wages in the form of silk,[14] or they diverted a portion of the diplomatic silk gifts destined for nomadic equestrian princes for their own purposes. This form of trade was a boon to the Sogdians since it allowed them to purchase Chinese silk without having to travel to central China and establish their own infrastructure there.[15] Despite this advantage, the Sogdians did not miss the opportunity of building a network of trading posts and their own postal service in China as early as the third century CE.

At that time, Sogdians were still playing only a secondary role in international trade which was then dominated by Bactrians, Parthians and especially Kushans. One of the reasons for this was that the trade routes passed mainly through Bactria and Gandhara. After a downturn in the first half of the fourth century caused by the turmoil of the war in China, international Sogdian trade took off in the late fourth and early fifth centuries. Four factors contributed to this: firstly, in China the political situation stabilised with the dynasty of the Northern Wei; secondly, in Bactria the war between the attacking Chionites and the defending Sassanids from the 360s to the 380s brought economic decline and a fall in population; thirdly, the Chionites, Kidarites and Hephthalites furthered the expansion of Sogdian cities and invested in urban as well as agrarian infrastructure. Finally, Sogdiana possessed its own sericulture by the end of the fifth century and so could export its own exquisite silk robes to the west and to the east.[16] The trans-continental trade in luxury goods, primarily silk, now shifted from the Bactrian Indus route mostly to the Sogdiana-Merv-Iran land route, and Sogdian traders gained a dominant position since they knew how to take advantage of their favourable geographic location between the large markets of China, India, Iran and the Pontic steppes leading to Byzantium. A Chinese tax register from the Turfan Oasis from 610–20 documents not only the dominance of the Sogdians in international trade but also the luxury goods that were traded: Sogdians exchanged gold, silver, brass, medicinal plants, saffron, amber, ammonium chloride, perfumes, musk and slaves against silk which they then sold on westwards.[17] Another document, from 553, reveals the huge size of their caravans, with some counting as many as 240 merchants and 600 camels carrying 10,000 silk bales.[18]

The Sogdians traded not only with foreign silks but, from the end of the fifth century, also exported their own silk fabrics to the Tarim Basin, to China and Tibet as well as to Byzantium. The new patterns soon became popular, and by the 580s at the latest, they were copied and adapted after Emperor Sui Wendi had been given a silk robe with golden leaf motifs in 581 by the Sassanid ruler Hormizd IV and then commissioned the Sogdian artist He Zhou to make a copy.[19] The motif found in many precious fabrics consisted of floral rosettes or roundels of the kind which can be found on the Sassanid rock relief of Taq-e Bostan near Hamadan (Iran)[20] from the early seventh century as well as on the Sogdian murals of Panjikant and Varakshah. Roundels and medallions on other fabrics had animal themes which in a Zoroastrian context originally possessed a religious symbolism. Birds holding pearl necklaces in their beaks symbolised the bird Varagan who is searching for light in the ocean and who in turn is an incarnation of Verethraghna; the humped zebu symbolised the deity of 'good mind' Wahman or the moon god Mah; the winged horse the young fire god Apam Napat, 'born of the waters'; the ram the majestic power and glory of Kwarnah; and the composite creature of a winged dog with lion's claws the mythical bird-like simurgh who mediated between heaven and earth (fig. 183).[21] This motif can be found in the boar hunt relief of Taq-e Bostan as well as on the robe of Great Shah Yazdegerd III in the wall paintings of Afrasiab.[22]

Apart from established centres of Sogdian silk weaving, there were competing workshops in the Tarim Basin, such as those in Khotan, Kucha and in the Turfan Oasis, as well as in Sichuan.[23] Here was created the new post-Sassanid motif of dual animals facing each other within a round, often pearled medallion. As Karel Otavský stresses, even though the animals themselves may have looked Sassanid, 'their representation in pairs is not a typically Sassanid textile motif'. This Sino-Sogdian innovation appeared in the seventh century in the Chinese cultural sphere thanks to the 'widespread use of the symmetrical harness repeat in weft-oriented looms which made it possible to double the repeat width'.[24] The harness system is a function of the draw loom.[25] For the formation of the shed each individual warp or each group of warps are lifted by a harness thread. The heddles, which are mounted in the harness, are lifted at the same time. The arrangement of the harness threads is determined by the wooden harness board, which lies horizontally over the loom and has one hole per harness thread. With this system it is possible to weave weft-faced patterned repeats independently of the total breadth of the fabric, and this can be repeated in symmetrical or asymmetrical order. The upper and lower wefts of the fabric hide the main warp threads so that these become practically invisible. The Sino-Sogdian medallions show symmetrically paired animals in profile, such as deer, peacocks, doves or pheasants on split palmettes, with the birds bearing a nimbus. Their outer rings are decorated with imitations of pearls or metal-coated boar fangs.



184. **Sogdian clay ossuary from Molla Kurgan, Uzbekistan, 7th c. Two female dancers are represented on the lid; on the long side of the vessel, two priests wearing *padams* stand in front of a fire altar. Samarkand Museum of History, Samarkand.**

1.2 The Sogdian-Turkic Alliance

The Sogdians consolidated their leading role in the silk trade after 560 thanks to their close relations with their Turkic overlords. As a first step in this collaboration, the Sogdians sold on the enormous quantities of silk bales which the Chinese Northern Zhou and Northern Qi paid to the Turkic khaganate to safeguard the peace, to the west for a profit. In order to further these sales, Ishtemi Yabghu sent a Sogdian-Turkic embassy to Byzantium in the winter of 568/69. The Sogdian-Turkic bonds became closer still when the two Turkic khaganates and especially the Uyghurs (744–840) forced the Chinese Tang dynasty to buy horses and camels of inferior quality at inflated prices and pay for them with high-quality silk bales. The Turkic and Uyghur elite – in alliance with Sogdian traders – now had a quasi-monopoly in the trade of Chinese silk within Central Asia. At the same time Sogdian merchants used the Turkic patronage to found trading settlements in central China itself whose elite, like that of Sassanid Iran, regarded mercantile professions as inferior. The local communities were led by a Sogdian *sabao*, who fulfilled both administrative and diplomatic tasks in relation to Turkic delegations. To identify the Sogdian immigrants, the Chinese authorities preceded every Sogdian name, which had been transliterated into Chinese, by a prefix which designated his home town. The Chinese introduced nine prefixes, six of which were widely used: *An* for Bukhara, *Cao* for the region north of the river Zerafshan as far as Ustrushana, *He* for Kushaniyya between Bukhara and Samarkand, *Kang* for Samarkand, *Mi* for Panjikant, *Shi* 石 for Čač (Tashkent) and *Shi* 史 for Kesh (Shahrisabz).[26]

After Xieli Khagan's capitulation in 630, China's Sogdian population grew rapidly when many Sogdians, who until then had been in Turkic service, were relocated to the Ordos. On the lush pastures of the Ordos they bred horses, which they delivered to the Chinese army in exchange for silk bales. In 679 the areas in which these strongly turkified Sogdians lived were divided up into the *Six Barbarian Prefectures*. Under the Uyghurs, who between 762 and 831 had intermittently established a kind of protectorate over the Tang dynasty whose army was weak, the Sogdians succeeded in developing flourishing banking activities in China which were

186. **Banqueting scene on a panel from the Sogdian funerary couch of Anyang, Henan, China, 6th c., Museum of Fine Arts, Boston. The panel did not come from a controlled excavation but was purchased on the antique market; further parts of the same funerary couch are in the Musée Guimet, Paris, and in the Museum für Ostasiatische Kunst, Cologne.**

able to influence the Chinese financial system. The special position of Uyghur-Sogdian banks only came to an end in 831 when the rapidly declining political and military dominance of the Uyghur Empire enabled Emperor Wenzong (r. 827–40) to sharply curtail Uyghur activities within China.[27]

Spectacular testimony to these Sogdians is provided by the ten stone tombs from the sixth century which have been discovered in central China. They consist of seven funerary couches each of which has pictorial panels, painted on the inside, and three house-shaped sarcophagi.[28] These stone tombs in white marble, grey granite or black limestone not only illustrate Zoroastrian rituals and ideas, and the high status of the deceased, but also show how Zoroastrian Sogdians adapted to Chinese funerary practice. Zoroastrians neither bury nor cremate their dead, since they believe that earth and fire must not be contaminated. The corpses are either exposed in the open air, in places where birds and other animals of prey or specially trained dogs eat the flesh off the skeleton, or they are temporarily kept in niches or on stone benches of mausoleums; in both cases the bare bones are gathered and placed in an ossuary.[29] In Sogdiana, where neither stone funerary couches nor house sarcophagi existed, ossuaries consisted of mudbrick vessels which were decorated on the outside. But in China the exposure of a corpse was totally unthinkable since it negated the integrity of the body; burial alone, or cremation in the case of Buddhists, were customary. With the stone couches and house sarcophagi, the Sogdians found a solution which complied with the rules of both religions. The dead body was buried in an underground chamber with dromos according to the Chinese custom, but since it rested on a stone base, the earth was not contaminated.[30] Thus the funerary couch and the house sarcophagus served the same function as an ossuary. The custom of furnishing an underground tomb with a funerary couch or a house sarcophagus only emerged in the fifth century in northern China under the Northern Wei.[31] It is not known why the sinified Xianbei imitated earlier Han Chinese shrines for the dead, which at the time were used for the veneration of ancestors, for use in their own burials. At any rate the Sogdians consciously adopted the idea of the house sarcophagus as a sacred memorial, as can be seen from the inscription on the grave of Sabao Wirkak (Shi Jun), who died in 579, since it explicitly calls it 'house of the god' (fig. 185).[32] By furnishing their burial sites with *mingqi* burial objects, the Sogdians adopted another typically Chinese funerary practice.

The outer sides of the stone sarcophagi and the pictorial panels of the funerary couches often show both secular and religious scenes. The former are of a biographical nature and illustrate important activities of the deceased (fig. 187). For example, the *sabao* greets a Turkic leader, negotiates with him on horseback and then offers him hospitality in a yurt, or, along with Turkic nobles, he hunts big game and gazelles, riding on a horse, camel or elephant. Other scenes show laden camel caravans, ox carts or a Turkic camp. The link between the secular and religious scenes is provided by the numerous banqueting images which show the deceased alone, with his wife or a Turkic guest. They are entertained by musicians, acrobats and men who perform the Sogdian whirling dance *Hu xuanwu*, which was very popular in China, and the leaping dance *Hu tengwu*. The theme of such Sogdian dance performances, which are accompanied by music, can also be found on water flasks made of stoneware and on the famous silver jug of Lhasa Jokhang, made during the eighth century in the Sogdian cultural sphere (fig. 189).[33] In the banqueting scenes the deceased are drinking from a chalice or a rhyton, and probably not only wine, but also *haoma*, the Zoroastrian sacred drink that bestows immortality; the scenes also evoke an image of the paradise, which the Sogdians imagined as an eternal banquet. The banqueting scene of the house sarcophagus of Yu Hong, who died in 592, clearly expressed the hope of entering paradise, for the deceased feasting couple is flanked by four Zoroastrian *yazatas*, divinities 'worthy of veneration': Ameretat (personifying immortality), Haurvatat (good health), Khshathra Vairya (hope) and Spenta Armaiti (serenity).[34]

Surprisingly, the content of the religious scenes is almost exclusively Zoroastrian although in Chinese sources Sogdians also appear as translators and promulgators of Buddhist, Christian and Manichaean texts. Zoroastrianism reached central China by the early sixth century[35] and was firmly established among the Sogdians of northern China. Dunhang alone had 20 Zoroastrian temples and shrines.[36] The religious representations remind us of the fact that Sogdian Zoroastrianism, with its multitude of gods, and its non-canonical customs, as for example the dramatic laments, differed strongly from Sassanid state religion, which is why it is more fittingly called Mazdaism.[37] The religious scenes include lamentations featuring face lacerations and striking hybrid creatures with human torsos and bird-like lower bodies. On the lintel at the tomb of An Jia (An Qie), who died in 579, the deceased and his wife conduct a fire ritual in front of a fire altar carried by three camel protomes, the camel being the attribute animal of the god of war and victory Vashagn.[38] On another representation, which is of the greatest importance, two priest-bird hybrids wearing white cloth coverings (*padams*) over their mouths, who were part of the retinue of the divinity (*yazata*) Sraosha, judge of the souls of the dead, help the deceased and their camel caravan with the crossing of the Chinvat Bridge which leads from life to death.[39] For the virtuous souls, who in their past lives have striven for 'correct thinking, correct speaking, correct action', this passage appears as a comfortable transition to paradise whereas to the sinful ones it is as narrow as a razor blade, which is why they will inevitably plunge into hell where greedy monsters await them.[40] Near the representation of the crossing of the Chinvat Bridge at the eastern outer side of the house sarcophagus, a deity on a throne can be seen at the top right, holding a trident, with three bulls lying at his feet. The deity who is observing the scene of the Last Judgement is the wind god Weshparkar, bearing the facial traits of the Hindu god Shiva who, according to a Chinese chronicle, was represented in the Zoroastrian temple of Chang'an as principal deity.[41]

How strongly Old Turkic culture adopted Sogdian elements can be seen from the development of the script. Initially, the First Khaganate took the Sogdian script for official proclamations, as is shown on the Bugut Stele in western Mongolia dating from the 580s. Then, during the Second Khaganate, Khagan Kapagan (r. 691–716)[42] introduced a separate Old Turkic alphabet, which had evolved over a long time. This runic alphabet consists of 38 signs of which four represent vowel sounds and can each signify two distinct vowels. Fifteen of the 38 signs were directly derived from the Sogdian alphabet; the remainder were new.[43] Johann von Strahlenberg, who was the first to draw these signs and published them in 1730, recognised that their runic script is not related to Germanic runes and surmised that they were a development of 'Parthic letters'; that is, Pahlavi, which, like the Sogdian script, derived from the Aramaic alphabet.[44] In late 1893, the Danish philologist Vilhelm Thomsen succeeded in deciphering this runic alphabet, usually written from

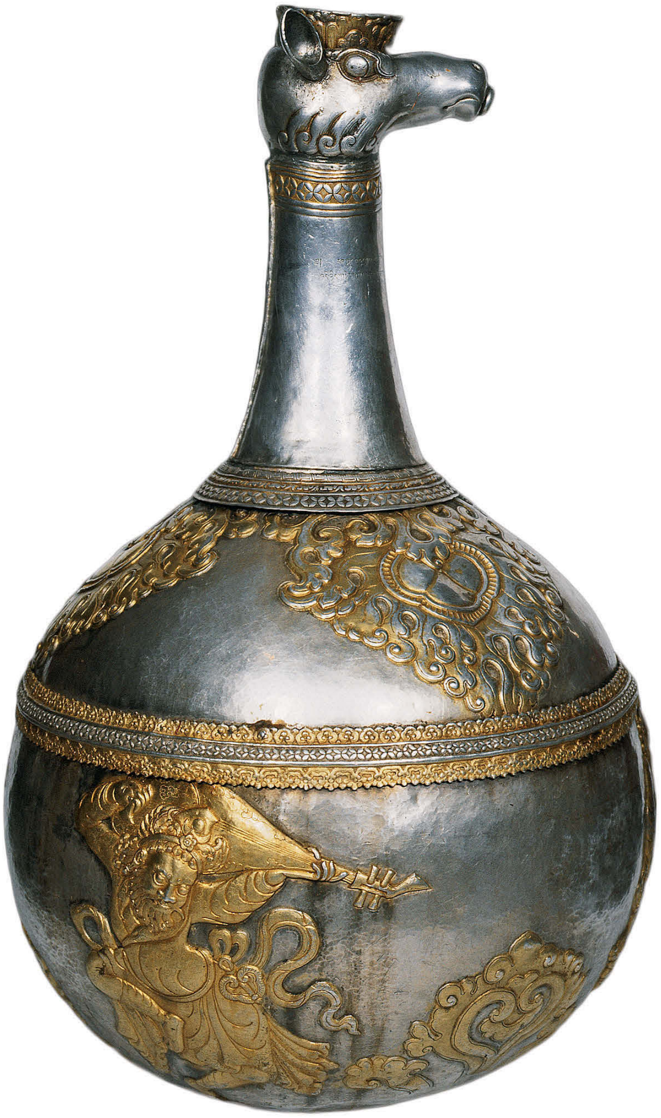
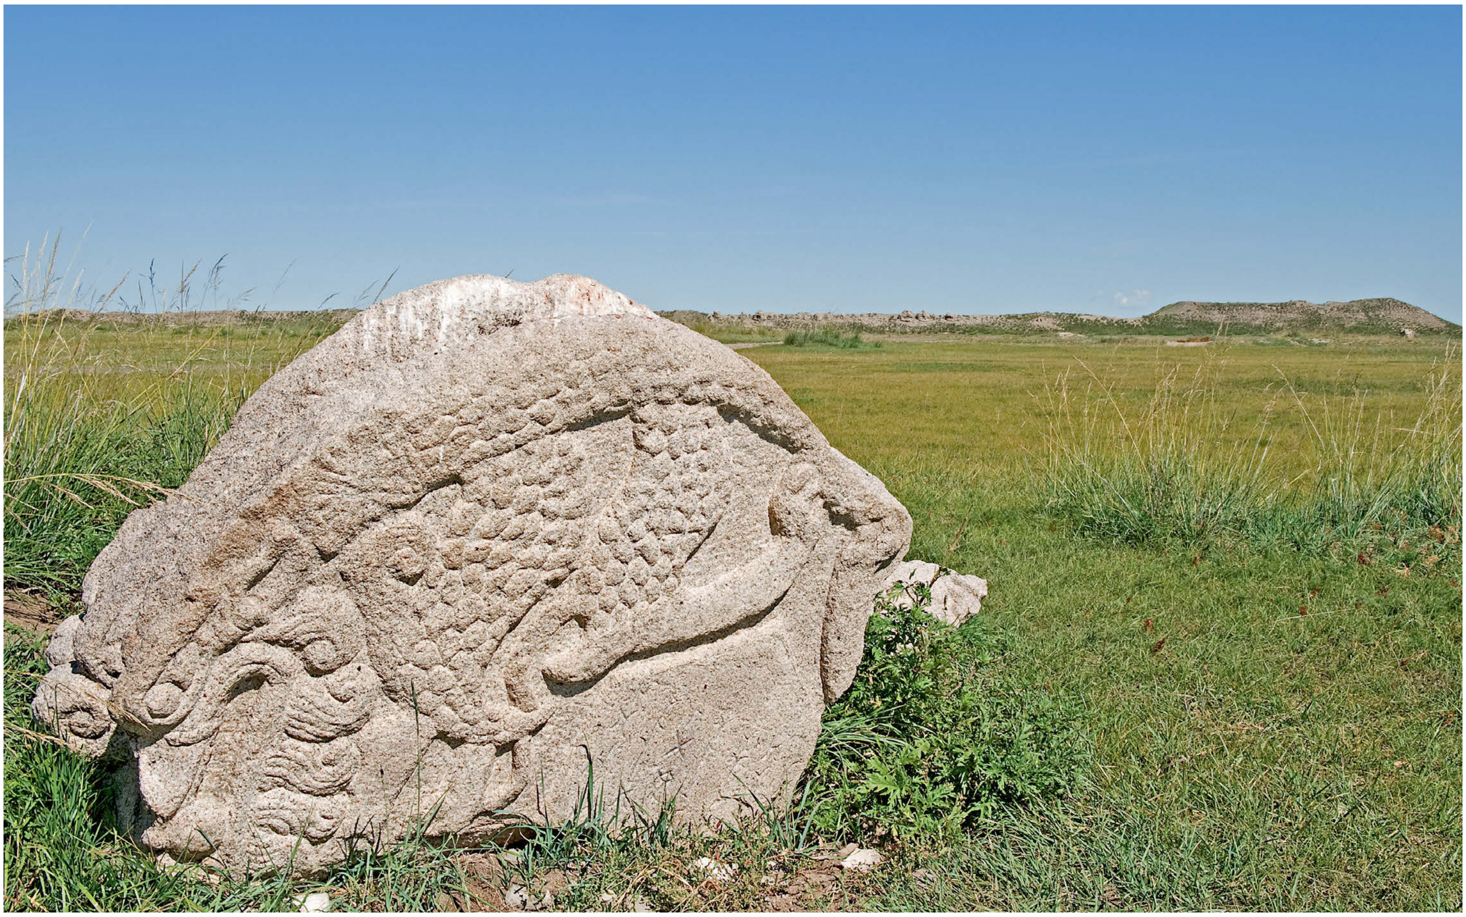
right to left, and in 1894 the German founder of Turkology, Wilhelm Radloff, translated the memorial text in honour of General Kül Tegin (d. 731), inscribed on a stone stele in the Orkhon Valley in Mongolia.[45] The Old Turkic alphabet was also used in the Uyghur Empire on the Orkhon, and, in slightly modified form, in the Kyrgyz inscriptions on the river Yenisei. Other central and east Asian scripts developed from the Sogdian alphabet. In the mid-ninth century, the Uyghurs in Turfan derived their script, which is written from right to left, from the Sogdian, and, under the influence of the Syriac-Nestorian Estrangelo script, they also wrote it from top to bottom. At the beginning of the thirteenth century, the vertical Mongolian script developed from the Uyghur script, and the Manchurian script, also written vertically, which served to write a Tungusic language, derived from this in the seventeenth century.[46]

The military advance of China into Eastern Turkestan from 640 had a decisive influence on the silk trade. The Chinese were now able to transport large quantities of silk to the west themselves, as gifts for vassal states or as wages for their own troops stationed in Xiyu. As a result the Sogdians lost the inner Chinese market. But they knew how to adapt to the new situation: on the one hand they strengthened their trade with Chinese border troops, on the other they moved into careers in the Chinese administration and army, or offered transport services for the army.[47] In the mid-eighth century, though, the situation changed dramatically and a period of turbulence commenced: the highest commander of the Chinese troops in the north-east of the country, General An Lushan (703–57), who had a Sogdian father and a Turkic mother, led the rebellion (755–63) which has come to bear his name. In the summer of 756, he conquered the capital Chang'an and plunged the ruling Tang dynasty (618–907) into its greatest crisis so far. It was only saved with the help of the intervention of Uyghur cavalry, and



189. Silver, partially gilt wine jug with a long neck surmounted by the head of a camel, total height 78 cm, *ca.* 8th century. Three Bacchanalian scenes are depicted on the lower part of the vessel; on one scene (not shown here) three drunken men support each other; on each of the other two a bearded man, who plays a lute which he holds behind his head, performs a wild dance. This dance is strongly reminiscent of the famous 'Sogdian whirl', called *Hu xuanwu* in Chinese. The silver vessel was probably produced in Tajikistan in the Sogdian style. It is not known how it came to Lhasa; perhaps it was brought from the Tarim Basin to Tibet as war booty.[21]



190. The upper part of the broken stele of Ordu Baliq (Karabalgasun), which was erected in 821, Övörkhangai Aimag, Mongolia. The stele was inscribed in Sogdian, Chinese and Old Turkic in Runic script which emphasises the important role that the Sogdians had in the Uyghur administration since the 6th c.[22] In the background, the ruins of the city of Karabalgasun.

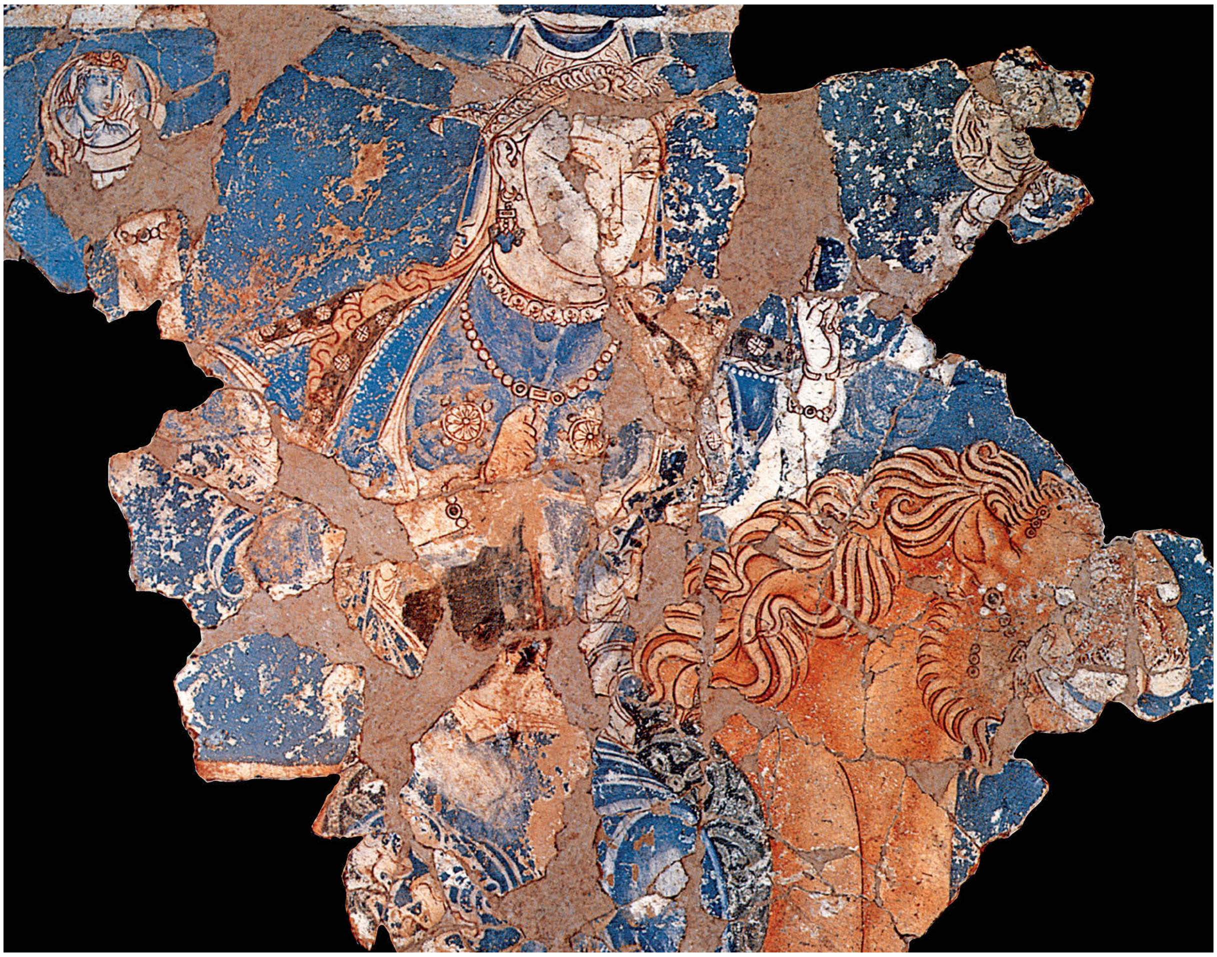
as a result China became dependent on the steppe empire of the Uyghurs.[48] But the Sogdians who lived in China paid a high price for An Lushan's revolt, for when the Chinese army reconquered the main cities, they massacred the Sogdians who lived there, and also encouraged pogroms against them by offering financial rewards for finding and killing Sogdians. To protect themselves, many Sogdians in China adopted Chinese names and forged birth certificates and family trees, thus vanishing from the sources and from history.[49]

The future of the Sogdians within China looked bleak towards the end of the An Lushan rebellion, but when the Uyghur ruler Muyu (Bögü) Khagan (r. 759–79) adopted the Manichaean faith in 763, their situation changed overnight. The trilingual stone inscription of Karabalgasun (fig. 190), the capital of the Uyghur Khaganate, in Old Turkic, Sogdian and Chinese from the first quarter of the ninth century explains how Muyu was converted by Sogdian Manichaeans in Luoyang, where he had helped to crush the rebellion, and soon afterwards elevated Manichaeism to a state religion. The khagan invited Sogdian Manichaean missionaries to Mongolia and entrusted the administration of his empire to educated Sogdians.[50] Since the Chinese Tang dynasty was dependent on Uyghur military support, they had to tolerate both Manichaeism and the activities of the Sogdian-Uyghur trade networks. Because of the continuing war in north-west China and the Tarim Basin between the Tibetans and the Chinese, who were allied with the Uyghurs, Sogdian trade routes moved further north through safe Uyghur territory. Despite the anti-Sogdian and anti-Manichaean putsch in 779 by Muyu's minister Tun Bagha Tarkan, who ruled under the name Alp Qutlugh Bilge (Dunmoho) Khagan until 789 and had numerous Sogdians massacred, the strong position of the Sogdians within the Uyghur Empire remained undisputed. As Colin Mackerras states, 'the roots of their [the Uyghurs'] later contributions in the fields of writing and art were planted through their adoption of Manicheism and absorption of Sogdian influence. In the social sphere, the empire period [. . .] witnessed a partial transfer from the totally nomadic existence of their ancestors to a more settled and sophisticated livelihood in which cities, commerce and agriculture played an important role.'[51]

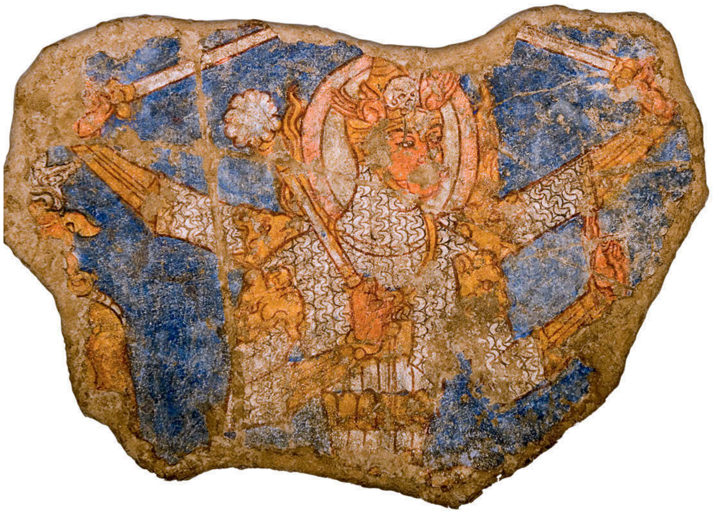
The destruction of the Uyghur Empire in 840 by the Kyrgyz and the simultaneous policies against foreign religions of Emperor Wuzong (r. 840–46), who did not have to fear Uyghur interventions any more, brought the privileged position of the Sogdians to an abrupt end. Sogdian merchants in China had already seen growing competition from Muslim Persians, who controlled the flourishing maritime routes, since the early ninth century. After the loss of the Chinese market, Sogdian merchants looked increasingly westward. They recovered from the destructive plundering and conquering wars of the Arabs, which started in 654 and only came to an end around 750, and seized the chance offered by the huge market of the Abbasid Caliphate (750–1258). Among their most important exports were musk, paper and Turkic slaves, especially young men who were captured by the thousands every year in the north-eastern hinterland and who were sought-after military slaves in Baghdad. Parallel to the ascent of the Muslim dynasty of the Samanids (875–999),[52] the Sogdian elite lost its former cultural identity and integrated into the Sunni Persian culture of the Samanids.

2. Sogdian Religion and Art

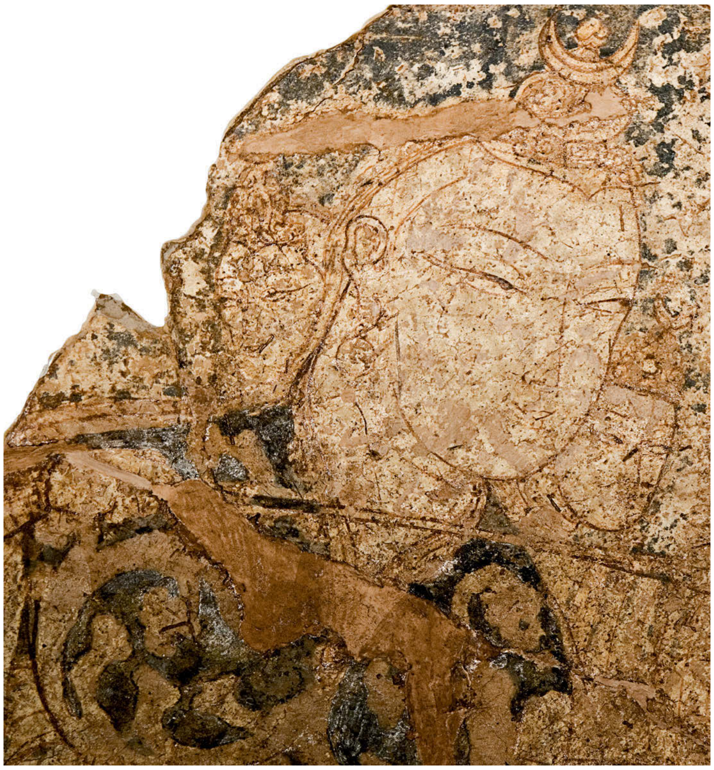
The special political constellation of Sogdiana is reflected in its religious diversity. Sogdiana did not form a unified state, and as a result had no state religion, no central control over the different faiths that existed, and no state clergy. Important Christian and Manichaean communities thrived in Sogdiana,[53] but so did Sogdian Zoroastrianism, called Mazdaism. This was very different from the puritan spirit of Sassanid orthodoxy[54] which would have shied away from a diversity of divinities, avoiding their visual representation. Indeed, some 23 or 24 divinities have been identified in Sogdian art.[55] The visual representations of these divinities took their models from the Hindu as well as the Hellenic or Irano-Mesopotamian pantheons; other images of gods were new creations. In each case the Sogdian divinities kept their identity. As Matteo Compareti observes, the adoption of Indian models for some of the most important Sogdian divinities took place in the sixth century, after the iconography of the Hindu pantheon in



191. Wall painting of the Sogdian goddess Nana from the Palace of Kala-i Kahkaha I, Bunjikat, Tajikistan, 8th–9th c. In her two upper hands, the four-armed goddess riding her lion holds anthropomorphic representations of the sun and moon, with flames blazing from their shoulders. State Hermitage Museum, St Petersburg.



192. Fragment of a wall painting from the 7th/early 8th c. discovered in 2003 in Panjikant showing a demon prince in the context of an epic or mythological battle scene.[23] The four-armed demon is wearing chain mail, and from his shoulders blaze flames, underlining his sublime status. He wields a sword in each of his two upper hands, and in his lower right hand he holds a mace. His head is surrounded by an aureole, and his helmet is decorated by two hands and a skull. Museum of National Antiquities, Dushanbe, Tajikistan.

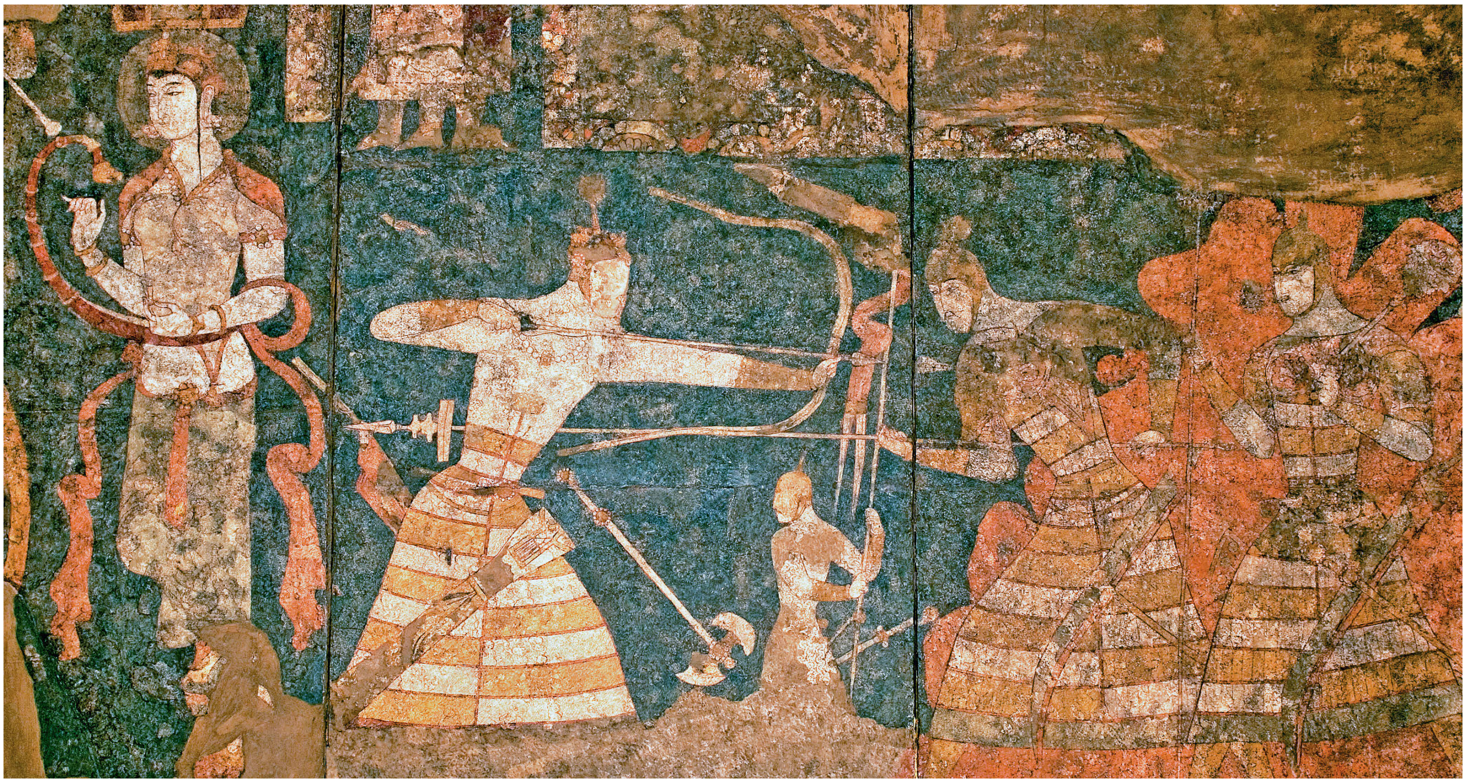


193. Fragment of a wall painting of the Sogdian wind god Weshparkar represented in the guise of the three-headed Hindu god Shiva shooting an arrow. The god wears the emblem of the sun within a half moon on his headdress and is depicted as a rider who turns in the saddle and shoots at enemies attacking from the rear.[24] Palace of Kala-i Kahkaha I, Bunjikat, Tajikistan, 8th–9th. c. Museum of National Antiquities, Dushanbe, Tajikistan.

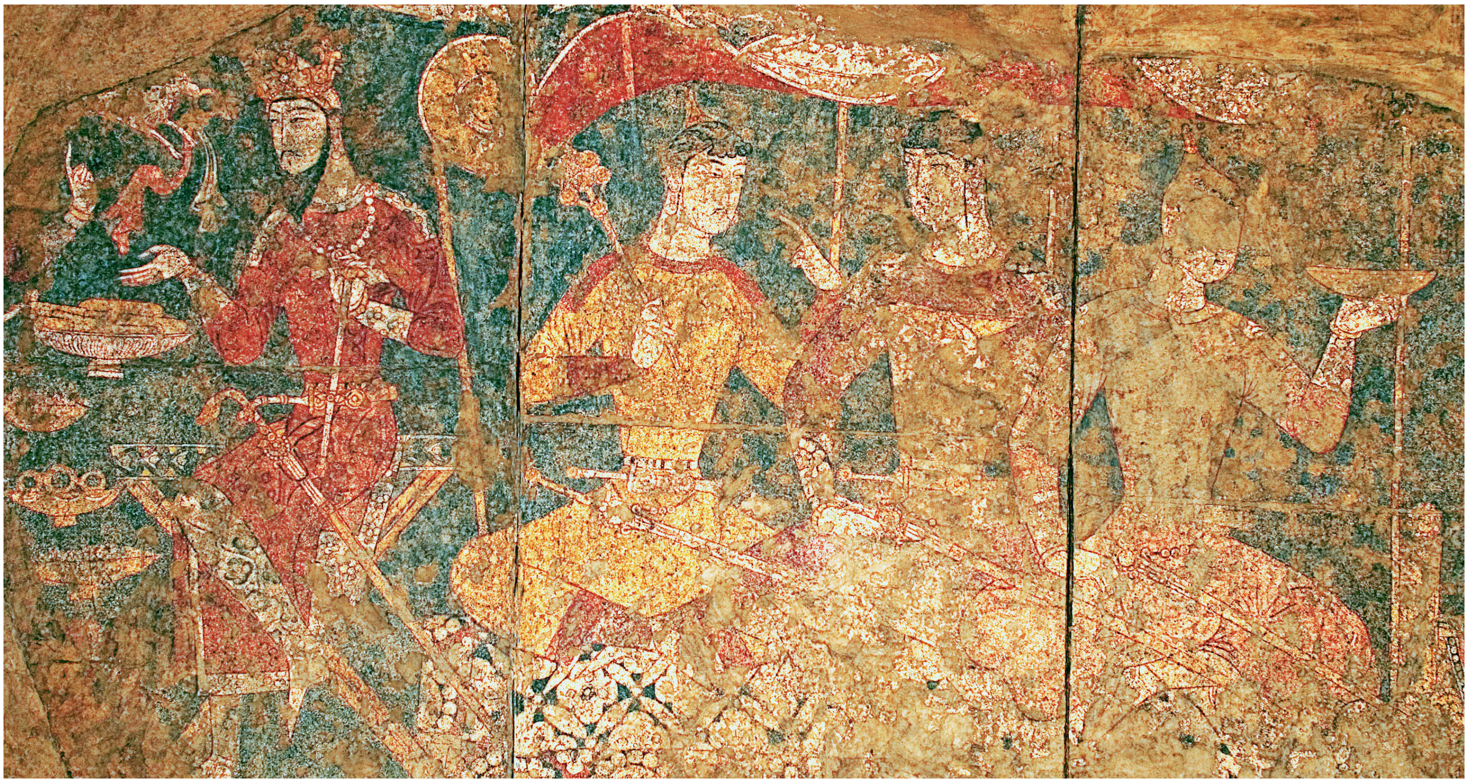
India had been initially established.[56] The latter had to some extent borrowed their representations of gods from the Kushans. The oldest Sogdian murals from Jar Tepe north-east of Urgut from the fourth or early fifth century suggest that Sogdian painting before the sixth century drew inspiration from Iranian models.[57]

The vitality of religious art was enhanced by the practice of venerating different divinities within the Sogdian pantheon in different communities and even individual families. In Panjikant the large two- to three-storey private homes of wealthy Sogdians were decorated with religious pictorial cycles, which prominently represented the tutelary deities of each house and included a variety of ritual scenes (fig. 198). These included banquets, battles and duels as well as episodes from epics such as the Greek fables of Aesop, the Iranian heroic epic about Rustam, slayer of dragons and demons,[58] as well as the Indian *Panchatantra* and *Mahabharata*. The broad palette of themes from different cultural spheres shows the Sogdians' wide-ranging connections and interests and also makes it clear that in Sogdiana painting was not so much serving religious or state propaganda as answering the demands of the wealthy class of noblemen and merchants. It is noteworthy, too, that this elite, whose wealth was directly or indirectly derived from trade, did not celebrate itself in painting but cherished educational parables and martial values from bygone times.

Most striking are those divinities who follow three-headed or four-armed representations of Hindu gods. They emphasise how far Sogdian Mazdaism had moved away from orthodox Zoroastrianism, for, as Frantz Grenet explains, 'three heads or four arms are attributes which are barely compatible with Zoroastrian ideas according to which physical abnormalities are demonic marks'.[59] The most important divinities of the Sogdian pantheon have been identified thanks to two Buddhist documents in the Sogdian language.[60] These gods in Indian garments all bear a nimbus[61] and some of them are represented in Temple D-13 of Dandan Oilik.[62] One was the supreme god **Ahura Mazda**, whose name the Sogdians avoided pronouncing and who was therefore called **Adbagh** (great god). He had the features of Indra, the highest Vedic deity and god of storms, whose mount is an elephant. In Hinduism each deity possesses a mount (Sanskrit, *vahana*) which can also embody the deity. Then there were the god of time, **Zurvan,** equivalent to the god Brahma whose *vahana* is a goose or swan, and the third god of the upper deity triad, the wind god **Weshparkar**, who had the features of the god of cosmic destruction, Shiva, whose *vahana* is the bull Nandi. Less clear is which Sogdian god was depicted with the features of the Hindu war god Karttikeya, who holds a bird in one hand and is accompanied by a



194. Wall painting from Panjikant, Tajikistan, first quarter of 8th c. On the left a female harpist, whose head is surrounded by a halo, and on the right a scene of combat between an armoured bowman, whose battle axe is falling to the ground, and another armoured warrior, who is fighting with a lance, his sword lying on the ground. Behind this foot soldier another warrior is waiting, his lance held upright and his mace on his shoulder. Museum of National Antiquities, Dushanbe, Tajikistan.



195. Wall painting of a banqueting scene from Panjikant, Tajikistan, first quarter of 8th c. All participants are armed with sword and dagger; the king also holds a sceptre and has a bow case by his left knee. In the middle of the king's crown are the symbols of sun and moon, and from the left a bird hands him a ring with long ribbons as a sign of divine confirmation of his authority. Museum of National Antiquities, Dushanbe, Tajikistan.
